While living in Philadelphia (1778–85), Salomon, an Ashkenazic Jew, initiated a measure in behalf of Jews in the state of Pennsylvania that later resulted in more liberal conditions of employment for them. At that time, persons seeking to qualify for civic employment in Pennsylvania were required to take an oath affirming their belief in the New as well as the Old Testament. Salomon presented a petition to the Council of Censors on Dec. 23, 1783, in which he requested the removal of this condition, so that public service might not be closed to orthodox Jews. Later, the constitution of the state was so amended.

Salomon died in Philadelphia, Pa., on Jan. 6, 1785.

SALONIKA (SALONICA; ancient Greek THESSALONIKE, Latin THESSALONICA, modern THESSALONIKI), the capital and seat of the governor-general of northern Greece, of the region of Macedonia, and of the department (*nomos*) of Salonika, is one of the principal seaports of southeastern Europe. It lies on the west side of the Chalcidic peninsula, at the head of the Gulf of Salonika (ancient Thermaic Gulf), on a fine bay whose southern edge is formed by the Kalamaria heights, while on its northern and western sides is the broad alluvial plain produced by the Vardar and Aliakmon rivers. The city is built on the foothills and slopes of Mt. Khortiatis overlooking the bay. Its centre, largely destroyed by a disastrous fire in August 1917, was rebuilt in European style, and much reconstruction was done after World War II; but the older parts retain something of their Turkish character. Salonika is the seat of a metropolitan bishop of the Greek Orthodox Church. It has a university, founded in 1926, with over 7,000 students, and a large number of Greek and foreign schools, including the American college, the German school, and the French *lycée.* It is a divisional headquarters of the Greek army and has a military and a civil airport. At the census of 1961 the department had a population of 544,394, the city 250,920; the city population included the remnants (about 1,300 in 1961) of a large colony of Jews, numbering about 50,000 before the German occupation of 1941–44, whose ancestors fled to Salonika from Germany, Italy, Spain, and Portugal in the 15th and 16th centuries.

History.—Thessalonica was built near the site of the older Greek city of Therme, so called from the hot springs of the neighbourhood. It was founded in 315 B.C. by Cassander, who gave it the name of his wife, a sister of Alexander the Great. It became the capital of the Roman province of Macedonia after 148 B.C. and was Pompey's base of operations during the Civil War. As a military and commercial station on the Via Egnatia, which ran from the Adriatic to Byzantium, it grew to great importance in the

Roman Empire. It became famous in connection with the early history of Christianity through the two epistles addressed by St. Paul to the community he founded there (*see* THESSALONIANS, EPISTLES TO THE); and its first bishop, Gaius, was one of Paul's companions (Acts 19:29). Under Constantine, who repaired the port and enriched the city, it became capital of the prefecture of Illyricum. In A.D. 390, 7,000 citizens accused of insurrection were massacred in the hippodrome by command of the emperor Theodosius I. In the Byzantine Empire Thessalonica was a most prosperous centre of trade, famous for its annual Fair of St. Demetrius, its patron saint, who was martyred in the reign of Maximian. Confident of the protection and guidance of their saint, the inhabitants beat off repeated attacks of Goths in the 3rd and 5th centuries and of Avars and Slavs in the 6th and 7th. In 732 the emperor Leo III detached the city from the jurisdiction of the papacy and made it, with Illyricum, dependent on the patriarch of Constantinople. During the iconoclastic regime (*see* ICONOCLASTIC CONTROVERSY) of the same emperor and his successors it stood on the defensive and succeeded in saving some of the artistic treasures of its churches, although its bishop, Joseph (807–832), a brother of St. Theodore Studites, suffered exile for his defense of image worship.

Thessalonica was made into a special theme or military district of the empire in the 9th century; and an attempt to transfer the whole Bulgarian trade to Thessalonica in the close of that century caused the invasion of the empire by Simeon of Bulgaria. In 904 the Arabs from Crete took the city by storm, and 22,000 inhabitants were sold into slavery. It was attacked by Samuel of Bulgaria in 985. In 1185 the Normans of Sicily took the city after ten days' siege and perpetrated endless barbarities, of which Eustathius, then bishop of the see, has left an account.

After the Fourth Crusade in 1204, Baldwin, conqueror of Constantinople, conferred the kingdom of Thessalonica on Boniface, marquis of Montferrat; but Theodore Angelus Comnenus Ducas, the Greek ruler of Epirus, captured the city in 1224, and had himself crowned emperor there by the archbishop of Ochrida in Macedonia. Demetrius of Montferrat, supported by Pope Honorius III, tried without success to recover his father's throne; and when he died the empty title of king of Thessalonica was adopted by several claimants, including Frederick II of Sicily, the house of Burgundy, and Philip of Tarentum.

In 1246 the independent Greek empire of Thessalonica ceased to exist; the city was incorporated into the rival empire of Nicaea and thence passed into the revived Byzantine Empire after 1261. It was unsuccessfully attacked by the Catalans or Almogávares (*q.v.*) in 1308, and soon after became deeply involved in the civil war between John V Palaeologus and John VI Cantacuzenus, and in the controversy over hesychasm (*q.v.*). The great hesychast apologist, Gregory Palamas, became bishop of Thessalonica in 1350. From 1342 to 1350 the city governed itself as an independent commune under the rule of a popular party calling themselves the zealots. In the latter part of the 14th century it fell twice (1387 and 1391) into the hands of the Ottoman Turks, only to be recovered by the emperor Manuel II in 1403. But when the Turks finally closed in, Manuel's son, Andronicus, in desperation ceded the city to the Venetians in 1423. It was still in Venetian hands when the sultan Murad II appeared and, on March 29, 1430, after a short siege, took it by assault. The Turkish conquerors devastated the city, massacred thousands of its inhabitants, and converted many of the churches into mosques. Salonika became a vilayet of the Ottoman Empire.

In the late 17th century the influence of Sabbatai Zebi (*q.v.*) led to the foundation of the Donmeh sect of Jews professing Islam but preserving many Jewish customs and regarding Sabbatai as the Messiah. In 1876 the French and German consuls in the city were murdered by the Turkish populace. In September 1890 much of the southeastern quarter was destroyed by fire. It was the birthplace of Mustafa Kemal (Atatürk), and during the early years of the 20th century it was the headquarters of the Committee of Union and Progress, the central organization of the Young Turk movement, which carried out the constitutional revolution of 1908. Before this event the weakness of Turkey had encouraged the belief that Salonika would ultimately pass under the control of Austria-Hungary or one of the Balkan states, and this gave rise to many political intrigues which helped to delay the solution of the Macedonian question.

When the First Balkan War broke out in 1912, Salonika surrendered to the Greeks on Nov. 8, after 482 years of Turkish occupation. King George I visited what was now the second largest city of his kingdom and was assassinated there on March 18, 1913. The Treaty of London in the same year assigned Salonika to Greece, and the Battle of Kilkis in the Second Balkan War in 1913 prevented the Bulgarians from approaching it. Salonika was becoming more and more hellenized when World War I brought it into prominence as the base of Allied operations in the Near East in 1915–18 (*see* WORLD WAR I). In 1916 a revolution against King Constantine by supporters of Eleutherios Venizelos (*q.v.*) broke out there, with the formation of the League of National Defense; in October Venizelos arrived and formed a provisional government, which the Allies recognized, and which declared war against Bulgaria and Germany.

After the war an arrangement, not finally ratified until 1929, was made by which Yugoslavia should have a free zone in the harbour; similar but less extensive facilities were offered to Bulgaria in 1939. After the proclamation of the Greek republic in 1924, Salonika often had a decisive voice in politics, and the large immigration of Greek refugees from Asia Minor further hellenized the country round it.

Salonika again figured prominently in World War II. It was bombed by Italian aircraft in 1940. German forces driving southward from Bulgaria and from Yugoslavia drove back the Greek and British armies and captured the city on April 9, 1941, thus cutting off all Thrace from the rest of Greece and splitting Macedonia in two. During the civil war following the German occupation Salonika was crowded with refugees from the towns and villages of Macedonia. Since the restoration of the Greek monarchy it has increasingly taken its place as the second capital of Greece.

Antiquities.—Numerous remains of the earliest or Hellenistic period of the city have been excavated. The Via Egnatia of the Romans, once spanned by two Roman arches, traverses it from east to west, between the Vardar Gate and the Kalamaria Gate. The arch near the Vardar Gate, a massive stone structure probably erected toward the end of the 1st century A.D., was destroyed in 1867. The other arch, built of brick and partly faced with sculptured marble, dates from the reign of Galerius (A.D. 305–311), who extended the city walls to the southeast to include a palace and hippodrome. Remains of a large octagonal building of the same period have been found a little to the south of the arch. The walls of Salonika and of the upper citadel, which forms a separate fortress, date originally from the time of Theodosius I (379–395), though rebuilt and restored on many occasions, with towers and gates added by the Palaeologi and by the Turks. The sea walls were demolished in 1866 to accommodate the quay, though the Levkos Pirgos ("White Tower") still stands on the quay. The *Heptapyrgion,* the keep of the citadel, is now a prison.

Once the second city of the Byzantine Empire after Constantinople, Salonika is remarkable for its many fine Byzantine churches. The domed Basilica of Hagia Sophia, probably erected early in the 8th century, was converted into a mosque in 1589 and damaged by fire in 1890 and by bombing in 1940. The nave, forming a Greek cross, is surmounted by a hemispherical dome covered with a rich mosaic, probably of the 9th century, representing the Ascension. The Church of St. Demetrius, originally of the early 5th century, was destroyed by the fire of 1917 but has been lavishly reconstructed. It is a five-naved basilica with an atrium and narthex and a transept at the east end; it still contains mosaics dating from the 7th century, and frescoes of 1303 adorn the chapel on the right of the sanctuary. The Church of St. George, a rotunda with eight niches in the walls, was originally a Roman construction (possibly a mausoleum), converted to Christian use in the 5th century with the addition of a circular gallery (now destroyed) and the enlargement of the eastern niche to make a sanctuary and apse. The dome is decorated with 5th-century mosaics, of which the lower zone survives, showing martyr-saints against a background of archi-

tectural compositions. The three-naved Basilica of the Panagia Acheiropoietos (formerly St. Paraskevi; Turkish Eski Djouma) also dates from the 5th century and contains mosaics of that period. The little Church of Hosios David has a fine 5th-century mosaic of the Vision of Ezekiel; and the domed churches of St. Catherine and of the Holy Apostles with their mosaics date from the 13th and 14th centuries respectively.

Railways, Harbour, and Commerce.—Salonika is the principal Aegean seaport of the Balkan Peninsula, the centre of the import trade of all Macedonia, and the natural port of shipment for the products of an even larger area. It is the terminus of four railways: one goes north to Skopje and Nis in Yugoslavia, where it meets the main Paris-Vienna-Istanbul line; another runs westward from Salonika to Bitola (Yugoslavia); a third runs via Serrai and Drama to join the main line at Kuleli Burgas (Pithion, Gr.); a fourth extends south to Larissa and Athens. The present harbour, opened to navigation in December 1901, allows the direct loading and unloading of all merchandise. The harbour works consist of a breakwater 1,835 ft. (559 m.) long and 492 ft. (150 m.) wide, with 28 ft. (8½ m.) of water on its landward side. Opposite is a quay 1,475 ft. (450 m.) long, which was widened in 1903–07 to 306 ft. (93 m.); at each end of the quay a 656-ft. (200-m.) pier projects into the sea. Between the extremities of these two piers and those of the breakwater are the two entrances to the harbour. Salonika exports grain, flour, bran, silk cocoons, chrome, manganese, hides and skins, cattle and sheep, wool, eggs, and tobacco. Other industries are cotton spinning, brewing, tanning, and the production of bricks, tiles, carpets, textiles, soap, flour, ice, wines, and spirits.

Macedonia Region, of which Salonika is the capital, is rich in minerals, including chrome, manganese, zinc, iron, lead, and lignite, but some of these are unworked. The chief agricultural products are grain, rice, beans, cotton, fennel, and red pepper; there is also some trade in timber, livestock, furs, wool, and silk cocoons. The tobacco industry is one of the largest, but wine, liqueurs, sesame oil, macaroni, and soap are also manufactured. The principal towns, besides Salonika, are Edessa, Kavalla (*qq.v.*), and Serrai. Drama is one of the centres of tobacco cultivation; and the towns of Veroia, Kozani, Naousa, Florina, and Katerini all have populations over 10,000. The total population of the region was 1,890,654 in 1961.

SALSETTE (a corruption of the Marathi Sashti), a large island north of Bombay city in India. Area 246 sq.mi. (637 sq.km.). Pop. (1961) 186,449. The island was taken from the Portuguese by the Marathas in 1739 and from them by the British in 1774; it was formally annexed by the East India Company in 1782. In 1950 it was divided administratively between Greater Bombay and Thana district (within which the whole island formerly lay). In various parts of the island are ruins of Portuguese churches, convents, and villas, and at Kanheri are more than 100 Buddhist cave shrines dating from the end of the 2nd century to the 6th century A.D. Salsette is crossed by the Central and Western railways and is encircled by a motor road. It is connected with Bombay Island and also with the mainland by bridge and causeway. (F. R. A.)

SALSIFY, sometimes called oyster plant or vegetable oyster because of its taste, is a hardy biennial with long, cylindrical, fleshy, edible roots resembling small parsnips. Botanically it is *Tragopogon porrifolius,* of the family Compositae. When properly cooked, the roots are extremely delicate and wholesome. Native to the Mediterranean region, salsify has escaped from cultivation and become a troublesome weed in many temperate regions, as in Great Britain and North America.

Salsify succeeds best in a free, rich, deep soil. Since the plant requires a long season to develop usable roots, the first seed should be sown an inch deep in early spring (more, a month later) in rows a foot apart; when three inches tall, the plants should be thinned to four to eight inches apart. The first season's growth produces a rosette of grasslike leaves up to one foot long. In late autumn some of the whitish roots may be taken up and stored in sand or in a moist cellar for immediate use; others may be dug as desired during intervals of mild weather. The roots may be left in the garden until spring, but should be dug up before growth starts. The second season's growth produces an erect branching stem two to four feet tall and handsome purple flower heads followed by elongate, plumed seeds.

Other related root vegetables, also native to the Old World and used as is salsify, are black salsify (*Scorzonera hispanica*), having a white-fleshed but black-skinned root, and Spanish salsify or golden thistle (*Scolymus hispanicus*), longer-rooted than salsify and milder-flavoured, with prickly leaves.

In the U.S. salsify is occasionally grown in home gardens but is of little importance as a market vegetable. Black salsify and Spanish salsify are little known in the U.S.

SALT (As Salt), the chief town of the *liwa'* (district) of Balqa, Jordan, lies about 18 mi. (29 km.) WNW of Amman on the old Jerusalem road. Pop. (1961) 16,176. The town is picturesquely built on steep hillsides. It contains fine examples of old Turkish houses, for under Turkish rule (16th century) it was the chief town of Transjordan. It is noted for its grapes and raisins. The name Salt may derive from the Latin Saltus (meaning a narrow pass or mountain valley), for under this name it was the seat of a bishopric in Byzantine times. (G. W. L. H.)

SALT, a mineral substance of great importance to man, is chiefly sodium chloride, NaCl. It is sometimes called common salt to distinguish it from chemical compounds of the same kind, called salts (*see* Acids and Bases). This article is concerned with common salt only.

Properties.—Pure sodium chloride may be made by passing dry hydrogen chloride gas into a saturated solution of common salt, whereupon the purified salt is deposited as a colourless crystalline powder. It crystallizes in the cubic system, usually as cubes; the mineral form is known as halite (*see* below, *Rock Salt*). The melting point is 800° C, which is a bright red heat. Vaporization begins near this temperature. It dissolves easily in cold water and a little more readily in hot water; 100 parts by weight of water dissolve 35.8 parts of salt at 20° C, 39.2 parts at 100° C and 39.6 parts at 108.7° C, the boiling point of the saturated solution. If a saturated solution in water is cooled below 0° C a crystalline hydrate, $NaCl.2H_2O$, separates.

Common salt (and other salts such as calcium chloride), when mixed with snow or ice, lowers the melting point of the latter. Hence salt is frequently used to rid walks and roads of accumulated snow and ice.

Uses.—Table salt, used universally as a condiment, is fine-grained common salt of high purity. To ensure that it will remain free-flowing when exposed to the atmosphere, small quantities of sodium carbonate or trisodium phosphate are added to combine with such moisture-absorbing impurities as calcium and magnesium chlorides. Usually potassium iodide is added in small quantity to overcome any possible iodine deficiency of the consumer.

Salt is essential to man's health (*see* Blood: *Plasma: Salts;* Nutrition: *Components of Nutrition: Inorganic Materials*); it is fed to livestock for the same reason.

Common salt used for various manufacturing purposes may be coarser in grain than table salt. It is employed as a preservative or seasoning, or both, in meat packing, fish curing, and the food-processing industries; for curing hides, and as a brine for refrigeration. It is indispensable to the manufacture of sodium carbonate (washing soda), sodium bicarbonate (baking soda), sodium hydroxide (caustic soda), hydrochloric acid, bleaching powder, chlo-

rine and many other heavy and fine chemicals. The glass and soap industries are dependent upon it, and it is used also in the glaze and enamel trades. As a flux, it enters into metallurgical processes and has been used in the manufacture of cement to aid in the recovery of potash as a by-product. Salt also is used to melt snow and ice from streets and highways (*see* above, *Properties*).

The production of salt is one of the world's most widely distributed mineral industries. Outputs of salt vary with the population and industrial activity of the country in question. Heavily populated countries like India and China require the major part of their production for food uses only; the United States on the other hand requires several times as much salt for industrial purposes as is consumed in food. Many countries contribute to the total world production of salt; leading producers include the United States, United Kingdom, U.S.S.R., China, India, France, West Germany and Italy, with a total annual production of about 50,000,000 tons. In the 1960s U.S. consumption of salt was about 25,000,000 tons a year; about three-fourths of the amount was used in manufacturing.

Historical Background.—Salt must have been quite unattainable to primitive man in many parts of the world. Thus the *Odyssey* speaks of inlanders who did not know the sea and used no salt with their food. In some parts of America, and even of India (among the Todas), salt was first introduced by Europeans; and there are still parts of central Africa where its use is a luxury confined to the rich. Indeed, where men live mainly on milk and flesh, consuming the latter raw or roasted, so that its salts are not lost, it is not necessary to add sodium chloride, and thus it can be understood how the Numidian nomads in the time of Sallust and the Bedouins of Hadhramaut at the present day never eat salt with their food. On the other hand, a cereal or vegetable diet calls for a supplement of salt, and so does boiled meat.

The habitual use of salt is intimately connected with the advance from nomadic to agricultural life; *i.e.*, with precisely that step in civilization which had most influence on the cults of almost all ancient nations. The gods were worshiped as the givers of the kindly fruits of the earth, and, as all over the world "bread and salt" go together in common use and common phrase, salt was habitually associated with offerings, at least with all offerings which consisted in whole or in part of cereal elements. This practice was prevalent among the Greeks and Romans and among the Semitic peoples (Lev. ii, 13).

As covenants were ordinarily made over a sacrificial meal, in which salt was a necessary element, the expression "a covenant of salt" (Num. xviii, 19) is easily understood; it is probable, moreover, that the preservative qualities of salt made it a peculiarly fitting symbol of an enduring compact, and influenced the choice of this particular element of the covenant meal as that which sealed an obligation to fidelity. Hence the Greek saying "Trespass not against the salt and the board," the Arab avowal "There is salt between us," the expression "to eat the salt of the palace" (Ezra iv, 14), and the modern Persian phrase *namak haram*, "untrue to salt" (*i.e.*, disloyal or ungrateful). In English the metaphor "salt of the earth" describes a person held in high esteem.

Salt and incense were economic and religious necessities of the ancient world and contribute greatly to knowledge of the ancient highways of commerce. Thus one of the oldest roads in Italy is the Via Salaria, by which the produce of the salt pans of Ostia was carried into the Sabine country. Herodotus' account of the caravan route uniting the salt oases of the Libyan desert makes it plain that this was mainly a salt road, and to the present day the caravan trade of the Sahara is largely in salt. The salt of Palmyra was an important element in the trade between the Syrian ports and the Persian gulf. In like manner the ancient trade between the Aegean and the coasts of southern Russia was largely dependent on the salt pans at the mouth of the Dnieper and on the salt fish brought from this district. The vast salt mines of northern India were worked before the time of Alexander. The economic importance of salt is further indicated by the prevalence down to the present day of salt taxes or of government monopolies. In oriental systems of taxation high imposts on salt are seldom lacking and are often carried out oppressively with the result that the article is apt to reach the consumer in an impure state largely mixed with earth. "The salt which has lost its savour" (Matt. v, 13) is simply the earthy residuum of such an impure salt after the sodium chloride has been washed out.

Cakes of salt have been used as money; *e.g.*, in Abyssinia and elsewhere in Africa, and in Tibet and adjoining parts. In the Roman army an allowance of salt was made to officers and men; in imperial times this *salarium* was converted into an allowance of money for salt.

Salt in Sea Water.—Many substances make up the salt in sea water, but sodium chloride is by far the dominant compound. Assuming that each gallon of sea water contains 0.2547 lb. of salt, and allowing an average density of 2.24 for rock salt (the natural form of salt occurring in the earth), it has been computed that if dried up the oceans of the world would yield no less than 4,500,000 cubic miles of rock salt, or about 14½ times the bulk of the entire continent of Europe above high-water mark.

Sea water contains on the average about 3.33% salt, but the concentration varies from about 2.9% in the polar seas to 3.55% and upward at the equator. Enclosed seas such as the Mediterranean and Red seas contain a higher proportion of salt than the open ocean at the same latitude. The salt obtained by evaporation of sea water has, however, the following composition irrespective of the source of the sea water: sodium chloride 77.82%, magnesium chloride 9.44%, magnesium sulfate 6.57%, calcium sulfate 3.44%, potassium chloride 2.11%, magnesium bromide 0.22% and some calcium carbonate. (*See* also OCEAN AND OCEANOGRAPHY: *Chemistry of Sea Water: Elements in the Sea Salts.*)

Natural Brines.—Brine is water containing a high concentration of salt. Natural brines of commercial importance are found in Austria; France; Germany; Kharaghoda and Kuda, India; Michigan, New York state, Ohio, Pennsylvania, West Virginia and the salt lakes of Utah in the United States; and in the Dead sea. In Great Britain there are salt brines in Cheshire, Worcestershire, Lancaster and Yorkshire and in deep wells in Derbyshire, Staffordshire and Midlothian. Salt in brines is nearly always accompanied by chlorides and sulfates of potassium, calcium and magnesium; in many cases carbonates and the element bromine are present.

The Dead sea, which covers an area of 394 sq.mi., contains approximately 11,600,000,000 tons of salt, and the river Jordan, which contains only 35 parts of salt per 100,000 of water, adds each year 850,000 tons of salt to this total. The composition of Dead sea water is given in Table I (although the salts exist as ions in solution and are so analyzed; it is customary to express the analyses in terms of compounds):

TABLE I.—*Composition of Dead Sea Water*

Item	Surface water	Deep water (250 ft.)
Specific gravity	1.1651	1.2356
Sodium chloride	6.11%	7.20%
Potassium chloride	0.85%	1.25%
Magnesium bromide	0.38%	0.61%
Magnesium chloride	9.46%	13.73%
Calcium chloride	2.63%	3.82%
Calcium sulfate	0.11%	0.05%
Total solids	19.54%	26.66%

The concentration of salts in the Dead sea increases to a depth of about 250 ft., after which it remains practically constant. At this depth and below it is a concentrated solution, which, indeed, is supersaturated when pumped up, for a slight deposition of salt takes place owing to diminished pressure. Noteworthy features of Dead sea water are its relative freedom from sulfates and the high proportions of potassium and bromine. These facts, coupled with the circumstance that atmospheric conditions in Palestine are favourable to solar evaporation for about eight months of the year, indicate that the production of salt, potassium and even bromine is feasible in the Dead sea area, the process as regards salt and potash being similar to that described below under *Manufacture*. The brines at Kharaghoda resemble sea water in the character of their dissolved salts, but are much more concentrated and in some cases practically saturated.

TABLE II.—*Composition of Some Concentrated Natural Brines*

Item	Droitwich	Winsford	Syracuse, N.Y.	St. Charles, Mich.	Artern, Saxony	Friedrichshall, Württemberg
	%	%	%	%	%	%
Sodium chloride	24.97	25.46	21.71	22.84	25.27	25.49
Sodium sulfate	0.26	..	..	..	..	..
Potassium chloride	..	..	..	..	0.12	..
Potassium sulfate	..	..	..	..	0.29	..
Magnesium bromide	..	..	..	0.26	..	..
Magnesium chloride	0.05	0.21	0.14	4.03	0.42	0.01
Calcium sulfate	0.37	0.45	0.50	0.20	0.40	0.44
Calcium chloride	..	..	0.19	0.77	..	..
Total solids	25.65	26.12	22.54	28.10	26.50	25.94

Table II gives the composition of some concentrated natural brines used for the production of salt in various countries.

Certain natural brines occurring in England and the United States are of interest, not only from the economic point of view, but also because they contain salts not usually found in brines, such as the chlorides of barium and strontium; when salt is produced from such brines special methods of manufacture are adopted.

In Great Britain these brines were found at great depth in boreholes in Derbyshire, Staffordshire and Midlothian during the search for petroleum. In the U.S. they occur in deep wells in West Virginia, Ohio, Texas, and other places.

TABLE III.—*Natural Brines Containing Unusual Salts*

Item	Renishaw, Derbyshire	West Calder, Scotland	Pomeroy, Ohio	Malden, W. Virginia
Depth (feet)	3,198	3,910	..	..
Specific gravity	1.127	1.063	1.075	1.063
Sodium chloride	10.28%	6.26%	7.92%	6.01%

Barium chloride	0.14%	0.07%	0.04%	0.07%
Total solids	15.75%	8.49%	9.96%	8.15%

It has been suggested that those brines which are characterized by the absence of carbonates and sulfates have been produced by a natural process akin to the ion exchange (*q.v.*) process for softening water. (J. J. F.; A. G. F.; R. H. RN.; X.)

Rock Salt.—Rock salt is crystalline sodium chloride, called halite by mineralogists. It occurs in the form of rock masses and beds. It has a wide geographic distribution and occurs abundantly in rocks of all ages. Because of its great solubility in water it occurs under extremely thick cover in humid regions, but lies close to the surface in arid regions.

All important rock-salt deposits originated from the evaporation of sea water at some time during the geologic past. Some 77% of the mineral matter in normal sea water is sodium chloride. Upon evaporation of about nine-tenths of the volume of sea water, rock salt is precipitated. The precipitation of rock salt overlaps the precipitation of calcium sulfate (gypsum and anhydrite) on the one hand and potassium and magnesium salts on the other. Thus these compounds commonly occur with rock salt. Deposits are found in beds from a few feet to many hundreds of feet thick. In age these beds are distributed through much of geologic time from the Cambrian through the Mesozoic.

Since it is necessary to evaporate a large quantity of sea water to deposit a small amount of salt, it is thought that many extremely thick rock-salt beds were deposited in partly enclosed arms of the seas in which evaporation was greater than inflow of fresher water. The supply of water was continually renewed by inflowing currents while a barrier on the sea floor at the entrance to the basin prevented the outflow of the concentrated saline water so that the salts were deposited in thick beds on the basin floor.

Such bedded salt deposits occur in the Lower Cambrian of the Punjab Salt range in Pakistan and in Iran, but are little exploited. The Silurian and Devonian rocks of the northeastern United States and Ontario in Canada contain important rock-salt deposits which are extensively worked for industrial and domestic use. The Carboniferous of Nova Scotia contains extensive rock-salt deposits which are utilized in eastern Canada and northeastern United States. The Pennsylvanian (Carboniferous) of Colorado and Utah contains large amounts of rock salt.

The rocks of Permian age contain some of the largest rock-salt deposits in the world. The most important are the Zechstein deposits of Germany, long exploited not only for their common salt but for their potassium content. The salt deposits of the sub-Carpathian region extending from Poland through Hungary and Rumania may be of this age. In the Donetz basin and the Volga region of European U.S.S.R. are extremely important deposits of Permian rock salt. In the United States enormous thicknesses of rock salt underlie much of the Permian basin extending from Kansas to western Texas.

The Triassic of England contains important rock-salt deposits which have been worked for many years. In the Tirol the Triassic strata also contain important salt deposits. In the province of Szechwan, China, rock salt occurs in beds of Triassic Age and has been exploited through salt wells for more than 2,000 years.

Another type of rock-salt deposit which is economically important is the salt dome. This deposit has been forced up by earth pressure from great depths in the form of plugs of roughly circular shape a few yards to a mile across. The domes appear to be a development of folding, in which the salt is forced up through other rocks, because of its great plasticity under high pressure, from depths as great as 20,000 ft. Such salt domes are abundant along the Gulf coast of southern United States and extend into the east Texas basin and northern Louisiana. Many domes occur at shallow depths and are extensively mined to supply the southern United States. Similar domes in the sub-Carpathian region of Europe have been worked since ancient times. The north German plain has many domes, extensively worked, which are thought to have originated below 6,000 feet. (*See* SALT DOME.)

Rock salt may be exploited by usual mining methods. Another method of exploitation is by drilling wells into the salt strata, pumping water down them to dissolve the salt and treating the returning brine in a manner similar to the treatment of natural brines. It is difficult to arrive at any estimate of the relative importance of rock-salt production as compared with production of other types of salt since most available statistics make no distinction between natural and artificial brines. The United States and Europe are leaders in exploitation of rock-salt deposits. However, South American countries are developing their deposits rapidly with Brazil the largest producer. (J. M. Hs.; R. H. RN.)

Manufacture.—At one time almost all of the salt used in commerce was produced from the evaporation of sea water, and sea salt still is a staple commodity in many maritime countries, especially where the climate is dry and the summer of long duration. Commercial salt is manufactured (1) from rock salt and (2) from sea water and other natural and artificial brines. Most of the artificial brines are obtained by pumping water into wells drilled into underground salt beds and pumping up the solution which results when this water dissolves salt from the deposit. In addition to the ordinary uses of crystalline salts, much is used directly in the form of brine in industrial countries.

Manufacture From Rock Salt.—The beds of rock salt are mined or quarried by the usual excavation methods, depending upon the depths and thicknesses of the deposits and upon local conditions. In some cases the mined rock salt is dissolved and salt manufactured by treatment of the brine as described below. This treatment affords opportunities for purification of the salt. Where the rock salt is of high degree of purity, as in the United States and in Galicia, the salt is ground, sieved and marketed with no further treatment. The mined salt in large lumps is first crushed, then more finely ground and screened to separate the various size grades; the oversize material going back to the mill and the acceptable sizes being packed for market, usually by bagging. A disadvantage of such salt is the tendency to revert to hard masses in storage. In Germany rock salt is treated in similar fashion, except that the larger fragments of impurities such as anhydrite and gypsum are hand picked from the coarsely crushed rock salt.

Less pure German rock salt is purified by fusion, either alone or with sodium carbonate and silica or with chalk and saltpetre (sodium nitrate). In some cases, the fused mass is "blown" with air to burn away carbonaceous material, leaving a clear melt which crystallizes on cooling. After separation from the slag by concussion, the salt is ground and sieved. Alternately, an impure salt is leached with a saturated solution of pure salt in dilute hydrochloric acid whereby impurities such as gypsum, magnesium salts and iron oxide are dissolved. The treated salt is filtered, washed with a saturated solution of pure salt, dried, ground and graded for market.

Manufacture From Sea Water and Brines.—When an aqueous solution of several salts is evaporated, the salts separate, each as it reaches its point of saturation in the solution. The solubilities of the salts in the complex solution will, in general, be similar to but not the same as the solubilities for the same salts in water. In the case of sea water and many brines the order of deposition is calcium carbonate, calcium sulfate, sodium chloride, magnesium sulfate, carnallite (potassium magnesium chloride) and magnesium chloride. These salts are not, however, deposited within sharply defined limits of concentration. As each salt reaches its own point of saturation it deposits along with all the other salts which have reached their own saturation points. Therefore each salt deposited is contaminated by some of the other salts and by the residual brine. Further, the relative solubilities are altered by temperature and hence in solar evaporation the difference in temperature between day and night and also the seasonal temperature changes affect the character of the salt deposited. The art of the saltmaker is to produce grades of salt suitable for the particular use to which it is to be put.

Salt is produced by solar evaporation from sea water in France, Portugal, Spain, Italy, India, the U.S.S.R. and the United States—in fact, in nearly all maritime countries. The processes generally adopted are similar in principle, although details of evaporating pans and of manufacturing plants vary with local conditions. A preliminary concentration is usually carried out by allowing the brine to flow through a series of channels to concentration ponds constructed of wood, puddled clay or concrete. The areas of the ponds vary from 280 sq. ft. to 50 ac. in different countries. The solution is concentrated first to a specific gravity of about 1.21. At this stage, suspended impurities (sand and clay) and the less soluble salts (calcium carbonate or chalk and calcium sulfate) are removed. The clear concentrated brine is then run successively into a series of crystallizing pans, usually three, where the salt is deposited. The total area of the crystallizing pans is approximately one-tenth of that of the evaporating pans. In the first crystallizing pan the brine is concentrated to a specific gravity of 1.25 and here the best grade of salt is produced. The specific gravity of the mother liquor increases slowly during crystallization of the salt because of the increasing concentration of the other salts. The mother liquor reaches a specific gravity of 1.26 in the second pan where a second grade of salt is obtained. In the third pan a specific gravity of 1.275 is obtained and here the lowest grade of salt is deposited. The final mother liquor, termed bitterns, is used in some countries (*e.g.*, France, India and the United States) for the manufacture of potash, bromine, Epsom salts (magnesium sulfate) and magnesium chloride.

The salt in each crystallizing pan is raked into rows and allowed to drain for several days, is then collected into heaps, drained again, lifted from the pans and finally dried. As a tax is levied on salt (by weight) in most European countries, it is obviously an advantage to trade in the dried material. The salt from the first pan is frequently used locally as table salt, that from the second pan may go into the chemical industry and that from the third pan is used for pickling fish, refrigeration and other purposes. Typical compositions of the salts thus produced are given in Table IV.

TABLE IV.—*Typical Compositions of Salts from Evaporation Pans*

Item	Grade I	Grade II	Grade III
	%	%	%
Sodium chloride	96.0	95.0	91.0
Calcium sulfate	1.0	0.9	0.4
Magnesium sulfate	0.2	0.5	1.0
Magnesium chloride	0.2	0.5	1.2
Insoluble matter	..	trace	0.2
Water (moisture)	2.6	3.1	6.2
	100.0	100.0	100.0

In Palestine, solar evaporation of the Dead sea water is aided by dye added to the water. The dye permits complete absorption of sunlight in thinner layers of water so that shallow ponds may be used and absorption of brine by the ground is reduced.

In England, Germany, most of the eastern part of the United States and other places where it is impractical to manufacture salt by means of solar heat, the brines are concentrated and evaporated by artificial heat. Formerly the brine was concentrated in open pans over fire. More recently steam-jacketed vessels were used, but now the largest part of the salt produced in the colder countries is manufactured in multiple-effect vacuum evaporators and an important quantity is made in open crystallizers or grainers which produce a type of crystal preferred for use in some of the food industries. The brine, natural or artificial, is first pumped into settling tanks, where calcium and magnesium compounds may be removed by chemical treatment, usually lime and sodium hydroxide are used. After settling and filtration, the brine is delivered to the grainer, which is a long open trough with steam coils. The brine is fed into the grainer at approximately the same rate as that at which evaporation is taking place and at a temperature only slightly below that of the brine in the grainer. The residue of brine or bitterns, may be removed daily or less often or may be withdrawn continuously. The evaporation occurs at the surface of the liquid and the crystals originate there. They remain at the surface, held up by the surface tension of the brine. The crystal grows at the top edges, becoming a small inverted hollow pyramid or hopper. Eventually the hopper sinks and ceases to grow. When the crystals are recovered the salt is largely in the form of flakes, whence the name "flake salt." When multiple-effect evaporators are used, the vacuum in each vessel is adjusted so that the vapour from the first vessel is sufficiently hot to boil the brine in the second; the vapour from the second supplying the heat to operate the third vessel or effect. The brine is usually sent through the stages or effects in succession, although in the case of salt manufacture, fresh brine may be fed to each stage if desired. In a triple-effect system, vacuums of 15 in., 25 in. and 27 in. of mercury have been found efficient. With open pans, one ton of coal will produce about two to two and one-half tons of salt whereas it will yield five to six tons of salt with an efficient triple-effect plant.

After crystallization, with either closed or open equipment, the brine is separated from the salt by draining or by centrifugal separation. The moist salt is then dried by a current of hot air, usually in rotary driers; however, a "fluid bed" type of drier may be used.

During the 1960s the proportions of salt produced in the United States by various processes were approximately: open-pan evaporation 2%, vacuum evaporation 10%, solar evaporation 5%, rock salt 20%, used in brine 59%.

SALTA, a city of Argentina and capital of Salta Province, lies in the picturesque and historic Andean valley of Lerma, 1,007 mi. (1,621 km.) NNW of Buenos Aires by rail. Population (1960) 121,491. The city was founded in 1582 as San Felipe de Lerma by Hernando de Lerma, governor of Tucumán. In 1813, during the War of Independence, the Spanish royalist forces, following their decisive defeat at Salta, capitulated to Gen. Manuel Belgrano.

Situated 3,895 ft. (1,187 m.) above sea level, the city is an important industrial and trading centre. Its commercial prominence dates from colonial times when it was the scene of the largest pastoral fairs of northwest Argentina.

Despite earthquakes the city has preserved many of its colonial buildings, including the cathedral, and colonial styles are imitated in many modern buildings. It is a tourist centre with thermal springs nearby. At an annual fiesta in September a revered 16th-century image of Christ is honoured in commemoration of the city's deliverance from a severe earthquake in 1692.

SALTA PROVINCE in northwestern Argentina has, since the breakup of the territory of Los Andes in 1943, included the departments of San Antonio de los Cobres and Pastos Grandes. Pop. (1960) 408,987. Area 59,759 sq.mi. (154,776 sq.km.). Bounded on the west by Chile, the Andean half of the province, with its high *sierras* and *valles*, forms part of the Puna de Atacama, the highest region of Argentina, some mountains exceeding 19,000 ft. (5,790 m.). It is a bleak, arid, and cold plateau with desert-like inland drainage basins (*salares*). The eastern half, bounded on the north by Bolivia and Paraguay, is the highest part of the Gran Chaco plain. Drained to the southeast by several rivers, of which the Bermejo is the chief, this part of Salta has forested valleys which deteriorate in the drier west into scrub-covered mountain slopes. The western *puna*, or high plateau, is the home of Coya Indian tribes, but the eastern valleys contain many settlements peopled by mestizo Argentines.

The railway links the province with Bolivia via Yacuiba and Villazón, and since 1948 with the Chilean port of Antofagasta. There are rail and road connections with all parts of Argentina. The province has been important since colonial times for its pastoral activities, especially the raising of mules and cattle for north Chilean markets. Its trade throughout the colonial period was predominantly with Bolivia and Chile, and it had little intercourse with Buenos Aires. Lumbering, sheep raising, and the growing of sugarcane, tobacco, grapes, and maize (corn) are other occupations; the mining of soda and borax from the *salares* is also important. The upper Bermejo valley contains an important oil field, the chief centres being Orán and Tartagal, with a refinery at Embarcación. Lead, silver, iron, and copper are mined. Most of the factories in the province are concerned with processing agricultural products; predominant among them are sugar and vegetable oil refineries, tobacco curing works, flour mills, tanneries, and plants for meat packing and wine making. (G. J. B.)

SALTASH, a municipal borough in the Bodmin parliamentary division of Cornwall, Eng., 4 mi. W.N.W. of Plymouth by road and ferry. Pop. (1961) 7,425. Area 8.3 sq.mi. It is on the wooded west shore of the Tamar estuary, on the opposite side of which lies Plymouth. Communications are maintained by two floating ferry bridges. At Saltash the Royal Albert bridge (1848–59), built by I. K. Brunel, carries the railway across the estuary. The church of St. Nicholas and St. Faith has an early Norman tower and that of St. Stephen retains its ornate Norman font. Saltash (*Aysh,* 1284; *Saltesh,* 1337), the oldest borough in Cornwall, belonged to the manor of Trematon, and at the Domesday survey was held by Reginald de Valletort. A charter was granted sometime at the end of the 12th century. Roger de Valletort gave the borough to the earl of Cornwall, and thenceforth the earls, and subsequently the dukes of Cornwall were lords of Saltash. The privilege of parliamentary representation was conferred by Edward VI.

In 1584 Elizabeth I granted the town a charter of incorporation which was superseded by another in 1683, and the modern charter was adopted in 1886. In 1832 Saltash was deprived of its two members of parliament. Saltash is in part a fishing town. One mi. S.W. is Trematon castle, associated with the Black Prince.

SALT DOME. Geologic structures in which salt is a controlling factor may be steep folds in which salt flowage modifies the geologic deformation or structures in which the flow and uplift of the salt itself is the primary geologic movement. It is this latter type of geologic phenomenon which is commonly meant by salt dome. Such structures commonly are roughly circular in plan although some may be greatly elongated. Usually the vertical dimensions are of the same order or greater than the horizontal dimensions. A typical dome may consist of a more or less cylindrical vertical salt column about two miles across and with a vertical dimension of three to six miles. However, the size of individual domes in the same area may vary greatly.

Salt domes always occur in areas underlain by thick layers of salt, or halite, which is primarily sodium chloride (NaCl). Domes are not found in all areas of thick salt deposits but only where such deposits have been buried to great depth by subsequent deposition. It appears that a minimum overburden of the order of 10,000 ft. is required for salt domes to form and domes are known where the depth to the salt is estimated to be as great as 30,000 to 40,000 ft.

Origin and Mode of Formation.—There has been considerable controversy and speculation in geological literature on the mechanics of the formation of domes. European geologists, from studies of the German and Rumanian salt structures, recognized that the domes were formed from bedded salt which had flowed under pressure. In some areas the salt flowage resulted from recognized tectonic forces. In other cases, however, such as in the Gulf coast of the United States, there is no recognized tectonic pattern. The intrusive uplift of the domes now is generally attributed to buoyancy resulting from the fact that the density of the salt is less than that of the surrounding sedimentary rocks. The existence of a density difference is shown by the negative gravity anomalies of practically all of the simple, round intrusive salt domes of the Gulf coast and many other areas, as determined by geophysical prospecting (*q.v.*) methods.

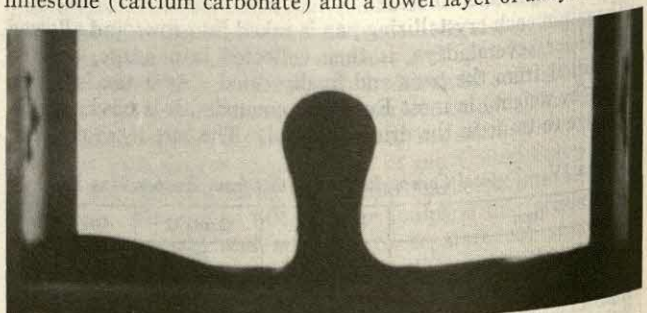
FIG. 1.—CROSS SECTION OF A GULF COAST SALT DOME, ALLEN DOME, BRAZORIA COUNTY, TEX.

This theory, which appears to account for many of the major features of salt domes, may be likened to the flow of fluids. One can compare the layer of low density salt under heavier sediments with a low density fluid under a heavier one, and models based on this principle produce forms which are rather strikingly similar to the forms which salt domes have in nature. Figure 1 shows a cross section of a salt dome and fig. 2 a fluid model consisting of a layer of asphalt with a density of 1.0 beneath heavy sirup with a density of 1.4. After the flow is localized by an initial disturbance, the asphalt rises up through the sirup because of its lower density and takes a form very similar to that which many of the Gulf coast domes are known to have from drilling and from analysis of geophysical surveys. Moreover, the ratios between the mechanical properties of the model and those of its prototype in nature are such that the dimensional relations are approximately correct for dynamic similitude. Thus, it appears quite clear that a major factor in the uplift of intrusive salt domes is simple isostatic flowage of the salt because it is of lower density than the sediments.

Cap Rock.—Many of the salt domes, especially in the Gulf coast of the United States and in Germany, have a so-called cap rock. In the Gulf coast, this usually consists of an upper layer of limestone (calcium carbonate) and a lower layer of anhydrite (an-



BY COURTESY OF GRAVITY METER EXPLORATION CO.

FIG. 2.—FLUID MODEL TO SIMULATE SALT DOME FORMATION. BLACK PART IS LOWER DENSITY ASPHALT FLOWING UPWARD IN HIGHER DENSITY SIRUP. ONE-FOURTH NATURAL SIZE

hydrous calcium sulfate). In some shallow domes, the limestone may be missing and part or all of the anhydrite changed to gypsum (hydrous calcium sulfate), apparently by contact with surface waters. When present, the cap rock usually covers the top of the dome completely and may extend down the flanks forming a cap or thimble over the salt. It may vary in thickness from a few feet to over 1,000 ft.

The mechanism and chemistry of the formation of cap rock is not clearly understood. It has been suggested that the cap rock is a disk of overlying evaporite deposit which was punched out and pushed up by the intrusive salt, but this theory has been largely discarded.

The more generally accepted theory is that the cap rock is formed from minerals originally disseminated through the salt which become concentrated as the salt is dissolved away by circulating waters near the surface.

Distribution of Domes.—The simple piercement salt domes resulting from isostatic flowage so that the salt plug has pierced overlying strata, are best known in the southeastern United States because of the intensive drilling around them on account of their economic importance. The Gulf coast belt of domes extends 50 to 100 mi. northward from the coast and reaches from the Mississippi river westward across Louisiana and Texas to midway between Houston and Corpus Christi. The same belt extends offshore for many miles, as shown by geophysical surveys and drilling in the waters of the continental shelf. There are now some 150 proven domes in this belt. A separate small group of five domes lies between Corpus Christi and Laredo, in southern Texas. The "interior" domes include about 20 in the Tyler basin of northeast Texas and about 70 in a belt extending southeastward from Shreveport, La., across northern Louisiana and southern Mississippi to southwestern Alabama.

In addition to these domes proved by drilling into salt, there are a great many probable and deeper domes indicated by geophysical work.

Outside of the southeastern states, the only salt structures known in North America are in the Paradox basin of western Colorado and eastern Utah, but these structures are long folds controlled by tectonic movement and not simple piercement domes. Salt occurrences, possibly in domes, are found in Nova Scotia.

Domes controlled primarily from flowage of salt, but in some cases with modification by tectonic forces, occur in northern Germany, Denmark, Poland, Rumania, northern Spain, the Isthmus of Tehuantepec in Mexico, in small areas in Colombia, Peru, and Argentina, in southern Iran along the northeasterly shore of the Persian gulf and in the Persian gulf itself, in western U.S.S.R. with the largest area being north of the Caspian sea, and on the west coast of equatorial Africa.

Economic Importance.—Salt domes are of great economic importance because of oil, sulfur, and the salt itself.

In areas where the salt domes have intruded or uplifted petroleum-bearing sedimentary rocks, the deformation which localizes oil accumulation is commonly over or around a dome (*see* PETROLEUM).

A very large fraction of the oil production of the Gulf coast of Texas and Louisiana is taken from salt dome structures. Since the discovery of the first salt dome oil field in the Gulf coast in 1901 some 350 proved or probable salt domes have been located (a large number by geophysical surveys) and many have oil fields over them or around their flanks.

The most productive salt dome area is the Texas-Louisiana coastal belt, where oil production averages about 300,000,000 barrels per year. Oil is also found in salt dome structures in Germany, Rumania, the U.S.S.R. and in West Africa.

A relatively small number of the shallow domes with thick cap rock are very prolific sources of sulfur, which occurs in the porous limestone in the upper part of the cap rock. It is mined by the Frasch process in which the sulfur is melted by superheated water and pumped, by compressed air, as a liquid. Approximately one-fourth of the domes in Texas, Louisiana, and Mississippi are shallow and have thick cap rock but of these only relatively few, in the coastal belt, have sulfur in sufficient quantity and purity to be mined economically. Sulfur is also mined from a small number of domes in the Isthmus of Tehuantepec in Mexico.

In a small number of domes, the salt itself is mined, either by shafts into the dome and normal mining operations or by solution of the salt by circulating water. *See* also SALT.

SALTILLO, capital city of the Mexican state of Coahuila, 668 mi. (1,075 km.) N of Mexico City. Pop. (1960) 98,839. Altitude 5,244 ft. Served by the National Railways of Mexico, Saltillo is also linked by highway to Eagle Pass, Tex. (280 mi.), as well as to Torreón (180 mi.) and Monterrey (55 mi.).

Saltillo lies at the northern edge of the great central plateau of Mexico. Its cool, dry, healthful climate has made it a summer resort with facilities for golfing, hunting, and swimming. Founded in 1575, Saltillo retains but few of its colonial buildings, the main exception being an impressive cathedral. The city is chiefly significant as an active commercial and communications centre, and for the manufacture of woolen fabrics, knitted goods, and flour. Its blankets, or serapes, have for centuries been considered among Mexico's finest, and many are collector's items. Gold, silver, lead, zinc, copper, iron, and coal are mined in the vicinity. During the U.S.-Mexican War Saltillo was captured by U.S. forces under Maj. Gen. Zachary Taylor on Nov. 17, 1846. Nearby is the site of the Battle of Buena Vista (Feb. 22–23, 1847), a decisive victory by Taylor over the Mexican forces under Gen. Antonio de Santa Anna. (R. B. McCK.)

SALT LAKE CITY, the capital of Utah, U.S., and seat of Salt Lake county, is the largest city between Denver and the Pacific coast. World capital of the Latter-day Saints (Mormons), it is also the seat of Roman Catholic and Episcopal dioceses and a regional metropolis influencing the economic, social, cultural, educational and political life of people in an area of about 185,000 sq.mi., embracing not only Utah but southern Idaho, eastern Nevada and southwestern Wyoming.

Salt Lake valley, in which the city is situated, is the southernmost of the numerous valleys which together compose the valley of the Great Salt Lake and is almost central in the longer chain of fertile irrigable valleys lying at the west base of the Wasatch mountains. Salt Lake City lies at an approximate elevation of 4,200 ft. under magnificent peaks that rise in places more than 7,000 ft. above the valley floor; its wide, generally rectangular, tree-lined streets are laid out on a series of terraces lifting gently east and north from the Jordan river. This river, which connects Utah lake with the Great Salt lake (*q.v.*), flows nearly north through the valley, bordered on the west by poorly drained, alkaline and generally infertile plains. The principal incorporated area of Salt Lake City occupies the northern part of Salt Lake valley, east of the Jordan; in the central and southern reaches are various suburban communities, including South Salt Lake, Murray, Midvale, Sandy City and Draper.

On its founding, the centre of Salt Lake City was placed close under the northern benchlands, so the city developed asymmetrically to the east, south and southeast. Major expansion westward came only during and after World War II. That same period made the whole of Salt Lake valley a residential appendage of the city, as also Davis county to the north; this growth was directly related to the development of an adequate metropolitan water supply in the late 1930s and early 1940s. The metropolitan area of Salt Lake City reaches toward that of Ogden (*q.v.*), 35 mi. N., with which it has a twin-city relationship, but because of historical priority, general economic dominance and Salt Lake City's status as a federal and state government centre, the influence of the capital city is overriding.

History.—Salt Lake City (until 1868 Great Salt Lake City) was founded in 1847 as the central city of Mormon settlement in the west, and its history since has been inextricable from that of the church (*see* LATTER-DAY SAINTS, CHURCH OF JESUS CHRIST OF) and of the state (*see* UTAH: *History*). A planned community from the outset, Salt Lake City was laid out by Brigham Young

(*q.v.*) in accordance with a plat for the city of Zion drawn by Joseph Smith in 1833. Streets 8 rods wide were made to run with the cardinal directions and to cross at right angles, dividing the land into square blocks of 10 ac. each, originally divided into 1¼ ac. lots, with provision for public squares, of which one was set aside as the Temple block. Streets were numbered outward from the central Temple block, those on the south being named South Temple, 1st South, 2nd South, etc., those on the west, West Temple, 1st West, and so on. However, East Temple eventually was renamed Main street, and 1st East became State street. Later, as the city grew, "courts" and "places" were cut into many of the large central blocks, and new subdivisions were cut up into smaller areas, especially on the steep North Bench and south of 9th South street. The old rectangular street pattern continued dominant until World War II, and curving streets are found chiefly in modern subdivisions, west of the Jordan or high on the eastern benchlands.

Those who wintered in Salt Lake valley in 1847–48, numbering about 1,700, lived in a log and adobe fort centring upon the present Pioneer park. Permanent allocation of the land began when Young made his final return from the Missouri river in Sept. 1848, and most of the settlers began building on their lots the following spring. At that time the city was divided into 19 ecclesiastical wards of nine square blocks each, the bishop of each ward acting as magistrate.

Previously, reflecting the theocratic character of Mormon society, the city had been ruled by a high council, administering an ecclesiastical jurisdiction called a stake of Zion, coextensive with the city. It was the high council that enacted the first municipal ordinances, ratified in public meeting Jan. 1, 1848. Out of this original localized theocratic government evolved the broader State of Deseret, organized by the Mormons in 1849 to embrace a vast area between the Sierra Nevada and the Rocky mountains. By that time, the treaty of Guadalupe Hidalgo having been ratified, the site of Salt Lake City with the rest of Utah had passed from Mexican to U.S. sovereignty. The provisional State of Deseret was not recognized by congress, which instead created the Territory of Utah in Sept. 1850, but before its dissolution, the Deseret legislature in Jan. 1851, incorporated Great Salt Lake City. The city charter almost exactly duplicated that once granted the Mormon city of Nauvoo by the Illinois legislature, which made the city virtually an autonomous political unit, empowered to pass any law not in conflict with the state or federal constitutions and to maintain its own militia and city court. Until its repeal the Nauvoo charter was a storm centre of Illinois politics; in a different environment, the Salt Lake City charter occasioned no trouble.

Organized Mormon immigration, gathering the faithful initially from the midwest and later from the eastern states and Europe, quickly made Salt Lake City famous as "the New Jerusalem," "the City of the Saints." The unexpected discovery of gold in California in 1848 contributed greatly to its early growth, as a flood of gold seekers en route to California poured in upon the city in 1849, trading clothing, tools and manufactured goods for fresh livestock and crops. Overland migration continued as a stimulus through the 1850s, not without friction between Mormon settlers and non-Mormon travelers. The city continued as a staging point for arriving Mormon converts, who were sent from Salt Lake to open or strengthen new communities down the entire length of Utah. This planned system of colonization thus tended to drain off population that might otherwise have stimulated the early growth of the church headquarters city, but at the same time gave it deep roots in the entire mountain-desert west. Public works projects, instituted by the church in the early 1850s to furnish employment for the needy, contributed to the building up of the city, including a wall erected around the Temple block and a never-completed wall around the city itself, supposedly to protect it from the Indians but chiefly useful as an object-lesson to smaller and more exposed Mormon towns.

In 1858, during the so-called Utah war of 1857–58, when anti-Mormon agitation led to the federal government's declaring "a state of substantial rebellion" in Utah, Gen. Albert Sidney Johnston's army marched through the city en route to establish a military post, Camp Floyd, west of Utah lake. There followed a considerable influx of non-Mormons, giving Salt Lake City a rowdier character but also renewing economic vitality. These federal troops were withdrawn from Utah after the American Civil War broke out, but were replaced in 1862 by a regiment of California-Nevada volunteers commanded by Patrick Edward Connor, who established Camp (later Fort) Douglas on the benchland above the city, the better to keep the doubtfully regarded Mormons under military scrutiny. Prospecting by these soldiers soon opened up Utah's mining economy and gave non-Mormon merchants a better foothold in Salt Lake City, but their position continued precarious until the completion in 1869 of the Union Pacific railroad (which by-passed the city itself) put the mining industry on a sound basis.

The Mormon-built Utah Central railroad, completed Jan. 1, 1870, connected Salt Lake City with the Union Pacific at Ogden, and during the next decade other roads were built from Salt Lake City in all directions to now-booming mining regions. Violent political strife came for the first time with this new order of things, the non-Mormon Liberal party contending with the Mormon People's party for local supremacy, while the federal government intervened massively with legislation, ostensibly directed against the Mormon practice of polygamy but basically designed to force a separation of church and state. In 1890 the Mormon church surrendered on the polygamy issue, and though intermittent conflicts between Mormon and non-Mormon elements continued as late as 1905–07, when the American party captured the city government, the old social antagonisms gradually disappeared. Since World War I the history of the city has been primarily economic and cultural, as in the case of most other large U.S. cities.

Except between 1851 and 1856, when Fillmore was the legal capital, Salt Lake City since its founding has been capital of Utah in name as well as fact. The graceful capitol building at the head of State street overlooking the city was erected in 1912–15. Other familiar landmarks include Temple square, with the many-spired gray granite temple and the turtle-domed tabernacle; and on the adjacent block to the east, two of Brigham Young's residences, the Beehive house and the gabled Lion house. On what was once Emigration square the City and County building with its lofty sandstone clock tower was built in 1897. High office buildings and hotels along Main street were principally completed between 1909 and 1924. Along the East Bench sprawls the broad campus of the University of Utah, and above it old Ft. Douglas, established in 1862. Farther south, near the mouth of Emigration canyon, is a state park centred upon the This is the Place Monument, which commemorates the Mormon entrance into Utah in 1847.

Population.—By the 1960 census Salt Lake City's population was 189,454. The population of the standard metropolitan statistical area (Salt Lake and Davis counties) in 1960 was 447,795, an increase of 62.9% over 1950. The nonwhite percentage was less than 2% of the total and consisted principally of Japanese, Negroes, Chinese and Filipinos. Many of the early settlers came from Europe, particularly England and the Scandinavian countries, as the result of Mormon missionary work. After the Civil War the number of non-Mormons in the city steadily increased and by 1960 comprised an estimated 40% of the population. (For comparative population figures *see* table in UTAH: *Population.*)

Government.—Salt Lake City is governed by a mayor and board of five commissioners, elected in nonpartisan elections. Revenue comes mostly from taxation of real property but also from franchise and other taxes, from fees and licences, and from the municipally owned waterworks and airport.

Commerce, Industry and Transportation.—Principal industries include food processing, printing and publishing, oil refining, coking, copper refining, smelting of silver, lead and copper, manufacture of iron, steel and clay products and of radio equipment, electronics and textiles. The copper mines at Bingham and a Geneva steel plant in Utah valley have greatly contributed to the growth of metal fabricating industries since the early 1900s. The city serves a major wholesaling function in its region, aided by transportation facilities which include service by several railroads, highways and airlines. The city is the seat of a branch of

the Federal Reserve Bank of San Francisco.

Education and Cultural Activities.—Public education is administered by a board made up of two members elected from each of the six municipal wards and by a superintendent appointed for a minimum term of two years. Institutions of higher learning in the city include the University of Utah (*see* UTAH: *Education*) and Westminster college (interdenominational, established in 1875). Hospitals are operated by religious denominations and a fraternal organization as well as by Salt Lake county and the Veterans administration. The Utah Symphony orchestra, Salt Lake opera, Tabernacle choir and organ recitals and University of Utah music festival are among the best known of the state's musical activities. Art collections are displayed in the state capitol, the State Historical society mansion, the University museum and the Art Barn. Besides many specialized museums at the university and displays at the capitol, pioneer collections are shown in museums of the Mormon church at Temple square and the Daughters of Utah Pioneers, and in the Pioneer Village of the Sons of Utah Pioneers. Principal libraries are those at the university, Salt Lake City Free Public library, Utah State library, and Utah State Historical society, as well as the private Historian's Office of the Mormon church.

Parks and Recreation.—The 80-ac. landscaped Liberty park, once the Brigham Young farm, is the principal municipal park. Memory grove, below the capitol, is a war memorial. Other parks and playgrounds are scattered about the city, and some are maintained in nearby canyons, a contrast to beach resorts and a yacht harbour on Great Salt lake, west of the city. Golf courses, a zoo, tennis courts and other recreational facilities are easily accessible. (D. L. M.)

SALTO, a rich department in northwest Uruguay, on the Uruguay River. Area 4,866 sq.mi. Pop. (1962 est.) 128,444. The rolling rocky soil is well suited for pasture and there are considerable numbers of both cattle and sheep on the ranches of Salto. Orange and tangerine production is also important; citrus groves stretch for about 20 mi. around the departmental capital, Salto (*q.v.*). The department's vineyards are considered the best in Uruguay. Salto also grows corn, cereals, sunflower seeds, flax, forage crops, tomatoes, and strawberries. (M. I. V.)

SALTO, capital of the department of Salto in Uruguay, a river port on the Uruguay River, rivals Paysandú, farther south, for position as Uruguay's second city. Pop. (1962 est.) 55,313. North of Salto the Uruguay River is too shallow even for river boats so the port supplies northwest Uruguay and parts of the Brazilian state of Rio Grande do Sul. Salto has air and road connections with Montevideo and other points. Wine production and orange-drink bottling, both from locally grown fruits, are outstanding among Salto's industries. Pueblo Nuevo, a new suburb north of the city, has important shipyards. Salto probably was founded as a depot where hides could be assembled for shipment downriver, either in 1756 or 1817. (M. I. V.)

SALTPETRE: *see* NITRIC ACID AND NITRATES.

SALT RANGE, a hill system in West Pakistan, derives its name from extensive deposits of rock salt, one of the richest salt fields in the world. The main chain begins in the Jhelum district, in Chel (Chail) hill (3,701 ft. [1,128 m.]) on the right bank of the Jhelum River. The range runs westward in two parallel ridges till it culminates in the Sakesar hills (4,992 ft. [1,522 m.]). Its average height is 2,200 ft. above sea level. Between the two lines of hills lies an elevated, fertile plateau, intersected by ravines and peaks with several passes, and containing the beautiful salt lake Kallar Kahar. From Sakesar the range swings in a north-northwest direction to Mari Indus, where it is broken through by the Indus River; then swinging south, from Kalabagh on the west of the Indus, continues into the Khattak-Maidani hills. The range contains the great salt mines of Khewra, Warcha, and Kalabagh in the Cis-Indus, the main manufacturing areas, and the good-quality but smaller mines of Jatta, Bahadur Khel, and Kharak in the Trans-Indus section. Coal is also found at Dandot, Pidh (Pidth), and Makarwal Kheji (Makerwal). High-quality gypsum occurs from Jalalpur to Kalabagh, mixed with varying quantities of anhydrite, particularly in the Khewra-Dandot and Daud Khel areas.

The range displays one of the most complete geological columns in the world, from Cambrian to Pleistocene, with the only major gap occurring in the Middle and Upper Paleozoic. Much unresolved controversy has arisen about the age of the saline series of the Cis-Indus section of the range. Supporters of the Tertiary view base their conclusion chiefly on the normal position of the series in the Trans-Indus section of the range and consider its abnormal position in the Cis-Indus section to be due to an overthrust. Another school of thought holds that Cambrian or Precambrian is the correct age, because of the consistent conformable position of the saline series for 152 mi. (245 km.) of the Cis-Indus. (K. S. AD.)

SALTYKOV, MIKHAIL EVGRAFOVICH (pseudonym, N. SHCHEDRIN) (1826–1889), Russian satirist and novelist of radical sympathies, best remembered for his novel, *Gospoda Golovlëvy,* which traces the falling fortunes of a family of landed gentry, was born on Jan. 27 (new style; old style, 15), 1826, in the village of Spas-Ugol in the province of Tver. A sensitive boy, he was deeply shocked by his mother's cruel treatment of the peasants, which he later described in one of his most important works *Poshekhonskaya starina* ("Old Times in Poshekhona," 1887–89). In 1836 he entered the Moscow Noblemen's Institute and in 1838 he was sent to the famous Imperial *lycée* at Tsarskoye Selo, Russia's training-ground for high officers of state. Reacting violently against its bureaucratic regime, he soon joined the revolutionary circles in St. Petersburg, and met the great critic Vissarion Belinski (*q.v.*). In 1847 he began his literary career as a reviewer in the radical periodicals *Sovremennik* and *Otechestvennye zapiski.* In 1848 he wrote the story *Zaputannoe delo* ("A Complicated Affair"), which expressed sympathy for the then popular French utopian socialists, and as a result, was exiled to Vyatka, where he spent eight years in a minor position in the provincial governor's office. In 1855 he returned to St. Petersburg, and, a year later, published his first successful book, *Gubernskie ocherki* (1856–57; selections in English translation, *Tchinovnicks. Sketches from Provincial Life,* 1861), in which he satirized different types of Vyatka officials. In 1857 he wrote his only comedy, *Smert Pazukhina* (performed 1893; Eng. trans. *The Death of Pazukhin,* 1924), dealing with malpractices common among Russian merchants, and between 1857 and 1863, he wrote two series of stories, *Nevinnye rasskazy* ("Innocent Stories") and *Satiry v proze* ("Satires in Prose"), both published as collections in 1863. In 1858 he was appointed vice-governor of the province of Ryazan, and in 1860 vice-governor of Tver.

After his return to St. Petersburg (1864) he was appointed president of the local taxation boards at Penza, Tula, and Ryazan successively. He retired from the civil service in 1868, and thereafter devoted himself to literature. He joined the radical poet Nikolai Nekrasov (*q.v.*) as co-editor of *Otechestvennye zapiski,* becoming editor after Nekrasov's death (1878). His major works include *Istoriya odnogo goroda* ("The History of a Town"), written in 1869–70, and *Pompadury i pompadurshi* ("The Pompadours and Their Ladies"), written between 1863 and 1874, two biting satires on the highest Russian officials; and his famous novel *Gospoda Golovlëvy* (1876; Eng. trans. *The Golovlyov Family,* 1955). Saltykov died in St. Petersburg on May 10 (N.S.; O.S., April 28), 1889. (D. MK.)

SALUS, an ancient Roman goddess of safety and welfare, later identified with the Greek Hygieia (*q.v.*) who was exclusively a personification of health. Although essentially a deified abstraction, Salus was nevertheless worshiped quite early both at Rome and throughout Italy. Her temple on the Quirinal was dedicated in 302 B.C. and was the scene of an annual sacrifice on Aug. 5. Its walls were decorated with frescoes painted by C. Fabius, consul in 269 B.C. As a result he was called Pictor, "the Painter," a name which he handed down to his descendants—among them Fabius Pictor the annalist.

The *augurium salutis,* not involving a personification and possibly antedating the deification of Salus, was an annual performance; it was an inquiring to ascertain whether it was acceptable to the gods to hear prayers for the public *salus.* Since it had to be performed on a day of peace, the constant warfare of the late

republic caused its interruption, but it was revived by Augustus. In the empire the goddess appears both as Salus Publica and Salus Augusti.

In 180 B.C. on the occasion of a severe pestilence a *supplicatio* was held in honour of Apollo, Aesculapius, and Salus, revealing that the identification with Hygieia was made this early and Salus was regarded as a deity of public health. Indeed, on coins she appears regularly as Hygieia, with patera and sacred snake, although at times with ears of grain, symbolic of general prosperity.

SALUTATIONS (GREETINGS), the customary forms of kindly or respectful address, especially on meeting or parting or on occasions of ceremonious approach. Etymologically salutation (Lat. *salutatio,* "wishing health") refers only to words spoken.

Embraces.—Forms of salutation frequent in preliterate societies may persist almost unchanged in civilized custom. The habit of affectionate clasping or embracing is seen at the meetings of the Andaman islanders and Australian aborigines, or where the Fuegians in friendly salute hug "like the grip of a bear." This natural gesture appears in old Semitic and Aryan custom.

Rubbing Noses.—The salute by smelling or sniffing (often called by travelers "rubbing noses") belongs to Polynesians, Malays, Burmese and other Indochinese, Mongols, and extending thence eastward to the Eskimo and westward to Lapland.

Kissing.—The kiss, the salute by tasting, appears constantly in Semitic and Aryan antiquity. Herodotus describes the Persians of his time as kissing one another—if equals on the mouth, if one was somewhat inferior on the cheek. In Greece, in the classic period, it became customary to kiss the hand, breast, or knee of a superior. In Rome the kisses of inferiors became a burdensome civility. The early Christians made it the sign of fellowship: "greet all the brethren with an holy kiss." Of more ceremonial form is the kiss of peace given to the newly baptized and in the celebration of the Eucharist, which is retained by the Greek Church. After a time, by ecclesiastical regulations, men were only allowed to kiss men, and women women, and eventually in the Roman Catholic Church the ceremonial kiss at the communion was only exchanged by the ministers, a relic or cross called an *osculatorium* or *pax* being carried to the people to be kissed. While the kiss has thus been adopted as a religious rite, its original social use has continued. Among men, however, it has become less effusive. Court ceremonial keeps up the kiss on the cheek between sovereigns and the kissing of the hand by subjects. When these osculations cease to be performed they are still talked to by way of politeness: Austrians say, *Küss d' Hand!* and Spaniards, *Beso a Vd. las manos!* ("I kiss your hand!"). Strokings, pattings, and other caresses have been turned to use as salutations.

Weeping.—Weeping for joy is sometimes affected as a salutation. Highly ceremonious weeping is performed by several primitive peoples when, meeting after absence, they renew the lamentations over friends who have died in the meantime. Among the Australian aborigines, the male nearest of kin presses his breast to the newcomer's, and the nearest female relative, with piteous lamentations, embraces his knees with one arm, while with the other she scratches her face till the blood drops. Obviously this is mourning. So, too, the New Zealand *tangi* is performed at the reception of a distinguished visitor, whether he has really dead friends to mourn or not. Weeping, as A. R. Radcliffe-Brown has shown, is for the Andamanese a rite for the revival of sentiments that have lain dormant, the renewal of interrupted social relations, and for the recognition of a change in personal relations.

Cowering.—Cowering or crouching is a natural gesture of fear or inability to resist. Its extreme form is lying prostrate, face to the ground. In barbaric society, as soon as distinctions are marked between master and slave, chief and commoner, these tokens of submission become salutations. The sculptures of Egypt and Assyria show the lowly prostrations of the ancient East, while in Dahomey or Thailand subjects crawl before the king. A later stage is to suggest, but not actually perform, the prostration, as the Arab bends his hand to the ground and puts it to his lips or forehead, or the Tongan would touch the sole of a chief's foot, thus symbolically placing himself under his feet.

Kneeling.—Kneeling prevailed in the middle stages of culture, as in the ceremonial of China; Hebrew custom set it rather apart as an act of homage to a deity; medieval Europe distinguished between kneeling in worship on both knees and on one knee only in homage.

Bowing.—Bowing, as a salute of reverence, appeared in its extreme in Oriental custom, as among the ancient Israelites: "bowed himself to the ground seven times." The Chinese according to the degree of respect implied bowed kneeling or standing. The bowing salutation, varying in Europe from something less than the eastern salaam down to the slightest inclination of the head, is given mutually. Uncovering is a common mode of salutation, originally a sign of disarming or defenselessness or destitution in the presence of a superior. Taking off the hat by men has for ages been the accepted mode in the Western world. Some Eastern nations are apt to see disrespect in baring the head, but insist on the feet being uncovered. Europeans have been called on to conform to custom by taking off their shoes to enter the royal presence. In Burma it is respectful to squat in the presence of a superior; elsewhere the inferior should stand.

Handshaking.—Grasping hands appears in antiquity as a legal act symbolic of the parties joining in compact, peace, or friendship. In marriage, the hand grasp was part of the ancient Hindu ceremony, as was the *dextrarum junctio* (joining of right hands) in Rome, which passed on into the Christian rite and became a mere salutation. (*See* also SUPERSTITION: *Survivals.*)

Words of Greeting.—As to words of salutation, even among primitive peoples certain ordinary phrases have passed into formal greetings. Many formulas express difference of rank and consequent respect, as where the Suto (*q.v.*) salute their chiefs with *Tama sevata!* (*i.e.,* "Greeting, wild beast!"). Congo Negroes returning from a journey salute their wives with an affectionate *Okowe!* but they, meekly kneeling round him, may not repeat the word, but must say *Ka! ka!* Among civilized peoples salutations are apt to be expressions of peace and good will. There are numerous biblical examples; *e.g.,* "Peace be to you and peace be to your house" (I Sam. 25:6). Such formulas run on from age to age and may be traced on to the Muslim greeting *Salam 'alaikum!* ("The peace be on you"), to which the reply is *Wa-'alaikum as-salam!* ("And on you be the peace [of God]!"). This greeting is a password among fellow believers, for it may not be used by or to an infidel. The Babylonian form, "O king, live for ever!" (Dan. 3:9), represents a series of phrases which continue still in the *Vivat rex!* ("Long live the king!"). The Greeks said, "Be joyful!" both at meeting and at parting. The Romans applied *Salve!* ("Be in health!") especially at meeting, and *Vale!* ("Be well!") at parting. In the modern civilized world, everywhere, the old inquiry after health appears, the "How do you do?" becoming so formal as often to be said on both sides, without either waiting for an answer. Hardly less wide in range is the set of phrases "Good day!" "Good night!" etc., varying according to the hour and translated into every European language. Among other European phrases, some correspond to the English "Welcome!" and "Good-bye" ("God be with you!") and French *Adieu!* ("To God!"). Such half meaningless forms of salutation serve the purpose of keeping up social relations.

See H. Measures, *Styles of Address,* rev. ed. (1962). (E. B. T.; X.)

SALUTE, a friendly greeting or gesture of respect. Although the salute has existed in one form or another, both civilian and military, for many centuries, the modern connotation of the word is primarily military and naval. In this sense salutes are usually performed by prescribed movements of the hand, flag, rifle, sword or sabre, or by firing guns or playing music. Cheering and manning the yards of naval ships are forms of saluting that have become obsolete. It is not possible to determine the exact origin of the various forms of salute practised today, but they all have

in common the symbolism of showing defenselessness or obeisance in the presence of a superior or friend. It is assumed that the hand salute, for example, originated in prehistoric times as a means of showing one's weapon hand raised and empty. Uncovering one's head—removing or simply tipping the hat—later became a universal form of salute or obeisance. During the age of chivalry an armoured knight removed his helmet or raised the visor to reveal his identity and also to indicate defenselessness in the presence of superiors or friends. Bowing and kneeling had the same connotation.

When the wearing of uniforms became common in military forces around the mid-17th century, soldiers saluted, as did civilians of the period, by removing the hat. It was soon noted, however, that this practice soiled the hat and shortened its life. A regimental order of the Coldstream Guards in 1745 recorded: "The men ordered not to pull off their hats when they pass an officer. . . . but only to clap up their hands to their hats, and bow as they pass by." But this custom was not generally adopted by other units until the advent of more cumbersome headgear such as the busby and bearskin made doffing the hat impracticable. At one time it was proper to salute with either the left or right hand, the rule being that one used the hand opposite the person being saluted.

Raising the right hand to the cap visor is now a universal military and naval salute. The junior initiates a hand salute when approaching or leaving a superior, when addressing or being addressed by a superior except when in ranks and on other prescribed occasions. The salute is a gesture of mutual recognition and respect among fighting men and the superior normally returns it or at least acknowledges it.

In the U.S. army, navy and air force the hand salute is executed with the palm down. The British navy salutes the same way, but the British army and Royal Air Force salute with the palm turned forward. In several other European countries there are slightly different variations of the hand salute within the armed forces.

The rifle salute has various forms. When troops are in formation it consists of the movement in unison of "present arms." At this command, soldiers move their weapons to a vertical position with triggers forward. This ceremony has been traced to the restoration of Charles II in 1660. Monck's regiment (now the Coldstream Guards), wishing to come over to the king's service, was formed for his inspection in a field. On the king's approach they were given the command "Present your weapons for service under His Majesty." On this order each man held his musket or pike forward. With an eye for the dramatic, Charles prescribed that this ceremony be standardized for the entire army. When not in formation a soldier renders the rifle salute by touching his weapon in a variation of the normal hand salute.

The sword or sabre salute is executed by raising the hilt opposite the chin and then lowering the point of the weapon to one side. The first motion is believed to go back to the crusaders' custom of kissing the cross (symbolized by the hilt) before battle; the second motion symbolizes lowering one's guard. Some old military prints show the sword salute being rendered with one hand and the hand salute with the other.

Gun or cannon salutes, now used to honour distinguished persons or to mark special occasions, originate from the practice of firing all guns of a battery, fort or ship as a token of disarming them, for early guns could not be speedily reloaded. Modern gun salutes are fired with blank cartridges or charges. The number of shots is prescribed by international custom and agreement, and is determined by the rank of the person being honoured. A 21-gun salute, for example, is fired for chiefs of state, heads of government, members of a reigning royal family and others of comparable rank; it is commonly referred to as a royal salute. Nineteen guns are fired for ambassadors, cabinet members, state governors (in the U.S.) and officers above the rank of admiral or general; salutes of 17, 15, 13, 11, 7 and 5 guns are fired for persons of lesser ranks. In some cases it is prescribed that guns be fired on the person's departure as well as on arrival. The convention of firing an odd number of shots is believed to stem from an ancient naval superstition that an even number of shots is unlucky.

In the United States the national salute of 21 guns is fired on Feb. 22 (Washington's birthday) and May 30 (Memorial day); the salute to the union, fired July 4 (Independence day), is one gun for each state.

(For saluting the flag of the United States, *see* FLAG: *Flags of the United States.*)

Musical honours consist of a prescribed number of drum ruffles and bugle or trumpet flourishes followed by a march or by the national anthem of the person honoured. They are rendered in conjunction with gun salutes to an individual.

Saluting with the colours (flags carried by troops) consists of dipping them to the ground. Although it is a fundamental rule that the U.S. national flag is never dipped, an exception is made in the interest of international courtesy: U.S. vessels dip the national ensign in return for such a compliment from a passing ship of a country formally recognized by the U.S. In this case, dipping consists of lowering the flag a short distance and then running it back to the top of the mast. The U.S. navy dips the national ensign only in return for such a compliment, and answers dip for dip. The origin of the flag salute has been traced by some authorities to the naval custom of lowering sails as a token of respect.

SALUZZO, a town and episcopal see of Piedmont, Italy, in the province of Cuneo, 1,145 ft. (350 m.) above sea level and 37 mi. (60 km.) SSW of Turin by rail. Pop. (1961) 17,099 (commune). In the old, upper town is the 13th-century castle of the marquesses of Saluzzo, whose line ran from 1142 to 1548. Other noteworthy buildings are the 15th-century Casa Cavassa Museum, a richly furnished Renaissance mansion; the late Gothic cathedral (1480–1511); and the Church of S. Giovanni (13th–15th centuries). Saluzzo of the early 14th century is the background of Chaucer's *The Clerk's Tale.* The printer and typographer G. Bodoni (1740–1813), examples of whose work are in the public library, and the dramatist Silvio Pellico (1788–1854) were born there. There are rail connections with Cuneo, Savigliano (Turin–Cuneo), and Airasca (Turin–Pinerolo). Saluzzo is a centre for the restoration of antique furniture. From 1548 until 1601 it was under French domination. (M. Bs.)

SALVADOR, known as SÃO SALVADOR and BAHIA, the oldest city and first capital of Brazil, now the major port and capital of the state of Bahia. Pop. (1960) 630,878. Salvador is located at the southern tip of a picturesque and bluff-formed peninsula that separates All Saints bay (Bahia de Todos os Santos), a deep natural harbour 28 mi. wide and 22 mi. long, from the Atlantic. The mean temperature is 78° F. and the annual rainfall is 52 in. The terrain on which the city is built is sharply broken by a series of short, narrow valleys and steep hills that range in elevation from slightly above sea level to about 250 ft. Residences and public buildings for the most part are situated on the slopes (*ladeiras*) and ridges. The valleys and other open places in the city are characterized by lush, tropical vegetation.

A distinctive feature of Salvador is its division into two separate sections, the lower city (*cidade baixa*) and the upper city (*cidade alta*). The port, commercial district and adjoining residential zones are located at the foot of a cliff on a low shelf of land facing west onto the bay only a few feet above the water level. The principal shopping districts, state and municipal government offices and the leading residential areas are on the upper level. This section extends northward for several miles and eastward to the Atlantic shore. The two sections of the city are connected by a few graded, winding roads, a funicular railway and several elevators. Of these, the Lacerda elevator, the outstanding landmark of Salvador, is the chief link joining the separate streetcar systems that operate on the upper and lower levels of the city.

Salvador was a major centre of the African slave trade in the colonial period and still has one of the largest concentrations of

Negro and mulatto population in Brazil. These two racial groups, which constitute the great bulk of the inhabitants of the city, have contributed many of the folkways, costumes and distinctive foods for which Salvador is noted. After 1940 the city experienced continuous and rapid population growth, increasing at the rate of about 40% per decade. During this growth the racial composition of the population remained fairly constant.

Significant economic expansion accompanied the population growth. It was reflected in extensive public works and private construction—notably in the form of new residential suburbs in the upper city and improvements in port facilities and the erection of numerous modern office buildings in the lower city. The port of Salvador is one of the finest and more important of Brazil. It is protected by two long breakwaters and is dredged to permit ocean-going vessels to tie up at the docks. There are many large warehouses, and mechanical energy has largely replaced physical labour in handling cargo. Imports consist chiefly of manufactured goods, while exports include cacao, tobacco, sugar, hides, castor beans, diamonds, hardwoods and petroleum from the nearby Candeias oil field. The number of industrial plants in Salvador rose at a slow and steady rate during the middle part of the 20th century. Food and tobacco processing, textile manufacturing, metallurgy, wood- and leatherworking and shipbuilding and repair are the chief industries. The Brazilian government maintains a naval base and dockyard in the port area. Abundant electric power is available from the Paulo Afonso hydroelectric project on the São Francisco river 250 mi. N. of the city.

In the second part of the 20th century Salvador was becoming a fairly important tourist attraction. It is served by domestic and foreign steamship lines and by domestic airlines. There are regular rail and bus connections with central and southern Brazil. Salvador is famed throughout Brazil for the number and beauty of its baroque colonial churches, the most striking of which is the church of the convent of the Third Order of St. Francis. Among other leading attractions of Salvador are examples of colonial lay architecture, the Barra lighthouse at the Atlantic tip of the peninsula and the numerous 17th-century fortresses which dot the bay shore and harbour. The city's educational facilities include a university with schools of medicine, law and engineering; normal, commercial and trade schools; and schools of fine arts and arts and crafts.

Salvador was founded in 1549 by Tomé de Sousa, first governor general of Brazil, as capital of the Portuguese colony. It was named, and is still known officially as, São Salvador da Bahia de Todos os Santos. As the seat of the colonial government and entrepôt of the thriving sugar trade that developed in the Recôncavo area along the shores of All Saints bay, Salvador soon became a tempting prize for pirates and enemies of Portugal. Chief of these were the Dutch, who attempted to wrest northeastern Brazil from Portuguese control between 1624 and 1654. Salvador was captured by Dutch forces in 1624 but was retaken the following year. It remained under the control of Portugal until 1823, when the last Portuguese troops were expelled in the war for Brazilian independence. With the transfer of the capital to Rio de Janeiro in 1763, Salvador lost political pre-eminence in Brazil and entered a long period of economic decline from which it did not emerge until after 1900. (R. E. P.)

SALVADOR, EL, the smallest and most densely populated republic of Central America and probably the most intensively cultivated country in all of Latin America. Its capital city is San Salvador. The country is bounded on the north and east by Honduras, on the south by the Pacific Ocean, and on the west and northwest by Guatemala. It is the only republic of Central America that has no Caribbean coastline. El Salvador is 140 mi. long from east to west and 60 mi. wide and has a total land area of 8,164 sq.mi. (21,146 sq.km.).

Physical Geography.—*Geology.*—The three principal physiographic-geologic features of El Salvador are: (1) mountain ranges in the north and south; (2) broad plateaulike areas between the mountain ranges cut by the upper Lempa and San Miguel rivers; and (3) the coastal and lower Lempa and San Miguel plains bordering the Pacific. The northern mountain range consists of lavas, andesitic rocks, and ashes of the Tertiary Period, except for small areas of older Cretaceous sandstones, shales, and conglomerates in the west. Older rocks in the southern mountain range are covered deeply with Pliocene and Pleistocene eruptives—basaltic and andesitic lavas, pumice, and ashes—forming more than 20 volcanoes. These volcanoes are clustered in five groups that stretch across the country. The westernmost are Izalco (active since 1770, 6,183 ft. [1,885 m.]), San Marcelino, Santa Ana (highest mountain in the country, 7,724 ft. [2,355 m.]), Naranjos, Aguila, San Juan de Dios, Apaneca, Tamajaso, and La Laguneta. Next in order come San Salvador (6,399 ft.) and Cojutepeque; San Vicente and Siguatepeque; Tecapa, Taburete, Buenapa, Usulután, Chinameca and San Miguel (6,957 ft.); and, farthest east, Conchagua (4,101 ft.) and smaller ones nearby. Several of these volcanoes are still active. The coastal plain, 5 to 15 mi. wide, consists mostly of Pleistocene marine sediments and recent alluvium.

Relief and Drainage.—The northern and southern mountain ranges are high and rugged. Plateaulike areas between them, deeply carved by the upper Lempa and San Miguel rivers and tributaries, consist mostly of rolling to rough land between 700 and 3,500 ft. altitude. The Lempa River rises in Guatemala, crosses a corner of Honduras, cuts across the northern range, flows eastward for more than 80 mi., and then flows south for 65 mi. across the southern range to the Pacific. The San Miguel system drains eastern El Salvador. The sloping coastal plain is mostly well drained by these two rivers and many other short ones.

Climate.—The temperature of various regions varies according to their altitude. The Pacific lowlands and low areas in the middle Lempa valley have mean monthly temperatures between 78° and 85° F (25° and 29° C). At San Salvador (2,156 ft. [657 m.]) the maximum monthly mean temperature is 95° F (35° C) in March and the lowest monthly mean is 58° F (14° C) in January. At 4,800 ft. mean monthly temperatures vary between 63° and 72° F (17° and 22° C). El Salvador has two seasons, the wet or summer season from May to November and the dry or winter season from November to May. Annual precipitation on the Pacific lowlands averages about 68 in. (1,727 mm.); on the southern (volcanic) and northern mountain ranges between 2,000 and 3,500 ft. between 70 and 97 in. (1,778 and 2,464 mm.); the higher mountains receive a little more. Annual precipitation in the deep valleys and plateaulike areas is between 45 and 60 in. (1,143 and 1,524 mm.).

Vegetation.—The northern mountains have temperate grasslands and remnants of deciduous oak and pine forests. The southern volcanic mountains have temperate grasses, and below these are remnants of pine and deciduous broadleaf forests, including oak and many other species. Between these two mountain ranges the natural vegetation of the plateaulike areas and deep valleys, with 45 to 60 in. of rainfall annually concentrated during six rainy months, consists of small deciduous trees, or bushes, and of subtropical grasslands. On the Pacific plains and lower southern mountain slopes are savannas and deciduous broadleaf forests. Among the many species is balsam, the trunk of which yields excellent lumber and resin, the latter used in antiseptics and medicinal gums. There are many varieties of tropical fruit and many medicinal plants.

Animal Life.—The fauna of El Salvador is less varied than that of other Central American countries because of the scanty rainfall and forest cover. However, it includes many species of land birds and water fowl, rodents, reptiles, insects (butterflies, beetles, bees, wasps, spiders, ants, flies, and mosquitoes), and freshwater and saltwater fish. Although many fish inhabit streams and lakes, most of the catch of nearly 750,000 lb. comes from offshore waters and coastal lagoons, and consists chiefly of mullets, grunts, snappers, jacks, groupers, sharks, and anchovies.

Geographical Regions.—El Salvador may be divided into four major geographical regions: (1) northern mountains; (2) southern volcanic mountains; (3) between these two mountain ranges, the plateaus and deep valleys region; and (4) Pacific lowlands and coastal hills.

The northern mountains, comprising about 15% of El Salvador,

are high and rugged. They have 6% of the national population, widely dispersed in many deep valleys; the region has no large towns. Although these mountain dwellers are engaged chiefly in subsistence farming and grazing, the region has several small coffee and lumbering districts, for the high rainy areas still have considerable stands of oak and pine forests.

As noted above, the southern volcanic mountains consist of about 20 steep cone-shaped volcanoes between 4,000 and 7,800 ft. (1,219 and 2,377 m.) and areas of gently sloping land between 1,000 and 4,000 ft. (305 and 1,219 m.) altitude. This region comprises 30% of El Salvador. It has 63% of the country's population, including most areas of dense rural settlement and most of the cities with more than 10,000 people. Its soils, derived from lava and volcanic ashes, are the country's most productive. Its temperatures range from tropical to temperate. Three-fourths of its precipitation (between 70 and nearly 100 in.) falls during the period from May to November. This region produces 90% of El Salvador's coffee, tobacco, and manufactured goods; two-thirds of its corn, beans, fruits, vegetables, and sugar; and half the nation's cotton, rice, and animal and forest products.

The region of plateaus and deep valleys comprises 45% of El Salvador's area and has 25% of its population. The people live in rural areas and in many towns of less than 10,000 population. Lying between 700 and 3,500 ft. (213 and 1,067 m.) altitude, its temperatures are tropical to subtropical. With only 45 to 60 in. of precipitation during the rainy months from May to November, it is the driest region of El Salvador. Its soils are generally shallow and stony. The region has much more pasture land than cropland. It is significant in supplying animal products, corn, beans, vegetables, henequen, and simple manufactures.

The Pacific lowlands and coastal hills comprise 10% of El Salvador's area and have 6% of its population. This region is hot all year round and rainy for six months. It has much more land in either pasture or forest than in crops. It is significant in the production of beef, forest products, cotton, sesame, rice, sugar, corn, and fish. (C. F. J.)

The People.—More than four-fifths of the people of El Salvador are of mixed Spanish-Indian descent (mestizo). The remainder are pure Indians, whites, and a few Negroes. When the Spaniards arrived the land was inhabited mainly by the Pipil Indians, whose civilization resembled that of the Aztecs in Mexico. The majority of the tribes were farmers; the others were potters, carpenters, masons, weavers, etc. The Indians were great builders, left numerous ruins, and had advanced to the stage of developing hieroglyphic writing. Of the several large towns which they established, two which have continued to remain in existence are the present cities of Sonsonate and Ahuachapán.

Few Spanish settlers arrived to colonize the area but intermarriage of these few Spaniards and the Pipil Indians resulted in a racially homogeneous people. Only a few pure Indians remain today, notably the Izalco Indians, and the Panchos from the village of Panchimalco near the capital. Their bright costumes and traditional ceremonies lend much colour to the land. The language of El Salvador is Spanish, although a few of the Indians still speak their native tongue. The majority of the people are of Roman Catholic religion.

The Salvadoreans are sports loving and have been hosts to numerous national and international sports events. Many festivals are held throughout the country, such as the day of *El Salvador del Mundo* ("the Saviour of the World"), held from July 24 to Aug. 6, and the *Día del Indio* ("Day of the Indian") held on Dec. 12. (P. H. Ar.)

History.—El Salvador was in early times the home of Indian groups who were advanced in civilization but whose identities are unknown. The Pipil, most significant of the three groups who inhabited the land in the 15th century, had their capital at Cuscatlán, a name still sometimes used as that of the country. The first Europeans to enter El Salvador were Spaniards commanded by Pedro de Alvarado (*q.v.*), who came from Guatemala in 1524. Though Cuscatlán was briefly occupied at that time, and nearby San Salvador founded in 1525, it was not until 1527 that the Pipil were subdued by Alvarado's lieutenants. San Salvador was a part of the province of Guatemala, as was San Miguel, founded east of the Lempa River in 1530 to discourage the territorial ambitions of Pedro Arias de Ávila (*q.v.*) in Nicaragua. The port of Acajutla was used by Alvarado in preparation for his illegal expedition to Ecuador in 1534. Western El Salvador became valuable to the Spaniards economically when Acajutla became the funnel through which passed a lively export trade in cacao. Nearby Sonsonate was founded in 1552 to handle this trade.

Sonsonate and San Salvador developed as separate provinces, ruled by *alcaldes mayores*, each subject to the jurisdiction of the Spanish *Audiencia de Guatemala*. Sonsonate was the smaller of the two but remained the wealthier for about a century until the cacao trade declined under competition from Ecuador. San Salvador grew more slowly, with dependence upon stock raising, general agriculture, and the manufacture of indigo, but eventually became more important. The city of San Miguel was included in its territory. The Spanish town of San Vicente, founded in 1635 to remove Spaniards, Negroes, and persons of mixed

PHYSICAL FEATURES AND PRINCIPAL TOWNS, HIGHWAYS, AND RAILROADS OF EL SALVADOR

blood from nearby Indian villages, was also included in this province as was Cihuatehuacán (Santa Ana), an Indian centre which grew second in size to the city of San Salvador but went unrecognized as a Spanish town until 1812. The province of San Salvador was raised in 1786 to the rank of an intendancy, along with León (Nicaragua), Comayagua (Honduras), and Ciudad Real (Chiapas, Mexico), each continuing to be subordinate to the government in Guatemala. Both Sonsonate and San Salvador had by this time a large mestizo population, with some mixture of Negro blood as well. Most of the important "Indian" villages, including Ahuachapán, Chalchuapa, Zacatecoluca, Cojutepeque, Suchitoto, and Usulután, were becoming progressively non-Indian in their customs.

Independence Movement.—In the rapid evolution of Central American affairs from 1811 to 1840, San Salvador played a most active role. The first Central American defiance of Spain occurred there in Nov. 1811, inspired by the deeds of Miguel Hidalgo y Costilla (*q.v.*) in Mexico, and led by another priest, José Matías Delgado (who aspired to become San Salvador's first bishop) and his nephew, Manuel José Arce. Both this attempt and another in 1814 failed. When the government in Guatemala declared independence from Spain, Sept. 15, 1821, subject to the approval of a Central American congress, the authorities in San Salvador went one step further (Sept. 22) and declared absolute independence. Battles were fought in 1822 and 1823 to resist annexation to the Mexican empire. Arce even traveled to Washington, D.C., to seek the protection of the United States. Delgado and Arce played prominent roles in the provisional government of the United Provinces of Central America (1823–1825), and Arce was chosen first president of this federation (1825–1829). Although San Salvador, which became a state in the union, tried unsuccessfully to secede in 1832 and 1833, the federal capital was transferred there in 1834. The union ended in 1839; Francisco Morazán, its second and last president, was forced to leave San Salvador in 1840.

The republic of El Salvador ("The Saviour") was first so named on Jan. 30, 1841, but only provisionally so until 1856. It then underwent 45 years of checkered history, in which Conservatives (heirs of the opposition to Francisco Morazán) battled with Liberals (the Morazán party, generally the more interested in a renewal of the Central American union) for control of the country. Both groups found support from and lent assistance to similar parties in the neighbouring countries. In the midst of the turmoil, El Salvador organized its first university and was finally established as a bishopric. Agitation quieted somewhat during the longer administrations of Francisco Dueñas (1863–1871), who was backed by Conservative elements in Guatemala, and Rafael Zaldívar (1876–1885), a protégé of Dueñas who nevertheless maintained friendly relations for some time with Liberal administrations in all the bordering republics. Coffee, introduced as a crop in 1840, was exported in sizable quantities by the 1870s. Zaldívar successfully opposed the move of Pres. Justo Rufino Barrios of Guatemala to reunify Central America by force (1885), but was himself pushed out of office soon after Barrios was killed in battle.

Coffee became all-important to the country's economy in the period from 1885 to 1931, while international conflicts became less frequent and the presidential succession more regular. Violence upset only one of the eight four-year terms which followed each other starting in 1899. Relative absence from turmoil did not bring democracy. Each president's successor was a friend or close relative and all power remained in the hands of the wealthy. But the coffee plantations flourished; companies from Britain and the United States built a national network of railroads; the port of La Unión was developed; the population more than doubled (passing the million mark); and El Salvador enjoyed some of the blessings of peace.

Military Dictatorships.—A step toward democracy in 1931 led to a military dictatorship instead. Pío Romero Bosque, president from 1927 to 1931, decided not to control the election of his successor. When no candidate won a majority of the popular vote, Arturo Araujo was chosen by congress, but he was overthrown by force before the year was out. Gen. Maximiliano Hernández Martínez then came to power but was not recognized by the other Central American states or by the United States because he had been involved in the *coup d'état*. Hernández Martínez retained power only by a ruthless policy which involved mass executions.

Hernández Martínez maintained his authoritarian rule from 1931 to 1944. Reelected to the presidency in 1935, he was chosen to continue in 1939 by an assembly which he had picked to write a new constitution. Recognition of his government by neighbouring republics came in 1934. Energetic measures of the early years of this regime included the establishment of a new coinage system, the organization of a national bank, the completion of the Pan-American Highway across the country, and the extension of state control over the coffee industry. Hernández Martínez gained international attention by early recognition of the Japanese puppet regime in Manchukuo (1934) and of the regime of Francisco Franco in Spain (1936). He was generally accounted to have warm relations with Nazi Germany and Fascist Italy, and German business interests had considerable holdings in El Salvador in the late 1930s. Nevertheless, El Salvador after Pearl Harbor quickly joined the side of the United States against the Axis, and Hernández Martínez received the same material benefits from co-operation with Washington through the war as did his isthmian neighbours.

Post-World War II Era.—The end of the Hernández Martínez regime was not the end of government by military officers. Hernández Martínez' resignation came after a fierce revolt (which brought bombings and fire to the capital) and a general strike, prompted by a decision of the assembly to extend his term five more years. Gen. Andrés Menéndez, vice-president, held office from May to October 1944, when a new coup brought in Col. Osmín Aguirre y Salinas. Salvador Castaneda Castro, who took office March 1, 1945, after elections, lasted until Dec. 14, 1948 when a military junta took control. Maj. Oscar Osorio, important in this junta, was the popular choice in new elections of March 1950. His political group, the new Partido Revolucionario de Unificación Democrática (PRUD), came to dominate the political life of the country.

Osorio remained in the presidential chair for a full six-year term, starting Sept. 14, 1950. Material progress during this period was considerable. To coffee exports, which continued as valuable to the country as ever, were added significant sales of cotton. Low standards of living continued to prevail for the masses of underpaid workers, but various measures, including government construction of low-cost homes, held some hope for their future. Of particular importance were the hydroelectric power project on the Lempa River, the asphalting of the Pan-American Highway nearly from border to border, the development of a new east-west highway closer to the Pacific, the construction of a few industrial plants,

and plans for modern port facilities at Acajutla.

When a new beginning was made in the 1950s on the project of Central American union, El Salvador qualified as a ready participant. The Charter of San Salvador, written in the city Oct. 8–14, 1951, and ratified by the five Central American governments, provided for meetings at regular intervals of the chief officials of the republics, with the purpose of constituting an economic and cultural unity on the isthmus which might eventually express itself through a political federation. After further delay caused by renewed isthmian dissension, a meeting of the foreign ministers held in Antigua, Guatemala (August 1955) chose José Guillermo Trabanino of El Salvador as first secretary general of the Organización de Estados Centroamericanos (ODECA). Serving in this capacity for four years beginning Oct. 14, 1955, Trabanino was able to conciliate ruffled feelings between the nations on more than one occasion, even when his own country was involved.

Lieut. Col. José María Lemus, candidate of PRUD for the presidency in 1956, had no trouble winning when all the opposition parties either were barred from the ballot or withdrew from the race. PRUD also held all the seats in the National Legislative Assembly after elections of 1956, 1958, and 1960. Lemus continued the policies of his predecessor as to carrying out public works projects, undertook a variety of measures to buoy sagging price levels for coffee, and in April 1957 arranged a treaty with Guatemala for mutual hydroelectric developments utilizing the waters of international Lake Güija. Continued one-party rule in the face of mass discontent with low standards of living, however, led to the ousting of the PRUD government by force on Oct. 26, 1960.

Plans for a democratic election were sponsored by the six-man junta which ruled El Salvador for the following three months. Another junta which seized control on Jan. 25, 1961, however, first canceled the participation of parties of leftist orientation and then arranged the election of a constitutional convention all of whose seats were held by the new Partido de Conciliación Nacional. Julio Adalberto Rivera, running as candidate of that party, was elected without opposition as president for a five-year term beginning July 1, 1962. Dents in Rivera's one-party structure appeared in subsequent elections for the Assembly. (F. D. P.)

Population.—One of the most pressing problems of El Salvador is overpopulation. The smallest country in size in Central America, it is the most densely populated with 307.5 persons per square mile according to the 1961 population census of 2,510,984. The annual growth rate is 2.9%. Three-fourths of the people are concentrated in the area around the department of San Salvador, which has a population density four times the national average. The least heavily populated department is Chalatenango in northern El Salvador, with 159 inhabitants per square mile in 1961.

Population and Area of El Salvador by Department

Departments	Area (sq.mi.)	Population*	Capital	Population*
Ahuachapán	472	130,710	Ahuachapán	40,359
Cabañas	423	94,590	Sensuntepeque	27,360
Chalatenango	817	129,897	Chalatenango	15,137
Cuscatlán	283	113,042	Cojutepeque	18,347
La Libertad	642	203,480	Nueva San Salvador (Santa Tecla)	40,817
La Paz	464	130,659	Zacatecoluca	40,424
La Unión	770	148,108	La Unión	21,556
Morazán	666	119,381	San Francisco Gotera	7,528
San Miguel	837	231,821	San Miguel	82,974
San Salvador	336	463,228	San Salvador	255,744
Santa Ana	768	259,155	Santa Ana	121,095
San Vicente	466	112,920	San Vicente	34,723
Sonsonate	459	166,932	Sonsonate	35,531
Usulután	762	207,061	Usulután	30,465
Total	8,165†	2,510,984

Administration and Social Conditions.—The constitution adopted in 1962 provides for a representative form of government with three branches—legislative, executive, and judicial. All Salvadoreans, male and female, who have attained the age of 18 are permitted to vote. Executive power is exercised by the president, his cabinet ministers, and undersecretaries of state. The president is elected by direct, popular vote for a term of five years and is ineligible to succeed himself. Legislative power is vested in a unicameral National Legislative Assembly (*Asamblea Nacional Legislativa*), which meets in regular session on the first of June and the first of December of each year. The number of deputies is determined by apportionment. They are elected by popular vote for two-year terms and can be reelected. The judicial branch is composed of a Supreme Court of Justice, whose members are selected by the National Assembly, and of other tribunals as established by statute. The Supreme Court consists of ten magistrates, one of whom serves as president.

The territory of El Salvador is divided into 14 departments (see *Population*, above). Each department has a governor and a substitute governor, appointed by the executive power. For purposes of local government the departments are divided into municipalities, which are governed by popularly elected municipal councils (*consejos municipales*), consisting of a mayor (*alcalde*), a syndic (*síndico*), and two or more aldermen (*regidores*), the number of whom are in proportion to the population. Independent in their local functions, the municipalities are limited to economic and administrative activities.

The standard of living of the artisan class in El Salvador is high, but that of the agricultural labourer remains low. The government is taking active steps to ensure a more equitable distribution of income by emphasizing workers' education, sponsoring projects in literacy, and training workers for union activity and community life. Union organization was given government support in 1950 and soon more than 50 unions were in existence. In 1950 the Urban Housing and Rural Colonization institutes were created to help overcome the lack of low-cost housing and to ensure adequate housing facilities for future population increases. The Social Security Institute was inaugurated in 1949 as an autonomous organization to provide health, accident, unemployment, old age, and life insurance. Its benefits are financed by contributions from workers, employers, and the government.

All public and private institutions of learning are under the jurisdiction of the Ministry of Culture. The school system is composed of preschool, primary, secondary, and university categories. Primary education is free and compulsory but the illiteracy rate is high. The National University of El Salvador has schools of law and social sciences, medicine, engineering, chemistry and pharmacy, architecture, dentistry, economics, and humanities. The Institute of Fine Arts fosters the talents of novelists, poets, and essayists. The Institute has a literary department, a department of plastic arts and music, and a department of theatre and dancing. There is also a National Agricultural Institute, and there are schools of public administration, social service, and nursing, and various other vocational schools.

Military service for at least one year is compulsory for all Salvadorean males from 18 to 30 years of age. The strength of the Army is fixed annually by the National Assembly; in no case can it be less than 3,000 men.

Economy.—The foundation of El Salvador's economy in modern times has continued to be agriculture. Coffee accounts for about 60% of all exports by value, making the country vulnerable to world price changes. During the second and third quarters of the 20th century, however, there was a steadily increasing investment in industry and other fields, stimulated by the development of the Central American Free Trade Area and the Alliance for Progress. At the present time El Salvador is one of the most industrialized countries in Central America.

Cotton and sugar rank next to coffee in El Salvador's agricultural production, the output of sugar having been greatly stimulated by the assignment of a sugar allocation to El Salvador for export to the United States. As the wooded area of the country is small, there is little forestry. Mining activities are limited and the production of gold and silver declined during the 1950s. The fishing industry, on the other hand, was greatly expanded during the 1950s. Of the country's local industries, textiles were the most important; by 1960 El Salvador had the largest number of cotton mills in Central America. Other industries included the processing of foods and beverages, and the production of cement, bricks, simple chemicals (soap, candles, matches, and fertilizers), leather, ciga-

rettes, footwear, hats, and cardboard. There were also woodworking shops, printing establishments, and machinery and metal-repair shops.

The monetary unit of El Salvador is the colón, which is divided into 100 centavos. The colón has been stabilized in world market quotations at 2½ to the U.S. dollar. Central banking functions are performed by the Central Reserve Bank of El Salvador, created in 1934.

El Salvador's transportation facilities are well developed. Two railroad companies, the International Railway of Central America and the Railway of El Salvador, cover a distance of 383 mi. (616 km.). A highway network stems from the Pan-American Highway, which crosses the country from border to border and is completely paved. The total highway mileage in El Salvador in 1962 was 7,412 mi. (11,928 km.), of which 981 mi. (1,579 km.) were paved.

SALVAGE, a term used in maritime law to designate either the act of rescuing life or certain kinds of property defined by salvage law from peril on water or the reward to which the rescuers, known as salvors, are entitled. In common English usage the term is used generally to describe rescue operations of various sorts (in commercial and banking circles, for example, the refloating of a corporation that has run on financial reefs is often referred to as a salvage operation), but it has no legal significance outside the field of maritime law. The present article is devoted exclusively to the legal aspects; for salvage engineering *see* SALVAGE OPERATIONS.

Rescue Efforts and the Law.—In Anglo-American law (apart from the law of the sea) there is neither a duty to go to the aid of another person when he or his property is in peril nor a right to a reward if aid is furnished and life or property preserved. At sea, however, there is both a duty to give aid and assistance and, where property is saved, a right to a reward, which is not looked on merely as a compensation for services rendered but is, it has often been said, to be generously computed in order to furnish an inducement to mariners and shipowners to risk their lives and property. The generosity with which salvage awards are computed may also serve, as one judge has realistically reminded us, "to withdraw from the salvors as far as possible every motive to depredate upon the property of the unfortunate owner" (Justice Clifford, in *The Clara* and *The Clarita,* 90 U.S. [23 Wall.] 1, 17 [1874]).

The salvage rules are a branch of property law rather than of moral law; this proposition may be illustrated by the fact that under general maritime law salvors of life at sea had no right to a reward. Life salvage was made the subject of reward, as such, in the United Kingdom in the 19th century, and this is still the law under the Merchant Shipping act, 1894. The provisions of the act extend to British ships everywhere and to foreign ships in British waters. Life salvage was formally recognized in the Salvage convention of 1910, which was adopted by many of the principal maritime countries of the world.

The U.S. version of the life salvage provision is that: "Salvors of human life, who have taken part in the services rendered on the occasion of the accident giving rise to salvage, are entitled to a fair share of the remuneration awarded to the salvors of the vessel, her cargo and accessories." It will be noted that this provision does not purport to reward "pure" life salvage. If only life is saved, the situation remains as it was before the convention. If both life and property are saved on the same "occasion," the life salvors get a "fair share" of the award to the property salvors, and there is nothing in the quoted language to suggest that the total amount of the award is to be increased over what it would have been if only property had been saved. Neither does one whose life is saved in such an operation become liable to the salvors for any fraction of the award, which is assessed exclusively against the property.

As will be seen, the courts in computing salvage awards have traditionally, and without regard to the life salvage provision of the Salvage convention, taken into account the moral aspects of the salvors' behaviour. Daring rescues of survivors inure to the benefit of good salvors when the award is computed, and the greedy salvors who let the survivors drown while they save the property find themselves appropriately punished. The only situation in which the Salvage convention appears to justify an award that would not otherwise be made is one in which, following the same accident, two sets of salvors appear and, acting independently of each other, one set saves only life and the other set saves only property. There have been a few such cases (*e.g., The Shreveport,* 42 F. 2d 524 [E.D.S.C. 1930]), and the judges have taken the life salvage provision to mean that a portion, typically a small portion, of the award made for saving the property should be taken from the property salvors and given to the life salvors.

The position under British law is that there is no life salvage reward where life alone and no property at all is saved by anyone, although the government has statutory powers to make *ex gratia* payments in such circumstances. Those who save life from a British vessel anywhere or from a foreign vessel in British waters are entitled by statute to life salvage, provided some property has been saved, although they themselves have saved none. Apart from these statutory provisions, the admiralty court in London and inferior admiralty courts usually give, and have traditionally given, higher rewards to salvors of property who also saved lives than they would have done if only property had been saved, and this is so regardless of where the services are performed. Awards for salvage of property, too, are increased where life has been in danger on board a salved vessel. All these principles also apply to aircraft (Civil Aviation act, 1949; Aircraft [Wreck and Salvage] order, 1938). Claims for life salvage as such have always been very rare and are now virtually unknown.

Salvage Defined.—The classical statement of the components of an act of salvage is: the rescue of maritime property (a ship or her cargo) on navigable waters within the jurisdiction of the admiralty from a peril which, except for the salvor's assistance, would have led to the loss or destruction of the property. Under British law aircraft may also be salved. Except for salvage performed under contract, a salvor must act voluntarily without being under any legal duty to do so, apart from the general duty, which has been reinforced by statute, to give assistance to those in peril at sea or to stand by after a collision. Since the salvage award is related to the value of the property saved, it is evident that only successful salvage attempts will be rewarded. So long as the owner or his agent remains on the ship, unwanted offers of salvage may be refused. A derelict (*q.v.*) is fair game for anyone who comes across it. It was not merely romantic heroism that in Dec. 1951 prompted Capt. H. K. Carlsen to remain aboard the "Flying Enterprise" until the contract salvors arrived but a commendable desire to protect his owners from a judicially computed salvage award.

There appears to be a fairly widespread belief that a salvor becomes the owner of the property that he rescues, at least if the property had been abandoned by the owner or was derelict. There is no foundation for this belief. The owner may always reclaim his property from the salvor on paying salvage money. The salvor has a maritime lien on the salved property. As lienor, the salvor need not return the property to the owner until his claim is satisfied or until a security to meet an award is given, and he may institute legal proceedings in rem against the property, in which case the admiralty court will take possession of the property unless the owner provides security to obtain its release. An owner may elect not to reclaim his property but to abandon it; if he does so, he cannot be made liable for a salvage award, although the admiralty court will sell the ship, reward the salvors out of the

proceedings of sale and hold the residue for the owner or for other claimants.

The only basis for the popular belief about the salvage of derelict property is that awards for salvage of such property may run somewhat higher than for other property because salvage under such circumstances will usually be a more dangerous operation, the degree of danger being one of the most important factors in fixing the proper reward, than when the ship in peril is still manned by her own crew, and because derelict property is usually in grave peril.

Derelict is narrowly defined by British salvage law: a thing, such as a ship or cargo, abandoned and deserted at sea by those who were in charge of it, without hope on their part of recovering it and without intention of returning to it. For the purposes of the Merchant Shipping acts "derelict," together with flotsam, jetsam and lagan (*q.v.*), is classed as "wreck," which is practical but historically confusing. Unclaimed derelict and other forms of "wreck" are droits of admiralty.

Any act that contributes to the preservation of property in peril may rank as a salvage service. At the bottom of the scale is the situation in which one ship merely tows another into port, without danger to the towing vessel, difficulty or delay. The owner of the towed ship, now safe in port, will naturally take the position that the towage was convenient but not necessary, that his ship could have made port under her own power, and will offer to pay for the service at the customary towage rates. The owner (and crew) of the towing ship will claim salvage on the ground that, except for the assistance rendered, the other ship would have been unable to make port and might have come ultimately into serious peril although no immediate disaster threatened. If the court finds that the danger was real, it will decree salvage and make an award that will be substantially in excess of the towage rates.

Typical acts of salvage include releasing ships that have run aground or on reefs, raising sunken ships (or their cargo), putting out fires and so on. In centuries more colourful than the 20th, one of the liberally rewarded acts of salvage was the recapture of a ship taken by pirates or taken as prize in time of war. Following the Russian Revolution of 1917 an English court made such an award to an impromptu crew of Allied soldiers who sailed a ship out of Murmansk harbour under gunfire after collapse of the Allied intervention (*The Lomonosoff,* [1921] P. 97). The salvage act need not be some kind of physical assistance directly rendered to the ships in peril. Standing by ready to give aid if necessary, summoning assistance that is given by others and even giving information as to the channel to follow in dangerous waters have all been regarded as salvage acts. Salvage by, as well as to, aircraft may be rewarded (*The American Farmer,* [1947] 80 Lloyd's Rep. 672).

Objects of Salvage.—It is often said that the only objects of salvage (known as subjects in British law) are a ship, her accessories and her cargo, and that the rescue of other types of property, looked on as nonmaritime, from peril at sea will go unrewarded. The position regarding aircraft under British law has already been explained. The U.S. author G. H. Robinson has suggested, in a hypothetical example, that there would, under this theory, be no right to salvage for raising a freight car that had fallen into the sea from a railroad trestle, and this would be so under British law. The strict "maritime property" theory is principally based on two 19th-century cases, one U.S., one English. In *Cope* v. *Vallette Dry Dock Co.,* 119 U.S. 625 (1887), the U.S. supreme court decided that no salvage could be claimed with respect to a dry dock that, having been moored in a fixed position for 20 years, had broken loose from its moorings. A few years later the house of lords came to the same conclusion in *Wells* v. *Owners of Gas Float Whitton No. 2,* [1897] A.C. 337, with respect to a navigation beacon. There seems to have been neither much reason nor much authority behind these decisions of the two highest courts. A leading U.S. admiralty judge of the period had commented, in awarding salvage on rafts of timber found floating in Boston harbour, that it would be no defense to a salvage claim "that the goods had been washed out to sea from the shore by a gale or a flood, or had been dropped from a balloon" (Lowell, Justice in *50,000 Feet of Timber,* 9 Fed. Cas. 47 [D. Mass. 1871]). In the 20th century the invention of the airplane raised in a novel context the problem of whether "nonmaritime property" found in peril at sea is a proper object of salvage. After some initial hesitation while the courts wrestled with the distinguished authorities, the answer has been given, in England by statute, as stated above, and in the United States by the course of judicial decision, that salvage can be claimed for aircraft rescue on navigable waters. Recent U.S. cases in particular have shown a tendency to award salvage with respect to any kind of property found afloat—even money recovered from a dead body in New York harbour (*Broere* v. *$2,133,* 72 F. Supp. 115 [E.D.N.Y. 1947]). Since the supreme court has not reversed itself and since the house of lords is said not to be able to reverse itself, the *Cope* case and *The Gas Float Whitton* are still technically good law but, it may be, only as to dry docks and navigation beacons, respectively.

Legal Duty as a Bar to Claims.—There are several classes of salvage claimants against whom the legal duty rule is regularly employed to defeat the claim. One class consists of public officials and employees; municipal firemen and licensed pilots may be taken as examples. Special provisions in British law apply to claims by members of the armed forces, but the crown may claim salvage in respect of their efforts when crown property has been used. The rule is also applied to salvage claims by the crew of the salved ship. Since the crew is under a duty to save the ship at all costs, no feats of heroism, however extraordinary, will be rewarded as salvage. When the ship was recaptured from pirates or enemies, the traditional rules did allow for a liberal award to the crew; the modern formulation of such cases is that salvage can be claimed by crew members who voluntarily return to the ship after their contracts have ended, *e.g.,* by abandonment on master's orders.

The rule against crew salvage has been extended to passengers, although extraordinary contributions by passengers have occasionally been rewarded. The reason for the rule in British law is that the passenger should receive no reward for what he does solely in the interest of self-preservation. The legal duty rule applies similarly in cases where a tug claims salvage against a vessel she is towing under contract. Under the contract of towage the tug is said to be under a duty to come to the tow's assistance, and the salvage claim is denied unless, under British law at least, the tug does more than the contract of towage bound her to do. Salvage is frequently awarded in such circumstances. In most of the cases mentioned, with the possible exception of that of the crew when the master has not abandoned ship, the rule appears not to be an absolute bar. Rescue efforts that are above and beyond the call of duty may be rewarded as salvage.

In 19th-century salvage law the rule seems to have led to the conclusion that there could be no salvage claims when both the salving and the salved ship were in common ownership. Obviously the owner of the two ships had no interest in claiming salvage from himself; the effect of the rule in U.S. law was to deny salvage to the crew of the salving ship, presumably on the ground that the crew was under a duty to preserve the owner's property. Under British law, common ownership is a bar to the owner of the two vessels except, in certain circumstances, against cargo in the salved vessel; the crew of the salving ship may claim against a salved vessel and her cargo regardless of ownership. The Salvage convention of 1910 provided that common ownership of salving and salved vessels should not affect salvage claims, and in the United States a statute was passed to implement the rule of the convention. In the British case *The Kafiristan,* [1938] A.C. 136, it was decided that where a vessel is wrongfully damaged by another vessel and is salved by a third vessel (in common ownership with the second vessel), a claim for salvage by the owners of the third vessel is not barred. The salvage award will be an item in the damage claim against the owners of the wrong-doing second vessel, according to the degree to which that other vessel is to blame.

There appears to be no reason why a government should not claim salvage for rescue operations performed by its naval or merchant fleets. In several cases decided during and after World War II, both the British and the United States governments made sal-

vage claims, sometimes apparently for the benefit of the government, sometimes for the benefit of the crew of the salving ship. The Crown Proceedings act, 1947, s. 8, provides that salvage law shall apply to crown ships or cargo (except that there is no right in rem) as if belonging to a private person. The crown as salvor has the same rights and remedies in respect of salvage services as any other salvor. Naval personnel in the U.S. would presumably be unable to bring forward such a claim without governmental sponsorship, and under British law government permission is essential in cases of claims by officers and crew of H.M. ships. Crews of government-owned merchant ships have been allowed to claim salvage as freely as the crews of privately owned ships.

Computation of Awards.—The judicial computation of salvage awards is not an exact science. A classical statement of a method of computing awards was formulated by Justice Nathan Clifford in *The Blackwall*, 77 U.S. (10 Wall.) 1 (1869), in the following often quoted language:

> Courts of admiralty usually consider the following circumstances as the main ingredients in determining the amount of the award to be decreed for a salvage service:
> (1) The labour expended by the salvors in rendering the salvage service.
> (2) The promptitude, skill and energy displayed in rendering the service and saving the property.
> (3) The value of the property employed by the salvors in rendering the service, and the danger to which such property was exposed.
> (4) The risk incurred by the salvors in securing the property from the impending peril.
> (5) The value of the property saved.
> (6) The degree of danger from which the property was rescued.

It was noted earlier that salvage is a doctrine of property law and not of morals, but it is clear from Justice Clifford's list that in the United States the moral element intrudes to the extent of making it impossible for anyone successfully to contest the trial judge's computation. His decision depends on so many questions of judgment, such as "danger," that it will be almost impossible to say that any award he may choose to make is "wrong." Consequently, each salvage case is a law unto itself, and precedents are valueless except to indicate in a general way the maximum and minimum amounts which judges have, at various periods, in fact awarded.

In the United Kingdom appeals are infrequent but not unknown. The classic statement of principle on the topic is that of Lord Esher in *The Star of Persia,* (1887) 6 Asp. 220; "If [the court of appeal] cannot say that the learned judge has misapprehended the facts, or cannot say that he has acted contrary to any principle, then, if the amount does not seem to this court to be unreasonable, it cannot interfere." Unreasonable means greatly in excess of or greatly below the sum which the court of appeal considers should have been awarded.

The converse of the rule that good behaviour—extraordinary skill, daring, heroism or ingenuity—increases the award is that bad behaviour—negligence or incompetence or vandalism or theft—decreases the award or, in extreme cases, forfeits it entirely. In the United States it is regarded as a natural and obvious stratagem for owners to put forward such allegations, and a reading of the defense testimony in a random sample of salvage cases will leave the impression that the typical salvor is a blackhearted villain lineally descended from Captain Kidd. The admiralty courts, which sit without juries, are inclined to treat such testimony with deserved skepticism. Self-serving allegations of negligence or worse brought by owners against salvors will therefore be disregarded unless the proof is compelling. In the United Kingdom the defense is usually content to pour cold water on the statement of claim, although positive allegations of negligence or misconduct are made where the circumstances demand them. In both countries the salvor may forfeit his award, in whole or in part, for bad behaviour and is also liable to the owner for any unnecessary damage that an incompetently performed salvage service may have caused to the property.

An extension of the fault principle is that the owners and crew of a ship that has been solely or jointly at fault in a collision cannot claim salvage for services thereafter rendered to the other ship. This point is confidently stated in the leading British treatise on salvage as well as by most U.S. commentators.

The rule as to the amount of an award of salvage seems to be that though the value of the property salved is an important consideration, it must not be allowed to raise the amount of the award altogether out of proportion to the services actually rendered. (It is also customary, as the quotation from *The Blackwall* indicates, to value the salvor's property in order to determine how much he had put at risk. The valuation of the salvor's property, however, appears to have no direct relationship to the amount of the award. There is disagreement between British and U.S. commentators on whether cargo carried in the salving ship may be added to the value of the ship and her freight to increase the total value of the property at risk and thus, hopefully, the amount of the award.) The importance of the valuation of the salved property is that in U.S. law the award will be in all cases calculated as a fraction of that value; in any case of salvage that involves a large ship, this phase of the proceedings will typically be protracted, bitter and hard fought. Under British law the value of the salved property is merely one of the factors taken into consideration in assessing the award.

In arriving at the valuation the items taken into account are the value of the ship, the value of the cargo and the amount of freight that would, except for the salvage, have been lost. In valuing the ship, the customary method is to take its sound value before the salvage less the cost of repairs for damage suffered in the peril from which the ship was rescued. The owner is not, of course, entitled to deduct from sound value the cost of repairs that would put his ship in a better state than it was in before the accident or the cost of repairs not directly occasioned by the accident. The value of cargo will customarily be determined by the price for which it can be sold in the port where it is unloaded.

Another element not mentioned by Justice Clifford in *The Blackwall* that is taken into account is expenses incurred (and, less frequently, profits lost) by the salvor in the course of or as a result of a salvage service. Since the value of the salved property in any event ultimately determines the amount of the award, the salvor does not necessarily recover all that he may have lost; if he has spent, or lost, $1,000 in saving property worth $100, the loss is for his account and not for that of the owner. Items of reimbursement for expenses or for lost profits are often stated separately from the general award for the salvage. It is unclear whether such items represent an addition to the award that the judge would otherwise have made or whether all that is involved is a method of allocation. Since the expenses are incurred or the profits lost by the owner of the salving ship, such items are entirely for the owner's account and are not shared by him with the crew.

The amount of salvage awards, expressed in percentages of the value of the salved property, seems to have steadily decreased since the middle of the 19th century. This trend is obviously related to the tremendous increase in ship values that took place when steam replaced sail and that continues with 20th-century giant liners and supertankers, to say nothing of atomic-powered ships. It was once said that the general rule was a "moiety"—half the value—of the salved property; awards on that basis for the salvage of a multimillion-dollar ship would result in fortunes for the lucky salvors and, needless to say, such awards are not made. In *The Esso Greensboro,* 122 F. Supp. 133 (S.D. Tex. 1954), where the value of the salved ship was stipulated to be $1,000,000, awards of over $200,000 were made to the officers and crew of the salving ship, whose owner made no claim for his own account. The salvors of the "Greensboro" came across her in mid-ocean, burning and derelict; they boarded the burning hulk, searched for survivors, put out the fires, made necessary repairs and towed her to port, the whole affair taking eight days. At the other end of the scale, where the salvage barely rises above the level of simple towage, a customary award in the United States is double the usual towage rates.

Distribution of Awards.—A salvage award is divided between the owner of a salving ship and her officers and crew. Awards to absentee owners appear in U.S. cases as early as the end of the 18th century. In the course of the 19th century awards to own-

ers, as owners and not as participants, came to be regularly made. The usual explanation for this development is the continuing increase in ship values, which meant that increasingly valuable property was being put at risk when used (typically in emergency situations, without the owner's prior consent) in dangerous salvage attempts. It is also true that the increased values were insured against an even wider range of risks. Thus the risk for which the owner is said to be compensated by being given a share of the salvage award is to a degree illusory, although it cannot, on the other hand, be gainsaid that a ship in being is, in most situations, more useful than a claim on an insurance policy. The increasingly important part played by the power of salving vessels after steamships were invented is another major factor. Early 19th-century cases seem to have allocated a quarter or a third of the award to the owner, while 20th-century U.S. cases reveal that two-thirds of the award is customary and the leading British authority suggests that three-fourths of the award should go to the owner.

When the salving ship is operated under charter, a term in the charter party will usually provide for a division of salvage money between owner and charterer. In the absence of such a provision salvage goes to the owner except in the case of a so-called demise or bareboat charter (one under which the charterer is responsible for manning, supplying and navigating the ship).

Among the officers and crew basic awards are normally made according to rank or monthly pay. Additional awards are often made to individuals whose participation contributed to the success of the venture or who in situations of danger displayed unusual bravery. The officers' and crew's right to salvage cannot be defeated by agreement between the owners of the salving ship and the salved property or by arbitration proceedings to which they have not consented.

Cargo that may be carried in the salving ship is said not to have a right to share in the award. At first glance, it would appear that the absentee cargo interest should have a right to a share as the absentee shipowner has, since the cargo, like the ship, may be damaged in the course of the salvage. Furthermore, under most bills of lading and charter parties it will be provided that the ship is not liable to cargo for damage suffered in an attempt to save life or property at sea (although cargo, of course, carries its own insurance against such risks). There appear to be almost no modern cases in which cargo owners have demanded a share of the salvage award, and none under British law.

Payment of Awards.—The owners of the salved property are liable to the salvors for the award in the ratio that the value of their property (*i.e.*, such of it as is saved, valued in its condition after the salvage) bears to the aggregate value of all property saved. The usual contributing values are cargo, the ship and pending freight. For example, if the salved ship, including freight, is worth $1,000,000 and the salved cargo is also worth $1,000,000, being owned in equal shares by ten people, then the shipowner is liable for 50% of the award and each of the ten cargo owners for 5%; in Britain, however, if the dangers to the cargo differ from the dangers to the ship as, for example, where the cargo is perishable and the main danger to it is delay, the proportions may be varied (*The Velox* [1906] P. 263). Since the salvors have a maritime lien against the salved property, they can proceed directly against the property by proceedings in rem or (unless the owner abandons his property) they can proceed against the owners in personam. It has been said that any person who has a direct pecuniary interest in the salved property may be held liable for salvage (Justice Augustus Hand, in *The G. L. 40,* 66 F. 2d 764 [2d Cir. 1933]; Sir James Hannen, in *Five Steel Barges,* [1890] 15 P.D. 142). There are, however, almost no cases in which salvors have attempted to proceed against such more or less remote interests as insurers, mortgagees or buyers of salved property, and it may be doubted whether the attempt, if made, would be successful.

It is customary for the owner of a salved ship to pay the salvors in full and then to seek reimbursement from the owners of other salved property for the shares of the award for which they are liable. The shipowner has a lien against cargo for salvage money paid out on cargo's behalf and may refuse to deliver the cargo until his lien is satisfied. In any situation where large values are involved, the liability of ship and cargo for salvage will be worked out in a general average settlement. (*See* AVERAGE.)

Contract Salvage.—Much salvage work is also carried out under contract by professional salvors. The amount of compensation to which a contract salvor is entitled depends on the terms of his contract, which frequently provide for arbitration as to amount, almost invariably under Lloyds Standard Form of Salvage agreement ("no cure–no pay") rather than for a finally fixed sum. Salvors get nothing unless the salvage is to some degree successful. This reflects one of the basic principles in the law of volunteer salvage, that there can be no award unless property is actually saved. A contract under which a salvor would be paid for his labours, whether or not they were successful, would of course be quite as valid as the "no cure–no pay" contract, though this would not be true salvage.

See also MARITIME LAW.

BIBLIOGRAPHY.—The leading treatise is Sir W. R. Kennedy, *Civil Salvage,* 4th ed. by K. C. McGuffie (1958). This British text is usually considered authoritative by U.S. as well as by British courts. M. J. Norris, *The Law of Salvage* (1959); G. H. Robinson, *Handbook of Admiralty Law in the United States,* ch. 15 (1939), Grant Gilmore and C. L. Black, *The Law of Admiralty,* ch. 8 (1957); *Halsbury's Laws of England,* vol. 1, "Admiralty," 3rd ed. (1952) and vol. 5, "Shipping and Navigation," 3rd ed. (1961). (G. GI.; K. C. MCG.)

SALVAGE OPERATIONS are those required to refloat a ship or other vessel that has sunk or run aground or to assist her when she is in other kinds of danger; *e.g.,* when she has lost her propeller at sea and requires a salvage tow. There are many kinds of salvage operations, varying from those of utmost simplicity to those involving complicated technical studies and procedures which require special equipment, machinery and tools. One of the most important types of operation consists of services to ships which have lost their motive power; *e.g.,* by breakdown of engines, shortage of fuel, etc. The usual salvage service is by towing, sometimes for several thousand miles.

Ordinary Grounding.—The commonest salvage problem is ordinary grounding in which all or part of the grounded ship is above water. It can be simple, difficult or impossible. It is a simple problem if the ship or vessel has run only slightly aground on a mudbank or sand bar except in certain especially dangerous localities, such as the Goodwin sands, where, if the tide is falling, the ship may break her back. It is a difficult problem if grounding occurs on a rock-bound seacoast where wind and tide cause a pounding action which may spring plates or seams, thus opening the ship's interior to serious flooding from the sea. It is often impossible if the grounded vessel is "high and dry," having been lightly loaded when pushed up on the shore by heavy seas at high tide.

The first step in salvaging a ship that has run aground is to obtain the use of tugs. These powerful little vessels may be able to tow the grounded ship back into deep water. Another step is to place the ship's regular anchors, or special salvage anchors known as beach gear or ground tackle, in deep water so that the endangered vessel can hold to them and thus prevent heavy seas from forcing her farther up on the shore. A third method is to keep a strain on a towline while awaiting high tide in the hope that the grounded vessel will come afloat and can be towed away. This simple remedy of "tug and tide" is frequently successful, but when a vessel is hard aground it is usually not possible to move her by the few tons of pull exerted by a towline.

If the tug-and-tide method fails, the next step is usually to lighten ship. This consists of the removal of weight from the vessel to the extent computed to be necessary. The quickest and easiest items to remove are liquids such as water and oil that can be pumped overboard into lighters. If further lightening is required, the cargo may be removed along with, in extreme cases, boats, booms, furniture and anything else that is portable. These items may be transferred to barges alongside by the ship's own cargo-handling equipment or by onshore or floating equipment. Such removal of weight, however, should never be begun until the ship is sufficiently secured to prevent her, in her lightened condition, from being pushed farther ashore by storm and tide. This

is a rule that is often violated, with the result that the ship suffers greater damage or may be lost completely.

If the ship has remained generally watertight, the steps outlined above should prove successful. If, however, the vessel has been opened to the sea it is necessary to make temporary repairs of the fractured plates or to isolate the compartments into which sea water is flowing. If the ship is high and dry at low tide the diagnosis and treatment of ailing parts are easy. Temporary repairs, both inside and outside, are made as necessary. For submerged areas, trained divers may estimate damage, do underwater cutting and welding of steel and fit and secure steel or wooden patches. The securing of these patches is usually quite simple because water pressure tends to hold them in place and make them reasonably watertight. At times wooden patches are of the caisson (*q.v.*) type and are attached to the ship's hull by oakum packing or underwater concrete.

Water is removed from flooded spaces by the use of suction pumps or "push" pumps placed on the deck of the stricken vessel. The suction type of pump is not the best for a large ship because the maximum height to which water can be lifted under perfect operating conditions is only about 30 ft. The push-type pump is not so limited (*see* PUMP; VACUUM). One push type is the submerged electric pump; another is the deep-well type which has a centrifugal pump at the bottom of a steel pipe and is driven by a steel shaft rotated by an electric motor or gas engine. When enough pumps are operating, the water can be removed from the ship faster than it flows in; and, as the inflow is gradually lessened by repair work, the ship eventually comes afloat.

The use of compressed air to empty a vessel of water is a method which has proven very effective but requires that the structure to be emptied of water be made capable of withstanding the necessary air pressure. To lower the level of water in a compartment submerged 10 ft., for example, would require a pressure of about 5 lb. per square inch (p.s.i.); for 30 ft., it would require about 15 p.s.i., which may cause bursting unless the structure is strengthened. The air compressors required are usually on the salvage tug or the ship's deck or on barges alongside, and are operated by electricity or gas.

With all of the above operations completed a ship may come afloat at high tide. If it does not float, more of the same efforts may bring success. If the ship is aground on a sloping shore, a few additional steps are called for. When a ship is hard aground, or high and dry, it is customary to attempt removing some of the rocks and rough bottom to facilitate sliding the vessel toward deep water. This cutting of a channel is normally done by dredge or, at low tide, by bulldozer.

As noted above, beach gear or ground tackle is often employed to provide means for a strong and steady pull toward deep water. This gear consists of a number of heavy anchors strategically laid out toward deep water, to which chains or wire rope are attached. By using winches on the deck of the ship and tackle with high mechanical advantage, a tremendous pull can be exerted. Then, as the tide comes in, the bow or stern or both are skewed back and forth to break the suction between the ship and the ground and to start the ship moving. If calculations are correct, or the tide is especially favourable, the ship will come afloat.

Sunken and Submerged Ships.—As a result of collisions, explosions or other maritime disasters, vessels are sometimes sunk in deep water. Whether such vessels are salvable depends on the current, sea conditions, depth of water, equipment available, estimated cost and other considerations. Small vessels are salvable in depths up to about 300 ft., but salvage of large vessels in such deep water is rarely practicable. The lift required to bring a sunken vessel to the surface is furnished by such devices as compressed air, floating cranes or pontoons. Trained divers (*see* DIVING APPARATUS) must do the underwater work on a sunken ship. This may consist of connecting air lines to the ship's fittings, securing lifting chains or wire rope hawsers and girdling the sunken vessel's hull with lifting hawsers. Examples of such salvage operations are some of the vessels raised to clear the Suez canal in 1957 and raising of sunken submarines from time to time. The amount of lift that can be applied by pumping compressed air into a ship or by lifting hawsers limits the size of the vessel that can be salvaged by these methods.

For salvaging larger ships, lift pontoons are attached directly to the hull or to cables that girdle the hull. The pontoons are large steel cylinders, usually sheathed with wood, and are equipped with heavy shackles and air connections. Usually they are filled with water, sunk and secured alongside the submerged ship. When their water is expelled by compressed air they become buoyant and exert lift. In raising sunken submarines pontoons are arranged in pairs connected by hawsers under the hull. Four or five pairs are usually employed to provide a combined lift of about 700 or 800 tons. A simpler type of pontoon, one not designed for use of compressed air, can be used on the surface where the rise and fall of tide is great enough to permit the wreck to be gradually moved to shallower water during succeeding high tides.

Capsized Ships.—Ordinarily, a ship lying on her side on the bottom must first be brought to an upright position. This is done by pumping air into selected compartments. Another method is to fasten pontoons to the ship, or to wire rope or chain hawsers which pass under the ship, and to exert lift on such hawsers by floating cranes, derricks or winches and tackle on the beach or pier. Raising the giant liner "Normandie," which caught fire and capsized alongside a pier in New York city in 1941, was a good example of this type of operation.

The decision as to which operations apply to a specific salvage problem depends upon study, calculations and experience. The old practice of "cut and try" is usually the rule. Ingenuity is indispensable on a complicated job. Oftentimes it is advisable to concentrate effort toward raising one end of a sunken vessel and then to proceed progressively. This is often requisite when equipment and facilities are limited.

Salvage companies and navies have in readiness well-equipped salvage tugs with crews trained to perform many operations without procuring much of the special equipment referred to above. They also have naval architects who can determine whether a ship will be stable after it is refloated. (H. N. W.)

SALVARSAN or "606," the trade name of arsphenamine, a remedy for syphilis, was discovered by Paul Ehrlich (*q.v.*) in 1909. It is a yellow powder, $C_{12}H_{14}As_2Cl_2N_2O_2{\cdot}2H_2O$—the 606th organic arsenical compound tested by Ehrlich and his assistants in their search for an effective drug. Salvarsan was prepared for injection into a vein by a rather complicated process. Later, Ehrlich introduced a modification, "914" or Neosalvarsan, that was much easier to use. Salvarsan was the first successful drug developed out of Ehrlich's concept of chemotherapy (*q.v.*). It rapidly rendered syphilitic patients noninfectious but did not always bring a complete cure, even after several years' treatment. In some patients the drug had toxic effects on the nervous system, kidneys, or skin. Salvarsan and related arsenicals were replaced in the late 1940s by the antibiotics. (V. E.; X.)

SALVATION ARMY, THE, a Christian international religious and charitable movement, organized and operated on a military pattern. While the Army has a dual function of church and social agency, its first purpose is the salvation of man "by the power of the Holy Spirit combined with the influence of human ingenuity and love." International headquarters of the organization are located in London, Eng.; national headquarters for the United States are in New York City. Worldwide in scope, the Army is established in nearly 70 countries and colonies, preaching the gospel in about 160 languages in 17,000 evangelical centres, and operating more than 3,000 social welfare institutions, hospitals, schools, and agencies.

HISTORY

Origins.—William Booth, founder of the Salvation Army, an ordained minister in the Methodist New Connexion body in England, left the pulpit of that church in 1861 so that he might be free to become an evangelistic preacher. This step led him, in 1865, to the worst slum areas in the East End of London, where he began his ministry among the poverty-stricken, unchurched masses in Mile End Waste. Booth's first plan was to make his work supplementary to that of the churches, but this proved im-

practical because many converts did not want to go where they were sent and often were not accepted when they did go; furthermore, Booth soon found that he needed his converts to help handle the great crowds that came to his meetings. Consolidating his activities in Mile End Waste, Booth began to organize the work under the name of the Christian Mission, so that his followers would have a place to worship and an opportunity to become established in their newfound faith. Aware also that needy souls could not be cared for if the body were hungry or in distress, Booth soon inaugurated his social scheme to feed and house even the most depraved so that they might then be spiritually uplifted.

Booth's mission stations soon spread beyond London, and in 1878 the name was changed to the Salvation Army. Designated general, Booth gradually set up his organization on a military pattern which provided a direct line of authority and a system of training personnel. The system of government was autocratic, and unquestioning obedience was required throughout the ranks. A deed poll filed in the court of chancery in August 1878 invested the oversight, direction, and control of the Christian Mission in one person, the general superintendent. This secured William Booth in that office for life and gave him power to appoint his successor as well as complete control of all the property and money of the Army.

In spite of strong opposition from some quarters to the type of evangelism employed by the Salvation Army, the work spread quickly over England, Scotland, and Wales. Booth then committed the Army to a policy of expansion overseas, and pioneering parties were soon sent in different directions, the first reaching the United States in 1880. Steady overseas expansion has continued.

In the adaptation of the work to overseas countries, some modifications were necessary in the Army's system of government; but the general's ultimate control was practically autocratic. This did not go uncriticized, but during the generalship of the founder there was no organized opposition to it. Under the deed poll of 1878, each general was to name his successor under seal, the name of the successor not to be divulged until the death of the incumbent. At an international staff council in 1904, a supplementary deed poll was adopted, the principal object of which was to set up machinery for removing from the position any general proved unfit to carry on his work because of health or other stated reasons; it also provided for the selection of a general by a High Council of the Salvation Army which could be called into being for these purposes should necessity arise.

On the founder's death in August 1912 his eldest son, William Bramwell Booth, formerly the founder's chief of staff, became general with the virtually unanimous approval of the Army. During the 17 years of his generalship, Bramwell Booth gave to the Army a great missionary impulse. He also laid the basic foundations from which sprang the Army's great emphasis on youth programs and activities. In January 1929 the High Council decided to relieve Bramwell Booth on the ground of incapacity. The matter went to the law courts, which confirmed the judgment of the High Council. Edward J. Higgins, chief of staff to Bramwell, was elected to succeed him. This crisis in the history of the Army was the beginning of certain constitutional reforms that led to a more vigorous and democratic international organization. Among these was provision for the regular election of the general (from 1931) by the High Council, consisting of commissioners and other leading officers. Higgins' successors were Evangeline Booth (daughter of William), George Carpenter, Albert Orsborn, Wilfred Kitching, and Frederick Coutts.

A further development in Salvation Army government came in 1947 when an Advisory Council to the General was constituted, at international headquarters, London. The council consists of senior officers in regular session and makes reports, etc., on matters that call for the general's decision. After 1947, conferences of the commissioners responsible for the work in all parts of the world were convened periodically in London, and international congresses brought together officers and soldiers to consider various aspects of Army activity and to devise new methods and means of extending the movement's influence. Rapid travel by sea and air enabling the general to maintain close personal contact with the Army's leaders and work, and a college for officers established in 1950 and attended by future leaders from all countries, still further strengthened the internationalism of the movement. Symbolic of the spirit of unity which withstood the disruption and shock of World War II and which gives the Army a unique place in the world is the International Headquarters building in London, opened in 1963, to which every Salvation Army territory in the world contributed.

United States.—The Army's life in the United States may be divided into three periods of development: 1880 to 1904, the formative era of struggle, hardship, and rapid growth; 1904 to 1934, a period of further expansion and gradual, then mass, acceptance following World War I; 1934 and after, a period of broader integration of the Salvation Army with other national fund-raising agencies, along with wider recognition and acceptance of Army personnel and program among religious and social welfare organizations.

The Army was introduced into America in 1879, when a family of English Salvationists emigrated to Philadelphia and began to conduct evangelical services. They appealed to William Booth for officers, and Commissioner George Scott Railton, with a group of pioneer officers, was sent to officially open Army work in March 1880. The first headquarters were established in Philadelphia, and in spite of opposition—sometimes from city authorities and some Christians who opposed the Army's street meetings and unorthodox methods of spreading the gospel, and sometimes from rowdies and roughs objecting to the invasion of saloons and public houses—the work advanced rapidly. As the Army gradually became established, opposition subsided and passive acceptance of the work became general.

During these early years two schisms shook the international unity of the Army. In October 1884 Maj. T. E. Moore, in violation of orders, sought to establish the incorporation of the Salvation Army in the United States independent of General Booth. Removed from office, Moore established the American Salvation Army, which, deprived of the leadership of Booth and the Army's international kinship, gradually declined and was disbanded in 1889. In January 1896 Ballington Booth, son of the general and national commander in the United States, was appointed to another post, and when, in spite of public protest and Army appeal, the order was not rescinded, he resigned from the Army and set up a similar organization called the Volunteers of America (*q.v.*).

Evangeline Booth was national leader in the United States from 1904 until her election as general in 1934, and under her leadership the Army gave attention to internal study and development as well as to the improvement of personnel and program within the organization. In World Wars I and II the Salvation Army enlarged its services and personnel to serve the armed forces; Salvation Army officers also served as chaplains.

The work of the Salvation Army in the United States includes treatment centres aiding 56,000 men annually; maternity homes and hospitals, annually providing service for 18,000 hospital patients and 10,000 unmarried mothers; camps, providing camping experience for 16,000 children each year; boys' and girls' clubs and community recreation centres; Salvation Army–United Service Organizations (USO) and Red Shield clubs for servicemen; mobile canteens; hotels and lodges for men and women; nurseries and settlements; missing persons' bureaus; care for alcoholics; correctional service bureaus working with prisoners and their families; community centres for persons of all ages; and other allied services. All services are given without respect to race, colour, creed, or condition; the work is financed through voluntary subscriptions, participation in federated funds or like groups, and annual maintenance appeals.

The Salvation Army participates in national and international conferences in the social welfare field and is also one of the nongovernmental organizations with consultative status to the Economic and Social Council of the United Nations.

Later History.—International activities of the Army throughout the world are still directed from London, the birthplace of the movement. Its ability to react speedily to local need is largely due to the effective coordination of administration at the interna-

tional headquarters, and this has enabled the Army to make a major contribution to solving the problems of displaced persons, famine, and rehabilitation which followed World War II and subsequent national upheavals.

While pursuing its primary aim of preaching the Christian gospel, the Army has placed a new emphasis on educational and medical services in the less-developed countries. In Africa and India hundreds of Salvation Army schools are making provision for thousands of students who, with the spiritual guidance of Salvationists, are preparing themselves for future responsibility. At the same time doctors at an increasing number of Army hospitals and dispensaries are breaking through local prejudice to bring modern medicine and surgery to the relief of suffering and disease. In a world which is advancing to a deeper appreciation of social responsibility, the Army in Australia, New Zealand, Canada, and the United States is following the pattern laid down in Great Britain in making extensive provision for the aged, the homeless, and children in need of care and attention. The Army's internationalism binds together men and women of all classes and colours in a Christian, nonpolitical, worldwide community.

POLITY, WORSHIP AND DOCTRINE

Polity.—Administratively, the Salvation Army is under the command of a general, with appointed leaders in charge of 50 territorial and departmental commands of which about half encompass work in missionary lands and subsidized areas. The unit of the Army is the corps, commanded by an officer—with rank ranging from lieutenant to brigadier—who is responsible to a divisional headquarters. The work of the 45 divisions in the United States is under the supervision of divisional commanders. Divisions are grouped into four territories (regions)—Eastern, Central, Southern, and Western—with headquarters respectively in New York City, Chicago, Atlanta, and San Francisco. This same plan of organization is followed throughout the international Army, and in each territory (except in the U.S.; usually a separate country) a territorial commander is in charge with department leaders appointed to facilitate supervision and direction of all phases of the work.

Internationally, the general is the official representative and spokesman for the Army. In determining the organization's stand on matters of controversy, the general is assisted by the Advisory Council, which meets at stated intervals, as well as by the Conference of Commissioners, which is called periodically. Within the U.S., the national commander is the chief representative and administrative officer, official spokesman, and president of the Salvation Army Corporation established under the laws of New York, as well as of local corporations in a number of other states. Property and revenues are in the custody of a board of trustees or directors, and citizens' advisory boards, recruited by the Army, assist in promoting the Army's work and in public relations.

Within the structure of the Army, converts who desire to become soldiers (members) are required to sign Articles of War (pledge of membership), after which, as members, they give volunteer service to Army work. The function of officers is similar to that of ministers of other Protestant churches, and officers are commissioned to full-time service. Basic training for each officer, regardless of his work within the Army—evangelical or social welfare—is a two-year in-residence course at one of the schools for officers' training. Chief source of officer-candidates is the Salvation Army corps. After graduation from training school, each officer must continue, under supervision of qualified personnel, a five-year plan of advanced studies.

Although the Salvation Army corps performs the same basic function as the parish church does, the corps is essentially the local unit of an army whose demands—including abstention from alcohol and tobacco and rendering active Christian service—are still among the most stringent imposed upon any Christian. The parallels between Army and church terminology indicate the meaning of terms used throughout the former: the general corresponds to the head of the church; commanding officer to minister and priest; commissioning to ordination; Orders and Regulations to codes of discipline; and doctrines correspond to orders of faith.

Worship.—The simple structure of Salvation Army worship services has evolved from the determination of early officers to conduct services that would attract and hold converts largely from among poor, ignorant, unchurched, working-class people, whose greatest need was to understand clearly the power of God in their lives. William Booth was of the conviction that the sacraments were not in any way necessary to the salvation of the soul and in many instances would be a hindrance to his converts rather than a help. Church formality frightened the early converts, and Booth therefore sought to bring into his worship services an informal atmosphere that would put them at ease. Joyous singing, instrumental music, clapping of hands, personal testimony, free prayer, and an open invitation to repentance characterized the worship services. Modern services are perhaps more moderate in outward characteristics, but the same pattern is followed and the same lively spirit demonstrated. Ceremonies for enrollment of soldiers and dedication of children are comparable to acceptance into church membership and child baptism. The Lord's Supper is not observed.

Doctrine.—The motivating force of the Salvation Army in all its work is the religious faith of its officers and soldiers, and the fundamental doctrines of the organizations are stated in its Foundation Deed of 1878 in 11 cardinal affirmations. These doctrines affirm the Army recognition of the Bible as the only rule of Christian faith and practice; of God, who is the Creator and Father of all mankind; of the Trinity of Father, Son, and Holy Ghost; of Jesus Christ as the Son of God and Son of man; of sin as the great destroyer of man's soul and society; of salvation as God's remedy for man's sin and man's ultimate and eternal hope made available through Christ; of sanctification as the individual's present and maturing experience of a life set apart for the holy purposes of the Kingdom of God; and of an eternal destiny that may triumph over sin and death. As affirmations of Christian truth, these doctrines are the creed of the Salvation Army, and to those who accept them they are self-evident.

Undoubtedly William Booth's early training in the Wesleyan Methodist Church influenced the doctrinal position of the Army, but in actuality the statement of faith included the basic principles common to most Protestant evangelical denominations and ignored the controversial issues that might cause factionalism and interdenominational strife.

Distinctive Aspects.—That which preeminently sets the Salvation Army apart from other denominations is its methods and practices in the realistic presentation of religion and its use of various constraining means to bring people to salvation. Not content with reaching only those who attend indoor services, the Army regularly proclaims the gospel on the streets. Salvation Army music is also distinctive. From its primitive musical aggregations, the Army has evolved networks of music camps, institutes, and bandmasters' training courses and its many well-trained bands not only enhance Army worship services but also carry a spiritual message through the ministry of music to churches, hospitals, schools, and civic gatherings.

In maintaining its original character as a body of spiritual witnesses and aggressive evangelism, the Army continues to stress the need for conversion, preceded by penitence and followed by growth in holiness. In the series of Orders and Regulations for officers, local officers (laymen), and soldiers, definite guidance is given in all areas of everyday conduct.

Salvation Army marriages are solemnized "under the flag" and children are dedicated to become soldiers or officers in the "war." The distinctive uniform of the Salvationist, both officer and soldier, is worn "as an outward and visible sign of an inward and spiritual grace." Another of the great principles of the Army, firmly adhered to, is that women have absolute parity of privilege, position, and dignity with men.

In its worldwide activities, the Salvation Army publishes nearly 140 periodicals with 2,000,000 copies per issue. The weekly *War Cry* is the official organ, and reports and statistics of the spiritual and social operations of the Army internationally are published annually in *The Salvation Army Year Book.*

SALVI, NICCOLÒ (Nicola) (1697–1751), Italian sculptor, whose masterpiece is the Trevi Fountain in Rome, was born in 1697 at Rome. He began in the studio of the painter Niccolò Ricciolini and subsequently studied architecture under Antonio Canevari. In 1732 he competed unsuccessfully for the facade of S. Giovanni in Laterano, Rome, but in the same year his project for the Trevi Fountain was chosen in preference to those of a great number of competitors. Most of his energy was absorbed by the work; he was responsible not only for the overall design but also for the details of the decoration and the program of the statuary. After Salvi's death Giuseppe Pannini finished the fountain in 1762, somewhat altering the original scheme. The idea of combining palace front and fountain was derived from a project by Pietro de Cortona, but the grand pageantry of the central triumphal arch with its mythological and allegorical figures, of the natural rock formations, and of the gushing water was Salvi's. This queen of fountains is the swan song of the Roman Baroque era. Salvi also executed minor works in churches and has the doubtful merit (with Luigi Vanvitelli) of having enlarged G. L. Bernini's Palazzo Odescalchi. He died in 1751. (Rf. W.)

SALVIA, a large genus belonging to the mint family, and containing about 550 species in the temperate and warmer regions of both hemispheres. The name is derived from the Latin *salvo*, from the healing properties of the garden sage, *S. officinalis*, which has been known for at least three centuries and which has been cultivated in kitchen gardens for the grayish-green wrinkled leaves that are commonly used in flavouring meats.

Many native species of *Salvia* occur in western North America, especially in California, where 15 species are found. Among these are *S. carduacea* (thistle sage), cultivated for its thistlelike, white woolly foliage and blue flowers; *S. columbariae* and related, mostly Mexican, species are the source of chia. *S. verbenaca* is found in Great Britain in dry pastures and waste places, as is also *S. pratensis*.

Some California sages are important bee plants, among them the black sage (*S. mellifera*) and the bigflower sage (*S. grandiflora*). Some of the salvias are among the most showy of soft-wooded plants, the blossoms being of a bright glowing scarlet. A useful species is *S. splendens*, a Brazilian shrub, commonly called scarlet sage. Treated as a tender annual, it is one of the most popular bedding plants in American gardens. There are other very ornamental species of easy growth, increased by cuttings in spring, and succeeding well in ordinary rich loamy soil.

SALWEEN (Chinese Nu Chiang or Lu Chiang; Thai Mae Nam Khong), a river of Asia which rises in the Tibetan Plateau and flows east and then south through the Chinese province of Yünnan, entering Burma just south of latitude 24° N. In its lower course the river forms the frontier between Burma and Thailand for about 80 mi., but a longer stretch of this border follows the Thaungyin River, a minor tributary. The Salween is 1,500 mi. (2,414 km.) long. In its upper course it has a very narrow watershed, and for nearly 600 mi. until it leaves Yünnan it parallels the Mekong, in places at a distance of as little as 20 mi. In this narrow section between high ranges (over 15,000 ft. [4,572 m.]) the valley, lying more than 6,000 ft. (1,829 m.) above sea level, is little settled, but the population is more numerous in the comparatively open, though still exceedingly rugged, plateau lands of southwest Yünnan, which continues into the Shan states of Burma. Even there, however, settlement keeps to the more healthful higher basins and spurs, avoiding the river's deep, narrow gorge. Where the Salween enters Burma it is 2,000 ft. above sea level and the crest of the ridges forming its watershed frequently rises above 6,000 ft. and in places reaches more than 9,000 ft. Every few miles there are ferries but the valley itself is remarkably devoid of settlement except where larger tributaries make transverse communication easier, as at Kunlong at the confluence of the Salween and the Nam Ting.

The Salween occupies an almost continuous gorge to within 70 mi. of the sea, with many rapids and shoals. Consequently the river is practically useless for navigation by power craft except in those last 70 mi., though it is used by native boats in many sections and is of some value for floating down teak and bamboo from the Shan states to Moulmein. In the lower, navigable course there are many islands and the river crosses obliquely a number of open valleys trending northwest-southeast where settlement is fairly dense. Among several large villages and townships that stand on the riverbank are Kamamaung, Shwegun (a steamer terminus), and Pa-an. At Moulmein the Salween cuts through the last hill ridge to enter the Gulf of Martaban of the Andaman Sea by two estuaries encumbered with sand and mud banks. Bilugyun Island at the mouth of the river separates the bifurcating estuary and has as its core an outlying hill ridge. The southern estuary is the more important and is used by ocean-going shipping calling at Moulmein. The river is tidal for about 50 mi. from the sea, to a point between Pa-an and Shwegun.

The weather pattern of the Salween region is monsoonal, and there is sometimes a 90-ft. (27 m.) range between low water and flood in narrow gorges. High water in the Salween causes flooding in the lowlands behind Moulmein, as the main stream holds back the waters of the Gyaing and the other left-bank tributaries. Hydroelectric power has been developed on the Nam Pilu, a right-bank tributary of the Salween (via the Nam Pawn). A potentially promising site for a multi-purpose scheme involving development of power, irrigation, and navigation is at Salween rapids, immediately before the river leaves its gorge. If the rapids in this part of the river were flooded by a dam, power boats might penetrate a long way upstream, perhaps as far as Kunlong.

(B. L. C. J.)

SALZBURG, a *Bundesland* (federal state) of the Republic of Austria (*q.v.*). Area 2,762 sq.mi. (7,155 sq.km.). Pop. (1961) 347,292.

Physical Geography.—The *Land*, stretching from the headwaters of the Mur River south of the main crest of the Alps northward into the Northern Alpine foreland, shares in two of Austria's main physical regions: the Alps and, to a lesser extent, the Alpine foreland. Nine-tenths of Salzburg belongs to the Alps. The area south of the trough followed by the upper Salzach and upper Enns rivers is part of the Central Alps. North of the trough are moderately high mountains, part of the Kitzbühler Alpen. Farther north are the Salzburg Limestone Alps with karst features including caves, notably the Tennengebirge ice caves. The Flysch Mountains north and east of Salzburg City are in the Salzkammergut (*q.v.*). The Alpine foreland consists of the Salzburg Basin, divided into glacial tongue basins with small lakes or bogs and moraine hills.

The climate varies greatly, proximity to the mountains producing high rainfall in the Alpine foreland (more than 39 in. [1,000 mm.]). On the mountains rainfall exceeds 59 in. annually. The Lungau (basin of the Mur headwaters) suffers in the winter from temperature inversions and has the lowest rainfall (below 28 in.). On the Sonnblick (10,187 ft. [3,105 m.]) is a meteorological observatory.

History.—Numerous rich finds from the Neolithic Period onward have been made. Because of mineral resources there were prehistoric settlements in the mountains as well as in the foreland. Copper mining (near Bischofshofen) in the Bronze Age and salt mining (Dürrnberg near Hallein) in the Iron Age were important for the whole of central Europe. The area was settled by Celts in the later Iron Age and in 15 B.C. came under the Romans. Juvavum (Salzburg City) was made a *municipium* about A.D. 50, and the country was crossed by a major road. In the 5th century the area was invaded by the Teutons and then settled by the

Baivarii, except for the Lungau where the Celto-Romans were succeeded by subsequently Germanized Slavs.

The growth of Salzburg politically was initiated by grants of land in the 8th century by the duke of Bavaria to the bishop, its elevation to an archbishopric in 797, and subsequent acquisition of territory in the 13th century. At this time Salzburg was a buffer state between Bavaria and Austria. In 1278 Rudolph I acknowledged the archbishop as a territorial ruler. The prince-archbishopric reached its greatest extent about 1400, stretching not only into present-day Bavaria, Tirol, and Carinthia (Kärnten), but including also enclaves in what is now Yugoslavia. Many of the inhabitants became Protestants, and in 1731–32 Archbishop Firmian forced about 20,000 of them to emigrate, most going to East Prussia. Salzburg lost some of its possessions, but when it was secularized in 1803 its territory was still larger than the present *Land*. From the 17th century the archbishop has had the honorary title Primus Germania, and since 1184 he has been entitled to wear a cardinal's purple. Until 1951 he retained the status and title of prince. After 1803 Salzburg was an independent electorate and then changed hands between Austria, France, and Bavaria until in 1816 it became permanently part of Austria but lost some territory. It was an administrative district of Oberösterreich until 1850 when it became a duchy and Habsburg crownland. In 1918 it became a *Bundesland* and during the *Anschluss* (1938–45) it was a *Reichsgau* of Greater Germany. It again became a *Bundesland* in 1945.

Population.—Although the *Land* has shown a large increase in population since World War II, its population density per square mile is, except for Tirol, the lowest in Austria. Ethnically Salzburg is German, the dialect spoken belonging to the Bavarian group. Nearly 90% of the inhabitants are Roman Catholic, and Protestants form nearly 9%. The ecclesiastical province includes also Vorarlberg, Tirol, Carinthia, and Steiermark.

The principal towns (pop. 1961) are: Salzburg, the capital (*q.v.;* 108,114), Hallein (13,329), Saalfelden (8,901), Bischofshofen (8,287), Zell am See (6,455), St. Johann im Pongau (5,777), and Badgastein (5,742). Radstadt is a medieval town still enclosed by walls. Apart from some large villages in the lower areas, rural settlement consists mainly of hamlets and isolated farms. About three-quarters of the farms are larger than 12 ac. (5 ha.) but are mainly classified as mountain farms because of their inaccessibility.

Administration and Social Conditions.—Matters not reserved by the constitution for the federal government are dealt with by the *Bundesland* government, consisting of the governor and six ministers elected by and responsible to the provincial legislature (*Landtag*), which has 32 members elected for five years by popular vote. The *Landtag* is a legislative body, but its acts must be approved by the federal government. In the *Bundesrat* (upper house of the federal legislature) Salzburg has three votes. It is divided into six administrative districts (*Bezirke*). Local government is in the hands of burgomasters and town and commune councils elected by popular vote.

The Economy.—Half the land surface is used for farming and one-third for forestry, the most important arable areas being in the northern, low-lying parts, with rye and wheat as the leading crops. This is the only fruit-growing area. Elsewhere farming is almost entirely devoted to cattle rearing and dairy farming on meadows and summer pasture. There is horse breeding (of a heavy-type horse) in the Pinzgau. The forests of the Alpine foreland are 52% Austrian state-owned and 5% Bavarian, nine-tenths consisting of conifers. The annual timber yield exceeds 35,300,000 cu.ft. of which about two-thirds is used in industry. Timber, timber products, and paper form 70% of Salzburg's total exports.

Hunting for game (hares, roe and red deer, chamois) and fishing are strictly controlled, the licences providing much revenue.

Salt and copper are still the most important mineral resources. Brine from Dürrnberg is used in chemical plants as well as in the evaporation plant at Hallein. Copper is mined at Mitterberg near Bischofshofen (the smelting is done at Brixlegg in Tirol). The aluminum plant at Lend (based on imported raw material) is the second largest in Austria. Magnesite is mined at Leogang. Large reservoirs in the Tauern valleys are used for electric power stations, including the large one at Kaprun. The *Land* produces 10% of Austria's electricity. The heaviest industrial concentration is in the Salzburg Basin and apart from large breweries consists of medium-size enterprises (food processing, light manufacturing, textiles, clothing, leather, organ building). The tourist trade (including winter sports) is a major industry, the main centres being Salzburg City, Badgastein, and Zell am See.

Trade and Communications.—The area has been commercially important since copper was traded in the Bronze Age and salt in the Early Iron Age. The Roman Juvavum was the focal point of three major roads, one of which crossed the Radstädter Tauern Pass. Other crossings were used for trade with Italy. The salt trade was revived in the Middle Ages when the Salzach was an important waterway. Salzburg was again favoured by the coming of the railways, Austria's major line linking at Salzburg City with the line from the Hook of Holland which continues via the Tauern Tunnel to Villach and Belgrade. The Grossglockner Hochalpenstrasse mainly serves tourist traffic, but the *Autobahn* from Munich to Vienna, which runs north of Salzburg City, is of great commercial importance.

SALZBURG, a city, archbishopric, and capital of the *Bundesland* of Salzburg, Aus. It lies on the Salzach River in the northern foothills of the Alps at 1,391 ft. (424 m.) and is 192 mi. (309 km.) WSW of Vienna and 75 mi. (121 km.) SE of Munich, Ger., by road. Pop. (1961) 108,114. The celebrated traveler and geographer Humboldt described Salzburg as one of the three most beautiful towns in the world, a description due, perhaps, to its unique combination of scenic and architectural beauty. Little remains of the medieval period because of the later building activities of the prince-archbishops (*see* SALZBURG *Bundesland* above). The city's chief glories are the episcopal buildings and burghers' houses, Italian influence on the architecture leading to Salzburg's designation as the "German Rome."

The Salzach separates the older town on the left bank, overlooked by the Mönchsberg, from the newer quarters on the right bank, above which rises the Kapuzinerberg. The Untersberg (6,473 ft.) dominates the basin to the southwest, and the Gaisberg (4,226 ft.) to the east. In the centre of the older town is the spacious Residenzplatz with the Residenz (1595–1619) in the style of a Renaissance Roman palace. The facade was altered in 1710, and the northwest wing added in 1788–92. The Baroque state apartments have frescoes by Johann Michael Rottmayr and M. Altomonte. Opposite is the Neugebäude (1592–1602, enlarged about 1670) with a carillon (1702) in its tower. The cathedral on the south side of the square was built (1614–28) by Santino Solari at the instigation of Archbishop Wolf Dietrich, on the site of an earlier basilica. It was the first church in the Italian style to be built on German soil. The facade is of white and rose Untersberg marble, and the interior holds 10,500 people. Following bomb damage in World War II, new bronze doors were added in 1958.

Southwest of the cathedral is the Benedictine Abbey of St. Peter, founded by St. Rupert about 696 and the nucleus of the city. The 12th-century abbey church was remodeled in the rococo style in the 18th century. Within are a Romanesque portal (1240) and the tomb of St. Rupert. The adjoining cemetery is surrounded by arcades containing vaults built into the Mönchsberg. North of the abbey is the Franciscan church with a dark Romanesque nave, a 15th-century Gothic choir with delicate fan vaulting, and a Baroque high altar (1709). Also built into the cliff of the Mönchsberg are the various buildings forming the Festspielhaus (*see* below). In the Universitätsplatz, west of the Residenz, is the university, originally founded in 1623 and reestablished in 1964. East of the square, where a street market is held, is the Kollegien-Kirche, a masterpiece of J. B. Fischer von Erlach, built

1694–1707, with altar paintings by Rottmayr. Narrow passages lead from the Universitätsplatz north to the Getreidegasse, where Mozart was born in house no. 9, now a museum.

The great fortress of Hohensalzburg, crowning the southeast summit of the Mönchsberg, was founded in 1077 and altered to its present form about 1500. St. Georgs-Kirche (1501), in the main courtyard, has Gothic reliefs of the twelve apostles in red marble. The Mönchsberg (1,667 ft.) is a partly wooded ridge with shady paths and scenic views. To the east of the fortress is the Nonnberg, a Benedictine nunnery founded by St. Rupert and probably the oldest nunnery in existence. The church is late Gothic but has remains of an earlier building and Romanesque frescoes (1150).

The quarters on the right bank of the Salzach are reached by the Staatsbrücke, which leads to the Linzer Gasse, on the left of which is the St. Sebastianskirche, built in 1505–12 and remodeled in the 18th century. In the churchyard are the Gabriels-Kapelle, built in 1597–1603 as a mausoleum for Wolf Dietrich, the tomb of Paracelsus, and the graves of Mozart's wife Constanze and of Leopold Mozart. The Landestheater (1892) is in Makartplatz opposite the Dreifaltigkeitskirche (1694–1702), a beautifully proportioned building by J. B. Fischer von Erlach. Nearby is the Mozarteum (1910–14) comprising a music academy, concert halls, and the Mozart archives. Schloss Mirabell was originally built by Wolf Dietrich in 1606 for his mistress Salome Alt and remodeled in the high Baroque style in 1721–27. The splendid marble staircase is by Georg Raphael Donner. It has a fine Baroque landscape garden and a park. To the northeast of the city rises the wooded Kapuzinerberg (2,093 ft.) with a Capuchin friary (1599–1602).

South of the Mönchsberg is Schloss Leopoldskron (1736), with an outstanding rococo interior, once the home of Max Reinhardt and now the seat of the Salzburg Seminar in American Studies. Schloss Hellbrunn, to the south of the city, was built as a pleasure palace and garden by Santino Solari for the Prince-Archbishop Markus Sitticus in 1613–15. The Baroque garden, the oldest of its kind north of the Alps, contains an open-air theatre, statues, fountains, grottoes, and mechanical devices that spray the unsuspecting onlooker.

The Abbey of St. Peter and the Nonnberg were founded about 696 on the site of the Roman commercial centre of Juvavum. In 739 Salzburg was made a bishopric by St. Boniface and in 798 it was raised to an archbishopric. From this time the history of Salzburg (first mentioned under this name in 755) is the history of its archbishops, later prince-archbishops. The most notable of these princes were Leonhard von Keutschach (1495–1519), Wolf Dietrich von Raitenau (1587–1612), Markus Sitticus (1612–19), Paris Lodron (1619–53), Johann Ernest, Count Thun (1687–1709), and Leopold Anton von Firmian (1727–44).

Salzburg has been for many centuries a music centre. The monks of St. Peter's Abbey were famous for their church music long before Mozart was born in Salzburg in 1756, and the Salzburg Antiphony dates from the 11th century. The first Italian opera produced north of the Alps was given in the Steinernes Theater at Hellbrunn in 1619. The International Mozarteum Foundation was established in 1880. There were music festivals at irregular intervals throughout the 19th century, and in 1917 Hugo von Hofmannsthal, Richard Strauss, and Max Reinhardt formed the Festspielhausgemeinde. Hofmannsthal's *Jedermann,* based on the English morality play *Everyman,* was performed in the Domplatz on the cathedral steps in 1920, and two years later the first opera was presented. The annual festival comprises recitals, concerts of orchestral and chamber music, church music, opera, and drama as well as the presentation of *Jedermann.* The Festspielhaus, converted from the court stables, consists of the Felsenreitschule (1693) for open-air performances, two large indoor opera houses (1926, 1960), and the Winter Riding School, with a ceiling painting by Rottmayr (1690), used as a reception hall.

Salzburg is the northwestern gateway to Austria and an important road and rail junction. It is on the Munich–Vienna, Paris–Vienna, and Munich–Klagenfurt railways. The *Autobahn* from Munich to Vienna skirts the town. There is an international airport at Maxglan. Salzburg is one of the chief tourist resorts of Austria. Its convention building (1956) attracts international conferences. Manufactures include musical instruments and hardware. The town was the headquarters of the U.S. forces in Austria from 1945 to 1956.

SALZGITTER, a city of West Germany in the *Land* (state) of Lower Saxony, Federal Republic of Germany, lies 19 mi. (30 km.) SSW of Brunswick by road. Pop. (1961) 110,276. The municipality covers 82 sq.mi., being the result of the administrative merging and development of the old town of Salzgitter (now Salzgitter-Bad) and 28 adjoining villages.

Salzgitter is situated in the foothills of the Harz Mountains, rising in a ridge in the southwest to about 800 ft. (244 m.) above sea level. About 60% of the land in the municipal area is agricultural (wheat, sugar beet, grazing), 14% woodland, and 10% industrial. The area covers the largest deposit of iron ore in Germany, and iron has been smelted in the vicinity since about the time of Christ. The old town of Salzgitter was an important market for salt and produce in the Middle Ages and, together with the surrounding villages, was first mentioned in documents in about 1000, although there is evidence of settlement in antiquity.

As a result of the German policy of autarchy before World War II, the Hermann Göring Reich Company for Ore Mining and Iron Smelting was established in 1937. To bring these activities into a single administrative district, the existing municipality was created in 1942 and was until 1951 known as Watenstedt-Salzgitter. Watenstedt was chosen as the centre for the preparation of the ore and for the metallurgical works, and from the adjacent northeastern district of Hallendorf a branch canal 11 mi. long was made to the Mittelland Canal for the transport of Ruhr coal. In 1938–40 and after World War II the districts of Lebenstedt, Salzgitter-Bad, Thiede, Gebhardshagen, and Hallendorf were built up as modern residential estates. The iron ore is mined around the Salzgitter ridge and Salzgitter-Bad. The iron content of the ore is comparatively low. In addition to coking plants, blast furnaces, steel furnaces, and rolling mills, the industries include the production of railway coaches and wagons, trucks, radio and television sets, and beet sugar, canned food, textiles, and pharmaceuticals. Salzgitter-Bad is a recognized spa with an invigorating brine spring. The district of Lebenstedt in the north has the largest population and is the seat of the municipal administration. Salzgitter is linked by railway with Brunswick, Goslar, Hildesheim, and other centres and is skirted westward by the Hamburg-Frankfurt am Main motorway. (E. H. FR.)

SALZKAMMERGUT, a region comprising parts of the Austrian *Länder* Upper Austria (Oberösterreich), Styria (Steiermark), and Salzburg. It consists mainly of the Traun River Basin, and is renowned for its varied and beautiful mountain and lake scenery, often called the Austrian "Lake District." There are about 30 lakes; among them are the Atter, Traun, Mond, Aber (Wolfgang), and Hallstätter lakes. The highest mountains are the Dachstein massif in the south, rising to 9,826 ft. (2,995 m.). Together with the Totes Gebirge (Dead Mountains; 8,268 ft. [2,520 m.]) and the Warscheneck, they are formed of Triassic limestone.

The district owes its name (literally "salt exchequer property") to the salt deposits at Hallstatt, Bad Ischl, and Bad Aussee, which have been mined since the Iron Age (*see* HALLSTATT). Evaporation plants are worked at the three original centres and at Ebensee and Gmunden. The region produces half the total salt of Austria. Forestry is important; timber is used both for constructional purposes and as raw material for factories (paper, man-made fibres). There is also cattle breeding and dairy farming, production of hydroelectricity (Lake Gosau), and manufacture of cement and ceramics (Gmunden), but the most important source of income is the tourist trade. The main health and holiday resorts are Gmunden (pop. [1961] 12,518), Bad Ischl, Bad Aussee, and

Sankt Wolfgang. The region is served by a branch of the Westbahn railway, and the Salzburg-Vienna motorway, touching the Mond and Atter lakes, gives easy access by road. (K. A. S.)

SAM'AL: *see* ZINCIRLI HUYUK.

SAMANÁ, a province in northeastern Dominican Republic. Area 382 sq.mi., pop. (1960) 44,592. It occupies the mountainous (to 1,673 ft.) Samaná Peninsula, the delta region of the Yuna River, and a large part of the northeastern coastal plain. It is a rich coconut region, a leading rice producer from reclaimed marshlands, and a significant producer of cacao, corn, and tropical hardwood. The province was created in 1908 from El Seibo Province. The capital, Santa Bárbara de Samaná (pop. [1960] 3,309), was founded in 1756 by Spaniards from the Canary Islands, and in 1825 there was a notable influx of Negro immigrants from the U.S. Sánchez is a railroad terminus and port.

SAMANÁ BAY, which is bounded on the north by the Samaná Peninsula is approximately 40 mi. long and 15 mi. wide, with deep water and well-protected anchorages, and is one of the finest natural harbours in the West Indies. Apart from its importance as a fishing and tourist site, it is used relatively little for commerce. However, the bay's location, on the Mona Passage between the Atlantic and the Caribbean, makes it potentially important strategically. Two treaties, one leasing the bay to the United States and the other providing for the annexation of the Dominican Republic were signed in 1869, but both agreements were defeated by opposition in the U.S. Senate when it was learned that U.S. speculators were promoting the annexation in the hope of profiting by concessions in the Samaná region.

(D. G. Mo.; D. R. D.)

SAMANIDS, the first great native dynasty which arose in Persia after the Arab conquest. In the 8th century Saman Khudat, a Persian noble of Balkh, who was a close friend of the Arab governor of Khurasan, Asad ibn 'Abdullah, was converted from Zoroastrianism to Islam. His son Asad, named after Asad ibn 'Abdullah, had four sons who rendered distinguished service to the caliph al-Ma'mun. In return they all received provinces: Nuh obtained Samarkand; Ahmad, Fergana; Yahya, Shash; and Ilyas, Herat. In 875 Ahmad's son Nasr was recognized by the caliph al-Mu'tamid as governor of Transoxiana. He was succeeded in 892 by his brother Ismail, who overthrew the Saffarids (*q.v.*) in Khurasan and the Zaidites of Tabaristan (Mazanderan) and thus, though remaining nominally a provincial governor under the caliph of Baghdad, established an almost independent rule over Transoxiana and eastern Persia, with Bukhara as his capital.

The descendants and successors of Ismail, almost all renowned for the impulse that they gave both to the patriotic feelings and the national poetry of modern Persia (*see* PERSIAN LITERATURE), were Ahmad ibn Ismail (907–913); Nasr II, ibn Ahmad (913–943), the patron and friend of the great poet Rudaki; Nuh I, ibn Nasr (943–954); 'Abd ul-Malik I, ibn Nuh (954–961); Mansur I, ibn Nuh (961–976), whose vizier Bal'ami translated Tabari's universal history into Persian; Nuh II, ibn Mansur (976–997), whose court poet Daqiqi began the *Shah-nama;* Mansur II, ibn Nuh (997–999); and 'Abd ul-Malik II, ibn Nuh (999).

Under their government, which was organized on a loosely centralized feudal system, the provinces of Transoxiana and Khurasan attained a high degree of prosperity. The expansion of their industry and commerce is attested by the use of Samanid silver coins as currency all over the north of Asia. The later interruption of the northern trade routes was a factor in weakening the dynasty; and it succumbed eventually to the internal feuds and rivalries of the nobles and to the pressure of the rising Turkish powers in central Asia and Afghanistan.

Under Mansur I a Turkish slave, Alptigin, formerly commander of 'Abd ul-Malik's guard at Bukhara, had to flee for refuge to the mountainous regions of Ghazni, where he established a semi-independent rule, to which, after his death *c.* 963, his son-in-law Subuktigin, likewise a former Turkish slave, succeeded. Nuh II, in order to retain at least a nominal sway over those Afghan territories, confirmed him in his position and invested Subuktigin's son Mahmud with the governorship of Khurasan, in reward for the help they had given him in his struggles with a confederation of disaffected nobles under the leadership of Fa'ik. During this conflict, the greater part of Transoxiana was occupied by the Turkish Qara-khanids, whose chief, Boghra Khan, occupied Bukhara for a short time in 992. Subuktigin died in the same year as Nuh II (997); and Mahmud (*see* MAHMUD of Ghazni), confronted with an internal contest against his own brother Ismail, had to withdraw for a short time from Khurasan. This interval sufficed for Fa'ik, supported by a Qara-khanid force under the Ilek khan Nasr I, to concentrate power in his own hands and to involve Mansur II in a conflict with Mahmud. After the deposition of Mansur, who was suspected of intending to come to an agreement with Mahmud, the latter took possession of Khurasan. A few months later, the Ilek khan Nasr marched on Bukhara and carried 'Abd ul-Malik and his relatives into captivity. The last prince of the Samanid house, Muntasir, a bold warrior and a poet of no mean talent, carried on guerrilla warfare for some years against both Mahmud and the Qara-khanids, till he was assassinated in 1005. *See* also CALIPHATE; PERSIAN HISTORY.

See V. V. Barthold, *Turkestan Down to the Mongol Invasion,* 2nd ed. (1959); S. Lane-Poole, *Mohammadan Dynasties* (1894).

SAMAR, an island in the east central part of the Philippine archipelago, which with several dozen surrounding islets constitutes a province. Area 5,050 sq.mi.; pop. (1961) 867,994. Samar is the third largest island in the Philippines (after Luzon and Mindanao). It lacks the high mountains which characterize many of the islands in the group but is exceedingly hilly, with extensive level land found only in the coastal areas. The highest point is Mt. Capotoan (2,789 ft.), in the north central section. Annual rainfall varies from 100 to 170 in. and is evenly distributed throughout the year except on the east coast where there is a marked winter maximum. Samar receives considerable wind and flood damage from frequent typhoons.

Rice is the main food crop followed by root crops such as sweet potatoes and cassava. Coconuts and bananas are raised for cash along the coastal lowlands. Iron ore in small quantities is mined in the southeastern part of the island and is shipped from the port of General MacArthur. There are deposits of coal and phosphate rock near the west coast.

The provincial capital and important trading town is Catbalogan, pop. (1960) 34,873, on the west coast; Calbayog, a chartered city, is also a trading centre located on the northwest coast.

(R. E. HE.)

SAMARA: *see* KUIBYSHEV.

SAMARAN (SAMAR-LEYTE, SAMAREÑO or WARAY-WARAY), a member of the sixth largest Filipino cultural-linguistic group, occupying Samar and part of eastern Leyte. Most Samarans inhabit Samar, the third largest Philippine island; those who settled in nearby Leyte are concentrated from Calubian in the north down the island's eastern coast southward to Abuyog. Latest available estimates in the mid-1960s gave the Samaran population as 1,226,000.

Mountainous, thinly populated Samar is one of the eastern Bisayas (Visayan) Islands; most of the people are farmers, living in small villages near the sea, a river, or road (*see* BISAYAN). The island is largely isolated from main interisland shipping lanes; the major port is also the capital, Catbalogan. Daily buses from Leyte are ferried to western Samar across the narrow San Juanico strait. Among the island's main products are copra, abacá (Manila hemp), rice, and fish (*see* SAMAR).

Archaeological evidence suggests Late Paleolithic and Neolithic settlements in Samar. Samaran, as do all other Philippine languages, belongs to the Malayo-Polynesian (Austronesian) linguistic family; closest affiliation is with the languages of Indonesia (*see* MALAYO-POLYNESIAN LANGUAGES). It has been suggested that Samaran is most closely interrelated with other Bisayan languages and also those of central and southern Luzon (Tagalog, or Pilipino, and Bikolan). The majority of Samarans are Roman Catholics; Protestant communities, however, are found in the island.

Although the kinship system and family structure is almost identical with other Christian Filipino groups, Samarans are re-

garded by many Filipinos as less culturally advanced, particularly in their addiction to many pre-Hispanic beliefs related to magic and witchcraft. One of the earliest historical accounts of this region is Jesuit F. I. Alzina's *History of the Islands and Indios of the Bisayas* (Spanish, 1668). This source indicates extensive retention of older supernatural beliefs, folklore, and other cultural practices by present-day Samarans. *See* also PHILIPPINES, REPUBLIC OF THE. (D. V. H.)

SAMARIA, the central region of ancient Palestine, extending about 40 mi. from north to south and 35 mi. from east to west. It was bounded on the west by the Mediterranean sea; sea travel and commerce were discouraged by the marshy nature of the coastal Plain of Sharon and by the lack of any safe natural harbour along the coast, although Herod the Great (40–4 B.C.) built an artificial harbour at Caesarea Palestinae and that Hellenistic city became a political centre of Palestine for the next several decades. The northern boundary of Samaria was formed by the Plain of Esdraelon, part at least of which was considered to belong to Samaria. This plain made a clear separation between Galilee and Samaria. The eastern boundary was the Jordan river, easily accessible by valleys running down from Samaria and easily crossed by fords which made Samarian contacts easy with the region east of Jordan. On the south, Samaria had no natural boundary to separate it sharply from Judaea; the mountainous range of southern Samaria continued south into Judaea with no clearly marked division.

In general, the landscape in Samaria was more open than that found in Judaea, and it possessed more broad valleys that provided fertile farming land. This was particularly true of the northern half of Samaria. In the southern half, extending from the central region around Mt. Ebal (Jabal 'Aybal) and Mt. Gerizim (Jabal at Tur) to the border of Judaea, Samaria presented a continuous mountainous region, with higher altitudes and less farming land. In the northern half, marked by wide valleys and fertile plains (among which the Plain of Dothan was famous) the land supported a more prosperous civilization than Judaea could achieve.

In the centre of Samaria lay the central crossroads of the region. Mt. Gerizim rises to a height of 2,890 ft. and Mt. Ebal to a height of 3,085 ft. In the narrow valley between them lay ancient Shechem, from which roads ran west to the coastal region and east to the Jordan; from this same central area roads ran north and south to the various parts of Samaria and to regions beyond. It was thus natural that the political centre of Samaria was always near this focal point where the roads of the region met and crossed. Shechem (which excavations have shown to be at the modern Balatah in western Jordan) was the outstanding Canaanite city of this area. Later, under Israelite control, the former Canaanite city Tirzah, which may be the modern Tall al-Far'ah, 7 mi. N.E. of Shechem, became the capital until the time of Omri (876–869, or *c.* 884–*c.* 872, B.C.). He built a new and strong capital city on the hilltop which he named Samaria; it was located about 7 mi. N.W. of Shechem, and it remained the capital until its destruction in 722/721 B.C. In New Testament times Samaria was rebuilt by Herod the Great with a notable temple to Augustus and with many features of Hellenistic cities; he renamed it Sebaste, in honour of the Roman emperor Augustus (Greek Sebastus); the name is preserved in Sabastiyah, the name of the modern village at the foot of the hill on which the city of Samaria was built.

Other prominent cities of Samaria were: (1) Jezreel (*q.v.;* Zer'in), a royal city of the kings of Israel, on the northwest spur of Mt. Gilboa. (2) Beth-Shan (called Scythopolis in New Testament times; the modern Tall al Husn), on the border between Galilee and Samaria, with a strategic location which controlled the valley that sloped down from the Plain of Esdraelon to the Jordan river (*see* BEISAN); Midianite and other invaders from east of the Jordan came up this valley (Judg. vi, 33). (3) Ibleam (Tall Bel'ameh), Taanach (Tall Ta'annak), Megiddo (*q.v.;* Tall al Mutesellim) and Dor (Al Burj, near the modern Israeli settlement Nasholim, on the coast), a line of Canaanite cities which in early times cut Galilee off from Samaria; Megiddo, which commanded the strategic pass from the southern coastal plain to the Plain of Esdraelon, was of particular importance throughout the ancient history of Palestine. (4) Shiloh (*q.v.;* Khirbat Saylun), site of the ancient sanctuary of the invading Israelites in the days of Joshua (Josh. xviii, 1) and in the days of the judges (Judg. xxi, 19; I Sam. iii, 21). (5) Bethel (*q.v.;* Beitin), a centre of worship in the days of the patriarchs, the judges, the kings Saul and David and the kingdom of Israel after its separation from Judah; during this latter period Bethel, located on the southern border of Samaria, was given importance by the kings of Israel to keep Israelites from going south to Jerusalem to worship.

Before the conquest of Palestine by the tribes of Israel, the strategic sites of the region of Samaria were in the hands of the Canaanites. When the people of Israel invaded the region, they won footholds in the hill country, but key Canaanite strongholds in the neighbouring plains or valleys successfully resisted them, in some cases until the days of David. As Josh. xvi–xvii shows, the region of Samaria was assigned to the house of Joseph, that is, to the tribes of Ephraim (south of Mt. Gerizim and Mt. Ebal) and Manasseh (north of those mountains; half of the tribe of Manasseh, as Josh. xxii, 7, recalls, occupied the Trans-Jordan area east of northern Samaria). While David and Solomon united all the tribes of Israel under one ruler, with Jerusalem as the capital, the northern tribes separated from the Jerusalem-centred kingdom after the death of Solomon, and this separate kingdom of Israel had its capital, as has been said, first in Tirzah and then, from the time of Omri, in the city of Samaria. The biblical narrative might lead the reader to think that the greater strength lay in the kingdom of Judah, but in fact the northern kingdom of Israel was often the stronger and it enjoyed the greater economic development, with the corresponding evils which the prophets, including Elijah, Elisha, Amos and Hosea, roundly denounced. Its greater wealth and its political intrigue, however, failed to give it stability and permanence, and in 722/721 B.C. the kingdom of Israel was crushed by Assyria and the cream of its population was carried into captivity to break its capacity to revolt or plot against the Assyrians, who brought settlers from other parts of their empire into Samaria to mingle with the remaining Samarians (II Kings xvii, 6, 24). During the period after the exiles from Judah had been permitted to return to their homeland by the Persians, Sanballat, the governor of Samaria, and his friends harassed the Jews settled in and near Jerusalem and hindered for a time their rebuilding of the city walls (Neh. iv–vi).

In New Testament times, under Roman control, Samaria was ruled as was the remainder of Palestine by Herod the Great and by his grandson Herod Agrippa I (A.D. 41–44); Herod the Great's son Herod Archelaus governed Samaria, Judaea and Idumaea (4 B.C.–A.D. 6), as did Romans appointed during A.D. 6–41 (Pilate's term ran from A.D. 26–36) and A.D. 44–66, when the Jewish revolt broke out. During this period Samaria was to some extent a centre of Hellenistic life. Jesus had little to do with the Samaritans (Luke xvii, 11–19; John iv), but in the apostolic age Greek-speaking Christians preached to them (Acts viii), and this preaching marked a transition stage in the outreach of the church into the gentile world. The Samaritan sect, which traces its origin back to the northern Israelite form of the Mosaic religion, still exists in small numbers at Nablus (close to the site of Shechem) and accepts the Pentateuch as Scripture (*see* SAMARITANS).

SAMARITANS, the name given to a religious community formerly widespread throughout Samaria in Palestine (and familiar because of the parable of the Good Samaritan; Luke 10:25–37) and now represented by a few families at Nablus (in modern Jordan). The Samaritans claim to be descendants of the Ten Tribes, denying that the latter were ever deported en masse to Assyria, as related in the Old Testament (II Kings 17:23).

Their religion, they assert, represents the true, unalloyed teaching of Moses, since they accept the Pentateuch alone as holy scripture; hence they call themselves *Shamerim,* "observant," rather than *Shomeronim,* "inhabitants of Samaria." They transmit the Pentateuch in an archaic script resembling ancient Phoenician characters and in a text which differs slightly (sometimes only through dogmatic manipulation) from that of the Jews. They identify the "chosen place" of God not, as do the Jews, with Zion, but with Mt. Gerizim, overlooking Shechem (*see* GERIZIM, MOUNT). In their version of Deuteronomy 27:4 the altar of God is enjoined to be erected on that mountain, not on Mt. Ebal, as in the Jewish recension, and a similar injunction is appended to the Ten Commandments, after Ex. 20:17 and Deut. 5:21. The Temple at Jerusalem and the earlier shrine at Shiloh are regarded as apostatic.

History.—The origin of the sect is obscure because the Samaritan and the Jewish accounts (in Josephus, *Jewish Antiquities,* xi, 7, 2; c, 8) are alike tendentious, the former deliberately apologetic and the latter deliberately defamatory. Most probably, the inhabitants of Samaria first organized themselves as a schismatic community when the Jews, regarding them as mongrel stock, refused their aid in the building of the Second Temple (Ezra 4:1–3). The schism, however, seems not to have crystallized till about 200 years later, when a rival temple was established, about 332 B.C., on Mt. Gerizim.

In spite of the differences which separated the two communities, their external histories at first ran parallel. Samaritans as well as Jews were deported to Egypt by Ptolemy I Soter (4th century B.C.), the two parties subsequently continuing their rivalry in Alexandria; while under Antiochus IV Epiphanes (reigned 175–163 B.C.) they too were compelled to devote their sanctuary to the worship of a heathen god (II Macc. 6:2). Open hostility would appear to have developed especially when the Hasmonaean state of the Jews embarked upon a policy of expansion, and this reached its climax with the destruction of the Samaritan temple by John Hyrcanus I in 129 B.C. Thereupon the Samaritans found themselves caught between the Jews on the one hand and the Romans on the other.

When the Jews were subjugated by Pompey in 63 B.C., Samaria was liberated from Jewish domination and entered briefly upon a new lease of life. The capital city was restored by the Roman governor Aulus Gabinius and enjoyed the special favour of Herod the Great, who there celebrated his marriage with Mariamme. On the other hand, the Samaritans supported the Jews in their uprising of A.D. 66 and paid dearly in a retributive massacre. Like the Jews they were grievously oppressed by Hadrian, who burned their traditional writings. They seem also to have shared in the Jewish dispersion, for in later times Samaritans and their synagogues are heard of in Egypt, in Rome, and in other parts of the empire. During the 4th century, however, they enjoyed a brief renascence on their native soil under the leadership of a certain Baba Rabba, who built many synagogues (some of which have been excavated) in the villages around Shechem. Eventually, hostility to the Christians brought about their final eclipse. In 529 a rigorous edict against them was promulgated by Justinian, and although he subsequently softened its terms, renewed hostility on their part resulted, in 572, in a definitive withdrawal of all their rights and privileges by Justin II.

Under Arab and, later, Turkish rule, the history of the Samaritans is generally one of constant oppression and subjection, relieved only by occasional bright intervals. Although they are mentioned in later times by such Arab writers as al-Masudi (943) and Sharastani (d. 1153), by Jewish travelers such as Benjamin of Tudela (1163) and Obadiah Bertinoro (1488 in Egypt), by Jehan de Mandeville (Sir John Mandeville; 1322), William of Baldensel (1336), and others, little was known of them in Europe until Joseph Scaliger opened communications with them in 1583.

In consequence of the interest thus aroused, the traveler Pietro della Valle visited them in 1616 and obtained from them a copy of their Pentateuch, of their ancient Aramaic translation (Targum) of it, and of various other writings. At that time they had already quit their colony in Damascus and were beginning

SAMARITAN HIGH PRIEST ON MT. GERIZIM, IN JORDAN, RAISING THE SCROLL OF THE LAW AT PASSOVER

also to abandon their other settlements and to concentrate themselves in Nablus. By mid-20th century they lived mainly in a special quarter of that city, about 190 in number, though a few families had migrated to Tel Aviv-Jaffa. Their economic and cultural level is extremely low, and their principal problem is how to perpetuate themselves without infringing the forbidden degrees of kinship in marriage.

Religion.—Briefly summarized, the creed of the Samaritans is as follows: (1) God is one, incorporeal and without associate; (2) Moses is the only prophet, a preordained creature *sui generis,* the vessel of the divine "light" and "image" and the intercessor for man on the final Day of Judgment; (3) the Law of Moses, coeval with the world, is the only divine revelation and is immutable; (4) Mt. Gerizim is the chosen place of God, the only centre of worship and the "navel of the earth"; (5) there will be a Day of Requital and Reward, when the dead will emerge from their graves, the righteous to enter paradise, the guilty to roast in eternal fire. The Samaritans divide their history into a period of Divine Pleasure (*Rahuta*), when their temple was standing, and one of Divine Displeasure (*Fanuta*), which has continued ever since it was destroyed. Eventually, 6,000 years after creation, a Restorer (*Taheb*) will arise to ameliorate their fortunes. He will live 110 years.

In religious practice, the Samaritans observe only those laws and institutions that are prescribed in the Pentateuch. They interpret them, however, in a manner divergent from normative Jewish tradition, often agreeing with the Sadducees against the Pharisees and with sectarian Jewish usages later revived by the Karaites (*see* KARAISM). Passover, for example, begins on the 14th day of that lunar month the beginning of which falls in April (Abib; *cf.* Deut. 16:1); Pentecost falls always on a Sunday, since the law (Lev. 23:15) which dates it seven weeks "from the morrow after the sabbath" is taken to refer to the sabbath in the paschal week. They do not wear prayer shawls or phylacteries, interpreting the laws of Num. 15:37–39 and Deut. 6:6–8 symbolically. The law of levirate marriage (Deut. 25:5) is taken to enjoin the marriage of a widow to any near kinsman of her deceased husband, not specifically to his blood brother. The paschal sacrifice is still offered on Mt. Gerizim, and pilgrimages are made thither on each of the seasonal festivals.

The religious direction of the community is vested in a high priest. Formerly he traced his ancestry to Aaron, but in 1623 the Aaronid line died out, and ever since he has been known as the "priest levite," claiming descent from Aaron's uncle Uzziel (Ex. 6:18).

In Jewish tradition, the Samaritans are styled Cuthaeans, the implication being that they are not genuine Israelites but simply descendants of the foreign colonists from Cuthah allegedly imported into Samaria by the Assyrian conqueror when the kingdom of Israel fell in 722 B.C. (II Kings 17:24). Various restrictions are imposed on intercourse with them, and intermarriage is forbidden.

Language and Literature.—The Samaritan language is a dialect of Western Aramaic (*see* SEMITIC LANGUAGES: *Aramaic*). After the Muslim conquest in 632, however, it was superseded by Arabic for all but liturgical purposes.

During the Hellenistic period, the Samaritans appear to have composed several works, including a translation of their Pentateuch into Greek, but all of these have perished except for a few fragments. Of extant writings there is none which can be dated before the 4th century A.D. The Targum or Samaritan-Aramaic

version of the Pentateuch was most probably redacted about that time, though it was clearly based on a much older tradition and must have undergone various recensions. It bears a strange similarity in many points to the contemporary Jewish Targum of Onkelos (*see* TARGUM). To the same period belong the liturgical compositions of Amram Darah and Marqah, as well as the latter's midrashic commentary (called "The Book of Wonders") on parts of the Pentateuch, all in Aramaic. The last named is especially valuable not only from the linguistic viewpoint but also because it exemplifies a tradition of exegesis divergent from that of the Jews and because it anticipates several concepts and even idioms found later in the Koran.

With the possible exception of one or two hymns there is nothing further until the 11th century, when there appears an Arabic version of the Pentateuch probably composed by Abul-hasan of Tyre and later revised by Abu Said and Abul-barakat. Of the same date (1053) is an anonymous commentary on Genesis, interesting because it quotes from books of the Bible other than the Pentateuch and from the Mishna. Other medieval writings of note are: (1) the *Kafi,* or "Ritual Compendium," by Joseph ben Solomon of Askar, a village near Shechem (1042); (2) the *Masa'il al-Khilaf,* a disquisition on differences between the Samaritans and the Jews, by Munajja ben Sadaqah (*c.* 1150); and (3) the *Tabakh,* or "Potpourri," a collection of ritualistic and doctrinal discussions by Abul-hasan of Tyre. All these works are in Arabic. To the same period probably belongs also an Aramaic book of biblical legends known as "The Stories [*Asatir*] of Moses," though this would appear to draw upon far older sources. Of Samaritan chronicles, mention may be made especially of the *Taulida,* begun in 1149 by Eleazar ben Amram and continued in 1334 by Jacob ben Ishmael in Damascus, as well as of the so-called Samaritan Book of Joshua, a record of events from the death of Moses until the 4th century A.D. This work appears to have been compiled from traditional material at some time in the 13th century. An Arabic chronicle by Abul-fath, written in Egypt in 1355, has survived. There are also several minor theological treatises and a more ambitious work entitled "Way of the Heart" (*Sirr al-Qalb*) by Abraham Qabazi of Damascus (1532), as well as a poetic book of praises in honour of Moses (*Molad Mosheh*) by Qabazi's pupil Ismail ar-Rumaihi (1537). In the 19th century, translations of these works were made from Arabic into Samaritan by the priests Pinehas ben Isaac and Jacob ben Aaron, and such activity was continued later by Abisha ben Pinehas and Ab Hasda (Abul-hasan) ben Jacob.

The principal collections of Samaritan manuscripts are in the British Museum and the Vatican Library. Most of the literature remains unedited and untranslated.

The Pentateuch was edited with critical apparatus by A. von Gall (1914–18). A convenient edition of the Targum is that by Adolf Brüll (1874–75). For the liturgy, *see* A. Cowley (ed.), *The Samaritan Liturgy* (1909). The best grammar of the Samaritan language is that of J. H. Petermann in the "Porta Linguarum Orientalium Series" (1873). *See* also "Samaritans" in *The Interpreter's Dictionary of the Bible,* vol. iv, pp. 190–197 (1962). (T. H. G.)

SAMARIUM is a silver-white metal of the rare-earth group. It was discovered and an impure oxide isolated in 1879 by L. de Boisbaudran; pure compounds were prepared by E. Demarçay in 1901. The element was named for the mineral samarskite, which in turn was named for a Russian engineer, Col. M. Samarski. Samarium occurs in many rare-earth minerals but is almost exclusively obtained from monazite (*q.v.*); it is also found in the products of atomic fission. Separation and purification of samarium by means of reduction to amalgams with sodium amalgam was accomplished by J. K. Marsh in 1942. Ion-exchange techniques are used for commercial production.

Because of its high absorption cross section for thermal neutrons, samarium has been suggested for limited application in nuclear reactor control rods and for neutron shielding. Other uses are in special luminescent and infrared absorbing glasses, inorganic and organic catalysis, and in the electronics and ceramics industries. Samarium is a minor constituent of Misch metal (a mixture of cerium and other rare-earth metals, used in ferrous and nonferrous alloys).

The symbol for samarium is Sm, atomic number 62, atomic weight 150.35. There are seven naturally occurring isotopes, of which three, Sm^{147}, Sm^{148}, and Sm^{149}, are radioactive alpha-emitters with very long half-lives. The most abundant of the isotopes, Sm^{154}, is stable. The metal is conveniently prepared by the thermoreduction of its oxide, Sm_2O_3, by lanthanum metal followed by distillation of the samarium metal, which is one of the three most volatile of the rare earths (the other two are europium and ytterbium). It has also been prepared by reduction of its halides by an alkaline-earth metal. The metal melts at 1,072° C. Its density for the rhombohedral structure is 7.536 g. per cc.; other forms are known.

Samarium is one of the three rare earths which have an oxidation state of plus two (the other two are europium and ytterbium); the Sm^{+2} ion is such a violent reducing agent that it reacts with water. The pure metal is not appreciably oxidized in air at room temperature, and at higher temperatures oxidation proceeds at a very slow rate.

Divalent (samarous) salts are prepared by hydrogen reduction of an anhydrous trivalent (samaric) halide at high temperatures. The reduction of the samaric ion in solution may be effected either by electrolytic methods, using a mercury pool cathode, or by alkali metal amalgams. The plus-two oxidation state is frequently stabilized by precipitation of the Sm^{+2} ion as the sulfate, $SmSO_4$, which is extremely insoluble. Other divalent salts are $SmCO_3$, $SmCl_2$, $SmBr_2$, and $Sm(OH)_2$; they are reddish brown in colour.

In its more stable trivalent oxidation state, samarium behaves as a typical rare-earth element: it forms a series of yellow salts and solutions. Solutions show discrete absorption peaks in the ultraviolet and visible regions of the spectrum which may be used for quantitative analysis. Due to the presence of unpaired electrons the trivalent ion, Sm^{+3}, is paramagnetic.

SAMARKAND, a town and *oblast* centre in the Uzbek Soviet Socialist Republic, U.S.S.R. It lies at an altitude of about 2,330 ft. (710 m.) in the valley of the Zeravshan River, 168 mi. (270 km.) SW of Tashkent by rail and about 155 mi. (249 km.) N of the Afghanistan frontier. Pop. (1959) 196,484.

The old city of Samarkand, as opposed to the "new town" built after the Russian conquest of 1868, took shape in the Middle Ages. Its plan consisted of streets converging toward the centre from six gates in the 11th-century 5-mi.-long walls. The walls and gates were destroyed after the capture of the town by the Russians, but the plan of the medieval period is still preserved. Here are to be found monuments of Central Asian architecture in which the developments of six centuries can be observed. The earliest of these are the five small 14th-century edifices (in the collection of mausoleums known as the Shah-i-Zindeh) and the Ruhabad mausoleum dating from the middle of the 14th century. In the time of Timur (Tamerlane), whose capital Samarkand became, the congregational mosque of Bibi Khanum (his Chinese wife) and the mausoleum of Timur himself, known as the Gur-Amir, were built. To the second half of the 15th century belongs the Ak Saray tomb with the superb fresco of the interior. A fine example of the town planning culture of Central Asia is Registan Square with its group of monumental buildings: the *medresehs* (Muslim schools) of Ulugh Beg (1417–20), Shirdar (1619–1635/36), and Tilakari (mid-17th century), which border the square on three sides. In the environs of Samarkand are the tomb of Abd-i-Darun (15th century), the mausoleum of Chupan-Ata (mid-15th century), the mausoleum of Ishrat Khan, the ruins of the 16th-century aqueduct leading to the Zeravshan River, the mosque of Namazgah (17th century), the *medreseh* at the tomb of Khoja Ahrar (built 1630–36 by the Samarkand architect Dost Muhammad), and the Khanigah (cloister) at the tomb of Abd-i-Birun (1633–34). The main features of the 15th- to 17th-century monuments are the splendid portals, the vast coloured domes, and the remarkable exterior decoration in majolica, mosaic, marble, and gold. The new town, construction of which began in 1871, has expanded considerably during the Soviet period, and public

buildings, dwelling houses, and parks have been built. There are Uzbek and Russian theatres, a university (established 1933), and higher educational institutions for agriculture, medicine, and trade.

Samarkand is on the Krasnovodsk–Tashkent railway and on the highway from Tashkent to Termez on the Afghanistan frontier. It has an airport. The town's commercial importance, which in ancient and medieval times derived from its location at the junction of trade routes from China (the "silk road") and India, declined during the 17th and 18th centuries, but greatly increased with the coming of the railway in 1896. Samarkand then became an important centre for the export of wine, dried and fresh fruits, cotton, rice, silk, and leather. Under the Soviet regime industry has been expanded and, although mainly based on agriculture (*e.g.*, cotton ginning, silk spinning and weaving, fruit canning, production of wine, clothing, leather and footwear, and tobacco), includes the manufacture of tractor and automobile parts, and cinema apparatus.

History.—Samarkand is one of the oldest cities of Central Asia. In the 4th century B.C., then known as Maracanda, it was the capital of Sogdiana (*q.v.*) and was captured (329) by Alexander the Great. In the 6th century A.D. it was part of the Turkish Khaqanate. At the beginning of the 8th century it was conquered by the Arabs and in the 9th and 10th centuries it was ruled by the Samanids. In the 11th century it was conquered by the Karakhanids and later by the Seljuks, in the 12th century by the Kara Kitais, and in the 13th century it came under the domination of Khorezm. In 1220 it was captured and destroyed by Genghis Khan. In 1365 the city revolted against the Mongol amirs and at the end of the 14th and the beginning of the 15th centuries it was the capital of the empire of Timur. At this period Samarkand was the most important economic and cultural centre of Central Asia. In 1500 it was conquered by the Uzbeks and came under the dominion of the Shaibanids, who in the middle of the 16th century transferred their capital to Bukhara. Samarkand later became part of the khanate of Bukhara. During the 17th and 18th centuries, as a result of attacks by nomad tribes and by the Persian Empire, Samarkand underwent a serious economic crisis, and from the 1720s until the 1770s it was uninhabited. In 1868 it was occupied by Russian troops and became a part of the Russian empire as capital of the Zeravshan district, which in 1887 became the Samarkand province. When the Uzbek S.S.R. was constituted in 1924, Samarkand became its capital but was replaced by Tashkent in 1930.

SAMARKANDSKAYA (Samarkand) OBLAST', formed in 1938, is divided into 17 *rayons*. Area 12,008 sq.mi. (31,101 sq.km.). Pop. (1959) 1,148,281, mainly Uzbek, but including Tadzhiks, Russians, and Ukrainians. More than one-quarter of the population lives in the three towns of Samarkand, Katta-Kurgan, and Dzhizak. The *oblast* is drained by the Zeravshan River and includes the Nuratau and Ak-Tau mountain ranges in the north. In the southwest is the Karnabchul' Steppe. The geological structure includes marble, granite, limestone, gypsum, and other valuable building materials and minerals. The climate is continental and is noted for the amount of sunshine and the absence of cloud; there is no frost during 200 days in the year. The economy is mainly agricultural and includes cotton and fruit growing and sericulture in the Zeravshan Valley; elsewhere there is dry farming of wheat. Karakul sheep and goats are bred. Extensive irrigation systems have been developed. The *oblast* is traversed by the Krasnovodsk–Tashkent railway to an extent of 200 mi. (about 320 km.) and there are about 5,000 mi. (8,000 km.) of motor roads. (G. E. WR.)

SAMARRA, a town of Iraq, in Baghdad *liwa'* (province), lies on the east bank of the Tigris River about 70 mi. (113 km.) NNW of Baghdad. Pop. (1957) 16,398. Samarra is the site of a prehistoric settlement, and has given its name to a type of Neolithic painted pottery of the 5th millennium B.C. In A.D. 836 the caliph al-Mu'tasim, forced by the indiscipline of his Turkish bodyguard to leave Baghdad, founded a new capital at Samarra, which he renamed Surra-man-ra'a ("he who sees it, rejoices"); the earlier form, however, persisted in common use. Al-Mu'tasim laid out gardens on the Tigris bank, and his vast palace on the cliff above included a quatrefoil racecourse, a polo ground, and an amphitheatre. Other palaces, barracks, and private houses were erected by al-Mu'tasim and his successors on a spacious, regular plan, extending more than 20 mi. along the river. Al-Mutawakkil (847–861) built the Great Mosque, said to be the largest mosque in Islam, with a spiral minaret probably inspired by the Babylonian ziggurat, and later added a northern suburb to the city, including a new palace and a second mosque, Abu Dulaf, with a similar minaret. In 892 the caliph al-Mu'tamid returned to Baghdad and Samarra rapidly declined; by 1300 it was largely in ruins. The town contains important Shi'ite shrines which include the tombs of the 10th and 11th imams, and the cave into which the 12th imam disappeared and from which the Imami sect of the Shi'ites expect him to reemerge as the leader of Islam (al-Mahdi). *See* also ISLAMIC ARCHITECTURE.

See E. Herzfeld, *Geschichte der Stadt Samarra* (1948); K. A. C. Creswell, *Early Muslim Architecture* (1932–41). (E. E. D. M. O.)

SAMAWAH (As SAMAWAH), a town of Iraq in Diwaniyah *liwa'* (province) at the junction of the Hindiyah and Hillah branches of the Euphrates. Pop. (1957) 26,838. The town is on the Baghdad–Basra railway and there is a clear stretch of river as far as Nasiriyah, 71 mi. downstream (upstream the river is practically impassable). It also lies on the caravan routes to Hillah, Najaf, and Basra, in a fertile area, and is a centre of trade in local agricultural products, including vegetables, rice, wheat, and barley. Like most of the Euphrates towns it is a market for such imported goods as sugar, indigo, and coffee, as well as textiles. Wool is raised locally and woolen carpets are manufactured. (W. B. FR.)

SAMBA, a dance of Brazilian origin, is characterized by tilting, rocking motions of the body. The music, in 4/4 time, has an uneven rhythm based on the sequence of a dotted quarter note, an eighth note, and a half note. The basic pattern corresponding to these notes is a step forward or backward, a quicker step forward or backward, and a transfer of body weight to the other foot. Forward steps are taken with the knees bent and the body tilted back; backward steps, with the knees straight and the body tilted forward. The samba is performed by embracing couples, who may dance in place or across the floor; occasionally the partners may separate and perform variant steps such as the "shuffle."

SAMBALPUR, a town and district of Orissa, India. The town, headquarters of the district, lies on the left bank of the Mahanadi River, 140 mi. (225 km.) WNW of Cuttack. Pop. (1961) 38,915. It has a ruined fort and old temples, and there are three colleges, including a teacher-training college, affiliated to Utkal University. The town is connected to the South-Eastern Railway on the north and to the Raipur-Vishakhapatnam Railway on the southwest.

SAMBALPUR DISTRICT (area 6,763 sq.mi.; pop. [1961] 1,508,686) is mostly an undulating plain with rugged hills, the largest of which, Bara Pahar, covers an area of 300 sq.mi. (777 sq.km.). The Mahanadi affords means of water communication for 90 mi. (145 km.). A dam (15,748 ft. [4,799 m.] long) was completed in 1957 across the Mahanadi at Hirakud, 8 mi. upstream from Sambalpur, for irrigation, flood control, and power production. Rice is the chief crop. The district yields graphite, bauxite, coal, and various forest products. There are a paper mill at Brajarajnagar, an aluminum factory near Hirakud, a match factory, a large number of sawmills, rice and flour mills, and ice plants. Silk and bell metal industries are widespread though on a small scale. A fishing industry has been developed in the artificial lake (400 sq.mi. [1,036 sq.km.]) at Hirakud. Burla, near Hirakud, has an engineering and a medical college affiliated to Utkal University. Jharsuguda, 27 mi. N of Sambalpur, is a rail junction. (MA. M.; N. K. S.)

SAMBATION (SANBATION; from SABATION or SABBATION, "Sabbath River"), a legendary river beyond which the Ten Lost Tribes of Israel were exiled by Shalmaneser, king of Assyria (II Kings 17–18). According to the rabbis (*e.g.*, the *Targum* of pseudo-Jonathan on Ex. 34:10) and the Roman geographer Pliny the Elder (*Natural History*, xxxi, 17), the river flows six days a

week and rests on Saturdays. According to Josephus (*Wars of the Jews*, vii, 5, 1) it rests on weekdays and flows on the sabbath. Josephus and the rabbis differ also as to the location of the river, Josephus maintaining that it is situated in Syria, whereas the rabbis assume that it is somewhere in a country far from Palestine. Pliny locates it in Judaea. Nahmanides (13th century) identifies it with the River Gozan of the Bible (II Kings 17:6).

Reports about the Ten Lost Tribes and an independent Jewish kingdom in the East stirred the imagination of the Jews through the ages and intrigued the Christian world as well. From the 12th century to the 19th, Jewish travelers left European countries for the East to search for the Sambation and the Ten Lost Tribes. The resulting legends gave rise to a vast literature concerning the miracles of the Sambation. According to the narrative of the 9th-century adventurer Eldad ha-Dani (*q.v.*), the Sambation surrounds the land inhabited by the children of Moses (*Bene Moshe*), who maintain there a powerful kingdom. It is waterless but full of sand and stones which heave with a great noise during weekdays. On the sabbath it rests, shrouded with clouds, making it impassable. (Manasseh ben Israel in the 17th century maintained that the sand, if kept in a bottle, moves restlessly during the week but rests on the sabbath.) The story of Eldad was widely repeated later, with accretions by other travelers. From Jewish sources, the legends about the Sambation penetrated into Christian and Arabic writings, among them the Alexander Romance. (*See* also TWELVE TRIBES OF ISRAEL.)

In the vernacular of Eastern European Jews an unruly child was often referred to as a "Sambation."

SAMBHAL, a town of Moradabad district in the Rohilkhand division of Uttar Pradesh, India, lies 23 mi. (37 km.) SW of Moradabad town by road. Pop. (1961) 68,940. It is an ancient town that became an important seat of power during the Muslim rule and was for a time the imperial capital in the reign of Sikandar Lodi (1489–1517). There are several mounds and *sarais* (rest houses). The chief monuments include the Kot, once occupied by a Hindu temple and now by an old mosque (1526); the fort of Nawab Amin ud-Daula; and the tomb of Fateh Ullah Shah (a Muslim saint) in Sarai Tarin (1559), a locality named after the Tarin Pathans. Several important Hindu and Muslim fairs are held there annually. The chief industries are sugar refining, handloom weaving, and calico printing. (B. SI.)

SAMMARTINI (SAN MARTINI). The brothers of this name, Italian composers and instrumentalists of the 18th century, were sons of the French oboist Alexis Saint-Martin. They were born in Milan, and both were for a time oboists in the orchestra of the ducal theatre there.

GIUSEPPE SAMMARTINI (*c.* 1693–1751), often called "St. Martini of London" to differentiate him from his more famous brother, first appeared as oboist of the Milan opera in the early 1720s. He composed an oratorio, *La calunnia delusa*, which was performed in Milan in 1724. In 1729 he went to London where he remained for the rest of his life. He was much esteemed by the English public, first as an oboist at the opera and later as a composer and concert performer. After leaving the opera he entered the service of Frederick Louis, prince of Wales, for whom he wrote a setting of William Congreve's *The Judgment of Paris*. He died in London before June 24, 1751. His works, written in the late Baroque style, include some fine trio sonatas and *concerti grossi*. He published many of his own works, not always profitably. After his death they were a source of profit to certain music sellers, who reissued them, using the composer's plates.

GIOVANNI BATTISTA SAMMARTINI (*c.* 1698–1775), unlike his elder brother, spent most of his life in Milan. He was first known as a church organist and composer of sacred music. As early as 1734 he had composed a four-movement symphony; as his orchestral and chamber music began to be known outside Italy it attracted pupils to Milan, among them Gluck, who studied with him from 1737 to 1741. He died in Milan on Jan. 15, 1775.

Sammartini was a prolific composer—of 2,000 works, by some estimates—and was one of the formative influences on the development of the preclassical symphony, and thus on the classical style itself. It is impossible, however, to decide whether certain works are his, or by his brother, or even by Giovanni Battista Martini (1706–1784), or by one of the numerous forgers who profited from the popularity of his genuine works.

See C. Sartori, "Sammartini postmortem," in *Hans Albrecht in memoriam* (1962). (Cs. CH.)

SAMNITES, the name given by the Romans to the warlike tribes inhabiting the mountainous centre of the southern half of Italy. The word Samnites was apparently not the name used by the Samnites themselves, which would seem rather to have been the Oscan form of the word which appears in Latin as "Sabini"; the ending of Samnites seems to be connected with the name by which they were known to the Greeks of the Campanian coast. Both from tradition and from surviving inscriptions it is clear that they spoke Oscan, and tradition records that the Samnites were an offshoot of the Sabines. On two inscriptions the form Safinim appears, which would be in Latin Sabinium (nominative or accusative singular, agreeing with some substantive understood). The abundance of the group names ending in the suffix *-no-* in all the Samnite districts classes them unmistakably with the great Safine stock (*see* SABINI; ITALIC DIALECTS; OSCAN).

Four cantons formed a Samnite confederation: the Hirpini, (*q.v.*), Caudini, Caraceni, and Pentri (the Frentani and other Sabelli were often loosely called Samnites but were not members of the confederation). Many lived in villages. Their chief towns, which were administered by a *meddix* or two *meddices*, were: of the Hirpini, Beneventum (modern Benevento), Aeclanum, and Abellinum (Avellino); of the Caudini, Caudium and Saticula; of the Caraceni, Bovianum Vetus (Pietrabbondante) and Aufidena (Alfedena); of the Pentri, Bovianum (Boiano), Aesernia (Isernia), and Saepinum. The league probably had no federal assembly, but a war leader could be chosen to lead their united forces for a campaign. Lack of a central administration and eagerness to scatter quickly for booty, however, made it difficult for these virile highlanders to sustain long wars. Common fear of the Gauls drove the Samnites and Romans into an alliance in 354 B.C. Soon the Samnites are said to have been involved in their first war against Rome (343–341), when the Sidicini had appealed to Rome for help against a Samnite attack. Details of the war are confused, and some historians doubt its historicity. At any rate in 341 Rome renewed the alliance with the Samnites. The Second Samnite War (326–304), with a lull after Rome's crushing defeat by the Samnites under Gavius Pontius at the Caudine Forks in 321, prevented Samnite expansion into Lucania and Apulia, and the Samnites found themselves being surrounded by Latin colonies. A third war (298–290), despite Samnite cooperation with Gauls and Umbrians against the Romans at Sentinum in 295, ended in defeat and the establishment of a Latin colony at Venusia (Venosa; 291) on the southern borders of Samnium. Thus the Samnites were reduced and depopulated, but they later gave Pyrrhus and Hannibal some help against Rome. They fought doggedly from 90 B.C. in the Social War (the war of the allies or *socii*) and in the subsequent civil war against L. Cornelius Sulla (*q.v.*), who defeated them at the Battle of the Colline Gate (82).

The longest and most important monument of the Oscan language as it was spoken by the Samnites (in, probably, the 3rd century B.C.) is the small bronze tablet, engraved on both sides, known as the *Tabula Agnonensis*, found in 1848 at Agnone, not very far from Bovianum. This inscription, preserved in the British Museum, is carefully engraved in full Oscan alphabet. It contains a list of deities to whom statues were erected in the precinct sacred to Ceres, or some allied divinity, and on the back a list of deities to whom altars were erected.

SAMOA ISLANDS, a group of islands about 1,600 mi. N.E. of the northern tip of New Zealand, 2,700 mi. E. of Australia and 2,200 mi. S.W. of the Hawaiian Islands. The archipelago, which extends from latitudes 13° 26′ to 14° 22′ S. and from longitudes 168° 10′ to 172° 48′ W., is divided administratively into two parts: the six islands east of longitude 171° W. constitute American Samoa, a dependency of the U.S., and the nine islands west of the 171° meridian constitute Western Samoa, a self-governing nation which, until 1962, was a United Nations trust territory administered by New Zealand. American Samoa consists of the inhabited islands of Tutuila, Tau, Olosega, Ofu and Aunuu and the uninhabited coral atoll Rose Island. Swains Island, 210 mi. N.W. of Tutuila and considered to be outside the Samoan archipelago, was made a part of American Samoa in 1925. Western Samoa consists of the inhabited islands of Upolu, Savai'i, Manono and Apolima and the uninhabited islands of Fanuatapu, Namua, Nuutele, Nuulua and Nuusafee.

The total area of American Samoa is 76 sq.mi. Tutuila, the largest island of American Samoa, has an area of 53 sq.mi. and is about 18 mi. long and about 3 mi. across in the widest part.

Western Samoa has a total area of 1,097 sq.mi. Savai'i, the largest island, has an area of 602 sq.mi. and is 60 mi. long. Upolu has an area of 435 sq.mi. and is 58 mi. long. The other seven islands of Western Samoa are quite small.

All the Samoan islands, except Nuusafee, are rocky and of volcanic origin. Upolu, Savai'i and Tutuila have high inland ridges rising to peaks of 6,095 ft. in Savai'i, 3,608 ft. in Upolu and 2,141 ft. in Tutuila. These islands have little level land except along the coast and in the case of Tutuila there is a broad fertile plain in the southwestern part of the island. The soil is alluvial and quite fertile in the valleys. Because of the heavy rainfall, the soil on hillsides is thin and there is no subsoil.

The climate of the islands is tropical but equable for a good portion of the year. From May to November strong southeast winds blow and the islands have experienced many severe hurricanes. June and July are the coolest and most pleasant months. The average temperature is 26.3° C. (79.3° F.) with a mean range from 23.2° to 29.3° C. (73.8° to 84.7° F.). Rainfall is generally heavy; the central ridges receive over 200 in. annually.

History.—The archipelago was probably discovered by Jacob Roggeveen, a Dutchman, in 1722. The islands were subsequently visited by Louis Antoine de Bougainville in 1768, Jean François de Galaup de La Pérouse in 1787 and Otto von Kotzebue in 1824. The first missionaries to go to Samoa were two members of the London Missionary society who established a mission in 1830. Charles Wilkes, a U.S. explorer, surveyed the islands in 1839. Great Britain, the U.S. and Germany appointed representatives on the islands in 1847, 1853 and 1861, respectively.

In Jan. 1878 the U.S. signed a treaty with the then independent Samoan kingdom which gave the U.S. the right to establish a naval station in the harbour of Pago Pago, best in the archipelago. A trading agreement was also concluded. Germany and Great Britain received similar privileges the following year, but the interests of the three countries were often in conflict. A conference of the three powers, held in Berlin in 1889, concluded a general act providing for the neutrality of the islands and establishing in effect a tripartite protectorate over the islands.

This arrangement did not operate so successfully as planned, and on Dec. 2, 1899, a convention was signed by Great Britain, Germany and the U.S. by which the paramount interests of the United States in those Samoan islands east of longitude 171° W. were recognized and Germany's interests in the other Samoan islands were similarly recognized. Great Britain withdrew from Samoa altogether in consideration of rights in Tonga and the Solomon Islands. The high chiefs of the islands of Tutuila and Aunuu ceded those islands to the U.S. on April 17, 1900, and the chiefs of Tau, Olosega and Ofu islands ceded their islands to the U.S. on July 16, 1904. The U.S. congress accepted the islands under a joint resolution approved Feb. 20, 1929. American Samoa under navy administration (1900–51) became a strategic U.S. naval base in the Pacific.

Germany controlled Western Samoa until World War I. New Zealand troops occupied the islands on Aug. 30, 1914, and the League of Nations granted New Zealand a mandate over them in 1920. Western Samoa was made a trust territory by the United Nations with New Zealand as the administering authority on Jan. 25, 1947.

Population.—The population of American Samoa totaled 20,051 in 1960 with about four-fifths of the population on the main island of Tutuila, the site of Pago Pago, the capital (pop. [1960] 1,251), and Fagatogo (1,344). The population of Western Samoa was 114,427 in 1961 with about three-fourths on Upolu. Apia, the capital, on Upolu, had a population (1961) of 22,237. The Samoans are Polynesian and closely akin to the people of Hawaii and the Maoris of New Zealand.

The Samoan language is believed to be the oldest form of Polynesian speech in existence. It is closely related to the Maori, Tahitian, Hawaiian and Tongan languages.

Despite the increasing contacts with the western world, Samoan culture is still the dominant influence in the lives of the people. The basic unit of Samoan society is the *aiga,* an extended family system headed by the *matai.* Kinship ties are important in Samoan social and economic life and all who are related by birth or adoption are recognized as belonging to one *aiga.*

Samoa differs from most large Polynesian communities in its system of chieftainships. The basis of this system is an intricate hierarchy of graded titles. Essentially, those titles are of two kinds —*ali'i* and *tulafale.* The former may be called titular chiefs and the latter orator chiefs. All chiefs are referred to by the generic title *matai.* Succession to a title is elective within a family and while heredity is a contributory qualification, general ability, popularity and the capacity to make a good speech are governing qualifications.

Most of the population have become converts to Christianity. In Western Samoa, one-half of the population is affiliated with the London Missionary society. Other major religious affiliations in Samoa are Roman Catholic, Methodist, Mormon and Seventh-Day Adventist.

Government.—*American Samoa.*—American Samoa is a possession of the U.S. with a governor appointed by the secretary of the interior of the United States. The islands were under the jurisdiction of the navy department between 1900 and July 1, 1951, when administration was transferred to the department of the interior.

American Samoa is divided into 14 counties grouped into three administrative districts; the counties and districts correspond to the old Samoan political units. Each district has a governor who is appointed by the governor of American Samoa from the ranks of county chiefs. In each village of the district a chief is appointed by the district governor.

The first constitution of American Samoa became effective on Oct. 17, 1960, as the basic law of the territory. Under the constitution there is a bicameral legislature with certain defined legislative powers as compared with the advisory powers enjoyed by the legislature in existence prior to the constitution. The senate has 15 members, 1 elected by each of the 14 counties, who serve for four years and 1 additional senator, who serves for two years, elected on rotation from 4 of the 14 counties. The house of representatives has 17 members, popularly elected, plus 1 delegate from Swains Island who has all the privileges of a member of the house except the right to vote.

The constitution established the judicial branch independent of the executive and legislative branches. There is a high court and five district courts. The seat of the government is at Pago Pago on Tutuila.

Western Samoa.—New Zealand's trusteeship over Western Samoa was terminated on Jan. 1, 1962, when the islands achieved self-governing status. A new constitution and independence were approved by the Western Samoans at a UN-supervised referendum based on universal suffrage on May 9, 1961. The vote was 26,766 to 4,666. The first prime minister was Fiame Mata'afa

Faumuina Mulinu'u II. Western Samoa has had a legislative assembly since 1948. Village and local affairs are controlled by native village officials nominated by the villages. The seat of government is at Apia on Upolu.

Education.—Education in American Samoa is compulsory for all children from 7 to 15 years of age, inclusive. By the 1960s only about 1% of the total population 10 years of age and over were illiterate. There were 6,500 pupils enrolled in about 60 public and 10 missionary schools with about 300 teachers in the public schools and 50 teachers in the missionary schools. About 80% of the pupils were enrolled in public schools.

Education in Western Samoa is dependent to a large extent on the activities of various missions. Education has not been compulsory and there has not been an age limit on attendance. As a result, the rate of illiteracy has been greater than in American Samoa. In the 1960s there were about 20,000 pupils enrolled in 150 government schools and 10,000 pupils in 250 private schools with about 500 government-school and 270 private-school teachers.

Economy.—The natural resources of Samoa are of little economic consequence. There are no minerals and no timber of sufficient quantity to warrant industrial development for export. The U.S. naval station at Pago Pago has been a major source of employment as well as trade. A cannery was established at Pago Pago in 1953 to process and export tuna caught by Japanese fishing vessels under contract and canned tuna has become the main product of American Samoa.

Other important products are copra and native handicraft consisting principally of mats and rugs woven from local grasses. Western Samoa's main products are copra, cocoa beans, desiccated coconut and bananas.

Agriculture is the basis of the Samoan economy. Crops cultivated are corn, beans, peas, watermelons, cucumbers, squash, eggplant, tomatoes, lettuce, radishes, sweet potatoes, breadfruit, papayas, bananas, taro and pineapples. There are also some cattle and in American Samoa there is a small dairy industry.

Fish, mostly processed tuna, account for more than 95% of American Samoa's total exports, with copra and handicraft products accounting for about 2% each. Most trade is with the U.S., New Zealand, Australia, Japan and Western Samoa. Western Samoa exports copra, cocoa and bananas to New Zealand, Australia and the United Kingdom. Chief imports, from New Zealand, Australia, the United Kingdom, the United States, Japan and Fiji, are meat, sugar, cotton goods and motor vehicles and accessories.

(S. NR.; J. W. MW.)

SAMORY (SAMORI TOURÉ) (*c.* 1830–1900), a Mandingo Negro, was a prominent figure in French colonial history in the late 19th century. Born near Sanankoro (north of Beyla, Guinea) he became a professional soldier. In 1868 he declared himself an *almami* (religious chief) and, having created a corps of warriors (the *sofa*), he occupied Wassoulou, a country east of the upper Niger River.

From 1883 he fought against the French who had recently occupied Bamako. In 1886 he accepted the Niger as his frontier, and French protection. He then turned east against the king of Sikasso, but was repulsed (1887–88). In 1891 war broke out again between him and the French. Driven out by them from the Sudan he established himself in the upper Ivory Coast colony. Having seized and pillaged Kong (1897) and Bondoukou (1898) he was pursued by French columns under the command of Capt. Henri Gouraud. He was captured on the upper reaches of the Cavally River, on Sept. 29, 1898, and died in exile in Gabon on June 2, 1900.

Samory was a remarkable organizer but his large army lived by plundering conquered peoples. His restless, warlike temperament, coupled with the French conquests, prevented him from creating a lasting empire. (HU. DE.)

SAMOS, a Greek island in the Aegean Sea, separated from the mainland of Turkey by a strait about a mile wide. It is about 27 mi. (43 km.) in length by 14 mi. (23 km.) at its greatest breadth and is largely mountainous, the highest peak, Mt. Samos, near its western end, being 4,705 ft. (1,434 m.) high. The mountains of Samos are a continuation of Mt. Mycale (Samsun Dagi) on the mainland. Pop. (1961) 41,124. With Ikaria and the Fournoi Islands, the island forms the *nomos* (department) of Samos (pop. [1961] 52,022) and the Greek Orthodox bishopric of Samos and Ikaria. The capital of the *nomos* is at Samos (formerly called Limin Vatheos) in a deep bay on the north coast of the island, a modern town connected by road with villages round both sides of the bay and with Pithagorion (formerly Tiganion) on the south coast, the site of the ancient city. A third port, Karlovasi, farther west on the northern coast, serves a separate lowland district. The island is remarkably fertile, and a great portion of it is covered with vineyards. Oil, resins, silk, cotton, and tobacco are also grown, and barges and sailing vessels are built at Pithagorion, almost wholly from local timber. Cigarette making employs many women and girls, the tobacco coming chiefly from Thrace.

History.—The island was occupied in the Early Bronze Age and by Mycenaean Greeks. Later it received an Ionian population, reputedly from Epidaurus in Argolis. By the 7th century B.C. it had become one of the leading commercial centres of Greece because of its offshore position near the trade routes from inner Asia Minor that ran through the valleys of the Maeander and Cayster rivers. The Samians also traded with the Black Sea and with Egypt, and claimed to be the first Greeks to reach the Strait of Gibraltar. Their commerce brought them into close relations with Cyrene, Corinth, and Chalcis but made them bitter rivals of their mainland neighbour, Miletus. The feud involved both cities in the Lelantine War (8th century B.C.), when Corinth built ships for the Samians. The result favoured Miletus, but in the 6th century the insular position of Samos preserved it from the mainland aggressions to which Miletus was exposed.

About 535 B.C., when its oligarchy was overturned by the tyrant Polycrates (*q.v.*), Samos reached the height of its prosperity. Its navy "ruled the waves" from its new deep-sea harbour and blockaded the mainland subjects of Persia; the tunneled aqueduct (still open) insured a plenteous water supply, and the great Temple of Hera was built, replacing a succession of earlier temples. Polycrates first intrigued and then quarreled with the Persian governor of Lydia, and after his death by treachery (*c.* 522) Darius conquered Samos and partly depopulated it.

The island had regained much when, probably in 499, it joined the general revolt of the Ionians against Persia; but part of its contingent deserted at the decisive Battle of Lade (*c.* 495). In 479, however, following Xerxes' defeats in Greece, the Samians serving in the Persian fleet assisted the Greeks at Mycale. In the Delian League (*q.v.*) the Samians held special privileges, and they remained loyal to Athens until 440, when a dispute with Miletus which the Athenians had decided against them provoked them to secede. With a fleet of 60 ships they held their own for some time against a large Athenian fleet led by Pericles himself, but after a siege they capitulated and were degraded to a tributary rank. Throughout the Peloponnesian War Samos was one of the most loyal dependencies of Athens and a temporary home of the Athenian democracy during the revolution of the Four Hundred at Athens (411 B.C.); in the last stage of the war, it was rewarded with the Athenian franchise. After the defeat of Athens by Sparta (404), Samos was besieged by the Spartan admiral Lysander and placed under an oligarchy. In 394, when the Spartan navy withdrew, the island declared its independence and reestablished a democracy, but by the Peace of Antalcidas (386) it fell under Persian dominion. Recovered by the Athe-

nians in 365 after a siege, Samos received a body of military settlers.

After 322, when Athens was again deprived of Samos, its fate is obscure. For some time (about 275–270 B.C.) it served as a base for the Egyptian fleet, at other periods it recognized the Seleucid kings of Syria. In 189 B.C. it was transferred by the Romans to the kings of Pergamum. Included from 133 in the Roman province of Asia, it revolted and joined Aristonicus of Pergamum (132) and Mithradates of Pontus (88) against Rome and forfeited its autonomy. Between the reigns of Augustus and Vespasian it recovered its autonomy and remained prosperous.

Under Byzantine rule Samos became the head of the Aegean *theme* (military district). After the 13th century it passed through much the same changes as Chios and became the property of the Genoese company of Giustiniani (1346–*c.* 1550; *see* CHIOS). At the Turkish conquest it was severely depopulated and provided with new settlers, partly Albanians.

The Samians declared themselves independent of Turkey in 1821 and took a great part in the ensuing war, being saved from Turkish invasion in 1824 by the naval victories of A. V. Miaoulis. On the conclusion of peace (1832), however, the island was handed back to the Turks, but it held an exceptionally advantageous position, being in fact self-governed, though paying tribute, and ruled by a Greek governor (nominated by the sultan) who had the title "prince of Samos" and was supported and controlled by a Greek council and assembly. The island prospered but was eventually annexed to Greece in 1912.

The ancient capital was on the south coast of the island, at the modern Pithagorion, directly opposite the promontory of Mycale. There a natural cove, dominated by a low hill, has been converted by ancient and modern breakwaters into a safe port for small vessels. Behind the modern town rises a steep enclosing ridge, Astipalaia, crowned by Polycrates' wall and pierced by his aqueduct. From this city a road led about 4 mi. W to the Temple of Hera, whose site, close to the shore, is still marked by a single column which has given to the neighbouring headland the name of Kolonna. German excavators have revealed its foundations, and several others of the sanctuary buildings, as well as rich finds of sculpture and minor objects.

The modern capital was at Khora, about 2 mi. from Pithagorion, until 1832, when it was moved to Vathi on the north coast (now part of the town of Samos).

Samos was the birthplace of the philosopher Pythagoras and also produced a school of sculptors, beginning with Rhoecus and Theodorus, who are said to have invented the art of casting statues in bronze and were the architects of the Temple of Hera. Another famous Samian sculptor was Pythagoras, who migrated to Rhegium. Some fine 6th-century vases can be attributed to the island. The name "Samian ware," often given to red pottery found in Roman settlements, has little scientific meaning.

SAMOSATA (modern SAMSAT), a ruined city on the right bank of the upper Euphrates, the site of which is now occupied by the small village of Samsat in Adiyaman *il* (province), Turkey. The village lies about 30 mi. NNW of Edessa (modern Urfa) and has a population (1960) of 991. In ancient times Samosata was an important crossing point of the river. It formed one of the series of border forts, of which Edessa (*q.v.*) was the most important, for the frontier defense of Upper Mesopotamia. Although it is uncertain whether it was ever on the Persian royal road, there was a bridge at this point in Strabo's time, and caravan routes diverged to Diyarbakir in the north and downstream to Edessa.

Samosata appears originally to have been a Hittite city, incorporated in the Assyrian Empire in 708 B.C. It later became the capital of the Hellenistic kingdom of Commagene, and part of the Roman province of Syria in A.D. 72. It lost its status as capital city of a district under Constantine, and in the 10th century was temporarily an administrative military district of the Byzantine Empire. (N. Tu.; S. Er.; E. Tu.)

SAMOTHRACE (modern Greek SAMOTHRAKI), an island in the north of the Aegean Sea, nearly opposite the mouth of the Hebros (Maritsa) River and 15 mi. NNW of Imbros (Imroz), included in the modern Greek *nomos* (department) of Evros. Area 69 sq.mi. (178 sq.km.). Pop. (1961) 3,830. The island rises to 5,577 ft. (1,700 m.) at Mt. Fengari, the highest peak in the northern Aegean; Homer (*Iliad,* xiii, 12) pictures Poseidon using its summit to watch the fighting round Troy. Agriculture and sponge fishing are carried on, and the hot sulfur springs on the north coast attract visitors.

Samothrace's mountainous character and lack of harbours precluded political importance, but it was famous for the cult of the Cabeiri (*q.v.*), attributed by Herodotus (ii, 51) and others to pre-Greek Pelasgians. Under the Romans it was a free state. It was captured by the Turks from the Genoese Gattilusi in 1456 and remained almost continuously Turkish until taken by the Greek fleet in 1912. During World War II it was under Bulgarian occupation (1941–44).

The ancient city was situated at Palaiopolis on the north side of the island near the sea, below the modern village of Samothraki. In the 19th century there were French and Austrian excavations on the site, renewed by the French in 1923–25, and taken up again by archaeologists from New York University in 1938. The Sanctuary of the Great Gods lay on a long terrace below the town walls. Most of the buildings are Hellenistic, notably the Rotunda dedicated by Queen Arsinoe II of Egypt in the 280s; Ptolemy II's Propylon; the Nike Fountain, over which stood the "Victory" (probably set up by the Rhodians *c.* 190 B.C. to commemorate a sea battle, discovered in 1863 and now in the Louvre, Paris; *see* GREEK ART); and the great Hieron, or sanctuary. There are traces, however, of earlier buildings of the 6th century, and of the Anaktoron, or hall of initiation, built about 500. The finds give evidence for the worship not only of the Cabeiri but also of the Anatolian Great Mother (Cybele). The earliest are of the 7th century and reflect well the interaction of the Greek and native cultures.

SAMOYED, a division of the Uralic linguistic stock found in the northern U.S.S.R. and comprising two language groups, Northern and Southern Samoyedic (*see* URAL-ALTAIC LANGUAGES). The former includes the Yurak or Nenets (about 25,000 in the 1960s, probably including a small number of Yenets, *see* below), reindeer pastoralists, sea-mammal hunters, and fishermen occupying tundras from Kanin Peninsula on the White Sea 900 mi. eastward to the Yenisei River in Siberia as well as the forested basin of the Pur; the Yenets (800 in 1926), sedentary fishermen on the lower Yenisei; and the Tavgi or Nganasany (about 700 in the 1960s), wild-reindeer hunters of the Taimyr Peninsula in the far north. In the 20th century the Selkup (about 4,000 in the 1960s) alone represent Southern Samoyedic. They include fishermen and trappers of the Taz River basin; fishermen, cattle and horse breeders, and trappers on the Tym and Ket (southeast branches of the Ob or Obi River), roughly half of them speaking only Russian. In the Sayan ranges, the Samoyedic dialects (Kamasin, Karagas, Mator or Koybal, and Taigi) have been totally replaced by the Turkic languages and Russian. The Nenets were (1960s) increasing at about one percent per year, while the smaller groups seemed to be barely holding even against assimilation.

Early in the Christian era, proto-Samoyedic peoples lived in southwest Siberia, probably occupying the Ob–Irtysh (Irtish) basin. They traded with archaic Turkic folk, borrowing from them terms for horses, sable and ermine, bells, and money; early contacts with Kettic peoples are also evident (*see* KET). Proto Samoyedic culture included reindeer domestication (with castra-

tion); the casting of bronze and forging of iron; tailored arctic clothing (parka is an indirect Samoyedic loan to English); the conical tent and the cache raised off the ground; and, in religion, shamans, enchantment by singing accompanied by a drum, wooden idols, and the idea of luck. Furthermore, the archaeology of early Samoyedic sites (and, in part, Selkup ethnology) reveals villages with semisubterranean houses fortified by earthen walls and moats; subsistence from domesticated horses, cattle and sheep as well as fishing and hunting; pit-and-comb marked pottery; birch-bark manufactures; bone as well as metal tools and weapons; helmets and armour; cemeteries and votive hoards, with cast images of men, beasts, and fantastic creatures, with imported wares and money.

Ostyak (*q.v.*) pressures from the west, beginning about 700 A.D., displaced the Samoyeds. The Mator were identified east of the Irtysh River in the 10th century; other Samoyeds reached north Russia before 1100. Cultural change accompanied migration. Pottery disappeared. In the tundra, the Samoyeds adopted arctic aboriginal elements, such as sea-mammal hunting, reindeer hunting with decoys and enclosures, and sacrificial mounds of reindeer antlers. They transmitted reindeer domestication and many religious beliefs to the Ostyaks, the Zyrians, and the Yukaghir; they had less influence on the Lapps.

Despite variant subsistence patterns, recent Samoyedic cultures have retained similar forms of social organization and religion. All have patrilineal, named clans owning definite territories, with sanctuaries, cemeteries, and exclusive economic rights. Marriage is strictly exogamic (outside the clan) and residence is usually patrilocal; widows normally marry a younger clansman of the deceased. Older sons receive allotments, leaving to form new lineages; the youngest inherits the residual. Shamans are clan officials, curing, divining luck and ill-doing (*see* SHAMANISM). The cosmogony includes a high god; a universe tree upholding seven heavens; an underworld; sun, moon, forest, water, and ancestral spirits. Shamanistic magic "flights," animal sacrifices and dedications, and the "feeding" of household idols are prominent rituals.

SAMPAN: *see* BOAT.

SAMPLER, a small rectangular piece of embroidery worked as a "sample" of a beginner's skill and as a means of teaching the stitches. During the 17th–19th centuries every little girl worked her "sampler," and samplers have become of interest to collectors. They usually contained the alphabet, the worker's name, the date, Bible texts, verses, and mottoes, the whole surrounded with some conventional design.

SAMPSON, WILLIAM THOMAS (1840–1902), commander of the U.S. North Atlantic squadron during the Spanish-American War (*q.v.*). He was born at Palmyra, N.Y., on Feb. 9, 1840, and graduated at the head of his class from the U.S. Naval Academy, Annapolis, Md., in 1861. He served in a wide variety of assignments and rose to the rank of captain by 1890. He was chief of the Bureau of Ordnance in 1893–97; about 95% of the guns employed in the Spanish-American War were made under his superintendence. His influence was felt decisively in the distribution of guns and armour, and in the training of the personnel of the Navy. In February 1898 he was president of the board of inquiry that investigated the destruction of the battleship "Maine."

At the outbreak of the war with Spain, Sampson was placed in charge of the North Atlantic squadron, and conducted the blockade of Cuba. The ships under his command destroyed the Spanish vessels when they issued from the harbour of Santiago and attempted to escape. Sampson himself was not actually present at the battle, having started for Siboney just before it began in order to confer with General Shafter, commanding the land forces, but the engagement was fought in accordance with his instructions. He was promoted to commodore in 1898, to rear admiral on March 3, 1899, and was made commandant of the Boston (Charlestown) Navy Yard in October of the same year. He died in Washington, D.C., on May 6, 1902.

SAMSON, a member of the tribe of Dan, was an early Israelite folk hero whose exploits against the Philistines are recorded in Judg. 14–16. The narratives, similar in essence to other stories in Judges and Samuel, fall into seven episodes in which individual anecdotes relate the circumstances of his birth and his various escapades with the Philistines. Samson, though listed among the judges, was neither a liberator nor a counselor of Israel as were other judges before him. His personal exploits serve not merely as a preview of the impending struggle between Israel and her most dangerous and toughest enemy; they also reflect the early Israelite customs and provide some information about the Philistine civilization. (*See* PHILISTINES.)

Although the narratives throw little light on the existing Israelite religion, they do show a religious motivation. The circumstances of Samson's birth (Judg. 13) have a strong resemblance to the birth stories of other Israelite heroes whose mothers conceived through supernatural intervention (*cf.* Gen. 17–18; 25:21; 29:31). Moreover, Samson, before his conception, was dedicated to God as a lifelong Nazirite (*cf.* Jer. 1:5). As such, he was to abstain from (1) wine and all other products of the grape, (2) cutting his hair, and (3) contact with the dead (Num. 6). He is described as a charismatic figure who is periodically seized by the Spirit of the Lord. (*See* NAZIRITE.) Thus, all his acts, even those without apparent religious significance, are presented as divinely guided. Some of this may be due to later editorial revisions, but undoubtedly much of it was an organic part of the original text.

Points of resemblance between Samson and various Babylonian and Greek mythological characters have often been noted. While these cannot be denied, Samson is much more human than his counterparts in the pagan myths and legends. On the other hand, to regard him as a solar cult hero is assuming too much. This theory is based on the facts that his home was near the shrine of the sun, Beth-Shemesh; and his power lay in his hair, which might be equated with the sun's rays, giving agricultural life, and cut off by night (the name "Delilah" could be a pun on the Hebrew word for "night"). Further, his name could conceivably be derived from the Hebrew word "sun" (*shemesh*). But Samson is in fact a good Canaanite personal name, derived probably from *shamshiyanu*, which later became *shimshon*, a personal name whose equivalent has been found in the 14th- or 15th-century B.C. Ugaritic texts; it is also found as the name of a Syrian town in a 12th-century Egyptian list.

Although the narratives in their present state show legendary accretions and contain some later theological ideas, Samson was a historical character. His individual exploits against the Philistines, which may have provoked their later aggression against Israel, must have so impressed the popular imagination that the people credited him with superhuman strength. The anecdotes about his marvelous deeds were probably related by storytellers with a great deal of gusto, yet the tragic end of the blind hero, crushed under the collapsed temple of Dagon at Gaza when with a surge of strength he pushed apart its supporting pillars, must have had a sobering effect on the listeners.

Samson narratives—especially the episode (Judg. 16:4–21) in which Delilah, bribed by the Philistines, wheedled from him the secret of his strength and betrayed him into their hands, and that of Samson's death—have been a source for many artistic creations. Rembrandt, Rubens, and Van Dyck used them as subjects for paintings, Dürer for woodcuts, Saint-Saëns for his opera *Samson et Dalila*, and Handel for his oratorio *Samson*. Milton made Samson's death the subject of his *Samson Agonistes*.

SAMSUN (ancient AMISUS), the chief town of Samsun *il* (province) of Turkey, lies on the south coast of the Black Sea between the deltas of the Kizil Irmak and Yesil Irmak, 200 mi. (322 km.) NE of Ankara. Pop. (1960) 87,688. A broad street with government offices, hotels, and shops traverses the town from east to west along the coast. An annual Black Sea Fair is held there in July. Samsun is a thriving town and the outlet for the trade of the interior regions and of the middle Black Sea coast. Its port is well protected and is the principal northern shipping point for Turkish tobacco, cereals, and wool. The chief industries are the manufacture of cigarettes and textiles. The town is connected by rail and road with Sivas and Ankara, and by sea with Istanbul.

Ancient Amisus, which stood on a promontory about 1½ mi. NW of Samsun, was, next to Sinop (*q.v.*), the most flourishing of the Greek settlements on the Euxine Sea, and under the kings of Pontus it was a rich trading town. By the 1st century A.D. it had displaced Sinop as the north port of the great trade route from Central Asia, and later it was one of the chief towns of the Comneni of Trabzon.

SAMSUN IL (pop. [1960] 654,602) is agricultural and densely populated. It is one of the principal sources of Turkish tobacco, one variety of which is known as "Samsun."

(N. TU.; E. TU.; S. ER.)

SAMUDRA GUPTA (reigned *c.* A.D. 335–375), Indian emperor, son of Chandra Gupta I and the Licchavi princess Kumaradevi. Most of the information about his reign is derived from the long inscription engraved on the Asokan pillar at Allahabad. According to this record, Samudra was appointed emperor by his father in preference to other claimants, and he seems to have had to repress revolts in the earlier part of his reign. On the pacification of the kingdom, which probably then reached from Allahabad to the borders of Bengal, he began a series of wars which much increased its extent. One of these led him to southern India where, after defeating a number of minor rulers, he penetrated to the Pallava kingdom of Kancheepuram (Kanchipuram), defeating a king called Vishnugopa. In this southern campaign he restored the defeated kings to their thrones on the payment of tribute, but several kings of northern India were "violently uprooted" and their territories added to that of the Gupta Empire. At the height of his power nearly the whole of the valley of the Ganges was directly administered and he received homage and tribute from rulers of parts of east Bengal, Assam, Nepal, the eastern part of the Punjab, and various independent tribes of Rajasthan.

Samudra Gupta issued gold *dinaras* of many types, all of high gold content and excellent workmanship. He performed the ancient Vedic horse sacrifice, which is commemorated by a special coin. According to the Allahabad inscription he was a skilled musician and poet, and on one of his coins he is shown playing the harp.

SAMUEL, the most outstanding character in Israel's history between Moses and David, is represented in I Samuel in every role of leadership open to a man of his day—seer, Nazirite, priest, judge, and military leader. The traditions concerning him have been much edited and embellished with legend, so that it is not easy to form a clear historical picture of him. One episode must be dismissed as fabrication: the story of his miraculous and conclusive defeat of the Philistines (7) is contradicted by the subsequent military exploits of Saul and David and is best ascribed to a late editor who wished to belittle the achievement of Saul. The story of Samuel's childhood (1–3) contains elements of folklore, but there is no reason to doubt that he grew up as a Nazirite associated with the priesthood at Shiloh, or that he had prophetic clairvoyance. As a Nazirite, dedicated to the defense of the religion of Yahweh against syncretism with the fertility cults of the Canaanite Baals, he had some affinity with the prophetic guilds of wandering ecstatics who made their first appearance at this time; but his visions, in his role of seer, owed nothing to their collective and contagious ecstasy, so that he resembled more closely the great prophets of later times than those who bore the name of prophet in his own day. As priest his chief function was the giving of authoritative decisions from God, including perhaps the dispensation of justice; and here too his gifts as seer differentiated him from ordinary priests who derived their decisions from the sacred lot (14:36–42; 23:6–12; 30:7–8).

Samuel's greatest claim to fame was the establishment of monarchy in Israel. The biblical account of this is a conflation of two apparently irreconcilable sources. According to the earlier one (9; 10:1–16; 11:1–11, 15), written probably in the reign of Solomon, Samuel, prompted by God, took the initiative in anointing Saul as king, to give unity to the divided tribes of Israel, and to lead them to freedom from Philistine domination. According to the later source (8; 10:17–24), written when the monarchy had fallen into disrepute, Samuel, already the theocratic ruler of a united Israel, resisted the popular demand for a king, because it involved a repudiation of the sovereignty of Yahweh. The early source is the more trustworthy, and it is possible to regard the later one as evidence only for the antimonarchical feeling of the prophetic school that produced it. On the other hand, it is unlikely that these prophetic writers would have depicted Samuel as the critic of monarchy if he had in fact been its wholehearted advocate. It may be, then, that the two sources preserve the two sides of an early and long-continued debate, and that Samuel the kingmaker was a big enough man to see both the advantages and the dangers of his innovation. *See* also SAMUEL, BOOKS OF; SAUL.

(G. B. CA.)

SAMUEL OF NEHARDEA, usually called MAR SAMUEL OR YARHINAI (*c.* 165– *c.* 257), Babylonian rabbi, master of the traditional Law and famed for his scientific attainments, was born and died in Nehardea in Babylonia. He was one of the first to compile a calendar of the Jewish year, thus preparing the way for the fixation of the festivals by means of scientific calculations. But Samuel's fame rests on the service he rendered in adapting the life of the Jews of the diaspora to the law of the land: "The law of the state is binding law" was the principle he enunciated. When the shah of Persia, Shapur, captured Caesarea Mazaca, the Cappadocian capital (modern Kayseri, Turk.), Samuel refused to mourn for the 12,000 Jews who lost their lives in its defense.

See H. Graetz, *History of the Jews,* Eng. trans., vol. ii, ch. xix (1893).

(I. A.)

SAMUEL, HERBERT LOUIS SAMUEL, 1ST VISCOUNT (1870–1963), English statesman and philosopher whose career as a social legislator, administrator, and Liberal leader was distinguished by adherence to principle and a gift for persuading others to compromise. He was born at Liverpool on Nov. 6, 1870. After working in the Whitechapel slums of London he resolved to enter Parliament and press for social legislation. Twice defeated in South Oxfordshire (1895 and 1900), he was elected (1902) Liberal M.P. for the Cleveland Division of Yorkshire. As parliamentary undersecretary to the Home Office (1905) in the new Liberal government he was responsible for the Children Act (1908) which established, among other things, juvenile courts, the probation system, and the detention centres which Samuel called "Borstals." Appointed chancellor of the Duchy of Lancaster (May 1909), he became the first member of the Jewish community to attain cabinet rank. As postmaster general (1910–14; 1915–16) he recognized the postal trades unions and nationalized the telephone services. In January 1916 he became home secretary, but resigned when Lloyd George formed his coalition government. He was chairman of the select committee on national expenditure (1917–18) and special commissioner to Belgium (1919).

Defeated in the general election (1918), in 1920 Samuel was appointed first high commissioner for Palestine, an office of especial delicacy and difficulty which he discharged with great distinction, improving Palestine's economy and fostering harmony among the different religious communities. On his return (1925) he presided over the royal commission on the coal industry; its report (1926) revealed his acute power of analysis and balanced judgment. Subsequently his skill as a mediator was a vital factor in negotiations which secured the settlement of the general strike.

As Liberal Party chairman (1927–29) he held the balance between Lloyd George and Asquith. Returned to Parliament for Darwen, Lancashire (1929), in 1931 he became home secretary in the national government; but his free trade principles led him to resign with other Liberal ministers in September 1932, in opposition to the Ottawa Agreements. In 1935 he was defeated at Darwen but in 1937 entered the House of Lords as Viscount Samuel of Mount Carmel, and of Toxteth in the City of Liverpool. In the Lords as Liberal representative, and leader (1944–55), he spoke with authority, lucidity, and wit. A visit to Palestine (1940) and the chairmanship of several committees showed his continued interest in the Jewish national home.

Empiricism marked Lord Samuel's career as both politician and philosopher. As president (1931–59) of the British (later Royal) Institute of Philosophy, he interpreted philosophy to the public in such books as *Practical Ethics* (1935) and *Belief and Action; an Everyday Philosophy* (1937; new edition 1953). The breadth of his liberal humanity was revealed in his *Memoirs* (1945), in *A Book of Quotations* (1947; 2nd edition 1954), and in broadcasts which made widely known the warmth and idealism underlying his intellectual brilliance. He died in London on Feb. 5, 1963.

See J. Bowle, *Viscount Samuel* (1957). (W. R. DA.)

SAMUEL, BOOKS OF, two books of the Hebrew Old Testament covering the stories of the prophet Samuel and of Saul and David, the first two kings of Israel. The Jews rank these books among the Former Prophets (Joshua to Kings) in distinction from the Latter Prophets (Isaiah to Malachi). They were originally one book and are so written in Hebrew manuscripts and so printed in the earliest printed Hebrew Bibles. The first complete Bible to divide the book into two parts was the sixth, known as the first great rabbinic Bible (printed by Daniel Bomberg, Venice, 1517). The division into two books first appears in the Septuagint, the Greek translation of the Old Testament made in the 3rd and 2nd centuries B.C. Here the two parts are called "I and II Kingdoms." This division is continued in the Vulgate, Jerome's Latin translation, but with the title "Kings," and so also in the Douai version. The Authorized or King James version, however (and other English versions derived from it), uses the Hebrew title. Thus I and II Samuel in the original Hebrew and in the King James version are I and II Kingdoms in the Septuagint and I and II Kings in the Vulgate and its translations, while I and II Kings in the Hebrew and in the King James version are III and IV Kingdoms in the Septuagint and III and IV Kings in the Vulgate.

The Books of Samuel form a link in the history of Israel and Judah between the settlement in Canaan under Joshua, and the early sporadic and local struggles with the original inhabitants described in the Book of Judges, on the one hand; and the story of the kingdoms of Judah and Israel, with unified control and central organization, that form the subject of the Books of Kings. The two books of Samuel give the history of "the making of the realm": they tell the story of the change from tribal chiefs to a country and a king.

Contents.—The Books of Samuel fall naturally into four parts:

I Sam. 1–15	stories of Samuel, of the fall of the house of Eli, and of Saul until his rejection
I Sam. 16–II Sam. 5	story of Saul and David
II Sam. 6–20:22	story of David the king
II Sam. 20:23–24:25	miscellaneous appendix

Stories of Samuel.—The book opens with a picture that is clearly contemporary of the ark-shrine of Shiloh at the annual festival. Elkanah and his wives come for the annual sacrifice and festal meal. His hitherto childless wife Hannah prays for a son and promises to dedicate him to God's service. Samuel (*q.v.*) is born, brought to Shiloh after weaning, and is left there to grow up in the holy service. The boy Samuel hears the voice of God in the night, and through him God warns Eli of the doom of his house. The ark is lost to the Philistines, who cannot hold it. After many wanderings it comes to rest in Israelite territory at Kiriath-jearim, the modern Israeli "forest of the martyrs." After 20 years, Samuel, now grown in prestige and wisdom, obtains some relief from the Philistine domination, but the clouds gather once more until Saul (*q.v.*) rallies Israel and obtains some respite. Saul, anointed by Samuel as first king of Israel, seeks to build up a small standing army and gathers around him all the strong fighting men he can find. Among them is David, whose friendship with Saul's son Jonathan is comparable with that of Orestes and Pylades in Greek story and that of Aeneas and "faithful" Achates in Roman story. David's lament for Saul and Jonathan is one of the treasures of Israel's literature.

Saul and David.—The second part of the two books tells of the rift between Saul and David. Saul ultimately becomes jealous of David's popularity and seeks to kill him. Partly because of his jealousy and partly because of increasing pressure from the Philistines, the king becomes afflicted with bouts of melancholia and ungovernable rage, until at last David flees for his life to the fastnesses of the Negev. For Saul, all grows dark. God has deserted him, Samuel turns against him, the witch of Endor can give him no hope, his resources become more and more limited as more and more of his toughest warriors join David's band of freebooters in the far south, and at last Saul and his three strong sons die with the flower of Israel in the last fight against the Philistines on the slopes of Mt. Gilboa.

David the King.—The third section of the books tells of David's rise to power. At the news of Saul's death, he sets up a rival kingdom in the south, and at the death of Saul's son Ish-baal (Ish-bosheth) seven and a half years later he gains control of the whole country. David was "a man of war" and he "conquered all his enemies round about" from the border of Egypt to away beyond Hermon, and from the Mediterranean to beyond Damascus. He established a dynasty in Judah which lasted for over 400 years, until there ceased to be a king in Judah. He was a man to whom both men and women could be loyal, and this was especially notable in his cousin Joab, his general in the field. He was a great fighter, a great lover, a foolishly indulgent father, a great singer, and a great sinner. He came to be the type of a God-fearing man, the type of the true king and the "father" of the coming Messiah and king. But was David really the generous hero and Saul the ill-tempered villain? Or was Saul the honest rugged ruler called to a task beyond the wit and power of man, and David the handsome villain? And was Samuel like Warwick, the kingmaker of English history, who made one king, could not control him, and therefore made another? This third part of the two books is continued in I Kings 1:1–2:11, the account of David's abdication which was broken off in order to be used to introduce the story of Solomon. (*See* also DAVID.)

Appendix.—The fourth section contains some early material, but it appears to have been added after the rest of the book had been compiled. After a fragmentary list of David's officers (II Sam. 20:23–26), there are six short sections: (*a*) 21:1–14, famine and reparation, and (*f*) 24:1–25, pestilence and penitence; (*b*) 21:15–22 and (*e*) 23:8–23, tales of prowess, with another list of heroes (23:24–39) added; (*c*) and (*d*) 22 and 23:1–7, psalms, the first of which is equivalent to Ps. 18 and the second a very ancient psalm. Apparently (*af*) was the first addition to the book, then (*be*) was inserted into (*af*), and finally (*cd*) was inserted into (*ab*)–(*ef*).

Composition and Date.—Scholars are for the most part agreed that there are two main strands in the two books of Samuel. The first, designated *A*, is the earlier history, in which Samuel is a local obscure seer and the prime mover in anointing Saul to be king, the man who set out to seek lost asses and found a kingdom. The second strand, designated *B*, is the later account, where Samuel is a national figure, judge of all Israel, and the last of the judges. After a preliminary doubt, he comes out strongly against the idea of a king, and finally, unwillingly and with dreadful warnings, agrees to the popular demand and makes Saul king.

Evidence of the existence of these two strands is to be seen not only in the two accounts of the founding of the monarchy (*A:* I Sam. 9:1–10:16 and 11:1–11; *B:* 8, 10:17–25a, 12) but also in the two accounts of David's coming to Saul's notice. In *A* (I Sam. 16:14–23) David is brought to court to play on his harp and thereby to soothe Saul's troubled mind. In *B* (I Sam. 17:12–58)

the boy David comes with supplies to visit his brothers who are serving in the Israelite army, pleads to stay and see the fight, accepts the challenge of the giant Goliath, and kills him with his slingstone and the giant's own sword. There are two accounts of the origin of the saying "Is Saul also among the prophets?" (*A:* I Sam. 10:10–12; and *B:* I Sam. 19:18–24); two accounts, so interwoven as to make a confused story, of David's flight from Saul (I Sam. 20); two accounts of the treachery to David of the Ziphites (I Sam. 23:19–28; and I Sam. 26:1–3), and two accounts (which, however, may genuinely refer to two occasions) of how David spares Saul's life (I Sam. 24:1–22; and I Sam. 26:4–25a). Some verses, scattered throughout the two books, have unmistakable associations with the Deuteronomic writings, and there are the miscellaneous additions of II Sam. 20:23–24:25. O. Eissfeldt maintains that there are three main sources, and there are certainly many passages which do not fit into the two main sources, *A* and *B*.

It has been suggested that the opening chapters are from a lost history of the ark. It is clear that II Sam. 9–20 is drawn from the court history of David and thus forms the oldest piece of continuous prose in the Old Testament. It bears every evidence of being contemporary with the events it describes, and whoever wrote this story (Ahimaaz? Zadok?) was the true father of history rather than the Greek Herodotus who flourished some 500 years later. The *A* strand is earlier than 800 B.C., the *B* strand is from the end of the 8th century; and the two books probably achieved finality (apart possibly from the appendix) in the great revision under Deuteronomic influence about 550 B.C. This was the revision which produced the long history which stretches from Deuteronomy through Joshua, Judges, and Samuel to the end of Kings.

Influence.—The influence of the Books of Samuel is general rather than particular, though there are three passages of great influence. The books take their place in the general pattern of God's providential care for his people of Israel and of his mighty acts of salvation on their behalf. The first of the three particular passages is the song of Hannah (I Sam. 2:1–10). This passage is part of the original reading from the prophets for the Jewish New Year's Day festival, already established before the time of Christ. The reading from the Law was Gen. 21, and both passages deal with a distressed and barren woman who at long last bore a son (*cf.* I Sam. 2:5, "the barren has borne seven"). The song is also the basis of the Magnificat (Luke 1:46–55), with its emphasis, so strong in both testaments, on God's particular care for and intervention on behalf of all that are distressed, the poor, the widow, the fatherless, and the stranger. The second important passage describes Samuel's sacrifice and prayer in I Sam. 7:9, which is mentioned in Ecclus. 46:16. Samuel and Moses in Hebrew tradition are the two great intercessors for Israel, the two men who were "mighty in prayer." The third passage, the most important of the three, is God's prophecy to David in II Sam. 7. Just as the song of Moses after crossing the Red Sea (Ex. 15) is the seedbed for all subsequent growth of the idea of the Kingdom of God, so this chapter is the seedbed for ideas of the Davidic Messiah. For both Christian and Jewish exegeses there is no element more fundamental. *See* also BIBLE.

(N. H. S.)

SAMUEL HA-NAGID (in full, ABU IBRAHIM SAMUEL BEN YOSEF HALEVI IBN NAGRELA) (993–1056), Jewish statesman, warrior, talmudic scholar, grammarian, philologist, poet, and polemicist, a man of remarkable talents who served simultaneously as vizier of the Sinhaja Berber kingdom of Granada and as the *nagid* ("chief") of Granadan Jewry, was born in Córdoba, Spain. The son of wealthy parents, he was accorded a thoroughgoing education in all branches of Jewish and Islamic learning. When Córdoba was sacked in 1013, he fled to Málaga, where he opened a small shop. His skill in Arabic calligraphy and literature caught the attention of the vizier of King Habbus of Granada, and Samuel was employed to serve as the vizier's secretary and adviser on affairs of state. On the death of his patron, Samuel succeeded in attaining the office of vizier, and on the death of the king soon after succeeded also in having King Habbus' younger son Badis elevated to the throne. From that moment until his death, Samuel was the power behind the throne. In this capacity, he steered Granada through years of continuous warfare, and he himself actively participated in all the major campaigns. His influence was so great that he was even able to have his son Joseph succeed him as vizier.

Samuel ruled not only Muslims but the Jews as well. As *nagid* of the Jewish community, he appointed all the judges and took strong measures against the schismatic Karaites. As head of the talmudic academy, he exercised control over the training of legal experts. He was a gifted poet whose songs of friendship, love, and war reveal an individual asserting his individuality with superb intensity. As a philologist and grammarian, he not only wrote a concordance to the Bible but was an active participant in the wars of the Jewish grammarians. As a student of Jewish Law, he is reputed to be the author of a long-lived introduction to the Talmud (*Mebo ha-Talmud*) and a treatise on the Law. He was even so audacious as to write a polemic exposing the contradictions in the Koran.

BIBLIOGRAPHY.—Samuel's works were written in either Hebrew or Arabic and are not available in English. For his life and works, *see* in English, Jefem Schirman, "Samuel Hannagid, the Man, the Soldier, the Politician," *Jewish Social Studies,* vol. xiii, pp. 99–126 (1951); Heinrich Graetz, *History of the Jews,* Eng. trans., vol. iii, pp. 254–261 (1927).

SAMURAI, the Japanese warrior caste. In Japan in the 11th century, the power of the imperial government to maintain order in the provinces waned. It was then that the samurai emerged as a distinct social group. Held together by personal loyalty to powerful chiefs, warrior groups brought ever more territory under their control, fighting wars for local and, eventually, national supremacy. From the end of the 11th century until 1868, government was exclusively in the hands of the samurai class. In the early years of almost continual warfare, when manpower was short and physical courage and prowess were at a premium, entry into the group was relatively open. But after 1600, when, under the strict rule of the Tokugawa shogun, the country was at peace for 250 years, warriors became a closed caste.

The establishment of warrior dominance at the end of the 12th century marked a break with the classical culture of the court. New forms of literature, religion, and drama emerged, forms congenial to the samurai, which helped mold samurai taste. But samurai political dominance lasted longer than samurai cultural dominance, which was surpassed around 1700 by the lusty plebeian culture of Japan's growing cities.

The samurai virtues of pride and loyalty are illustrated in the story of the Forty-Seven Ronin (*q.v.*). *See* also JAPAN: *History: Minamoto Yoritomo.*

(T. C. SH.)

SAN'A', capital of Yemen, lies at an altitude of about 7,700 ft. at the foot of Jabal Nuqum, and 160 mi. (257 km.) NE of Al Hudaydah by road. In 1964 the population was in excess of 80,000. The city, walled and shaped like the figure eight, is divided into three parts: San'a' itself, the old city; Bir al 'Azab, the garden city enclosed in Turkish times; and Qa' al-Yahud, the Jewish quarter. The old city, forming the eastern half of the eight, is dominated by the Qasr, the citadel, on a spur of Jabal Nuqum. It is traversed from north to south by a broad *wadi* (watercourse), dry except in times of flood, east of which are fine houses of several stories lining narrow streets. A broad street of shops, the Harat an Nahrein, extends from the western wall to the *wadi,* and the *suqs* (markets), each devoted to one craft or trade, are centrally situated to the east of the *wadi.* These include streets of sandal makers, dagger-sheath makers, silversmiths, tailors and embroiderers, locksmiths, jewel polishers, workers in brass, alabaster workers, black-

smiths, pawnshops, carpet sellers, and booksellers. San'a' is probably the only town in south Arabia with flower shops.

The imam's seven-storied palace, the Mutawakkil, stands in the neck of the eight. It was badly damaged in the revolution of September 1962. The other half of the eight contains the Bir al 'Azab and, at the western end, the Qa' al-Yahud. The Bir al 'Azab is residential, with large houses in walled gardens, mostly Turkish. In the Jewish quarter houses are two-storied; almost all the Jews have migrated to Israel. San'a' has eight gates, the most imposing of which the Bab ("gate") al Yemen, leading south, is of Turkish origin. Bab ar Rum, the Constantinople gate, leads north from the Bir al 'Azab. All except six of the 44 mosques are in the old city. The Great Mosque, built on the site of the Christian church (*see* below), is peculiar in having a Ka'ba (*q.v.*) similar to that at Mecca. Al Bakiliya mosque, with a large cupola and a fine minaret, belongs to the early Turkish period. Many mosques have minarets richly ornamented in Zaidi (Zeidi) style. There are numerous wells, caravansaries, public baths, and good markets.

Outside the city walls to the south are the old Turkish barracks, now used by the Yemeni forces, and an airfield. San'a' is linked with Al Hudaydah (the chief port of Yemen) by a modern road built with Chinese aid, and with Aden (288 mi. [463 km.] SSE) via Yarim, Ibb, and Ta'izz. Rawdah, a suburb well-known for its vineyards, lies six miles (10 km.) to the north.

San'a' is an ancient city, its foundation being legendarily attributed to Shem or the giant Ad. It was well known for its fortress, Ghumdan (1st century A.D.), of which some rubble remains. At first known as Uwal or Azal, identified with Uzal of Gen. 10:27, it became the capital of the Himyarites and later of the Abyssinian Abraha (A.D. 525), who built the Christian church which was destroyed two centuries later. The later history of San'a' has been a record of desert raids interspersed with periods of prosperity. After the withdrawal of the Turks (1918), San'a' became the capital of the imam of Yemen proper, and from 1962 it was the capital of the Yemeni Arab Republic. *See* also ARABIA: *Exploration;* YEMEN. (W. H. Is.)

SANA'I (ABU'L-MAJD MAJDUD) (*c.* 1070–*c.* 1140), Persian poet and mystic, author of the first great mystical epic in Persian. He was born in Ghazni, where as a young man he served as a panegyrist at the court of the Ghaznavid sultans. He later traveled to Balkh and other cities of Khorasan, and as a result of his association with mystics and philosophers, abandoned the life of the court, and devoted himself to the pursuit of the mystical life. Late in life he returned to Ghazni, where he lived in retirement, resisting the blandishments of the Ghaznavid ruler Bahramshah, and completed the composition of his most important work, the philosophical poem *Hadiqat al-Haqiqa* ("Garden of Truth"; Eng. trans. of book i by J. Stephenson, 1911).

Sana'i's poetical writings show clearly the spiritual change that divided his life; his early court panegyrics, though skilful, lack originality, whereas his mystical and philosophical poetry is full of deep feeling and sensibility. Sana'i wrote five or six other *mathnavi* (rhymed couplet) poems in addition to the *Hadiqa,* and also a number of fine *ghazals* (lyrics). He was the first major Persian poet to use verse for the expression of the mystical, philosophical, and ethical ideas of Sufism (*q.v.*) and so influenced the whole trend of Persian poetry. In particular he paved the way for both Farid ud-din 'Attar and Jalal-ud-din Rumi (*qq.v.*).

For discussions of Sana'i's life and work *see* E. G. Browne, *A Literary History of Persia,* vol. ii (1928); T. W. Haig in *Encyclopaedia of Islam,* vol. iv (1934). (L. P. E.-S.)

SAN ANDRÉS Y PROVIDENCIA, an *intendencia* of Colombia, consisting of San Andrés Island, Providencia Island, and three small keys in the Caribbean Sea, 250 mi. SW of Jamaica and 100 mi. E of Nicaragua. Area 21 sq.mi. Pop. (1964) 11,620. The islands were settled in 1629 by English Puritans and later by planters, woodcutters, and Negro slaves from Jamaica. They were awarded to Spain in 1786 and became part of Colombia in 1821. The population remains English-speaking and Protestant but decreased after 1938 by emigration. San Andrés produces coconuts, copra, and oranges; Providencia relies on subsistence agriculture. (G. J. B.)

SAN ANGELO, a city of southwestern Texas, U.S., is located 90 mi. SW of Abilene; the seat of Tom Green County. It was founded in 1867 near Ft. Concho at the confluence of the North Concho and Middle Concho rivers; the fort, abandoned as an army installation in 1889, is now a public museum. The mild climate (mean temperature 65° F.) and diversified recreational facilities attract tourists and sportsmen. San Angelo is also the educational, cultural, medical, and trade centre for an area larger than New England; its public-school system includes a municipal junior college. The region produces oil, gas, sheep, wool, a major portion of the nation's Angora goats and mohair, and diversified farm crops; San Angelo is a major wool market. Oil and Goodfellow Air Force Base, converted in 1958 from flight to security-service training, have been important in the growth of the city. Manufactures include boots, saddles, western-style jewelry, meat and dairy products, shoes and moccasins, cottonseed products, tile, trailers, printing and binding, and metal products. The multipurpose Twin Buttes dam, completed in 1961, provides the municipal water supply. The city has a large coliseum in which a ram show, fat-stock show, and rodeo are presented annually. San Angelo has a council-manager form of government, in effect since 1916. The population of the city in 1960 was 58,815, an increase of 12.9% from 1950; that of the standard metropolitan statistical area (Tom Green county) was 64,630, an increase of 9.7%. For comparative population figures *see* table in TEXAS: *Population.* (J. S. SP.)

SAN ANTONIO, a city of Texas, U.S., is located 80 mi. S.S.W. of Austin on the headwaters of the San Antonio river; the seat of Bexar county. San Antonio is exceptional among the larger cities of the U.S. in that its modern American character is blended with a considerable amount of foreign influence. This effect is due less to the fact that it was for 118 years a Spanish-Mexican outpost than to the close cultural ties which the city now has with Mexico. Situated on the plains of south-central Texas (*see* LLANO ESTACADO) at the foot of the Edwards plateau to the northwest, San Antonio is only 150 mi. from the Mexican border at Laredo and is on the most traveled route between the U.S. and Mexico by air, rail or highway. Spanish is spoken in most downtown retail establishments. The Latin section of the city, south and west of the business district, resembles an indigenous Mexican city, with its own shops, theatres, cafés, clubs, a weekly newspaper (*La Prensa*) and a Spanish-language television station. The population of the city in 1960 was 587,718, an increase of 43.9% over 1950; that part of the population which is of Spanish-Indian origin (estimated at 40%) has increased by a steady flow of immigration as well as by birth. The population of the standard metropolitan statistical area (Bexar and Guadalupe counties) was 716,168 in 1960. (For comparative population figures *see* table in TEXAS: *Population.*)

History.—San Antonio was founded on May 1, 1718, by a Spanish military expedition from Monclova, then capital of Coahuila, in northern Mexico, on the trail through the Texas wilderness to the recently opened trading posts of the French in Louisiana. The site was chosen for the springs welling up within what is now the city to form the San Antonio river, which flows southeastward into the Gulf of Mexico. Before the Spaniards came the site had been occupied by a Coahuiltecan Indian village, Yanaguana.

On the west side of the river the soldiers built a small fort which they called the presidio of Béjar; on the other side arose a Franciscan mission, San Antonio de Valero. In 1731 a party of 55 indigent settlers arrived, after an arduous journey from the Canary Islands (a Spanish possession), to colonize the lonely frontier post. Given land, they laid out a town near the fort and named it San Fernando. In time the three settlements grew together into a pueblo which was called San Antonio de Béjar. Eventually the presidio gave its name to Bexar county, of which modern San Antonio is the major part. For reasons which are now obscure, Mission San Antonio de Valero came to be known as the Alamo, from the Spanish word for "cottonwood tree."

Between 1720 and 1731 four more Franciscan missions were established at intervals for a distance of eight miles down the San Antonio river. When the missions were secularized in 1794 their

cultivated lands were distributed among the Indians under their tutelage and the buildings were abandoned. The Alamo was then used as a garrison by the soldiers defending San Antonio, replacing the old presidio.

With the Mexican revolution of 1821 San Antonio passed out of the hands of Spain and became a part of Mexico. It was still one of only three established communities in Texas, the others being Goliad, on the San Antonio river toward the Gulf, and Nacogdoches, near the Louisiana border. In August of that year, however, Stephen F. Austin arrived in San Antonio, where he arranged with the Mexican government to admit 300 families into Texas from the U.S. By 1836, when Texas in turn declared its independence, the Anglo-American settlers around the Gulf coast had grown to at least 35,000.

The high moment in San Antonio's history was the battle of the Alamo during the war between Texas and Mexico (*see* TEXAS: *Revolution and Republic*). At that time San Antonio had 2,500 inhabitants and was still the foremost city of Texas. Within 14 years, while it continued to grow, it had lost first place to Galveston, the Gulf port through which immigrants were pouring into Texas, and was being challenged by the new city of Houston.

During the last decades of the 19th century San Antonio was a major cattle centre, where herds were assembled for the long drives overland to the railroads in Kansas. The famous Chisholm trail, with its various offshoots, began in San Antonio; and it was usually to this city that cattlemen and cowhands repaired for relaxation after the drives. They brought a resurgence of prosperity to San Antonio. From 1900, when a hurricane virtually destroyed Galveston, until 1930, when both Houston and Dallas overtook San Antonio, it was again the first city of Texas.

The Economy.—Lacking the oil and chemical deposits around Houston and the rich trade area around Dallas, San Antonio after World War I gradually fell behind as a business and industrial capital. On the other hand, Ft. Sam Houston, on a tract of 3,365 ac. inside the present city, is the headquarters of the 4th U.S. army, an administrative district covering the five states of Texas, Louisiana, Arkansas, Oklahoma and New Mexico. Also at Ft. Sam Houston is Brooke army medical centre, which includes a large hospital, research laboratories and the army's basic school for medical officers, nurses and technicians.

BY COURTESY OF THE SAN ANTONIO CHAMBER OF COMMERCE

PARK SETTING OF THE FORMALLY CHANNELED AND LANDSCAPED SAN ANTONIO RIVER IN DOWNTOWN SAN ANTONIO

Surrounding the city are four important U.S. air force bases. Kelly, the oldest, was established in 1917. Until 1943 it was the advanced flight training centre of the air force. Then it was converted into an aircraft maintenance and supply base. By the end of World War II Kelly had grown into a vast industrial complex, with 24,000 civilian employees, acres of shops and warehouses, 8 mi. of concrete runways and 28 mi. of railway spurs and sidings.

An offshoot of Kelly, and adjacent to it, is Lackland air force base, the principal air force training school for recruits and officer candidates. Randolph air force base, 17 mi. N.E. of the city, is the headquarters of the Air Training command.

Brooks air force base, near Kelly and Lackland, is the site of the new Aerospace medical centre occupied in 1959 by the former school of aviation medicine. There the air force gives postgraduate training to flight surgeons and conducts advanced research on problems of atmospheric and space flight. The model air force hospital at Lackland is a unit of the centre.

These military operations largely account for the phenomenal growth of San Antonio after 1940, the city being without private industry of any great significance. They also explain its attraction for retired members of the armed forces, who permeate its social, business and professional life.

Education and Cultural Activities.—Among the many educational institutions in San Antonio are St. Mary's university (Roman Catholic; established 1852) and Trinity university (Presbyterian; established 1869); and two Roman Catholic colleges for women, Incarnate Word (chartered 1881) and Our Lady of the Lake (founded 1896). The Protestant Episcopal bishop of west Texas has his diocesan centre in San Antonio. Cultural exhibits are found in the Witte Memorial museum and in the Marion Koogler McNay Art institute, which contains a notable collection of modern French paintings.

Historic Sites.—Among places of interest to visitors in San Antonio, the most notable is the Alamo (*q.v.*). A small section of the Spanish colonial town near the Alamo has been restored with later additions; it is known as La Villita and is used as a civic centre. San Fernando cathedral, built by the Canary Islanders, is the seat of a Roman Catholic archbishop. For a discussion of the missions and the governor's palace, all of great architectural and historic interest, *see* TEXAS: *State and National Parks*. San Antonio river, formally channeled and landscaped, winds unobtrusively below the level of the downtown streets.

SANATRUCES (SINATRUCES; Parthian *Sntrwk*), Parthian king in Persia (*c.* 77–70 B.C.). In the troublous times after the death of Mithradates II (*c.* 87 B.C.) he was made king by the Sacaraucae, a Scythian tribe which had invaded Persia *c.* 77 B.C. He was 80 years old and reigned seven years. *See* PERSIAN HISTORY.

See Lucian, *Makrobioi*, 15; Appian, *Mithridateios*, 104.

SAN BERNARDINO, central city of the San Bernardino-Riverside-Ontario standard metropolitan area in southern California, is the seat of San Bernardino County (area 20,160 sq.mi., constituting 12% of the area of California). The city lies 60 mi. E of Los Angeles at an elevation of 1,054 ft. at the southern base of the San Bernardino Mountains (maximum altitude 11,502 ft.). Pop. (1960) of city 91,922; of standard metropolitan statistical area (San Bernardino and Riverside counties), 809,782. (For comparative population figures *see* table in CALIFORNIA: *Population.*)

Spanish military commandant Pedro Fages first explored the area in 1772. On May 20, 1810, Franciscan Father Francisco Dumetz from the San Gabriel mission named the valley for St. Bernardino of Siena. About 1820 the mission fathers started an irrigation ditch and a chapel. Diego Sepulveda established a great cattle ranch in the valley in 1839. The Rancho San Bernardino

was sold to Mormon immigrants who came by wagon train from Salt Lake City in 1851. In that year the leaders of this group, Charles C. Rich and Amasa Lyman, founded the city of San Bernardino. The county was created in 1853. The city was incorporated in 1854, and its present charter dates from 1904.

San Bernardino city, surrounded by orange groves and vineyards, is the centre of a rich, irrigated agricultural region. Adjoining is Norton Air Force Base, headquarters of the San Bernardino air matériel area. Numerous other large military installations are located in the vicinity. Seven miles west of the city is the largest integrated steel operation in the western U.S. The Santa Fe railroad maintains extensive shops; other important industries are foundries, aircraft and rocket factories, plumbing material, cement, and colour printing plants. San Bernardino is the centre of a large trade area with numerous wholesale distributors.

The city has fine churches and schools. In the metropolitan area are the University of Redlands (1907), the University of California Riverside campus (1905) with its Citrus Experiment station, Loma Linda University (1905), and Chaffey College (established in 1883 as Chaffey College of Agriculture). The state, county, and municipal buildings are grouped in a civic centre. The National Orange Show, held annually since 1915, has permanent exposition buildings.

Immediately to the north of the city the San Bernardino Mountains and National Forest provide a resort area with fishing, boating, and swimming in summer and skiing in winter. Beyond the mountains, on the way to Las Vegas and Palm Springs, are the numerous playgrounds of the Mojave Desert (*q.v.*).

(E. L. S.)

SAN BRUNO, a city of California, U.S., in San Mateo county, is located 14 mi. S. of San Francisco near the west shore of San Francisco bay. Tanforan race track, established in 1899, attracted early settlements, and the town was incorporated in 1914. Favoured by a cool, sunny climate and easy access to the metropolis, the city grew slowly as a commuter's suburb until the 1940s. Sharing in the bay area's rapid population growth, its size tripled between 1940 and 1960. Many of its residents work in San Francisco but a number are employed locally in printing, aircraft operation and maintenance (San Francisco International airport) and electronics. A U.S. naval personnel depot and the U.S. marine corps reserve 7th infantry battalion were stationed in San Bruno after World War II. For comparative population figures *see* table in CALIFORNIA: *Population.* (J. H. St.)

SAN BUENAVENTURA: *see* VENTURA.

SAN CARLOS, a city in California, U.S., in San Mateo County on the San Francisco Peninsula, is located 26 mi. SE of San Francisco on historic El Camino Real, now a federal highway. Local tradition seems to have suggested the city's name, for it is believed that it was on the feast day (Nov. 4) of St. Charles Borromeo, in 1769, that the expedition of Gaspar de Portolá first sighted San Francisco Bay from the nearby hills. The original townsite was plotted in 1888 for the Southern Pacific Railway on sections of an old Spanish land grant, but the city was not incorporated until 1925. The city-manager form of government was adopted in 1949. San Carlos shared in California's spectacular growth after World War II; its population increased about 80% from 1940 to 1960. Although predominantly a suburban residential community, it includes within its limits some light industry, mainly electronics. For comparative population figures *see* table in CALIFORNIA: *Population.* (S. B. Kn.)

SÁNCHEZ COELLO, ALONSO (1531/32–1588), Spanish painter who was one of the pioneers of the great tradition of Spanish portrait painting, was born at Benifayó, near Valencia. By 1540 he had moved with his family to Portugal, and before 1550 visited the Netherlands where he received his decisive training under Antonio Moro. Returning to Portugal *c.* 1550, where he worked for the court, he transferred in 1557 to the Spanish court, which he served until his death on Aug. 8, 1588, in Madrid. Philip II's favourite portrait painter, he introduced into Spain a style of portrait painting of specific Spanish character which was to continue to the time that Velázquez moved to the court in the 1620s. The basis of his style was Moro's painting, but, influenced also by the Venetians, and especially by Titian, Alonso's portraits show a lesser insistence on detail, a greater ease of pose and of execution, and a warmer colouring; *e.g.*, portraits of Philip II (*c.* 1575) and the Infanta Isabel Clara Eugenia (1579), both in the Prado. The many religious paintings he produced, especially for the Escorial, are comparatively conventional works. (P. O. T.)

SÁNCHEZ COTÁN, JUAN (1561–1627), Spanish artist, a great still-life painter, was born near Toledo, Spain, where he studied with Blas del Prado. Toledo was the spiritual and ecclesiastic capital of Spain, and at the time leading minds there, among them El Greco, were interested in ecstatic mysticism as well as sober rational thought. In 1603 Sánchez Cotán became a Carthusian lay brother, near Segovia, and in 1612 at Granada; there he died in 1627, venerated almost as a saint.

Sánchez Cotán's mysticism is expressed in both his still lifes and his figure paintings. His work is characterized by lovingly careful realism and dramatic depth; the sensations of harmony and ascetic withdrawal they induce were inspired by his own mystic spirituality. His best work, "Quince, Cabbage, Melon and Cucumber" (1602), was exhibited in 1823 in Philadelphia, where it influenced Raphaelle Peale. It is now in the Fine Arts Gallery of San Diego, Calif. With Alonzo Vázquez (*c.* 1564–1608), the earliest Baroque painter at Seville, Sánchez Cotán influenced Francisco de Zurbarán and other painters at Seville and Madrid.

See George Kubler and Martin Soria, *Art and Architecture in Spain and Portugal and Their American Dominions 1500–1800* (1959).

(M. S. S.)

SÁNCHEZ DE BUSTAMANTE Y SIRVÉN, ANTONIO (1865–1951), Cuban lawyer, statesman, and publicist who drew up the Bustamante Code dealing with international private law. He was born on April 13, 1865, in Havana, Cuba, where his father was professor and dean of the Faculty of Medicine in the university. He received most of his education in his native city, and obtained his law degree there. In 1884, before he was 20, he won the chair of international law at the university in public competitive examinations. In 1902, when the republic of Cuba was constituted, he was elected senator for the province of Pinar del Río; in 1909 he was reelected to represent Havana. In 1895 he was made a member of the Institute of International Law, the first Cuban to gain that honour, and in 1907 he was selected as delegate plenipotentiary of Cuba to the Second Peace Conference at The Hague. In 1908 he was made a member of the Permanent Court of Arbitration at The Hague.

Bustamante's codification of international private law was adopted by the sixth Pan-American Congress, which also elected him president in 1928. It was ratified by 15 Latin-American countries, 6 of them without reservations.

Bustamante also served as dean of Havana University; dean of the Havana bar; Cuban delegate to the League of Nations; and judge of the Permanent Court of International Justice. Among his numerous works, many of them pertaining to international law, are: *El orden público* (1893); *Tratado de derecho internacional privado* (1896); *Discursos,* five volumes (1915–23); *El Tribunal Permanente de Justicia Internacional* (1925); *Derecho internacional público,* five volumes (1933–38); *Derecho internacional aéreo* (1945). He died on Aug. 24, 1951, in Havana.

SÁNCHEZ RAMÍREZ, a province in central Dominican Republic. It occupies 453 sq.mi. (1,173 sq.km.) on the northern slope of the Cordillera Central (to 2,265 ft. [690 m.]) and in the eastern section of the fertile Vega Real, south of the Camu River. Cocoa accounts for nearly one-half of the area under cultivation. Other significant crops are bananas, corn, rice, and coffee. Silver, gold, and copper were mined during the colonial period, and a rich deposit of iron ore was mined near Hatillo after 1952. Sánchez Ramírez was created in 1952 from Duarte Province. Its 1960 population was 90,280. The capital, Cotuí (pop. [1960] 4,540), was founded in 1505. (D. R. D.)

SANCHI, a village in Madhya Pradesh state, India, the site of probably the oldest surviving buildings in the Indian subcontinent, apart from the Indus Valley remains of the Harappan civilization (*see* INDIA-PAKISTAN, SUBCONTINENT OF: *Archaeology*) which belong to an earlier and different archaeological period.

Pop. (1961) 796. The main structures of interest are the Buddhist stupas on Sanchi Hill, a 300-ft. sandstone feature on the left bank of the Betwa River. Although the remains include an Asokan pillar, a fact which points to the importance of Sanchi in the early growth of the Buddhist religion, it has not proved possible to identify Sanchi in the textual geography of early Buddhism. The evolved style at Sanchi seems to form part of an artistic sequence from the Bhaja Cave, near Poona, through the material from Bharhut and Gaya, to the Great Stupa which is Sanchi's chief glory. The stupa consists of a base bearing a hemispherical dome (*anda*) representing the dome of heaven enclosing the earth, which is surmounted by a square railed unit (*harmika*), the world mountain, from which rises a mast (*yashti*) to symbolize the cosmic axis. The mast bears umbrellas (*chatravalis*) which represent, by their tiered arrangement, the various heavens of the gods (*devaloka*). Provision is made for a railed circumambulatory (*pradaksinapatha*) about 16 ft. above the base of the dome, and the whole is surrounded by a flagged path with an enclosing railing and ceremonial gateways (*torana*) at the cardinal points. The Great Stupa in its present form—the basal diameter of the dome is about 115 ft., rising to a height of about 50 ft. at the *harmika* platform, which has a diameter of some 40 ft.—is the result of additions to an original, probably Asokan foundation of much less imposing proportions and ornamentation.

Other features of interest in Sanchi include a *chaitya* or assembly hall, apparently forming part of a complex, Asokan pillar-stupa-*chaitya;* monastic buildings, perhaps to be assigned to the Theravadin sect; and a small early Gupta temple (No. 17; early 5th century A.D.). *See* also INDIAN ARCHITECTURE.

SANCHO, the name of four kings of León and Castile.

SANCHO I (d. 965), king of León from 956 to 965 a younger son of Ramiro II, succeeded his brother Ordoño III, but was overthrown by a revolt of his nobles and replaced by a usurper, his cousin, Ordoño IV. Sancho went to Córdoba to seek help from Abd-al-Rahman III and was restored (960) by an army sent by the caliph.

SANCHO II (*c.* 1038–1072), king of Castile from 1065 to 1072, was the eldest son of Ferdinand I. He was allocated the kingdom of Castile in his father's will, León and Galicia being given to his brothers. He refused to accept this division and dispossessed García of Galicia by force (1071). Alfonso VI of León, defeated at Golpejera on the Carrión River in January 1072, had to seek refuge with the Moorish king of Toledo. Sancho's triumph was short-lived, for he was killed on Oct. 7, 1072, while besieging the rebel fortress-city of Zamora, held by his sister Urraca in Alfonso's name.

SANCHO III (*c.* 1134–1158), king of Castile from 1157 until his death in 1158, was the eldest son of the emperor Alfonso VII.

SANCHO IV (1258–1295), king of Castile and León from 1284 to 1295, second son of Alfonso X, was born on May 12, 1258. Though ambitious, ruthless, and violent-tempered, he was also an able politician and a cultivated man. In 1275 his elder brother, Fernando de La Cerda, was killed, leaving a son, Alfonso de La Cerda, heir to Alfonso X. Sancho, supported by the nobles and the military orders, sought recognition as heir instead of his nephew and took up arms against the king. After some years of strife he succeeded in making good his usurpation on his father's death (April 1284). Support for Alfonso de La Cerda came from factions at home and from France and Aragon. Sancho finally removed this threat by arranging a marriage (1291) between his eldest daughter Isabel and James II of Aragon. Despite these political troubles he succeeded in defeating an invasion of Andalusia by the king of Fez (1290). Sancho owed much to his ablest supporter, López Díaz de Haro, whom he—characteristically—killed in anger during an argument at Alfaro (1288). He also depended greatly on the courage and wisdom of his warrior-queen, María de Molina, who on his death (April 25, 1295) became regent for his son Ferdinand IV. (P. E. R.)

SANCHO, the name of seven kings of Pamplona (Navarre) and Aragon.

SANCHO I GARCÉS (d. 925), king of Pamplona from 905 to 925, expanded his kingdom south of the Ebro and maintained its independence despite the sack of his capital (924) by Abd-al-Rahman III, amir and caliph of Córdoba.

SANCHO II GARCÉS (Sancho Abarca) (d. *c.* 994), king of Pamplona from 970 to *c.* 994, count of Aragon, the son of García II, was defeated by the Moors in 973 and 981 when allied with Castilians and Leonese. He then submitted to the caliphate, one of his daughters marrying the dictator Almanzor and becoming a Muslim. Sancho visited Córdoba in 992 to pay homage to Almanzor.

SANCHO III GARCÉS (*c.* 992–1035), called "the Great," king of Pamplona from 1005 to 1035, the son of García III, established Navarrese hegemony over all the Christian states of Spain. A skilled politician, he pursued his aims more by subversion than by force of arms. Sancho was uninterested in the crusade against the Moors or the Visigothicizing traditions of the Leonese monarchy. The expansion of the kingdom of Pamplona began by the seizure of the ancient Frankish counties of Sobrarbe and Ribagorza (1016–19). Next Sancho persuaded the count of Barcelona, Berenguer Ramón I, to accept him as overlord. Gascony did likewise, giving him direct sovereignty over Labourd. As a consequence of his marriage (1010) to Munia, daughter of count Sancho García (d. 1017) of Castile, he secured his own acceptance as count when Sancho García's son, the child count García, was assassinated (1029). He then took up Castilian irredentist claims in eastern León and occupied the Leonese capital, where he was crowned (1034)—taking the imperial title. Sancho, who introduced some feudal practices into his new dominions, also encouraged the Cluniac reformers and established much closer contacts generally between Christian Spain and trans-Pyrenean Europe. In his will, however, he deliberately destroyed the empire he had created: he divided it into four kingdoms and left these to his four sons, thus making inevitable the fratricidal wars which followed his death (Oct. 18, 1035). Sancho created the kingdom of Aragon and was responsible for the elevation of Castile from county to kingdom, though he transferred some Castilian territory to Pamplona, which he left to his eldest son, García IV.

SANCHO IV (*c.* 1039–1076), king of Pamplona from 1054 to 1076, son of García IV, had to contend with Castilian irredentism and Aragonese ambition. He persuaded the Moorish king of Saragossa to become his vassal. This offended Alfonso VI of Castile who invaded Navarre (1074), conspiring with Sancho's brothers and magnates to assassinate him at Peñalén. The kingdom of Pamplona was then occupied by Sancho Ramírez of Aragon, with Navarrese approval.

SANCHO V RAMÍREZ (1043–1094), king of Aragon from 1063 to 1094 and of Pamplona from 1076 to 1094, was the son of Ramiro I of Aragon. After the murder of Sancho IV (*see* above) he, with Navarrese consent, became king of Pamplona, forestalling the ambition of Alfonso VI to annex that kingdom. Sancho's main historical importance, however, was as king of Aragon. After his father's death (1063) fighting the Moors at Graus, the papacy organized three international crusades against Spanish Islam (1063, 1073, and 1087). These all failed, but Sancho himself reconquered many places from his own resources, notably in the regions of Huesca and Monzón; at the end of his reign Aragon began to edge toward the Mediterranean coast. Sancho placed his kingdoms under the feudal protection of the Holy See in 1089—an act fraught with political consequences for Aragon. He died of wounds during the siege of Huesca (1094).

SANCHO VI (d. 1194), called "the Wise," king of Navarre from 1150 to 1194, son of García V the Restorer, was the first monarch to be known as king of Navarre rather than of Pamplona. At the beginning of his reign Castile and Aragon signed at Tudillén (1151) a treaty for the partition of Navarre. By skilled diplomacy Sancho escaped destruction, accepting the emperor Alfonso VII of Castile as his suzerain and marrying the emperor's daughter (1157). He himself intervened in Castilian affairs during the minority (1158–70) of Alfonso VIII. In 1176 both countries sub-

mitted their longstanding territorial disputes to Henry II of England as arbiter. Henry assigned Rioja to Castile. Sancho accepted this decision. He was a legislator of importance, conceding many municipal fueros (charters) and protecting Jews and immigrants (*francos*) from the north. He died on June 27, 1194.

SANCHO VII (d. 1234), called "the Strong," king of Navarre from 1194 to 1234, the son of Sancho VI, was a swashbuckling but enigmatic personality who offended the Holy See by his friendship with the Saracens; he was in Africa in the service of the Almohads (1198–*c.* 1200). His absence cost Navarre the provinces of Álava and Guipúzcoa, seized by Castile (1200). In 1212, however, Sancho fought with the allied army which crushed the Almohads at Las Navas de Tolosa. Like his predecessor, Sancho granted many municipal fueros. He received (1196) the feudal homage of the viscount of Tartas (Gascony), took the burgesses of Bayonne under his protection (1204), and became lord of Ostabat (near Mauléon) in 1228. He died at Tudela on April 7, 1234, and was buried in the collegiate church at Roncesvalles, which he had built. Sancho was the last Spanish-descended king of Navarre for 200 years. (P. E. R.)

SANCHO, the name of two kings of Portugal.

SANCHO I (1154–1211), king from 1185 to 1211, was the son of Afonso I. His reign was marked by a resettlement of the depopulated areas of his country, by the establishment of new towns, and by the rebuilding of frontier strongholds and castles. The king encouraged foreign settlers, and enlisted bishops, religious orders, and nobles in his colonization projects, granting vast territories to the military orders (the Hospitallers, the Templars, the Orders of Calatrava and Santiago). After an invasion by the Almohad prince Abu Yusuf Yaqub al-Mansur, he used the help of a passing Crusader fleet to capture Silves from the Moors (1189), but lost it (1191) and other lands south of the Tagus when al-Mansur again attacked. Sancho was involved in various disputes with his bishops and quarreled with Rome over the payment of tribute. He died on March 26, 1211.

SANCHO II (*c.* 1209–48), king from 1223 to 1245, was the son of Afonso II and of Urraca, daughter of Alfonso VIII of Castile. Factions were so fostered during his minority that his later government was never anything more than a series of vain attempts to achieve political stability in the kingdom. Renewing the struggle against the Moors, he took Tavira and Cacela (1238–39), thereby extending Portuguese sovereignty over a large part of the Algarve. But from 1240 onward internal disorders increased, and Pope Innocent IV's recognition of the king's political incapacity to govern led to Sancho's deposition (1245) and the entrusting of the administration to his brother Afonso (later Afonso III). Sancho's supporters were defeated and he retired to Toledo (1247), where he died on Jan. 4, 1248. (V. R. R.)

SANCHUNIATHON, a Phoenician writer who probably flourished before Trojan times. All information concerning him derives from the works of Philo of Byblos (fl. A.D. 100), who claimed to have translated Sanchuniathon's *Phoenicica* from the original text. The authenticity of this has been questioned, but excavations at Ras Shamra (ancient Ugarit) in 1929 revealed Phoenician documents supporting much of Sanchuniathon's information concerning Phoenician mythology and religious beliefs. According to Philo, Sanchuniathon derived the sacred lore from mystic inscriptions on the *Ammouneis* (*i.e.,* images or pillars of Baal Amon), which stood in Phoenician temples. *See* also PHOENICIA: *Religion.*

SAN CRISTÓBAL, a province in southern Dominican Republic (area 1,445 sq.mi. [3,742 sq.km.]; pop. [1960] 252,280), is mostly mountainous, occupying a section of the Cordillera Central (to 4,265 ft. [1,300 m.]) in the northern part, and an outlying range in the southwestern part. It is a significant producer of rice, sugar, cacao, and coffee. The province was established in 1935 when the coastal plain around the national capital, Santo Domingo, was set aside and designated as the federal district of Santo Domingo.

The provincial capital, San Cristóbal (pop. [1960] 16,580), was founded in 1575. The name of the province was Trujillo until 1961. (D. R. D.)

SAN CRISTÓBAL, capital of Táchira state in western Venezuela, is one of the country's three principal centres of population in the Sierra Nevada de Mérida, the other two being Valera and Mérida. The city lies at an elevation of 2,720 ft. (829 m.) on three alluvial terraces of the Torbes River. Pop. (1961) 97,977. San Cristóbal is a natural gateway to the western llanos, with which it is connected by highway and air lines. It is on the trans-Andean highway 620 mi. (900 km.) SW of Caracas, and is also served by Santo Domingo airport, 17 mi. (27 km.) SE. Founded in 1561, the city was heavily damaged by an earthquake in 1875. San Cristóbal has textile mills, tanneries, a shoe factory, cigarette factories, and a cement plant; the surrounding area produces cocoa, coffee, corn, cotton, and sugarcane. (L. WE.)

SANCROFT, WILLIAM (1617–1693), English archbishop of Canterbury, leader of the seven bishops who opposed James II's Declaration of Indulgence and later leader of the nonjurors (*q.v.*), was born at Fressingfield, Suffolk, on Jan. 30, 1617. Educated at Emmanuel College, Cambridge, he became a fellow (1642), but was ejected (1651) because of his refusal from 1649 to take an oath of loyalty to the existing government. On the restoration (1660) of Charles II, he was appointed chaplain to John Cosin, bishop of Durham. He was master of Emmanuel College (1662–65) and dean of St. Paul's in London (1664–77), doing much to speed the rebuilding of the cathedral after the Great Fire (1666). He was consecrated archbishop of Canterbury in January 1678.

The accession of James II (1685) brought Sancroft fresh difficulties. He refused to serve on the king's Court of Ecclesiastical Commission and James ignored his advice on appointments. With six other bishops he petitioned against James's second Declaration of Indulgence (April 1688), was imprisoned in the Tower (June 8–15) and tried for seditious libel (June 29–30). Finding James intractable, Sancroft accepted the arrival of William of Orange, but gave William no support as soon as it became clear that William meant to obtain the crown. Suspended in August 1689, Sancroft was deprived in February 1690, having failed to take the oath of allegiance to William III. Vacating Lambeth Palace in June 1691, he retired to a small house at Fressingfield, where he died on Nov. 24, 1693. As well as various sermons, he wrote *Modern Policies* (1652), an indictment of the Commonwealth. *Fur praedestinatus* (1651), a tract against Calvinism long attributed to him, was probably the work of a Dutch writer.

See G. D'Oyly, *The Life of William Sancroft,* 2nd ed. (1840); A. Strickland, *The Lives of the Seven Bishops* (1866).

SANCTION AND GUARANTEE in international law are methods of enforcing rules of international law through the collective action of states. Sanctions may range from votes of censure in international organizations, through economic boycott, to the use of military force.

Following World War I, statesmen, led by Pres. Woodrow Wilson, sought to find a new security system to replace the older one of flexible alliances which had characterized the 19th-century "balance of power" political system (*see* ALLIANCE). Wilson believed a new security system could be built around a League of Nations in which states would unite to guarantee each other's security through employing collective sanctions against any state which forcibly transgressed the established legal rights of another state. Sanctions and guarantees were to replace alliances as the cornerstone of peace. This concept was embodied in the Covenant of the League of Nations, the key enforcement provision of which was article 16.

The League of Nations.—Article 16 of the Covenant obligated League members to adopt common coercive measures, including the severance of all trade and financial relations, against any state which, in violation of the Covenant, resorted to war. In addition, armed force could be used against such an offender if the League Council so recommended. Unfortunately, art. 16 contained ambiguities which seriously diminished the confidence of governments in its efficacy, and efforts to supplement League sanction by regional guarantees were therefore undertaken. To avoid being stigmatized as old-fashioned "alliances," these were explicitly subordinated to League sanctions. The most important were the

Locarno treaties of 1925, which guaranteed French and Belgian borders with Germany; England and Italy signed as guarantors.

The failure of the League system of sanctions lay in its tendency to fragment opposition to an aggressor nation by placing emphasis on collective sanctions when particular states might have preferred to let others act for them and to remain inactive themselves. Italy was not deterred from conquest of Ethiopia by economic sanctions brought into play by the League, nor were the Japanese prevented from conquering Manchuria. Germany reentered the Rhineland and later absorbed Austria and the Sudetenland.

The United Nations.—Despite the failure of the League, the concept of collective security guaranteed by collective sanctions reappeared in 1945 in the United Nations Organization. Recognizing that the military capabilities of the world would be in the hands of the great powers, the United Nations provided machinery through which states represented in the Security Council could cooperate to enforce peace. The Charter contains an absolute prohibition of the use of force by a state against the territorial integrity or political independence of another state, qualified only by the right of individual and collective self-defense against armed attack provided in art. 51.

Sanctions available to the organization are detailed in Ch. VI and VII, which call upon the Security Council to take necessary action whenever a dispute or situation threatening international peace or security occurs. Chapter VI permits the Security Council to invoke a variety of sanctions, including the use of force, to enforce its decisions. Decisions are binding upon all members. Chapter VII, also available to the General Assembly, provides for "recommendations" of peaceful settlement. Charter provisions contemplating United Nations forces (art. 43–47) have not been implemented because of the inability of the great powers to agree on their composition, but the council can call upon individual states to supply military forces on an *ad hoc* basis. This procedure was followed in 1950 when the Security Council, acting during the absence of the Soviet Union, authorized UN military action in Korea.

The possibility that the veto in the Security Council could prevent the United Nations from applying effective sanctions has led to two alternative means of ensuring collective security. First, the creation of regional organizations, permitted by art. 52 of the Charter: these are multilateral defensive alliances against aggression, the most important of which are the North Atlantic Treaty Organization (*q.v.*), the Southeast Asia Treaty Organization (*q.v.*), the Organization of American States (*see* PAN-AMERICAN CONFERENCES), the Central Treaty Organization (*see* BAGHDAD PACT), and the Warsaw Treaty Organization (*q.v.*), which includes the Soviet Union and its satellites. These treaties provide that an armed attack against any member will be regarded as an armed attack against all other members, and each member will assist the party attacked by taking forthwith such action as it deems necessary. Second, there have been efforts since Korea to transfer to the General Assembly as many powers of the Security Council as possible under the Charter if the council, because of the veto, cannot act. This is the purport of the "Uniting for Peace Resolution" of 1950. The United Nations invoked forcible sanctions in Korea in 1950 but has not in other instances attempted to do so. In the case of the aggression of the Soviet Union in Hungary it was prevented from taking action by the veto. In other instances, *e.g.*, Arab-Israeli conflicts and the Anglo-French-Israeli attack on Egypt during the dispute over the Suez Canal in 1956, it has been successful in maintaining peace without the need to employ sanctions. *See* also PEACE, INTERNATIONAL: *Collective Security.*

SANCTI SPÍRITUS, a city in Las Villas Province in east-central Cuba, about 45 mi. (72 km.) SE of Santa Clara. It is situated in a hilly region on the Central Highway about 20 mi. (32 km.) N of its port, Tunas de Zaza. Pop. (1964 est.) 55,400. The city serves as a commercial centre of a fertile agricultural region producing sugar cane, tobacco, and dairy products.

Sancti Spíritus was founded in 1516 on the Tuinicú River but was moved to the banks of the Yayabo River in 1524. It is the oldest interior city of Cuba, and the narrow, crooked streets, old churches, and plazas preserve its colonial atmosphere.

(D. R. D.)

SANCTORIUS (SANTORIO SANTORIO) (1561–1636), Italian physician who introduced quantitative experimentation and exact measurement into the field of medicine, was born at Capodistria (now Koper, Yugos.) on March 29, 1561. He studied at Venice and Padua and received his medical degree in 1582. From 1587 to 1599, he lived and traveled in Cracow (Pol.), Hungary, and Croatia. In 1611 he was named professor of medical theory at Padua. He died in Venice on Feb. 22, 1636.

Sanctorius was an exponent of the iatrophysical school of medicine, which took a mechanistic view of the body and its processes. Inspired by the inventions of his friend Galileo, he devised a clinical thermometer, a pulse clock, and a hygroscope. His major interest was the investigation of "insensible perspiration"; *i.e.*, metabolism. He constructed a large scale, on which he ate, worked, and slept, so that he might study the fluctuations of his body weight in relation to his solid and liquid excretions. After 30 years of continuous experimentation he published his findings in *De statica medicina* (1614). The book was widely read and hastened the acceptance of measurement and instrumentation in medicine. *See* also DIAGNOSIS: *Instruments of Precision.*

See A. Castiglioni, "La vita e l'opera di Santorio Santorio," *Medical Life,* vol. 38, pp. 727–786 (1920). (I. V.)

SANCTUARY, a sacred or consecrated place, and particularly one that affords refuge, protection, or right of asylum. The word is also applied to the privilege itself, the right of safe refuge. It refers even to places of refuge for animals, such as a "bird sanctuary." (In a Christian church the word sanctuary usually refers to the area within the altar rails, though in Orthodox churches it is the space enclosed by the iconostasis, the icon-decorated partition between the holiest part of the edifice and that occupied by the laity.) Sanctuaries or "asylums" existed among many peoples at different stages of civilization: among primitive tribes as well as among the Phoenicians, Syrians, Egyptians, and Greeks. Sanctuary provisions may be found in Hebrew, Roman, Germanic, Irish, canon, common, and civil law.

Sanctuary has been granted to many types of beneficiaries—to enemies, to all criminals, to perpetrators of certain crimes only, to accidental killers (Deut. 4:41, 42), to killers in the heat of passion, and to animals—and has emanated from many different places, things, and persons. Thus at various times and in various places sacred trees, altars, temples, "cities of refuge," eagles of the Roman legions, statues and pictures of Roman emperors, tombs, and churches have represented sanctuary. Sometimes the quality of sanctuary adhered to a person rather than a place: to priests or priestesses (for example, the Vestal Virgins in Rome), or even, in some cultures, to all women, owing to belief in their magical qualities. Often the sanctuary was merely a place in which blood might not be shed, hence it was permissible to remove the fugitive and kill him elsewhere; in other cases, he could carry the immunity conferred by the place beyond its limits.

Various explanations of the institution of sanctuary have been suggested. The belief that it was rooted in a deterministic philosophy is supported by the biblical grant of refuge to the "accidental" as contrasted with the intentional killer, on the ground that God let the victim "fall into his hand" (Ex. 21:13), without knowledge on his part (Josh. 20:5). The Greek practice probably was referable to the role generally attributed by the Greeks to fate as a factor in crime (best evidenced by Orestes' tragic destiny and the sanctuary accorded to him).

According to another view, the right of sanctuary is based on the inviolability of sacred things and is derived from the primitive and universal belief in the contagion of holiness. Edward Westermarck questioned this explanation; in his view, in addition to the fear of shedding blood in a holy place, the dominant motive in protecting the fugitive who took shelter in such a place was fear of the evil magic force that would emanate from his curse, dangerous to gods as well as to men. Such fear is reflected in the pro-

tective measures taken both by certain primitive peoples and by the Romans; they gagged a condemned man to avoid exposing the king to contact with him or to his curse. It may have been one reason for the Hebrew practice, reported in the Talmud, whereby the mother of the high priest took care of fugitives to prevent them from praying for his death, which, by law, would set them free.

It is possible that all these reasons may have been combined in the institution of sanctuary. The Freudian view of the connection of opposites in primitive thought and in the unconscious makes it possible to interpret belief in the holiness of sanctuary and fear of the evil curse as related to one another rather than mutually exclusive. Both can be reconciled with belief in blood magic and the doctrine of fate.

Christian sanctuaries, first recognized by Roman law toward the end of the 4th century, developed through recognition of the office of bishop as intercessor. Definitely recognized in 399, sanctuary privileges were extended to wider areas of and around churches in 419 and 431. Justinian, in a statute of 535, limited the privilege to persons not guilty of the grosser crimes. In the Germanic kingdoms, while violent desecration of the right of sanctuary was forbidden, the fugitive was given up after an oath had been taken not to put him to death. This practice was copied by the church in a decree of the Council of Orléans in 511.

Canon law afforded sanctuary for a limited time to persons guilty of crimes of violence, in order that compensation might be paid to the victim or his kinsmen and to check blood vengeance.

In English common law a person accused of a felony might take refuge in a sanctuary; once there, he had a choice between submitting to trial or confessing the crime to the coroner and swearing to quit the kingdom (abjuration of the realm) and not return without the king's leave. Upon confession, he was deemed convicted; his lands passed to the Crown, his chattels were forfeited, he suffered attainder of blood (*i.e.*, could neither inherit nor transmit land), and his wife was regarded as a widow; if he returned without leave, his fate was that of an outlaw. If the fugitive would neither submit to trial nor abjure the realm, after 40 days he was to be starved into submission. Besides the general sanctuary which belonged to every church and which afforded temporary protection, there developed on obscure grounds a number of sanctuaries based upon royal charters. In at least 22 places throughout England the king's process did not run, the coroner could not enter, and the fugitive could remain there for life. The local lords regulated the activities of, and exacted oaths of fealty from, the fugitives.

The Reformation curtailed sanctuaries. Henry VIII abolished many and substituted, after the biblical pattern, seven "cities of refuge": Wells, Westminster, Northampton, Manchester (afterward transferred to Chester), York, Derby, and Launceston. An act of James I (1623) abolished sanctuary in cases of crime, but the privilege lingered on for civil processes in certain districts which had formerly been sanctuaries and which became the haunts of criminals who there resisted arrest. A notable example was the district known as Whitefriars in London, between Fleet Street and the Thames, east of the Temple. In this locality, nicknamed Alsatia, criminals were able to a large extent to defy the law, arrests being possible only under writs of the lord chief justice. So flagrant became the abuses that all such privileges were finally abolished in 1697, by the "Escape from Prison Act." A further amending act of 1723 completed the work of extinction of sanctuaries.

In Scotland, all religious sanctuaries were abolished at the time of the Reformation, but certain debtors were accorded sanctuary in and around Holyroodhouse, Edinburgh, until late in the 17th century. In continental Europe, the right of sanctuary (called asylum), though much restricted in the 16th century, survived until the French Revolution.

Whatever its origin and historically varying meaning, the institution of sanctuary seems to have performed an eminently useful social function. Although often abused, it prevented excessive use of capital punishment and safeguarded against uncontrolled blood vengeance and execution without trial. The sanctuary was also the root from which grew parliamentary immunities and the custom of diplomatic asylum in embassies; for these, *see* IMMUNITY; ASYLUM, RIGHT OF; DIPLOMACY: *Diplomatic Immunities*.

SAND, GEORGE (real name AMANDINE AURORE LUCILE DUDEVANT, *née* DUPIN) (1804–1876), French Romantic novelist who is also famous for her numerous love affairs. She was born in Paris on July 1, 1804, the daughter of a curiously ill-assorted couple: her mother, Sophie Victoire Delaborde, was the lowborn daughter of a Paris bird-fancier, while her father, Maurice Dupin, was the young officer son of Marie Aurore Dupin de Francueil, the natural daughter of the maréchal de Saxe and the granddaughter of Augustus II of Poland. Maurice Dupin and Sophie Delaborde married barely a month before their daughter was born, and Maurice died in a riding accident when the child was only four.

George Sand's plebeian mother and aristocratic grandmother, who had never liked each other, disagreed violently about the education of little Aurore until Mme Dupin de Francueil bribed Sophie with an allowance to go to Paris, leaving Aurore to be brought up at Nohant, near La Châtre in Berry, her grandmother's country home. Although the girl remained stubbornly loyal to her mother, she inevitably imbibed something of her grandmother's proud, skeptical, 18th-century view of life, as well as the profound love and understanding of the countryside which was to inform most of her works. In 1817 she was sent to the convent of the English Augustinians in Paris, where she was deeply attracted by the religious life, acquiring a mystical fervour which, though it soon abated, left its mark on her for the rest of her life. Returning to Nohant in 1820, she spent nearly two years of unrestricted freedom there, going shooting with her old tutor Deschatres, riding in masculine dress, talking with the peasants, reading widely if unsystematically in French and English, and consorting—innocently as yet—with the young men of the neighbourhood.

GEORGE SAND

Her grandmother died in December 1821, and a year later Aurore married a young Berrichon squire called Casimir Dudevant, to whom she bore a son, Maurice, in 1823. The first years of the marriage were happy enough, but soon Aurore tired of her well-intentioned but somewhat insensitive husband and sought consolation first in a platonic friendship with a young magistrate, Aurélien de Sèze, and then in a passionate liaison with Stéphane de Grandsagne, a free-thinking, free-living neighbour. Grandsagne did more than anyone else to turn Aurore Dudevant into George Sand, for it was he who broke down her moral inhibitions, shook her religious faith, and widened the breach between her and her husband until it was an unbridgeable gap; he was probably also the father of her second child, Solange, who was born in September 1828. For his part, Dudevant took to heavy drinking and making love to the maidservants. Finally, in January 1831, under the terms of an amicable agreement with her husband, Aurore left Nohant for Paris, in order to take part in the Romantic movement and also to join her latest lover, the young Jules Sandeau (*q.v.*).

In Paris, she found a good friend in Henri de Latouche, a native of Berry like herself and the director of *Le Figaro*, who taught her the trade of journalism and accepted some of the articles which she wrote with Sandeau under the pseudonym of "Jules Sand." In 1832, however, she adopted a new pseudonym, "George

Sand," for a novel in which Sandeau had had no part. This novel, *Indiana,* which brought George Sand immediate fame, is a transcript of its author's emotional experience in her married life. But it is also a passionate protest against the social conventions which bind a wife to her husband against her will, and an apologia for a heroine who "sets up against the interests of society, raised to the level of principles, the straightforward ideas and simple laws of common sense and humanity." On this point George Sand's opinion never changed. Toward the end of her life, though she might then preach the virtues of monogamy, she would still insist in a letter to Flaubert that "a union in which there is neither liberty nor reciprocity is an offence against the sanctity of nature."

In *Valentine* (1832) and *Lélia* (1833) this ideal of free association is extended to the wider sphere of social and class relationships. *Valentine* is the story of a country squire's wife who falls in love with a young peasant, and it is the first of many Sand novels in which the hero is a peasant or a workman and the setting is the Berry countryside.

Meanwhile George Sand had discarded Sandeau and was seeking satisfaction with a succession of other men. The list of her lovers is a long one, including Mérimée (for one unsatisfactory, much-publicized encounter), Musset (in the stormy liaison which gave rise to his *Confession d'un enfant du siècle* [1836] and her *Elle et lui* [1859]), Michel de Bourges (the advocate who, in 1836, secured her legal separation from Dudevant), Chopin (in an affair that lasted from 1838 to 1847), and Alexandre Manceau (an engraver, 13 years her junior, who was her favourite from 1850 until his death in 1865). (*See* MUSSET, [LOUIS CHARLES] ALFRED DE; CHOPIN, FRÉDÉRIC FRANÇOIS.) Yet it would be a mistake to accept the popular impression of George Sand as a nymphomaniac who betrayed Musset, destroyed Chopin, and changed her philosophy and politics to suit the views of each successive lover. Although reputed to be the most promiscuous of women, she longed for the stability of a single faithful love, and she once declared, in a letter which may raise a smile but which was nonetheless sincere:

> I have always believed above all else in fidelity, I have preached it, I have practised it, I have demanded it. Others have failed to live up to it and I too. And yet I have never felt remorse, because in my infidelities I have suffered a sort of fatality, an instinctive idealism which impelled me to abandon the imperfect for what seemed to me to be closer to perfection.

The proof of her sincerity is that when she thought she had found something approaching perfection in a man, she lived with him for years, caring for him with a love which was more that of a mother than a mistress: she stayed 8 years with Chopin for example, until he left her after a quarrel, and 15 years with Manceau, until his death from tuberculosis. It is patently untrue that she changed her religion and politics with every lover: she remained impervious to Musset's skeptical views and Chopin's aristocratic prejudices, while the man whose opinions she adopted wholeheartedly and preached for some 30 years, the philosopher Pierre Leroux, was never her lover.

The fact remains that most of her early works show the influence of one or other of the men with whom she consorted as friend, disciple, or mistress. Thus *Lélia* is full of pessimistic utterances which bear the mark of Gustave Planche, the dogmatic young literary critic; *Mauprat* (1837) reflects the vague longing for social betterment which George Sand had derived from her association with Michel de Bourges and Lamennais; *Spiridion* (1839) and *Les Sept Cordes de la lyre* (1840) echo the philosophic ideas of Pierre Leroux; while *Le Compagnon du tour de France* (1841) propounds the theories of Agricol Perdiguier on the union of the classes and the liberation of the manual worker from the shackles of overwork and exploitation.

After an ambitious *Entwicklungsroman,* a novel of development of character, entitled *Consuelo* (1842–43), which harked back to *Spiridion* and the idea of perpetual reincarnation, and some more novels in the socialist tradition, *Le Meunier d'Angibault* (1845) and *Le Péché de Monsieur Antoine* (1847), she eventually found her true form in her so-called rustic novels, which, though they owed something to the theories of Bourges, Leroux, and Perdiguier, drew their chief inspiration from her lifelong love of the countryside and sympathy for the poor. In *La Mare au diable* (1846), *François le Champi* (1848) and *La Petite Fadette* (1849), the old familiar theme of George Sand's work—love transcending the obstacles of convention and class—in the old familiar setting of the Berry countryside, regained pride of place. These rustic tales are probably her finest works; certainly she wrote no novels to surpass them between 1849 and her death.

In the revolution of February 1848, she played a self-important but courageous part, writing a whole series of appeals to the people. Later, however, the romantic and the revolutionary died in George Sand, and she produced a series of novels and plays of impeccable morality and conservatism, exalting marriage in *Constance Verrier* (1860) and condemning romantic passion in *Valvèdre* (1861). Probably the only works of the later George Sand, "la bonne dame de Nohant," which are likely to endure are her *Histoire de ma vie* (published 1854–55), which contains some brilliant character sketches, and *Contes d'une grand'mère* (1873), stories which she wrote for her grandchildren.

After a peaceful old age spent entertaining and corresponding with friends such as Flaubert and Dumas, organizing amateur theatricals and puppet shows, and educating her grandchildren, George Sand died at Nohant on June 8, 1876. She was mourned as a great writer, one of the greatest of her time; but, with a few exceptions, her works soon fell into neglect.

Two explanations are usually advanced for this neglect. It is said that she wrote too much and too quickly, and her detractors are fond of telling how one night, working as usual from midnight until four o'clock, she finished a novel at one o'clock and promptly started writing another. She certainly wrote with astonishing ease and fluency, and her collected works fill more than 100 volumes. But fluency does not necessarily imply facility; when a scene called for careful documentation, George Sand could provide it, and when an important problem of style presented itself, she grappled with it. One of the most remarkable features of her novels of country life is the speech of the peasants, which is neither literary French nor provincial patois but a cunningly devised halfway tongue which succeeds in being both intelligible and credible.

The other charge leveled at George Sand as a writer is that she was an idealist, that in her memoirs she shut her eyes to the unpleasant aspects of reality while in her novels she created characters of unbelievable innocence and charm. But in the opening pages of *Histoire de ma vie* she states explicitly that she has no intention of creating any scandals or settling any scores. She was well aware that the characters in most of her novels were idealized, and quite honest about it. "The novel," she declared, "need not necessarily be the representation of reality." And in a report of a conversation with Balzac, she quoted herself as saying to the elder novelist: "You aim at painting and do paint man as he is, but I am inclined to paint him as I wish he were, as I believe he ought to be." As she explained to Flaubert:

> Life is not composed *entirely* of criminals and scoundrels. That rogues should be exhibited and condemned is right, is even moral, but we should be shown the other side of the medal as well, otherwise the simple-minded reader—who is the common-or-garden reader—will react against such books, and will grow depressed and fearful.

This was no doubt her sincere conviction, but the real reason for her idealism was more instinctive than theoretical. She was a born storyteller, and with her childlike optimism and ingenuous faith in life, it was natural that her stories should be fairy tales, her peasants good and kind, her endings happy. And as long as there are readers with a similar view of life, George Sand's memoirs and rustic novels—the Bucolics of France as they have been called —seem destined to survive.

BIBLIOGRAPHY.—*Editions, etc.:* the fullest edition is that of Calmann-Lévy, 105 vol. (1862–1926); later annotated editions of single works include *La Mare au diable* (1956), *La Petite Fadette* (1958), *Les Maîtres sonneurs* (1958), *Consuelo* (1959), *La Comtesse de Rudolstadt* (1959), *Lélia* (1960), and *Indiana* (1961), all in the Classiques Garnier series. *See* also S. de Lovenjoul, *George Sand: Étude bibliographique sur ses oeuvres* (1914); M. SAND. The products of rocks and minerals broken down by natural or artificial agencies are gravels, sands, silts, and clays. In the U.S. the term sand is applied to particles $\frac{1}{16}$ to 2 mm. diameter, and in Europe to those from .02 to 2 mm. diameter. Although most of the rock-making minerals occurring on the earth's crust are found in sands, only a limited number are met with at all frequently.

For several reasons quartz is by far the commonest; it is abundant in rocks, is comparatively hard, and has practically no cleavage so that it is not readily worn down to a fine state. Moreover, it is nearly insoluble in water and does not decompose. In certain localities feldspar, calcareous material, iron ores, and volcanic glass, among other substances, have been found to be dominant constituents of sand. Most quartzose sands contain a small quantity of feldspar. Small plates of white mica, which, though soft and very fissile, decompose slowly, are often present. In addition, all sands contain small quantities of "heavy" rock-forming minerals among which may be garnet, tourmaline, zircon, rutile, topaz, pyroxenes, amphiboles, iron ores, etc.

In certain shore and river sands these heavier constituents become concentrated as a result of current action and the removal of the lighter constituents. Economically valuable deposits may then be yielded. Such are the sands worked for diamonds and other gem stones, gold, platinum, tin, monazite, and other ores. The greensands, widely distributed over the floor of the ocean and found in ancient strata on the continents, owe their colour to the presence of glauconite, a potash-bearing mineral. These sands are used for water softening and for land dressing, and attempts have been made to extract potash from them.

In the pottery, glassmaking, and silicate (water glass) industries very pure quartzose sands are used in large quantities as a source of silica. Similar sands are required for lining the hearths of acid-steel furnaces. Molding sands, that is, the sands utilized in foundries for making the molds in which metal is cast, usually have a clayey bond uniting the grains of quartz. Because of the hardness and poor cleavage of quartz, sands are used extensively as abrasives. Garnet sands, although of more restricted occurrence, are similarly used. Ordinary sands find a multitude of other uses, among which may be mentioned the preparation of mortar, cement, and concrete. In underground formations, sand strata are frequently sources of water supply.

(P. G. H. B.; X.)

SANDALWOOD, a hardwood, rich in fragrant oil, obtained from various oriental trees, and principally from *Santalum album,* a native of India. The use of sandalwood dates at least as far back as the 5th century B.C. It is still extensively used in India and China, wherever Buddhism prevails, being employed in funeral rites and religious ceremonies. In India it is used in the manufacture of boxes, fans, and other ornamental articles of inlaid work.

Sandalwood oil, obtained by distilling the wood in chips, is used as a perfume, few native Indian attars or essential oils being free from admixture with it. As a powder or paste, the wood is employed in the pigments used by the Brahmans for their distinguishing caste marks. As a substitute for copaiba (*q.v.*), which is used as a diuretic and stimulant, sandalwood oil, distilled from the wood of *Santalum album,* is pleasanter to take, but it is less efficient and more expensive.

Red sandalwood is the product of a small leguminous tree, *Pterocarpus santalinus,* native to southern India, Ceylon, and the Philippine Islands. The freshly cut surface of the wood has a rich deep red colour which on exposure assumes a dark brownish tint; this pigment is used in wool dyeing. Several other species of *Pterocarpus,* notably *P. indicus,* contain the same dyeing principle and can be used as substitutes for red sandalwood. The barwood and camwood of the Guinea coast of Africa, from *Baphia nitida* or an allied species, called *santal rouge d'Afrique* by the French, are also allied to the red sandalwood of the Orient.

SANDAWE, a tribe of about 25,000 persons in the 1960s living near Kondoa, Tanzania (*q.v.*), between the Bubu and Mponde rivers. The Sandawe have been known to anthropological and linguistic science since 1894.

Many aspects of their culture show the influence of their Bantu neighbours. Their isolated wooden houses with roofs of clay are built in the lee of the wind. The staple food is millet, supplemented with fat, milk, and butter, meat being rarely eaten; culinary utensils are largely wooden. Their traditional clothes were of *hika*-grass, feathers, and hides, and the dominant cosmetic practices include shaving of the hair, earlobe piercing, and face tattooing. Circumcision, general for both sexes, seems a recently acquired practice. Their weapons are bows and iron-tipped arrows; they also trap animals but regard hunting with a net as an occupation of the poor. Their hunting weapons, as well as the conservative beehive huts which are occasionally seen, resemble those of the Hadzapi (*see* Africa: *Ethnography* [*Anthropology*]: *East Africa*).

The Sandawe cultivate the soil with a mattock, fertilize with manure, and keep cattle, sheep, and goats. The men clear the land, tend the animals, and hunt, while the women do the cultivation and food gathering. They drink beer and mead, but the term for the latter is borrowed from Bantu.

Their legal practices, which have an indigenous terminology, relate to such subjects as inheritance and indemnity for adultery; the latter is not so serious a transgression as it is among the Bantu.

Households, each comprising a nuclear family, are organized into patrilineal exogamous clans that form the basis for autonomous local communities. Marriage, which is monogamous (as with the nearby Mbugwe) and requires bridewealth (*q.v.*), is forbidden with parallel cousins and preferred with the maternal uncle's daughter. Residence is patrilocal, often after an initial period near the wife's parents.

Language.—Sandawe shares certain syntactic features with Bushman-Hottentot: inflection is accomplished by suffixes, and not by prefixes as in Bantu languages; the modifying noun precedes the modified ("cow's head"; not "head-of-cow" as in Bantu); and the basic sentence order is subject—object—verb (*see* Bushman Languages; Khoisan).

Pronominal reference is expressed either by independent words or by suffixes to verbs and nouns; it distinguishes subject function from other relationships, including possession. Pronouns and many nouns distinguish two grammatical genders, feminine and "indifferent," and indifferent forms also show plural (feminine rarely so). Nouns are inflected in a limited way for case, such as instrumental and locative. Suffixes serve, too, to mark commands and interrogations. Certain of the most common verbs are anomalous in having totally unrelated shapes in the singular and plural.

The most striking feature is the presence, in addition to a rich set of about 26 conventional consonants, of three types of clicks (*q.v.*): alveolar, lateral, and palatal. In acoustic effect, these match the corresponding clicks of Hottentot and Hadzapi (which each have a fourth type) and of Bushman (Southern Bushman has five varieties). Like Bushman-Hottentot, Sandawe has tones, but no accurate description of them has been made.

Sandawe, Bushman-Hottentot and Hadzapi are genetically related not only by lexical agreements but also by specific suffixal grammatical correspondences: noun plural *-ko* = Hottentot masculine plural *-ku,* and /kham Southern Bushman personal plural *gu;* feminine singular *-su* = Hottentot *-s,* Naron Bushman and Hadzapi *-sa;* feminine plural *-tsi, -si* = Hottentot and Central Bushman **dzi* and Hadzapi *-ti,* Naron *-si,* and perhaps Southern Bushman *si;* predicative indifferent *-we* = Hottentot masculine singular *-p,* Naron *-ba,* Hadzapi *-wa;* interrogative *-ne* = Hie Bushman *na-*. Among pronominal correspondences there are first singular *ts-, s-* = Hottentot and Central Bushman *ti-;* first singular subject form *tsa* = Hadzapi and Hottentot first singular *-ta;* first plural *so, su* = ≠hũa Southern Bushman *si.* The vocalism of Bushman *ha* "that" and *he* "this" exactly matches that of Sandawe *ha* "that," *he* "this," and *na* "there," *ne* "here." Thus in

perfect accord are Sandawe *ha-we*, Hadzapi *ha-wa*, Naron *xa-ba* "he"; and the Central Bushman and Hottentot equivalent *e-b-* is precisely parallel on the base for "this."

Despite their geographic proximity, the relationship of Sandawe seems no closer to Hadzapi than to Bushman-Hottentot. If anything, it seems most akin to Central Bushman-Hottentot.

SANDAY, WILLIAM (1843–1920), English New Testament scholar, one of the pioneers in introducing to English students the mass of work done by continental scholars in biblical criticism, was born at Holme Pierrepont, Notts., Aug. 1, 1843. Educated at Repton and Balliol College, Oxford, he became a scholar of Corpus Christi in 1863. He was a fellow and lecturer at Trinity in 1866, and was ordained in 1867. In 1876, after holding various college livings, he was appointed principal of Hatfield Hall, Durham. In 1882 he was appointed Ireland professor of exegesis at Oxford, and in 1895 Lady Margaret professor of divinity and canon of Christ Church, positions he held until 1919. He died at Oxford on Sept. 16, 1920.

Sanday's chief works are *The Authorship and Historical Character of the Fourth Gospel* (1872); *The Gospels in the Second Century* (1876); *Inspiration* (Bampton lectures) (1893); *Commentary on the Epistle to the Romans*, with A. C. Headlam (1895); *Christologies, Ancient and Modern* (1910).

See obituary by W. Lock in *Journal of Theological Studies*, 22:97–104, also pp. 193–205 of the same issue list a bibliography of his published works by A. Souter.

SANDBLASTING: *see* BLAST CLEANING AND SHOT PEENING.

SANDBURG, CARL (1878–1967), U.S. poet, historian, novelist, and folklorist, one of the group of writers responsible for the pre-World War I "Chicago Renaissance" in letters, was born Jan. 6, 1878, at Galesburg, Ill. The son of a Swedish immigrant, he began earning his keep at the age of 11. He worked in a barbershop, drove a milk wagon, and turned hobo for a time in the Kansas wheat fields. When the Spanish-American War broke out, he enlisted in the 6th Illinois infantry. These early years Sandburg later described in his autobiography *Always the Young Strangers* (1953).

After attending Lombard College in Galesburg, he acted as an organizer for the Social Democratic Party and secretary to the mayor of Milwaukee (1910–12). Moving to Chicago in 1913, he was an editor of *System* and then joined the staff of the *Daily News*.

LEVITON—ATLANTA, FROM BLACK STAR

CARL SANDBURG

In 1914 he made his appearance in Harriet Monroe's *Poetry* magazine with a group of his *Chicago Poems*, which were issued in book form in 1916. Sandburg's poetry made an instant and favourable impression. In this and succeeding volumes—*Cornhuskers* (1918), *Smoke and Steel* (1920), and *Slabs of the Sunburnt West* (1922)—he was recognized as a genuine poet of the people. In *Good Morning, America* (1928) Sandburg seemed to have lost some of his faith in democracy, but from the depths of the depression he wrote a poetic testament, unique in form, to the power of the people to go forward, *The People, Yes* (1936).

Few Americans have known the lore of their country as has Sandburg. Some of its folk say is in *The People, Yes*. The folk songs that he sang before delighted audiences were issued in two collections, *The American Songbag* (1927) and *Carl Sandburg's New American Songbag* (1950). In 1923 his publishers suggested that he write a life of Lincoln for young people. The project grew into one of the most deservedly popular of biographies, *Abraham Lincoln: the Prairie Years* (2 vol., 1926) and *Abraham Lincoln: the War Years* (4 vol., 1939; Pulitzer Prize, history, 1940). In 1948 Sandburg published a long novel, *Remembrance Rock*, which recapitulates the American experience from Plymouth Rock to World War II. *Complete Poems* (1950) won the Pulitzer Prize for poetry in 1951. *The Sandburg Range* (1957) contains selections from his work. It is abundantly illustrated with photographs taken at various stages in his career. He died on July 22, 1967, at Flat Rock, N.C.

SAND DOLLAR, a common name for small, disk-shaped marine animals, the most specialized members of the Clypeastroidea, a group of sea urchins (*q.v.*). Throughout the temperate and tropical zones, they live molelike in sand at moderate depths. The sand dollar has a flattened body, from less than ½ in. to about 4 in. in diameter, with the plates of the test (or shell) firmly united and rather thick; the inside of the test is reinforced by pillars. The spines on the upper side are short and crowded, forming a dense fur which holds the sand out, while those on the underside are longer and assist in pushing the animal through the sand. The colour varies but is usually a dark shade—olive, purplish, brown, or black.

A bilateral symmetry is superimposed upon the original five-rayed symmetry, and these forms can only move forward, not in all directions as can the ordinary five-rayed sea urchins. When it meets an obstacle, the sand dollar stops and, with the aid of ventral spines, pivots around the axis which runs vertical through the mouth, and then continues in the new direction. The anus lies on the underside. In these forms the tube feet spread out from the radial canals over large parts of the underside, whereas those on the central part of the upper side are modified for respiration and form flattened leaves. On the dead tests, after the spines have dropped off, the characteristic star-shaped pattern of the gill pores is revealed. The centrally placed mouth has five ciliated grooves radiating out from it, along which food particles are carried in, sifted, and subdivided by the teeth.

Sand dollars live more or less concealed in the sand, at a depth of a few feet—sometimes placed at a sharp angle with the anterior edge downward. They have been extremely successful in utilizing a niche in nature which few other forms have invaded, and they occur usually in very large numbers, as evidenced by the thousands of shells washed up after a heavy storm.

SANDEAU, LÉONARD SILVAIN JULIEN, known as JULES SANDEAU (1811–1883), French writer, is remembered chiefly for his collaboration with other authors. Born at Aubusson on Feb. 19, 1811, he began his literary life in the company of George Sand (*q.v.*), whose lover he became in 1830 when he was a young law student in Paris. Under the pseudonym "Jules Sand," they published a novel, *Rose et Blanche* (1831), and some *nouvelles*. At the end of 1832 she broke off the affair, but retained her pen name, which had become George Sand.

In the following years Sandeau often met Balzac. He had a brief liaison with Marie Dorval, the actress. In 1842 he married, reverting to a regular, bourgeois life. Although in his writing he aims at simplicity, he is unable to escape romantic idealism. He expresses himself in a mannered style, full of false finery. His best novels are *Marianna* (1839), in which he portrays George Sand, *Mlle de la Seiglière* (1848), *La Roche aux mouettes* (1871), and *Jean de Thommeray* (1873). In collaboration with Émile Augier (*q.v.*) he wrote several plays: *Le Gendre de M. Poirier* (1854) was a particularly lasting success. Under the Second Empire Sandeau was a favourite at court. In 1858 he was elected

to the Académie Française. He died in Paris on April 24, 1883.

See M. Silver, *Jules Sandeau, l'homme et la vie* (1936). (P. Sa.)

SANDERS (Sander), **NICHOLAS** (*c.* 1530–1581), English Roman Catholic scholar, controversialist, and historian of the English Reformation, was born in Surrey about 1530 and educated at Winchester and New College, Oxford, at which university he became a lecturer in canon law. He left England shortly after the accession of Elizabeth I in order to be free to practise Roman Catholicism, and by 1561 had been ordained priest at Rome. Stanislaus Cardinal Hosius, prince-bishop of Ermeland, having been appointed one of the five papal legates at the renewed sessions of the Council of Trent, took Sanders with him as one of his theologians. Sanders' immense reputation among the English Catholic exiles in the Low Countries, however, caused the cardinal to allow him to go to Louvain, where Sanders became professor of theology and was soon busy controverting the claims of Episcopalian divines, especially Bishop John Jewel.

Of Sanders' many books the best known was a history of the English Reformation written in Latin, left unfinished at his death, and published with additions by a fellow exile, Father Edward Rishton, at Cologne in 1585. Many editions and translations followed rapidly; eventually it was put into English by David Lewis, entitled *The Rise and Growth of the Anglican Schism* (1877). Bitterly attacked at first by English Protestant writers as malicious and erroneous, it has come more and more to be appreciated as an outstanding piece of historical writing for its time.

The later part of Sanders' life was occupied in promoting a military invasion of England for the restoration of Catholicism. Lengthy and unsatisfactory negotiations for this purpose in both Rome and Madrid culminated in his landing in Ireland in 1579 as a papal agent to promote rebellion and his failure and death there in 1581.

Wainewright (ed.), "Some Letters and Papers of Nicolas Sander, 1562–1580," *Publications of the Catholic Record Society,* vol. xiii (1926). (E. McD.)

SANDERSON, FREDERICK WILLIAM (1857–1922), distinguished English schoolmaster whose maxim that "Education must be fitted to the boy, not the boy to education," has had considerable influence on the curriculum and methods of secondary education, was born at Brancepeth, County Durham, on May 13, 1857. He was educated at the local school, at Durham University, and at Christ's College, Cambridge. In 1889 he became senior physics master at Dulwich College, where he formed a successful "engineering side." His appointment as headmaster of Oundle School, near Peterborough, Northamptonshire, in 1892, came at a critical period in the fortunes of the school. In spite of initial opposition he transformed the school and completed an ambitious building program which included laboratories, workshops, a foundry, an observatory, an experimental farm, and a spacious library.

A scientist and a practical teacher, he understood boys and their interests. During his 30-year headship Oundle developed from a school of less than 100 pupils to one which accommodated five times that number. Though not mentioning him by name, the Hadow report on the *Education of the Adolescent* (1926) was strongly influenced by his ideas.

Sanderson died in London on June 15, 1922.

See *Sanderson of Oundle* (1923), an account of his work compiled by his colleagues; H. G. Wells, *The Story of a Great Schoolmaster* (1924). (S. J. C.)

SAND FLY, any of several small bloodsucking flies, particularly of the family Psychodidae, but the name is also applied loosely to certain species of the Ceratopogonidae and Simuliidae. The name comes from the fact that the aquatic larvae of some species live in the intertidal zone of coastal beaches, or in saturated sand elsewhere; however, most species pass their immature stages in water, mud, or wet, decomposing organic debris.

Sand flies are of considerable medical importance, in addition to being extremely annoying to man when present in large numbers. Species of *Phlebotomus* (family Psychodidae) transmit through their bite the virus of Pappataci fever (*q.v.*), in the Mediterranean area and southern Asia, and the protozoan parasites causing kala azar, Oriental sore, and espundia (*see* Leishmaniasis), in parts of South America, Africa, and Asia. Five species of *Simulium* (family Simuliidae), locally known as sand flies but more often as black flies (*q.v.*), have been found to infect man with the parasitic worm causing onchocerciasis, which may result in blindness.

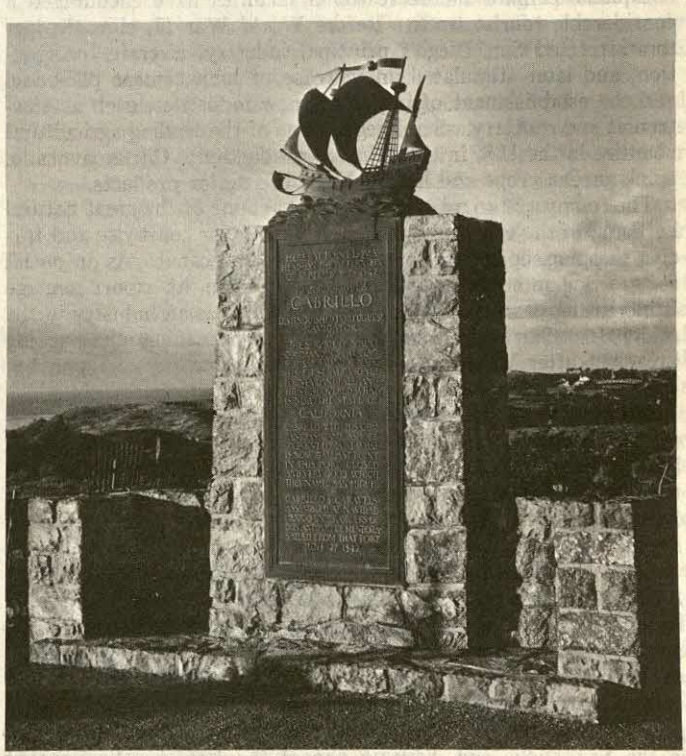
Far more pestiferous than these medically important species, but not known to transmit any pathogen to man, are the tiny biting midges, species of *Culicoides, Leptoconops,* and related genera (family Ceratopogonidae), sometimes called punkies or "no-see-ums." While individual bites are not painful, these flies often attack man in great numbers, causing extreme discomfort. *See* also Fly. (G. W. Bs.)

SANDHURST, a large village of Berkshire, Eng., 9 mi. (14 km.) N of Aldershot, Hampshire, is the site of the Royal Military Academy (RMA), which stands in wooded grounds, with a lake and playing fields, between the village and the town of Camberley, Surrey. At the academy most of the potential regular officers for the British Army undergo training as officer cadets. *See* Military, Naval and Air Academies.

SAN DIEGO, a Pacific coast city of California, U.S., an important naval base and seat of San Diego county, is situated 16 mi. N. of the Mexican border and about 110 mi. S.S.E. of Los Angeles. Between 1950 and 1960, the population, stimulated by industrial growth, naval and military activities, and a mild climate, increased from 334,387 to 573,224, one of the highest percentage increases for any major U.S. city. The population of the San Diego standard metropolitan statistical area, comprising San Diego county, was 556,808 in 1950 and 1,033,011 in 1960. (For comparative population figures *see* table in California: *Population.*)

History.—Juan Rodríguez Cabrillo, a Portuguese explorer in the service of Spain, discovered the bay on Sept. 28, 1542, and named it San Miguel. Sebastián Vizcaíno, who was sent in 1602 to reconnoitre California preparatory to the establishment of a Spanish colony, renamed the bay for San Diego de Alcalá de Henares, a Spanish monk whose name Vizcaíno's flagship bore.

In 1769 the harbour was chosen as the base for the exploration



BY COURTESY OF THE SAN DIEGO-CALIFORNIA CLUB

MONUMENT TO THE PORTUGUESE NAVIGATOR JUAN RODRÍGUEZ CABRILLO, DISCOVERER IN 1542 OF CALIFORNIA, AT POINT LOMA, NEAR SAN DIEGO

and settlement of California because of its excellence and its relative proximity to Mexico. The sacred expedition of that year, led by the first governor, Gaspar de Portolá, founded the San Diego presidio as the initial settlement in the new colony. On the same day, July 16, 1769, Father Junípero Serra dedicated San Diego mission, the first of the California missions. The settlement was slow to spread beyond the presidio walls because of the menace of Indian and foreign attack. In 1774 the missionaries removed to the site of an Indian village, but the new mission buildings were soon destroyed by Indians and a brief return to the protection of the ramparts was necessary. Not until 50 years had passed did the town itself expand outside the presidio, which was strategically located on a hill. Then, with the overthrow of Spanish control by Mexico, and the pacification of savage tribes, inhabitants were able to go below the walls onto flat lands to build what has become known as Old Town, which was organized a pueblo in 1834.

American conquest in 1846 brought few immediate changes. The Old Town was incorporated in 1850 but did not grow and lost its charter two years later. San Diego then remained a Mexican adobe village until Alonzo E. Horton arrived in 1867 with the intention of founding a new town. He purchased a tract by the bay, 3 mi. S. of Old Town, for 26 cents an acre. In a few years his promotion became the largest California community south of Los Angeles, and has remained so ever since. The new city was incorporated in 1872. In 1931 the council-manager form of government was adopted.

Favourable year-round climate proved the great attraction to early settlement. Rainfall averages only 10 in. a year, which comes mostly in the mild winters. Growth tended to be extremely influenced by California land booms. The Santa Fe railway arrived in 1884, at the time of a general boom, and population and real estate values multiplied. Most of the towns in the county were founded at that time. Except for hard times that followed and lasted through the early 1890s, the city's growth thereafter was rapid.

Commerce and Industry.—San Diego is the headquarters of the 11th naval district and the extensive development of installations including army, marine and coast guard establishments added a great government payroll to the income of the area. The pleasant living conditions attract retired persons, especially naval personnel.

Equable climate and recreational facilities have encouraged a considerable tourist trade. Before World War II, climatic factors attracted San Diego's principal industry, aircraft construction, and later stimulated an increase of management personnel and the establishment of important new industries, such as electronics and rocketry. San Diego is one of the leading agricultural counties in the U.S. in the value of production. Citrus, avocado, truck garden crops and livestock are the major products.

The roomy (22 sq.mi.), landlocked bay, one of the great natural harbours of the world, is a first port of call for coastwise and foreign shipping, operating through the Panama canal. As an outlet for growing amounts of Imperial valley cotton, its export tonnage is increasing yearly. Shipbuilding developed as an industry in the mid-1950s. San Diego was once the country's leading tuna-packing area, but after World War II there was a decline, as Japan became a major source.

Recreation and Culture.—Deep-sea fishing is a popular recreation. Opportunities for other aquatic sports, swimming, motorboat racing, water skiing and sailing, were expanded by the development of Mission bay, a shallow harbour just north of San Diego bay, as a large aquatic park area. There are many well-situated golf courses about the metropolitan area.

Cultural establishments are centred in Balboa park. An annual Shakespeare festival, which offers scholarships to promising actors, is centred around a replica of London's Old Globe theatre. The art gallery, the Museum of Man, the Natural History museum, an open-air amphitheatre and one of the world's largest outdoor organs are all set amid the park's landscaped area. Light opera productions are given outdoors in summer. Also in Balboa park is the San Diego zoo, housing one of the largest collections of animals in the world.

The southern city limit is also the Mexican border. The international gate is the busiest crossing on the southern frontier of the United States. Principal attractions in Mexico are bullfights, horse and dog racing, jai alai and Mexican and foreign merchandise.

Educational facilities include San Diego State college (1897), San Diego College for Women (Roman Catholic; 1949), University of San Diego (Roman Catholic; 1949), California Western university (Methodist; chartered in 1924 as Balboa university and rechartered in 1952) and San Diego Junior colleges (1914), including City college, Evening college and Mesa college. A rapidly developing branch of the University of California is at La Jolla, which is also the site of the Scripps Institution of Oceanography.

(A. P. N.)

SANDINO, CÉSAR AUGUSTO (1893–1934), Nicaraguan guerrilla leader, was one of the most controversial figures of recent Central American history. Although he was considered a bandit by the United States government, many Latin Americans viewed him as a patriot and fighter against "Yankee imperialism."

The son of a small farmer, Sandino first gained national recognition in 1926 when he took up arms in support of Vice-Pres. Juan Bautista Sacasa's claim to the presidency. After the United States intervened in 1927 to impose peace, Sandino refused to lay down his arms and with several hundred men withdrew to the mountains of northern Nicaragua. His success in eluding capture by the U.S. Marine Corps and the Nicaraguan National Guard attracted widespread sympathy for him throughout the hemisphere. The resulting anti-United States feeling helped bring about a change in U.S. foreign policy toward Latin America, which culminated in Pres. Franklin D. Roosevelt's "Good Neighbor Policy." Following the withdrawal of the Marines in January 1933 and the inauguration of Sacasa as president, Sandino finally laid down his arms. On Feb. 21, 1934, upon leaving a dinner with the president, Sandino and several aides were assassinated by members of the National Guard who resented the lenient treatment accorded him by the government.

(R. M. Sc.)

SANDOMIERZ, a town in Kielce *województwo* (province), southeastern Poland, and seat of a Roman Catholic diocese. Pop. (1960) 12,300. It stands on the high left bank of the Vistula above its confluence with the San. The town early gained importance from its geographical and defensive position between the fertile Little Polish Highlands and the once wooded Sandomierz Plain, on a wide navigable river and on the old trade routes between the Baltic and Black seas and Ruthenia; it was one of the oldest Little Polish fortresses, mentioned in 11th-century sources. It was the capital of the independent principality of Sandomierz when Poland was divided into smaller states, and acquired town rights in 1286. After the third partition of Poland it was occupied by Austria. During 1807–15 it belonged to the Duchy of Warsaw and became part of the Polish kingdom (dependent on Russia) in 1815. It was returned to Poland in 1918.

One of the largest Polish towns in the 16th century, Sandomierz is now a small township. Its old buildings, in their picturesque setting, give the town much charm. Among the finest are the Romanesque Church of St. Jakub (James), with its door and murals of glazed brick, the Gothic cathedral with Byzantine murals, the town hall (Renaissance façade), and the Gothic Opatowska Gate, part of the old fortifications. The town's food industry has developed; a large glassworks began operating in the mid-1960s, and a new industrial centre, based on local sulfur deposits, has grown up near the confluence of the rivers.

(K. M. Wr.)

SANDOWAY, a town and the southernmost of the three districts in the Arakan division of the Union of Burma. The town (pop. [1962 est.] 69,924), 150 mi. (241 km.) SE of Akyab, is ancient and is said to have once been the capital of Arakan (*q.v.*). It was formerly accessible from the remainder of Burma only by sea but the institution of air service from Rangoon made possible such developments as a delightful bathing beach at Ngapali near Sandoway.

The district has an area of 4,149 sq.mi. (10,746 sq.km.) and a population (1962 est.) of 164,670. The country is mountainous, with peaks of 4,000 ft. and more in the north. Only small areas are available for cultivation, and almost the only crop is rice. The chief pass is the Taungup, crossed by a cart track converted to a

motor road in 1959–60, leading from Taungup village to Prome on the Irrawaddy River. (L. D. S.)

SANDOWN-SHANKLIN, a holiday resort and urban district in the Isle of Wight, Hampshire, Eng. Sandown is 6 mi. and Shanklin 8 mi. S of Ryde by road. Pop. (1961) 14,386. Area 5.5 sq.mi. Sandown rises from the wide sandy shore of Sandown Bay, on the southeast of the island, and is bordered to the north by the white Culver cliff. Shanklin stands on the cliffs at the southerly end of the bay, with the esplanade below, and the winding chasm of Shanklin chine (ridge) lies to the south. The district is noted for its floral beauty and long hours of sunshine.

SANDPAPER, an abrasive material prepared by coating heavy paper with glue and sifting fine sand over its surface before the glue sets. It is used for smoothing the surface of wood, for rubbing down paint, and similar purposes.

See ABRASIVE.

SANDPIPER, an indefinite group name used for certain of the smaller shore birds of the family Scolopacidae, which also includes snipe, curlew, godwit, woodcock, etc. In North America, when these birds were shot in numbers, gunners had many alternative names for some of them, including "peeps" and "oxeyes." In Europe the name "stint" is used for species that in America would be called sandpipers.

In general, sandpipers are sparrow- to thrush-sized birds with moderately long bills and legs, long narrow wings, and fairly short tails, and often with a complicated "dead-grass" pattern of browns, buffs, and black on the upperparts. Sandpipers usually nest on the ground in the open, in a scantily lined little hollow; they lay four spotted eggs, from which hatch active downy young. Many sandpipers nest in the Arctic and sub-Arctic regions and pass through the North Temperate Zone in great flocks. They feed on beaches and mud flats of oceans and inland waters, running along near the water, picking up their food of insects, crustaceans, and worms. In flight the flocks show remarkable correlation of movement, all the birds turning and wheeling in unison.

ERIC HOSKING

COMMON SANDPIPER (ACTITIS HYPOLEUCOS)

Some sandpipers undergo long migrations, like the white-rumped sandpiper (*Erolia fuscicollis*) of the American Arctic, which winters in southern South America; and the rufous-necked sandpiper (*Erolia ruficollis*) of Siberia, which winters to New Zealand and Tasmania. Others, like the least sandpiper (*Erolia minutilla*) of the American Arctic and sub-Arctic, winter from the United States to Peru, while the purple sandpiper (*E. maritima*) winters as far north as the rocky coasts of southern Greenland. The common sandpiper (*Actitis*—formerly *Tringa—hypoleucos*) of Eurasia and the closely related spotted sandpiper (*A. macularia*) of America, gray-brown above, are notable for frequenting gravelly borders of streams and lakes and having a nervous mannerism of wagging the tail. The green sandpiper (*Tringa ochropus*) of Europe and the solitary sandpiper (*T. solitaria*) of America are unusual in nesting not on the ground but in old tree nests of songbirds such as thrushes and in looking more like the tall slender yellowlegs (*Totanus* species). (A. L. RD.)

SANDRINGHAM, a village in the Freebridge Lynn rural district of Norfolk, Eng., is 9 mi. (14 km.) NNE of King's Lynn by road. Sandringham House, a country seat of the sovereign, was acquired for the prince of Wales, later Edward VII, in 1861. The Sandringham estate of 19,500 ac. (7,890 ha.), including a park of 200 ac. (80 ha.), has appealed to successive sovereigns for its bracing air and excellent shooting. Since World War II its farming has been organized on business lines to make a substantial contribution to the royal economy. The church of St. Mary Magdalene contains memorials of the royal family. George VI was born at York cottage in the grounds on Dec. 14, 1895, and died at Sandringham House on Feb. 6, 1952. (R. R. C.)

SANDSTONE is a consolidated rock built up dominantly of grains of sand (*q.v.*) held together by a cementing substance. Sandstones are composed mainly of quartz, but may vary in composition in the same manner as sands. By increase in the size of their constituents they pass into conglomerates (*q.v.*) and by decrease into arenaceous shales and clay rocks. When the grains of sand are angular, the rock is termed a grit.

The minerals of sandstones are the same as those of sands. Quartz is the commonest; with it often occurs a certain amount of feldspar (as in the rock arkose) and frequently white mica. The flakes of mica may often be seen lying on the bedding planes and may give the sandstone a cleavable character (*e.g.*, paving stone) of much value in quarrying. The cementing material is often fine chalcedonic silica, or it may be secondary quartz, producing a quartzitelike rock. Calcareous material (calcite), glauconite, iron oxides, carbonaceous matter, and other substances also act as cements and give the sandstones characteristic colours. Glauconitic sandstones are greenish; ferruginous sandstones, red, brown, and yellow or gray. When the cementing substance is clay, the rock is often of white or gray colour and firmly compacted.

Pure sandstones may contain as much as 99% of silica. If relatively soft they are crushed to sand for commercial purposes. If firmly cemented they are utilized, on account of the resistance of silica to heat, for the manufacture of silica bricks, furnace linings, hearths, etc. Of this character is the well-known rock "ganister" worked in the districts of Sheffield, South Wales, etc. Less pure, but firmly cemented siliceous sandstones are used to make grindstones and millstones. Similar rocks, as well as calcareous, dolomitic (*see* DOLOMITES), and ferruginous sandstones, are extensively worked as building stones, mostly by quarries but sometimes by mines. As sandstones are porous, they do not take a good polish, and are not used as ornamental stones, but this property makes sandstone formations valuable storage basins and sources of water.

See also references under "Sandstone" in the Index.

(P. G. H. B.)

SANDUSKY, a city of northern Ohio, U.S., a port of entry and the seat of Erie County, is situated on Sandusky Bay off Lake Erie, 56 mi. SW of Cleveland. It was platted in 1818 and incorporated in 1824; the name is Indian, referring to "clear water." Both French and British traders established posts in the area and the English fort built in 1761 was burned during Pontiac's conspiracy in 1763. During the War of 1812 Sandusky was a supply depot; Perry's naval victory of Sept. 10, 1813, occurred about 25 mi. NW, near Put-in-Bay. (*See* WAR OF 1812.)

This terminated Indian and British aggressions in the area and it was then settled by Connecticut residents; the townsite was in that portion of the Connecticut Western Reserve set aside for persons who had suffered losses from British raids in Connecticut during the American Revolution. A large number of Germans came in 1840–60. Bypassed as a terminus of a lake to Ohio River canal, Sandusky obtained the first Ohio Railroad charter, and service began in 1838. Johnson's Island in Sandusky Bay was a prison for Confederate officers from 1862 to 1865. Sandusky's early trade was in lumber, fish, and wood and agricultural products. Principal trade items in modern times include crayons, school paints, ball bearings, automotive and small steel castings, corrugated paper products, pleasure boats, rubber toys, radios, paper and textile machine rolls, quarry products, and lake shipment of coal. The city is located in a boating, fishing, and sand beach vacationing area and has many municipal parks. Sandusky has a commission-manager form of government, in effect since 1916. For comparative population figures *see* table in OHIO: *Population.* (C. E. F.)

SANDWICH, EDWARD MONTAGU (MOUNTAGU), 1ST EARL OF (1625–1672), English admiral who brought Charles II to England at the Restoration in 1660 and who subsequently fought in the Second and Third Dutch Wars, was born at Barnwell, Northamptonshire, on July 27, 1625, the son of Sir Sydney Montagu. Following the outbreak of the Civil War, he raised a regiment for the Parliament in 1643 and fought at the battles of Marston Moor (July 2, 1644), Naseby (June 14, 1645), and at the siege of Bristol (September 1645). Although one of Oliver Cromwell's intimate friends and M.P. for Huntingdonshire from

1645 to 1648, he took little part in public affairs until 1653, when he was appointed a member of the council of state. In January 1656 he was made a general at sea, an office he held jointly with Robert Blake. He was sent by Richard Cromwell to Denmark with a fleet in April 1659 to arrange a peace between Denmark and Sweden, but after Richard's fall (May) he returned to England and in September resigned his command. Reappointed general at sea in February 1660, he secured the fleet for Charles II, then in Holland, and was entrusted with the duty of bringing the king to England. He was created earl of Sandwich in July 1660 and was the patron of Samuel Pepys at the Admiralty for some years.

In the Second Dutch War (1665–67) Sandwich commanded a squadron under the duke of York (later James II) and distinguished himself in the battle off Lowestoft on June 13, 1665 (new style; June 3, old style). When the duke retired in July, Sandwich became commander in chief, but after he had allowed the distribution of valuable cargoes from some captured Dutch ships without obtaining the king's permission he was dismissed from his command (November). Sent as ambassador extraordinary to Madrid in 1666, he arranged a commercial treaty with Spain (May 1667) and acted as a mediator between Spain and Portugal in the Treaty of Lisbon (February 1668). In 1670 he was appointed president of the council for trade and plantations. On the outbreak of the Third Dutch War in 1672, Sandwich again commanded a squadron under the duke of York and during the fight in Solebay (Southwold Bay) on June 7, 1672 (N.S., May 28, O.S.), his ship the "Royal James," which had taken a conspicuous part in the action, was destroyed by fire. Sandwich's body was found at sea some days later and was buried in Westminster Abbey. His *Journal* for the years 1659 to 1665, edited by R. C. Anderson, was published in 1929.

See F. R. Harris, *The Life of Edward Mountagu,* 2 vol. (1912).
(C. C. L.)

SANDWICH, JOHN MONTAGU, 4TH EARL OF (1718–1792), English statesman and first lord of the admiralty during the American Revolution, was born on Nov. 3, 1718. He succeeded to the earldom in 1729, and after traveling abroad took his seat in the House of Lords in 1739, joining the Whig group led by John Russell, 4th duke of Bedford. He served on the board of admiralty (1744–49) and was first lord (1749–51 and 1763). As secretary of state for the northern department (September 1763–July 1765), he took a leading part in November 1763 in the prosecution of John Wilkes, whose friend he had been, thereby earning the nickname of "Jemmy Twitcher," after a treacherous character in John Gay's *The Beggar's Opera.* He was postmaster general (1768–70) and secretary of state for the northern department (December 1770–January 1771). As first lord of the admiralty from 1771 to 1782, he was the most important member of Lord North's ministry, but it was his misfortune to be the principal enemy of the Whigs and to be ruined by the failures in the American Revolutionary War. Throughout his life he was keenly interested in naval affairs, the administration and patronage of the Navy, and the promotion of exploration. In 1778 Capt. James Cook named the Sandwich Islands (*see* HAWAII) after him. Sandwich has been frequently attacked for corruption, and in private life he was a profligate gambler and rake; but recently his administrative gifts have been recognized. He died in London on April 30, 1792. His *Voyage . . . Round the Mediterranean in the Years 1738 and 1739* was published in 1799. The "sandwich" was named after him in 1762 when he spent 24 hours at the gaming table without other food.

See G. R. Barnes and J. H. Owen (eds.), *The Private Papers of John, Earl of Sandwich, 1771–1782,* 4 vol. (1932–38); G. Martelli, *Jemmy Twitcher* (1962). (C. C. L.)

SANDWICH, a market town and municipal borough in the Dover parliamentary division of Kent, Eng., 12 mi. E of Canterbury on the Stour River. Pop. (1961) 4,264. Area 3.3 sq.mi. One of the original Cinque Ports, and second in precedence to Hastings, it is now 2 mi. from the sea. In the line of the old defensive ramparts, now marked by a public walk, the Fisher Gate (dating from 1384, restored 1954) is the only gateway remaining, the other three —Newgate, Sandown, and Canterbury gates—having been pulled down in the 18th century; the Barbican was built in 1539 as one of a chain of blockhouses along the coast. In the twisting streets of Sandwich are timber-framed houses, and others built by the Flemings; *e.g.,* White Friars on the site of a 13th-century Carmelite priory; three ancient hospitals—St. Bartholomew's (probably founded 1217), just outside the town, with a fine Early English chapel, St. Thomas' dating from 1392 and rebuilt in 1864, and St. John's; three old churches—St. Clement's (the parish church since 1948) which dates from the 12th century and has a beautiful Norman tower, St. Mary the Virgin which stands on the site of a 7th-century monastery, but is not now in regular use, and St. Peter's, of various dates from the 12th century, where the curfew is still rung at 8 P.M. on the tenor bell and which is now the chapel of Sir Roger Manwood's Grammar School (1563). The school's present buildings were put up in 1895 and the old house, Manwood Court (1564), is now a private house. The guildhall, a 16th-century building, is still in use.

Rutupiae (Richborough, *q.v.*), 1½ mi. N of Sandwich, was established as a Roman town in A.D. 43 and was the centre of administration and one of the main entries from the continent. Sandwich was called Lundenvic by the Saxons and later became Sandwic; it was a borough by prescription before 1226, when the record of mayors begins. The governing charter until 1835 was that granted by Charles II in 1684. For many centuries the naval headquarters, the port for the wool trade, and chief port of embarkation for the European continent, Sandwich lost its importance in the 16th century when the harbour became silted up. The town flourished again when the Flemish refugees were given permission by Elizabeth I to live there; during the Napoleonic Wars; during World War I; and in World War II when it was extensively used for the construction of Mulberry Harbour. The chief industries are agriculture, and the manufacture of antibiotics, rubber products, shuttlecocks, textiles, and welding equipment. It is also a holiday town with fine golf links and sands at Sandwich Bay.

SANDYS, SIR EDWIN (1561–1629), English parliamentarian and a founder of the colony of Virginia, was born in Worcestershire on Dec. 9, 1561, the second son of Edwin Sandys, archbishop of York. He was an elder brother of George Sandys (*q.v.*). After 12 years at Corpus Christi College, Oxford, he entered the Middle Temple in 1590, where he maintained a close friendship with Richard Hooker (*q.v.*). From 1596 to 1599 he traveled abroad, and wrote his *A Relation of the State of Religion* . . . (1605), a remarkably tolerant analysis of contemporary creeds. Knighted in 1603, Sandys was returned to Parliament in 1604 and emerged unexpectedly as a leader of opposition to the crown, rapidly achieving great influence by a combination of shrewd oratory, legal experience, and mastery of procedure. He also led the gentry's agitation to open to nonmerchants, through joint-stock companies, the profits of England's expansion overseas. He joined the Virginia Company in 1607, the East India Company by 1611, the Somers Islands Company in 1615, and became a director of all three. In 1619 he gained control of the Virginia Company, but his management was a failure despite the fact that the year saw a rush of colonists, the first meeting of a representative assembly in Virginia, and the arrangement that enabled the Pilgrim fathers to sail to America in 1620. Plagued by constant setbacks, the company was dissolved in 1624. After Sir Edward Coke became leader of the parliamentary opposition in 1621, Sandys became its elder statesman. He died in October 1629. His work paved the way for a new generation of opposition leaders who eventually took Parliament into open revolt against the crown.
(T. K. RA.)

SANDYS, GEORGE (1578–1644), English traveler, poet, colonist, and early foreign service career officer, whose life exemplifies the interests and accomplishments of his age and who played an important part in the development of English verse, especially of the heroic couplet. He is of particular interest, also, for his connection with the founding of the colony of Virginia. The seventh and youngest son of Edwin Sandys, archbishop of York, and brother of Edwin Sandys (*q.v.*), he was born near York, on March 2, 1578. He studied at St. Mary's Hall, Oxford, and Corpus Christi College and in 1596 was admitted to the Middle

Temple. Probably about two years later he married Elizabeth Norton, his father's ward. By 1606 the marriage had ended in permanent separation.

In May 1610 Sandys set out on the travels described in *A Relation of a Journey begun An:Dom:1610. Four Books containing a description of the Turkish Empire, of Egypt, the Holy Land, of the Remote Parts of Italy, and Islands adjoyning* (1615), which went through nine editions during the 17th century and was used as source material by Sir Francis Bacon, Sir Thomas Browne, Milton, and other writers. In the dedication Sandys explains that his aim is "to draw a right image of the frailty of man. . . ; and assurance that as there is nothing unchangeable saving God, so nothing stable but his grace and protection." His account shows his keen interest in the customs and beliefs of other peoples, his knowledge of classical myth and literature, and a lively curiosity about the history, topography, and animal life of the places visited. His prose style, though weighted with references to a wide range of authorities, is balanced and condensed and has an easy yet dignified rhythm. The book has an important place in the development of Elizabethan travel literature.

Sandys had returned home by March 1612. As well as preparing his book for publication, he was active in the companies established for colonization in America. His brother, Sir Edwin Sandys, had been instrumental in drawing up the Virginia Company's charter (1609), and George had been a member of the company since 1607. In July 1621 he accompanied his nephew-in-law, the governor, Sir Francis Wyatt, to Virginia as its first resident treasurer and director of industry and agriculture, continuing in these duties when the crown took over government of the colony in 1624. For about 15 years after his return to England (1625) he was a member of various committees administering the colonies and, finally (1640), agent for the Virginia colony.

Sandys had published a translation of the first five books of Ovid's *Metamorphoses* in 1621. During the hours he could snatch from "night and repose" on his voyage to, and while in, the New World, he completed the 15 books, publishing the whole in 1626. In 1632 he brought out a revised illustrated edition, including philosophical commentaries collected out of "sundrie Authors"—Plato, Apollodorus, Strabo, Plutarch, Lucian, Cicero, Pliny, Macrobius, Eusebius, St. Augustine, Fulgentius, Geraldus, Pontanus, Scaliger, and many others—and also a translation of Book I of Virgil's *Aeneid*. On this work, composed in remarkably compressed heroic couplets, his poetic fame largely rests; the 1632 edition has been described as the greatest repository of allegorized myth in English. Dryden (who called him "the ingenious and learned Sandys, the best versifier of the former age," and who commended his ability to give his verse the same turn as the original) and many later poet-critics have attested its value. In his compression, latinization of syntax, and balanced antithesis, he prepared the way for the heroic couplet of Dryden and Pope (who praised him as "one of the chief refiners of our language"), and his versions of, and commentary upon, classical myth were to be a valuable source for Keats.

On returning from Virginia, Sandys was made a gentleman of the king's privy chamber, and became one of the group of courtier-scholars and poets who gathered round Lord Falkland (*q.v.*), with whom he shared an interest in theological debate. His later works, less well known than the *Metamorphoses*, include *A Paraphrase upon the Psalmes of David* (1636), which includes Sandys' own finest original poem, a hymn to the Redeemer recounting with dignity and sincerity his own experiences of God's mercy and grace; *A Paraphrase upon the Divine Poems* (1638) in a variety of metres, which adds passages from Job, Ecclesiastes, and Lamentations to the psalms (here set to "new tunes for private devotion" by Henry Lawes, *q.v.*) and "hymns dispersed through the Old and New Testaments" of the 1636 edition; a translation of Grotius' *Christus Patiens* as *Christ's Passion* (1640); and *A Paraphrase upon the Song of Solomon* (1641), which contains some of Sandys' most sensuous and lyrical verse. Sandys' last years were spent in London, in Oxfordshire with the Falkland circle at Great Tew, and in Kent with Sir Francis Wyatt at Boxley Abbey, where he died in March 1644, being buried at Boxley Church on March 7.

BIBLIOGRAPHY.—*The Poetical Works of George Sandys,* ed. by R. Hooper, 2 vol. (1872), which does not include the *Metamorphoses. See* also Fredson Bowers and R. B. Davis, *George Sandys: a Bibliographical Catalogue* (1950); R. B. Davis, *George Sandys, Poet-Adventurer* (1955). (RI. B. D.)

SAN FERNANDO, a naval station of southern Spain in the province of Cádiz, on a rocky island among the salt marshes which line the southern shore of Cádiz Bay. It is linked with Cádiz by road (9 mi. [14 km.]) and by rail. Pop. (1960) 52,389. To the east is a Roman bridge, rebuilt in the 15th century after partial demolition by the Moors. To the northeast is the arsenal or dockyard of La Carraca, founded in 1790 with the name Villa de la Real Isla de León. The *Cortes,* which met at Cádiz in 1810 during the War of Independence, subsequently changed the name to San Fernando. The town has establishments of the naval department, and to the west is the astronomical observatory dating from the 18th century. In the neighbourhood salt is produced and stone is quarried, and there are some light industries. (M. B. F.)

SAN FERNANDO, a town and port of Trinidad, lies at the western end of the central range of hills on the flat, shallow coast of the Gulf of Paria, 32 mi. by rail and 35 mi. by road from Port-of-Spain. Pop. (1960) 39,830. San Fernando is Trinidad's second largest town and its chief function is that of an administrative and trading centre for the southern half of the island. Originally the area of the town was part of a grant of land made to Isidore Vialva in 1786. The subsequent owner sold a large number of building lots, which formed the nucleus of the old town.

In 1818 the town was destroyed by fire and the rebuilding caused such an expansion that in 1846 San Fernando acquired a town council as well as its present boundaries. It became a borough in 1853. (D. L. N.)

SAN FERNANDO (SAN FERNANDO DE APURE), capital of Apure State in central Venezuela, occupies a site on the south bank of the Apure River near the mouth of the Portuguesa River, 185 mi. (300 km.) S of Caracas. Pop. (1961) 24,443. The city is one of the three major river ports of the llanos (*q.v.*), being a port of call for steamers on both the Orinoco and the Apure. Live cattle, beef, cattle and alligator hides, and egret feathers are the city's most important products. Because San Fernando is not reached by railway and has unsatisfactory highway facilities, it ranks high as an air traffic centre. The city was founded in 1789 by Capuchin missionaries. (L. WE.)

SAN FRANCISCO, a city and port of California, U.S., co-extensive with San Francisco county, is centrally located on the California coast about 350 mi. (560 km.) N.W. of Los Angeles. It is the cultural, maritime, financial and trading centre of a densely populated metropolitan area.

PHYSICAL CHARACTERISTICS

Covering the tip of the southernmost of two peninsulas which guard the Golden Gate (*q.v.*) between the Pacific ocean and San Francisco bay, the city commands one of the world's finest land-locked harbours. Around the bay is a band of contiguous metropolitan subcentres. Inland lie the rich valleys and metropolitan zones which are linked geographically and economically to the bay area. Heavily traveled sea and air lanes make San Francisco the major U.S. Pacific coast port and the gateway to the orient.

From the ocean to the mid-line of the bay, the city controls 93.1 sq.mi., 47.6 on land. It is hilly with Telegraph, Nob, Russian and other hills rising almost from the water's edge; Twin Peaks, Mt. Davidson and Mt. Sutro stand more than 900 ft. high. San Bruno mountain (1,314 ft.) is just south of the city line. Encircling the bay, ridges of the Coast range rise from about 1,200 ft. to such peaks as Mt. Tamalpais (2,604 ft.), on the northern Marin peninsula; Mt. Diablo (3,849 ft.), east; and Mt. Hamilton (4,223 ft.), well south. The foothill vegetation varies from rich groves of redwood (*Sequoia sempervirens*) to oak, chaparral and grass. In some places, large stands of eucalyptus were planted in modern times. Green in winter and spring, golden brown in summer and autumn, marked irregularly by the deep blue of the trees, the hills are a dramatic amphitheatre for the bay.

San Francisco Bay.—Geologically, the bay is a drowned valley which drains the great central basin of California. The Golden

Gate, the outlet carved by an ancient river before the valley was inundated, is 1 to 1.7 mi. wide and about 3 mi. long. The bay varies from 5 to 12 mi. in width and stretches its two arms northeast about 41 mi. through San Pablo bay, the Carquinez strait, and Suisun bay; and south about 35 mi. The total surface area is approximately 400 sq.mi. Although the bay is 352 ft. deep in the Golden Gate channel, and from 100 to 140 ft. deep in the centre, about 70% of it is no more than 18 ft. in depth. At its northeastern extremity, the confluence of the Sacramento and the San Joaquin rivers passes through Carquinez strait, and numerous small streams descend from the surrounding hills.

Seven highway and two railroad bridges span the bay. Across the southern arm, a railroad bridge and two highway bridges were built in 1927 and 1929. The double-tiered bridge with two main spans of 2,310 ft. each across the central bay between San Francisco and Oakland, and the spectacular suspension bridge with a span of 4,200 ft. across the Golden Gate were completed in 1936 and 1937, at costs of more than $77,000,000 and $35,000,000, respectively. A bridge across San Pablo bay was built in 1956, and a matching span to an older bridge at Carquinez strait was completed in 1958. With its completion, ferry service on the bay ended after a century of operation. A bridge between Benicia and Martinez opened in 1963. Suisun bay is crossed by a railway bridge.

Several islands are within the bay. On Alcatraz, 12 ac. of rock just inside the Golden Gate are a 214-ft. lighthouse and the buildings that were used (1934–63) for a federal prison. Farther inside the Gate, Angel Island, the largest in the bay, rises 771 ft. above sea level; on it is old Ft. McDowell. Yerba Buena (formerly Goat Island) and adjacent Treasure Island (built by fill for the 1939 Golden Gate International exposition) are about in the bay's centre. The first anchors the San Francisco-Oakland bridge midway in its course; the second is the site of a naval training centre. Extending to the bay are two main valleys, the Santa Clara from the south and the Sonoma from the north. East of the ridges, more extensive valley systems open upon the delta and sedimentary lands of the central valley of California.

Climate.—San Francisco's climate is mild, cool and even. The annual mean temperature is 56.5° F., with an annual mean minimum of 50.4° F. and an annual mean maximum of 62.6° F. The average daily temperature range is but 12.2° F. The ocean's proximity produces not only equable temperatures but bracing breezes and a cooling fog. The annual mean wind velocity is only 9.1 m.p.h., and the city enjoys sun during 66% of the possible sunlight hours. Precipitation consists entirely of rain, the mean annual fall being 20.51 in., mostly from November through March. The relative humidity is 73%, ranging monthly from 69% (Nov.) to 80% (Aug.). Greater climatic variation occurs in the surrounding metropolitan region. Some valley points are notably warmer and dryer, while on the leeward slopes of the ridges greater precipitation and wider temperature ranges are encountered. Variability in rainfall characterizes the entire area, changes as high as 100% from year to year being not infrequent.

HISTORY

Inhabited by the Penutian linguistic family of Indians, the San Francisco area was unknown to Europeans until the late 18th century. From the 16th century onward the Spanish, who claimed California, had sailed along the coast without discovering the bay's entrance, although they had charted the Farallon Islands offshore. Sir Francis Drake, in 1579, had also sailed past the Golden Gate, anchoring briefly in a cove (Drake's bay) a few miles north. Rumours of Russian overseas expansion, however, stirred the Spanish into an effort to establish permanent control over Upper California. To that end Gaspar de Portolá (*q.v.*) led a party northward from San Diego during the summer of 1769. The expedition passed Monterey bay, its intended destination, without recognizing it, and continued northward until a scouting party under José Francisco de Ortega sighted San Francisco bay from the hills of the southern peninsula. Three years later, another party explored the region more thoroughly, and in 1775 the vessel "San Carlos," piloted by Juan Manuel de Ayala, sailed into the bay.

Early the following year, Capt. Juan Bautista de Anza selected a site for a permanent colony on the bay. Lieut. José Joaquin Moraga and Father Francisco Palóu, leading a band of settlers and soldiers from Monterey, then established a presidio (Sept. 17, 1776) and the Mission San Francisco de Asís (Oct. 9, 1776). The mission was soon more familiarly called for the stream near which it was situated, Mission Dolores. Beside a shallow cove inside the Golden Gate, the colonists settled in the pueblo of Yerba Buena (named for the "good herb," an aromatic vine growing on the sand dunes). In 1777 Father Junípero Serra (*q.v.*), founder of the Upper California missions, visited the new colony. Within a few years a group of six missions was located in the region which, 150 years later, comprised the modern San Francisco metropolitan area.

For a half-century, the small outpost led an isolated existence. Beginning in 1806, however, Russia spread its fur-trading activities into the area, unsuccessfully at San Francisco and with moderate success after 1812 at Fort Ross, about 75 mi. N. The Russian venture, which ended in 1841, was the forerunner of increasingly frequent visits from traders in hides and tallow, whalers and, by 1840, explorers, fur hunters and merchants. Meanwhile, Upper California became a province of Mexico (1825), and San Francisco

bay was made a Mexican port of entry (1835). In the same year, the United States attempted to buy the bay from Mexico, after traders and whalers had reported the commercial possibilities of the area.

With the outbreak of war between Mexico and the United States on May 13, 1846, a new era began. North of the bay at Sonoma, the insurgents of Capt. John Charles Frémont (*q.v.*) raised the "Bear Flag" of an independent California, and on July 9, 1846, Capt. John B. Montgomery in the sloop of war "Portsmouth" entered the bay, hoisted the Stars and Stripes in the plaza, now known as Portsmouth plaza, and claimed the territory for the United States. On Jan. 30, 1847, the pueblo was renamed San Francisco. It was incorporated in 1850. Even without the political stir which this turn of history produced, the moment was propitious for change. By the mid-1840s, immigrant parties were struggling across the Rockies, bound for Oregon and California. However, the discovery of gold on the American river at Coloma in Jan. 1848 produced social and economic results overnight which no mere shift of political fortune could have produced in decades.

Within three months, San Francisco was almost deserted, its residents off to the mother lode country. Then, in Feb. 1849, fortune hunters from all over the world crowded into the town. Deserted ships choked the bay. Shacks and tents, mire and dust, fantastic prices and a spate of gambling, drinking and vice appeared ashore. While gold fever was acute, many people in the city were transients. An increasing number, however, stayed to provide equipment, supplies and capital to the prospectors. Maritime enterprises, of course, flourished from the start. Merchants extended wharves out toward deep water. More improvements followed the transfer of harbour management from the city to a state board of harbour commissioners in 1863. Between 1877 and 1914, a great stone wall was built well outside the early waterfront; the bay was filled in behind it; and out from it finger piers were projected. Sardine fishing began in the 1850s, followed soon by shrimp fishing and, on the Sacramento river, salmon fishing. Whalers based their operations at San Francisco more and more, and the bay was one of the world's most important whaling bases between 1885–1905. Oyster beds were planted in the bay after 1870.

Inland shippers busily covered the bay and built up river ports at Sacramento and Stockton. Shipbuilding and repair works rose at numerous points. The first dry dock was built in 1851; the Union Iron works launched the first steel ship built on the Pacific coast in 1885. Overseas trade thrived. Exports of $8,500,000 in 1860 had increased sixfold by 1890, a period which saw the fast grain clippers give way to the more prosaic freighter fleets plying with monthly regularity to the orient (after 1867), Hawaii (after 1878), Australia (after 1885), and Europe (after 1899).

As a trading centre, the city increased its range significantly after the first transcontinental railroad was completed in 1869. By then, its commerce and local industries were firmly founded upon the rich resources of central and northern California. Food processing, meat packing, flour milling, lumber milling, woolen textile, tanning, iron foundries and implement manufacturing establishments appeared in the 1850s. Sugar refining, smelting and refining of minerals, and a wide variety of fabricating industries developed in the 1860s. By 1870, the value of manufactured goods exceeded $22,000,000 and 20 years later manufacturing products had multiplied in value to $120,000,000.

In contrast to this steady development, the city's financial growth was spectacularly unstable. Connected to the risks of gold mining in the 1850s, the heavily capitalized silver mining of the 1860s, and the vast railroad construction projects, and to speculative land development, San Francisco capital not only sustained long-term growth in the entire west, but provided some of the most acute fluctuations in banking and stock exchange in U.S. history.

Periodic panics wiped out fortunes; new waves of optimism and economic growth built them up again repeatedly. The city remained the centre of regional finance, however, and, with the more stable fiscal practices enjoined by national and state legislation in the 20th century, it increased its preeminence and security in this economic domain.

Political and social turbulence matched economic growth. Vicious gangs nearly overwhelmed the early city until they were forcibly suppressed by citizen vigilance committees on two occasions in the 1850s. Demagoguery often swept the city in the 1860s and 1870s, sometimes mixed with demands on behalf of the working class or based on hostility toward Chinese labourers who, having been brought to work on the railroads, drifted into San Francisco. Reform programs in government intermittently succeeded careless or corrupt administration. A notable outburst of public indignation early in the 20th century gave rise to a series of trials of public officials and ushered in the more businesslike governments of the modern period.

Swept repeatedly by fire in the early days, the more substantially built city of the later 19th century spread back from the water front onto the hills. A few early architectural landmarks survived into the 20th century, including a sober Greek Revival mint and a dignified block of offices. The Victorian fantasies and eclecticism of mansions on Nob hill and hotels and offices in the commercial centre reflected the opulence and confidence of the period.

Rapid introduction of technological improvements testified to the open physical structure of the ambitious city. Steam and horse-drawn street railroads appeared in the 1860s; these were replaced by street cars (in 1900; discontinued in 1963) and, on the hills, by cable-drawn cars (introduced by Andrew S. Hallidie in 1873), which continued in use in the 20th century. After the turn of the century, rail transportation to outlying districts and nearby villages provided means for daily commuting. The telegraph was introduced in 1853, the telephone in 1877, gas lighting in 1854 and electric lighting and power after 1876.

Cultural growth accompanied the improvement of economic and physical resources. Numerous educational institutions arose in the latter half of the 19th century. The city had welcomed the theatre and opera as early as 1849 and enthusiastically supported them thereafter. Symphony performances became annual occurrences after 1874, receiving public funds in 1911. In the sciences and arts, appropriate associations appeared in 1853 and 1871, respectively. In journalism, the *Alta California* (est. 1849) outlived many fugitive papers until its own demise in 1891, while the 20th-century *San Francisco Examiner, Chronicle* and *Call-Bulletin* (merged with the *News* in Nov. 1959 to become the *San Francisco News-Call Bulletin*) dated from the mid-1860s.

Earthquake and Reconstruction.—If the results of a city's early growth are measured not only by absolute achievement but by recuperative vitality, San Francisco met and passed the most severe of tests in 1906. The city had experienced earthquake disturbances in 1864, 1898 and 1900, but on April 18, 1906, a violent earthquake, followed by fire, demolished most of its central business and residential districts. (*See* EARTHQUAKE: *Great Earthquakes: California* [*1906*].) Hundreds were killed or injured. Homeless residents camped in thousands on the dunes west of the city, while others fled to outlying towns (incidentally giving impetus for 20th-century suburban growth). The loss in buildings was estimated to be more than $100,000,000, while the total property loss was believed to be well over three times as much. Within a short time, relief shipments of food and clothing reached the city, and some $10,000,000 in financial aid came from Europe and America. Although insurance payments in the neighbourhood of $300,000,000 were forthcoming, the long task of reconstruction was sustained by local courage and persistence. Much of the city was rebuilt to be earthquake and fire resistant, and new plans for civic development made headway as the debris of the old city vanished. In 1915 San Francisco invited the world, with pardonable pride, to see the results of its efforts at the Panama-Pacific International exposition.

The opening of the Panama canal, celebrated by the aforementioned exposition; westward expansion of American population; and the continual agricultural and industrial gains in California all stimulated steady metropolitan centralization in the 20th century. War industry in the second decade, and general, diversified growth in the third brought the city's population to more than 500,000. Static during the world-wide depression of the 1930s, San Francisco thereafter entered a new period of metropolitan history—the development of a regional metropolitan complex of which the city was the heart, not the whole; and the explosion of the city not so much by internal growth as by the rapid rise of contiguous, peninsular or trans-bay urban communities.

Change at Mid-20th Century.—San Francisco was the scene of the historic conference, April–June 1945, at which the charter of the United Nations was promulgated. The peace treaty with Japan was signed there in 1951.

Nineteenth-century San Francisco had been the unrivaled urban centre of an agricultural region. During the 20th century it became a city of international rank, and the principal, but not dominant, star in a metropolitan galaxy. It retained leadership in many social, economic and cultural activities. But the remarkable growth of population, economic institutions and cultural centres elsewhere in the bay metropolitan area was the most prominent change of the era. The quality of leadership, rather than the quantity of activity and resources, became the basis on which San Francisco retained its traditional role of pace setter and lodestone of the west.

POPULATION

Rich agricultural valley regions support the concentrated urban life of the bay area and give rise to notable inland metropolises: those of San Jose, 45 mi. S.; Sacramento, 80 mi. N. on the Sacramento river; Stockton, 50 mi. E. on the San Joaquin river; and Fresno, 160 mi. S.E. Though self-sustaining, these are integrally related to the San Francisco-Oakland standard metropolitan statistical area of 2,486 sq.mi., with a population of 2,648,762 in 1960, and which comprises Alameda, Contra Costa, Marin, San Francisco and San Mateo.

San Francisco has almost one-quarter of the population (740,316 in 1960) of the metropolitan area which includes Oakland, Berkeley, Alameda across the bay to the east; Richmond, Martinez and Pittsburg to the northeast; San Rafael, Mill Valley and Sausalito to the north; and a string of suburbs extending down the peninsula to the south—South San Francisco, Pacifica, San Bruno, Burlingame, San Mateo, Redwood City, Menlo Park and Palo Alto. (For comparative population figures *see* table in CALIFORNIA: *Population.*) With its historical priority, and its advantageous westerly site on the bay, the city is the heart of the entire complex of urban and regional development of the central Pacific coast. Through finance, commerce and shipping its influence is extended still further.

Social Characteristics.—After a century typified by population gains of more than 20% per decade, San Francisco by 1960 appeared to be approaching its maximum size, while the remaining cities and counties of the metropolitan area were experiencing remarkable growth. Oakland, half as large as San Francisco, was the next largest city of the bay area. The population of San Francisco, like that of the area, was predominantly white in 1960. Foreign-born and oriental peoples were relatively more numerous in San Francisco, however. Added to the indigenous inhabitants of foreign extraction, they gave the city a pronounced cosmopolitan atmosphere; citizens of Italian and Chinese descent were numerous. In total, but not among native-born white and Negro residents, slightly more men than women lived in the city; in the area, the same relationship prevailed except among Negroes, where it was reversed. The city population was much more dense and more mobile, somewhat older and more heavily weighted in upper income brackets than that of the area. However, the higher proportion of home owners in the metropolitan area was notable; ribbons of new houses encircled the hills and frantic programs of school construction had been undertaken in the suburbs, whereas the city was especially involved in projects to construct automobile freeways, parking centres and downtown office and public buildings. Reflecting this difference of emphasis was the heavy daily volume of traffic, especially automobiles, carrying commuters to and from San Francisco.

GOVERNMENT

San Francisco's five charters were granted respectively in 1850, 1856, 1861, 1898 and 1932. Initiative and referendum clauses were first included in the 1898 charter. Under its 1932 charter, San Francisco has a consolidated city and county government in which the mayor, certain executives, the judiciary and the 11-member board of supervisors are elected. The mayor appoints the city's chief administrative officer and a variety of administrative boards, including police, utilities, civil service and planning. Water supply, based on the Hetch-Hetchy system of dams and reservoirs, and a surface public transportation system are municipally owned; gas and electricity are supplied through private enterprise.

Peculiar to the mid-20th century were complex intergovernmental relationships involving the city with many overlapping county and community agencies, as well as with state and national institutions. Within the nine-county San Francisco bay area there were almost a thousand local governmental units, including more than 100 city governments, more than 200 school districts with elected boards, and approximately 600 special districts; of these special districts, about half were headed by elected commissions or boards, while the remainder were governed by the supervisors of the various counties. There was also a scattering of local authorities established for housing or urban redevelopment and renewal purposes.

In addition to these local units, a number of quasi-political boards with metropolitan area scope were developed, in order to coordinate local attacks on regional problems such as transportation, air pollution, waste disposal and economic resource development. In the majority of cases, these authorities were creatures of the state legislature in Sacramento. Some of them, such as

the San Francisco-Oakland Toll Bridge Authority, were set up as administrative agencies, but a large number were primarily concerned with study and planning, usually in specific areas; thus the Bay Area Transportation Study was designed to meet the need for overall highway planning within the area, and the San Francisco Bay Conservation and Development commission, in addition to some minor licensing functions, was charged with preparing a plan for the development of the bay itself. The Association of Bay Area Governments, of which the various local governments were members, was in charge of comprehensive planning within the area, but it had little actual authority. This fragmentation of governmental responsibility and the separation of active authority from the planning function, not unusual in large metropolitan areas of the United States, served to inhibit efforts to deal with the area's problems in a coordinated manner. Furthermore, although San Francisco exercised leadership in a number of metropolitan area enterprises, it no longer had independent control over many problems of vital concern to it.

Foreign consulates and branches of national and state political agencies are located in the city. Both the navy and the army maintain important headquarters.

Finance.—As the financial and insurance centre of the west, San Francisco's position grew far more rapidly than its population in the middle decades of the 20th century. In the Federal Reserve system (12th district headquarters), the city's banks ranked high in the nation in volume of transactions, debits and clearings. There are 15 banks (several with branches), including the headquarters of one of the world's largest, and 13 savings and loan associations. By the 1960s deposits, resources and clearings attained figures above $13,000,000,000, $15,000,000,000 and $33,000,000,000, respectively, having increased by about 300% after World War II. More than half the insurance companies authorized to transact business in California have their headquarters in San Francisco. The nearly 700 carriers and 20 insurance associations received a total of more than $2,000,000,000 in premiums and paid about $900,000,000 for losses annually. The San Francisco Stock exchange, which became part of the Pacific Coast exchange in 1957, listed transactions averaging $400,000,000. The San Francisco Mining exchange trades in millions of shares annually.

ECONOMY

The economic prosperity of San Francisco was founded on its maritime trade and its proximity to diversified resources. It is a great cosmopolitan seaport, the commercial and distributing centre for inland California and the financial hub of the western United States.

Commerce.—In the 1960s, San Francisco bay was sixth in importance as a U.S. port, and twice as active as any other on the Pacific coast. The water front (the Embarcadero) is state-owned and operated and has 1,912 ac. of harbour facilities, but port developments at Oakland, Richmond and Mare Island reduced its earlier relative eminence in the bay. However, its U.S. customs receipts annually account for more than 30% of Pacific coast export and import tariffs. A World Trade centre was opened in 1956. Coastal and other domestic traffic accounted for about two-thirds of the port activity. In foreign trade, commerce with Asia and the Pacific area took the lead; second, in imports, was trade with eastern South America (especially Brazil), and, in exports, Europe. The totals of both had increased by more than 50% since 1950. Vegetable food products, machines, textiles and vehicles were the chief export items; foodstuffs (especially coffee and sugar) and petroleum were the major import items.

As a wholesale centre, San Francisco's activity comprised over half of that in the bay area, with annual sales about $5,000,000,000. The principal items handled were machinery and equipment, foodstuffs, apparel and electrical products. For the metropolitan area, petroleum products distributed from the east bay refineries were far more important than for San Francisco, as were automotive products and construction materials. In the 1960s San Francisco's retail establishments sold approximately $2,000,000,000 of goods annually. Food, general merchandise, apparel and automobiles led in both San Francisco and the area, the former's share and growth in the trade approximating its share and growth in the population.

Industry and Labour.—By the 1960s, although San Francisco's historical lead in industry remained dominant in comparison to any other bay city, its industrial and labour strength had declined relatively from one-half to one-third that of the whole metropolitan area. The latter's economy was given tremendous impetus by World War II. Some evidence existed that declines of the late 1940s and early 1950s in the number of San Francisco industrial establishments and employees were accompanied by higher productivity and value added by manufacturing; reductions of about 20% in the former were balanced against increases of about the same amount in the latter. In both, however, the area as a whole recorded gains of from 30% to 50%. Leading products included foods and beverages, apparel (for San Francisco, principally), furniture and fixtures, chemicals, petroleum, and fabricated and primary metals (for the area), as well as machinery and equipment.

San Francisco's labour force in the 1960s was equal to about half its population. It was highly organized and relatively heavily weighted with technically trained, skilled and semiskilled workers. It comprised about 35% of the metropolitan area force. Women workers were relatively less numerous in the area than in San Francisco, finding employment in clerical, service, domestic and professional categories especially.

Transportation and Communication.—Serving the bay area and terminating in San Francisco are: 4 class-1 railroads connecting to 7 transcontinental routes; more than 100 truck lines; 2 transcontinental bus lines; and, at the International airport (opened 1954) south of the city, overseas and domestic airlines, as well as local and air freight lines. About 250 air and marine shippers have San Francisco offices. The great bridge system and the automobile freeways built in the 1940s and 1950s—and still expanding—were key forces in both the growth and the internal shifts in activity within the metropolitan area. Vast increases in automobile and truck movements precipitated serious problems of city parking and traffic flow, as well as safety and air pollution.

In the early 1950s study was begun on the possibility of constructing an integrated high-speed rapid transit system for the San Francisco bay area. The aim of the planners was to provide an attractive alternative to commutation by private automobile, thereby relieving the overburdened freeways. In 1962 the voters approved a $792,000,000 bond issue, which would provide most of the financing for the project; the remainder of the estimated $1,000,000 cost was to come from automobile tolls on the area's bridges and from the federal government, which agreed to underwrite much of the research and development work. Scheduled for completion in 1971, the Bay Area Rapid Transit (BART) system was to consist of approximately 75 mi. of elevated and subway lines linking San Francisco, Alameda and Contra Costa counties. The system would use lightweight electric trains, computer-operated and capable of traveling up to 80 m.p.h. It was hoped that eventually the system might be extended to include other bay area counties. BART was the first entirely new urban rapid transit system to be constructed in the United States since the opening of the Philadelphia subway in 1907, and as such it was being watched closely by city planners and others concerned with urban transportation problems.

In air and maritime traffic, city and area growth was reflected by gains of more than 100% between 1950 and 1960. The fact that rail freight movements in and out of the city remained about level in the same period reflected changes in the economic relation of San Francisco to the rest of the metropolitan area, as well as technological changes in transportation.

As a communications centre, San Francisco is the trans-Pacific headquarters of five radio systems and western headquarters for all telephone and telegraph networks. Military, naval and aeronautical headquarters and communications grids are located in the city.

There are nine standard and five frequency modulation radio stations, and four television stations, leading the area in these media of communications and entertainment.

EDUCATION AND CULTURAL ACTIVITIES

From its early days, San Francisco's concern with education was vigorous and area wide. It passed its first public school law in 1851. A century later there were 120,000 students enrolled in the public schools of the city. An additional 30,000 pupils were in Catholic and Protestant schools. About 40,000 more were students in the colleges and universities in or near San Francisco. Nearly 40,000 men and women were participants in various forms of adult education.

In higher education, St. Ignatius' college (Roman Catholic) was chartered in 1855 and rechartered in 1930 as the University of San Francisco, St. Mary's college (Roman Catholic, later moved to Oakland and, finally, to St. Mary's College) in 1863. Mills college (founded 1852) for women moved from Benicia to Oakland in 1871. The site of the University of California, a land-grant institution, was selected in Berkeley in 1857; and in 1855, at Palo Alto, Leland Stanford, California's Civil War governor and one of the "Big Four" in railroad development, began building the university he named as a memorial to his deceased son, Leland Stanford, Jr. Within the city, in addition to the University of San Francisco, are San Francisco State college (1899), San Francisco College for Women (Roman Catholic, 1930, formerly College of the Sacred Heart at Menlo Park, 1898), City College of San Francisco (1935, a two-year public junior college) and the San Francisco Art Institute college (established as School of Design, 1874). Important branches of the University of California, including the medical centre and Hastings college (law) are also located in the city. Extension programs of the colleges and universities, and public adult education programs engaged an increasingly large number of residents.

A CORNER OF CHINATOWN, WITH CALIFORNIA STREET CABLE CAR CROSSING GRANT AVENUE

The city's 19th-century cultural history was distinguished in literature. Among its writers in the 1860s and 1870s were Samuel L. Clemens (Mark Twain), Bret Harte, Joaquin (Cincinnatus Heine) Miller and Henry George; followed by George Sterling, Gelett Burgess, Ambrose G. Bierce, Edwin Markham, Hubert H. Bancroft, the historian, and the turn-of-the-century naturalistic novelists Jack London and Frank Norris.

Early San Francisco theatres and concert halls were important centres of western American culture. They continued to flourish in the 20th century. Though dependent upon New York for its road shows, San Francisco's numerous professional and amateur little theatres are distinguished and lively. Annual opera and symphony seasons of first quality; continuous art exhibits at public and private galleries; touring concert artists and ensembles—as well as motion pictures and television—maintain a varied cultural program unequaled elsewhere in the metropolitan area.

In the mid-20th century, San Francisco and its neighbouring cultural centres continued to foster the creative arts. Novelists such as Walter Clark, Wallace Stegner, George Stewart, Mark Harris and Arthur Foff; poets such as Yvor Winters, Josephine Miles, Kenneth Patchen and Kenneth Rexroth; and critics such as Mark Shorer were active. Many were on the faculties of bay area colleges and universities. From jazz to serious composition (*e.g.*, Darius Milhaud on the Mills college faculty) in music, in sculpture (Beniamino Bufano) and in painting and design, San Francisco's artists earned recognition for experiment, sharing attention with artists in such other centres as Sausalito on the Marin peninsula.

BUILDINGS, STREETS AND PARKS

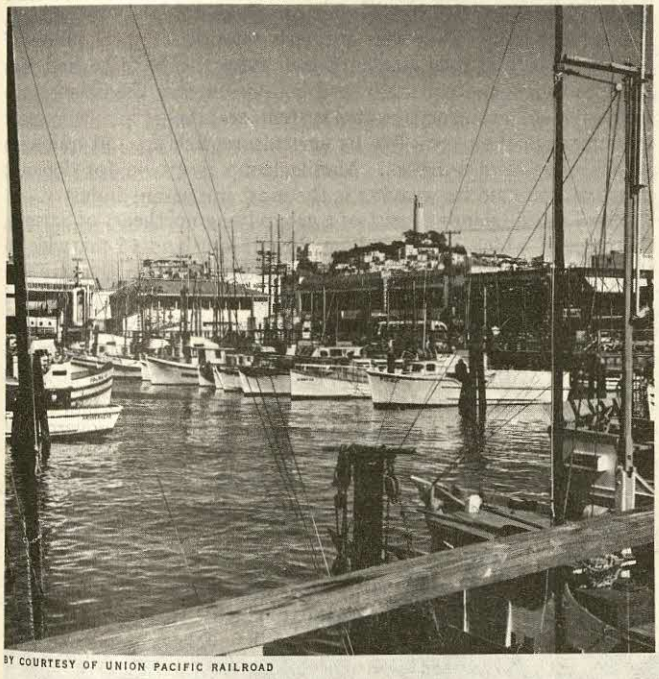
In its public and domestic buildings, San Francisco reflects all the prominent architectural styles of the later 19th century and modern periods. A distinguished group of 20th-century Renaissance classic buildings in the civic centre includes the city hall, public library, auditorium and state building. Elsewhere, a notable example of the mid-19th-century Greek Revival is found in the building formerly housing the U.S. branch mint. The California Palace of the Legion of Honour, overlooking the Golden Gate, is a replica of the Palace of the Legion of Honour in Paris. Reflecting Victorian and early 20th-century eclecticism are numerous homes originally designed for wealthy 19th-century business and financial leaders; the Palace of Fine Arts near the Presidio (a U.S. military reservation of 1,542 ac., which includes Ft. Winfield Scott and Letterman General hospital); the post office; the Hall of Justice; the Ferry building built by the state in 1896, 659 ft. long and 156 ft. wide; and the outstanding churches of the city. Notable examples of contemporary design include the V. C. Morris store (Frank Lloyd Wright); the Maimonides Health centre (Eric Mendelsohn); and the Crown Zellerbach office building.

San Francisco churches include the historic Mission Dolores, Grace cathedral (Episcopalian), an unfinished gray stone building of modified Gothic design, and St. Patrick's church, an example of early Gothic architecture which was rebuilt in 1906 after Old St. Patrick's (1854) was destroyed by fire. St. Mary's Cathedral of the Assumption (seat of the Roman Catholic diocese) is a large red brick German Gothic structure completed in 1894, while Old St. Mary's church (Paulist fathers) in Chinatown dates from 1853. The SS. Peter and Paul church (1924) serving the Italian community is of Romanesque design. Temples Emanu-el and Sherith Israel are the San Francisco centres of Reform Judaism; the unique Kong Chow and Tin How temples are monuments to the pioneer Chinese.

Recreational facilities are provided by more than 50 parks and numerous recreational units. The parks and the several government reservations account for an aggregate of about one-ninth of the city's area. All of San Francisco's parks are man-made. The Golden Gate park, in the midst of residential districts, comprises 1,017 ac. and is about 3 mi. long and ½ mi. wide, extending from Stanyan street on the east to the Pacific ocean on the west. In

the park are the De Young Memorial museum, Academy of Sciences, Steinhart aquarium, the Museum of Anthropology, an aviary, music temple, stadium, tennis courts, baseball and football grounds, bridle paths, an athletic field and running track, paddocks and children's playgrounds. Improved driveways in the park exceed 25 mi. in length. At the western end of the park is to be seen the sloop "Gjoa," the first vessel to navigate the northwest passage; it was given to San Francisco by its owner, Capt. Roald Amundsen. The Fleishhacker Playfield and Zoological gardens are set in a landscaped area of a small valley. The city is the home of the national professional football team, the San Francisco Forty-niners, and, since 1958, of the National league baseball team, the San Francisco Giants.

San Francisco's street system was begun in 1835 when Calle de la Fundación, or Foundation street, was laid out. The first survey, made in 1839, covered what is now the financial and retail sections of the city. Other streets and avenues were gradually added until 1845 when Jasper O'Farrell made a second survey. This system applied the "checkerboard layout," with Market street the main artery and division point.



BY COURTESY OF UNION PACIFIC RAILROAD

FISHERMAN'S WHARF WITH TELEGRAPH HILL IN THE BACKGROUND

The streets north of Market run north and south and east and west; the streets south run parallel and at right angles to Market street. The Market street slant is about southwest and northeast. Among the scenic boulevards are those in the Marina, Twin Peaks and the Market street extension districts, including the Lincoln, Embarcadero and Great Highway paralleling the ocean.

San Francisco's Chinatown, the largest Chinese settlement outside the orient, comprises an area paralleling Grant Ave. between Bush St. and Columbus Ave. The "town" is hedged in by the financial, hotel and apartment house districts and a part of North Beach, where once the riotous "Barbary Coast" gave both colour and notoriety to the city. The Latin Quarter, where many artists and colonies of Italians, French, Spanish and Portuguese reside, centres on Telegraph and Russian hills. Fisherman's wharf is the picturesque home of the fishing fleet and is renowned for its sea-food restaurants. Beaches, peninsular camping and picnic grounds, and other recreational facilities are within easy motoring distance.

SAN GABRIEL, a city of California, U.S., 9 mi. E. of Los Angeles and a part of the Los Angeles standard metropolitan statistical area, is famous as the site of the fourth Franciscan mission in the settlement of the region. Founded in 1771, the well-preserved mission (dating from 1775) owes its massive style of architecture to Father Antonio Gruzado, who modeled the church after a fortress of his native Andalusia. The first settlement was composed of Indians and their mission guardians who engaged in agriculture until 1834 when the Mexican government took over the lands. After years of confusion, during which California became part of the United States, the mission lands passed almost completely into private ownership. This second community was made up of wheat farms, cattle ranches, vineyards and citrus groves. Modern San Gabriel, incorporated in 1913, is a residential town whose inhabitants work mostly in neighbouring Alhambra and Los Angeles. It has a council-manager form of government, in effect since 1943. For comparative population figures *see* table in California: *Population.* (J. A. Sz.)

SANGALLO, the name of a family of Italian Renaissance architects and military engineers active in Florence and Rome.

Giuliano da Sangallo (1445?–1516), who worked for the Medici in Florence and built their villa at Poggio a Caiano in 1485. His masterpiece is a church of Greek cross plan, the Madonna delle Carceri in Prato (1485–91). Strongly influenced by Filippo Brunelleschi, it is the purest, most classic expression of that style of 15th-century architecture. In Rome Giuliano was overshadowed by Bramante. He designed influential facade projects for S. Lorenzo, Florence, in 1515–16.

Antonio da Sangallo, the Elder (1455?–1534), who often worked with his brother Giuliano but, under the influence of Bramante, became a more powerful designer. In S. Biagio, Montepulciano (1518–29), he created an ideal central church of the High Renaissance.

Antonio Picconi da Sangallo, the Younger (1483–1546), nephew of the two preceding, was trained in Rome under Bramante and became the most influential architect of his time. In 1520 he succeeded Raphael as architect of St. Peter's and held the position until the end of his life. His design, an elaboration of Bramante's, survives in a wooden model. He designed buildings for the Farnese family, including a palace-fortress at Caprarola; his most important work is the Farnese Palace in Rome, begun in 1541. Antonio the younger was an important military engineer and city planner as well as a keen student of ancient architectural remains.

See G. Clausse, *Les San Gallo* (1900–02); G. Giovannoni, *Antonio da Sangallo il giovane* (1959). (H. H.)

SANGER, FREDERICK (1918–), British biochemist awarded the Nobel Prize for Chemistry in 1958 in recognition of his outstanding achievement in determining the structure of the insulin molecule, was born on Aug. 13, 1918. Educated at Bryanston School and at St. John's College, Cambridge, he worked continuously from 1939 on biochemical research at Cambridge. He was a Beit memorial fellow from 1944 to 1951, and thereafter worked under the auspices of the Medical Research Council. In 1951 he was awarded the Corday-Morgan medal and prize of the Chemical Society, and in 1954 was elected a fellow of the Royal Society and a fellow of King's College, Cambridge. At the time of the completion in 1955 of Sanger's ten years' research on the insulin molecule, this was the largest protein molecule to have its chemical structure elucidated. Sanger's discovery opened the road to the determination of protein structure in general, and it was an essential preliminary to the chemical synthesis of insulin by P. G. Katsoyannis and associates in 1964. (W. J. Bp.)

SANGER, MARGARET (1883–1966), founder of the birth control movement in the United States and an international leader in the field, was born in Corning, N.Y., on Sept. 14, 1883, the sixth of 11 children of Michael H. and Annie (Purcell) Higgins. She took nurse's training at the White Plains (N.Y.) Hospital and in 1900 she married William Sanger. Following a divorce she married J. Noah H. Slee in 1922; Slee died in 1948.

As a nurse in the Lower East Side of New York City, Mrs. Sanger saw the coexistence of poverty, uncontrolled fertility, and high rates of infant and maternal mortality. A feminist who believed strongly in every woman's right to plan the size of her family, she devoted herself to the task of removing the legal barriers to the dissemination of information about contraception. In 1914

she was indicted for sending in the mail copies of *Woman Rebel*, a periodical advocating the practice of birth control. The case was dismissed in 1916. Later that year she opened in Brooklyn the first birth control clinic in the United States. She was arrested for "maintaining a public nuisance" and in 1917 served 30 days in the workhouse. In 1929 the Sanger Clinic was raided and the files were confiscated. Doctors, social workers, and others came to her defense and the case was dismissed. These episodes helped to crystallize public opinion in favour of the birth control movement and in November 1936 the application of the federal Comstock "Obscenity" Act of 1873, which classified contraceptive literature and devices as obscene materials, was modified when the United States Circuit Court of Appeals affirmed the right of physicians to prescribe contraceptives ". . . for the purpose of saving life or promoting the well-being of patients."

In 1921 Mrs. Sanger founded the American Birth Control League and served as its president until 1928. In 1929 she organized the National Committee on Federal Legislation for Birth Control. In 1939 the League and the Education Department of Birth Control Clinical Research Bureau united to form the Birth Control Federation of America, which in 1942 became the Planned Parenthood Federation of America. Mrs. Sanger was first president of the International Planned Parenthood Federation (organized in 1953) and devoted much energy to the cause of birth control in the countries of the Far East, especially India and Japan.

Margaret Sanger wrote many books, some of the best known of which were: *What Every Girl Should Know* (1916); *What Every Mother Should Know* (1917); *Women, Morality, and Birth Control* (1922); *Happiness in Marriage* (1926); *Motherhood in Bondage* (1928); *My Fight for Birth Control* (1931); and *Margaret Sanger: an Autobiography* (1938). She died in Tucson, Ariz., on Sept. 6, 1966.

See also BIRTH CONTROL. (C. V. K.)

SAN GERMÁN, a town in the southwestern part of Puerto Rico, is one of the two original settlements established by the Spaniards on the island. Pop. (1960) town 7,790, municipal district 27,667. Founded in 1508 by order of Diego Colón, a son of Columbus, San Germán was repeatedly destroyed by attacks of Indians and French pirates and was moved inland from the exposed seacoast in 1573. The modern town was the seat of government for the western district during several centuries. Along one of the town's plazas stands the Porta Coeli Convent, more than 400 years old and one of the oldest buildings in the West Indies. It is now a museum. San Germán is the home of Inter-American University, a private and fully accredited institution whose campus is built on a series of hills near the town.

Modern highways connect San Germán with Ponce on the south coast and Mayagüez on the west coast. The rural area surrounding San Germán produces sugar and coffee. To the south on the Caribbean coast near the fishing village of La Parguera is a famous phosphorescent bay where the College of Agriculture and Mechanical Arts of the University of Puerto Rico maintains an institute of marine biology and a zoological park. (T. G. Ms.)

SANGIHE AND TALAUD ISLANDS, a group of islands off the northeast coast of Celebes (Sulawesi), Indonesia. Area 712 sq.mi. The population of the islands in 1961 was 194,253, three-fourths of whom lived in the Sangihe group.

The Sangihe Islands continue the northeastern extension of Celebes toward Mindanao, in the Philippines, and are set upon a long, narrow ridge along a volcanic band, with very deep water on either side. Although fringed with recent coral formation, they are distinctly volcanic, Mount Awu (6,050 ft.) on Sangihe Island having experienced recent severe eruptions. Earthquakes also have occurred. Sangihe, Siau, and Tahulandang are the chief islands; Talise and Bangka lie off the north point of Celebes.

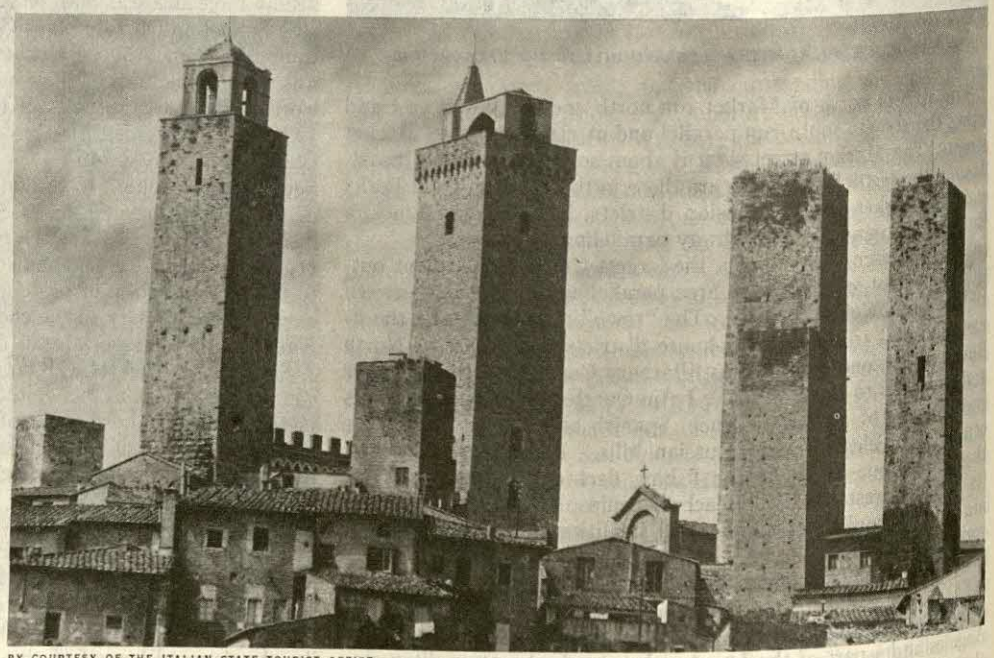
Bangka gives its name to Bangka Strait, the channel from the Celebes Sea to the Molucca Passage. Sangihe is 27 mi. long and from 9 to 17 mi. in width; it is mountainous in the north, its elevation decreasing considerably in the south, and has a coast that is generally steep. The average annual rainfall is 195 in. and, with Siau, it has an exceptionally fertile volcanic soil with extensive cultivation of nutmegs, coconuts, and manila hemp. Tahuna (Taruna), on the west coast, is the capital of the Sangihe Islands. Tahuna and Peta (or Enemawira), on the east coast, are regular ports of call; so are Ulu (Hulu), the capital and port of Siau, and Tahulandang and Talise on the islands of those names. Tahulandang Island has two mountains of 2,500 ft., and Ruang, a small island southwest of Tahulandang, has an active volcano.

The people of Sangihe and Siau are closely related to the people of Minahasa (the northern peninsula of Celebes) and of portions of the Philippine Islands, with fair complexion, high nose, and stiff, short, black hair. They were formerly terrorized by the pirates of Sulu (*q.v.*); but later, under Dutch rule, the Sangihe and Siau islanders advanced culturally and became mostly Christians. Society is based on the matriarchal system, and the people, who speak a language of their own, live by agriculture, fishing, and trading in wood, copra, and nutmegs. Manila hemp is grown for domestic consumption, and its weaving is the most important industry.

The Talaud Islands consist of a group lying northeast of Sangihe, the chief of which is Karakelong, 39 mi. long and 15 mi. wide, in the north. Heights of 2,300 ft. are said to exist in the southern part. The coast is steep, except on the south shore, which is fringed by a wide reef. Some tiny islands known as the Nenusa Islands lie northeast of Karakelong; vessels run regularly to these, to Beo, the capital of the Talaud group, and to Lirung, the port of a long island lying close to and southwest of Karakelong.

The Islands were incorporated under the Dutch governor of Ternate as early as 1677; later they were attached to the residency of Manado. During World War II they passed under Japanese military control, and in 1949 they became part of Indonesia, forming two districts of the province of Sulawesi Utara-Tengah (North and Central Celebes). (E. E. L.; J. O. M. B.)

SAN GIMIGNANO, a town of Tuscany, Italy, in the province of Siena, 18 mi. (30 km.) NW of Siena by road. Pop. (1961)



BY COURTESY OF THE ITALIAN STATE TOURIST OFFICE

MEDIEVAL TOWERS OF SAN GIMIGNANO

4,085 town; 10,099 commune. Originally called "City of Silva," it later took its name from the bishop of Modena (d. 397) who liberated the city from a barbarian invasion. Parts of the ancient fortifications are still intact including the city walls and gates, and 14 of the towers, which numbered 72 in 1350. With its predominantly Gothic architecture San Gimignano is one of the best-preserved Italian medieval towns. The Palazzo del Podestà was built in 1288. In the Sala di Dante is the *Maestà* (1317) by Lippo Memmi, a pupil of Simone Martini. In 1467 Benozzo Gozzoli added two figures of saints to the work. The Palazzo del Podestà also houses the museum which contains works by Gozzoli, Filippino Lippi, Pinturicchio (Bernardino di Betto), and many other Florentine and Sienese masters. The Collegiata (the former cathedral) was consecrated in 1148. The interior walls are decorated with numerous frescoes including Old Testament scenes (1356) by Bartolo di Fredi, New Testament scenes (1380) by Barna da Siena, and the "Martyrdom of St. Sebastian" (1465) by Gozzoli; the Chapel of Sta. Fina (a local saint who died at the age of 15 in 1253) has a marble altar carved by Benedetto da Maiano (1475), and frescoes depicting the death and funeral rites of Fina by Domenico Ghirlandaio. Close to the city gate of San Matteo is the Church of S. Agostino (1280–98) containing frescoes (1463–67) by Gozzoli, with scenes from the life of St. Augustine.

An independent republic in the Middle Ages, San Gimignano was dominated by two powerful, continually warring families, the Ardinghelli (Guelph) and the Salvucci (Ghibelline). In May 1300 Dante Alighieri, as ambassador of Florence, spoke in favour of the Guelph League (in the Sala di Dante). In 1352, its finances exhausted, the city placed itself under Florence. The present city, an important tourist centre, is noted for its wines, which are widely exported. (A. M.)

SANGLI, a town and district in the Poona division of Maharashtra, India. The town, formerly the capital of the princely state of Sangli and now the district headquarters, lies 11 mi. NW of Miraj junction on the Southern Railway and 185 mi. SSE of Bombay. Pop. (1961) 73,838. It is well laid out with broad streets and several parks. There are five colleges, including those of commerce, education, and engineering, affiliated to Shivaji University at Kolhapur. The old Ganpati temple is known for its architecture and was the seat of the family deity of the former princely rulers. The town is a trade centre for tobacco, turmeric, chilies, peanuts, and ghee (clarified butter). It has textile and oil mills and manufactures of brass and copper vessels. *Bidi* (local cigarette) making is a large-scale industry.

SANGLI DISTRICT, originally constituted as South Satara District on Aug. 1, 1949, comprises the former princely states of Sangli, Miraj, and Jath, and a number of *taluks* of the former Satara District. Area 3,299 sq.mi. Pop. (1961) 1,230,716. The district is fertile, its principal crops being jowar, bajra, peanuts, tobacco, chilies, turmeric, wheat, and sugarcane; other crops include cotton, rice, and oilseeds. Handloom weaving, flour milling, oil crushing, and engineering are the chief industries. Miraj is the only important town besides Sangli. It has a weaving mill, an oil mill, a mission hospital, a sanatorium, and a leprosarium. A medical college is affiliated with Shivaji University. (M. R. P.)

SANGRE DE CRISTO, a range of the Rocky Mountains, consists of a narrow, elongated, steep anticlinal uplift extending for about 220 mi. from Salida, Colo., southward to Santa Fe, N.M., U.S. The range was supposedly named by the Spanish explorer Antonio Valverde y Cosío in 1719 while breaking camp in the Purgatoire Valley in Colorado. He was so impressed by the red-tinted, snowy peaks at sunrise that he uttered a fervent "Sangre de Cristo" ("blood of Christ"). There are many spectacularly glaciated peaks, including the highest elevation, Blanca Peak, 14,317 ft. Two outstanding land forms, Great Sand Dunes National Monument and the volcanic Spanish Peaks (13,623 ft.), are located near the western and eastern foothills. (A. W. SM.)

SANGRUR, a municipal town and district in the Patiala division of Punjabi Suba State, India. The town, headquarters of the district, lies 48 mi. S of Ludhiana. Pop. (1961) 28,344. It was founded about the mid-17th century and was remodeled by Raja Raghubir Singh on the lines of Jaipur City. Raja Sangat Singh made it the capital of Jind State in 1827, and it remained so until 1949 when the Punjab princely states were merged into the Patiala and East Punjab States Union. A college is affiliated to Panjab University, and there are two hospitals and several parks. The town is on the Jakhal-Ludhiana railway line and is also linked by road with the rest of Punjab.

SANGRUR DISTRICT is a flat plain dotted with sand dunes. Area (before) 3,031 sq.mi.; pop. (1961) 1,424,688. In 1966 the district was divided between Punjabi Suba and the new state of Hariana. It is predominantly agricultural and a considerable area is irrigated. Wheat, gram, bajra (pearl millet), and cotton are the chief crops. The principal towns include Barnala (pop. [1961] 21,354); Malerkotla (39,543), a trade centre; Jind (24,216), a railway junction; and Sunam (21,408), an important rural trade centre. (O. P. B.)

SANHEDRIN (sometimes incorrectly written SYNEDRIUM or SANHEDRIM), the supreme rabbinic court in Jerusalem during the Second Commonwealth era. The term is a hebraization of the Greek *synedrion,* meaning "assembly"; the term also is used for the Areopagus in Athens.

Rabbinic sources speak of a Great Sanhedrin of 71 members and of smaller Sanhedrins, trial courts of 23, judging criminal cases or violations of Jewish law. The Great Sanhedrin as a permanent institution is to be distinguished from the temporary Great Assembly of that era. Meetings of the Great Sanhedrin were held on the Temple Mount in Lishkat Hagazit (Chamber of Hewn Stone [or Decision]). Talmudic tradition pictures the Great Sanhedrin as the highest legislative and judicial court of Halakha (rabbinic law), headed by a duumvirate known as *nasi* (head) and *ab bet din* (father of the court), whereas nonrabbinic sources describe the institution as a political-executive and judicial body headed by the high priest. Though some scholars have sought to regard the rabbinic picture as an academic reconstruction, descriptive of the patriarchal court of the 2nd century C.E., the discrepancy of sources is easily explained in recognizing the existence of two contemporary bodies, one strictly religious, the other wholly secular or the civil authority.

The Mishnaic Sanhedrin consisted of scribes (*soferim*) who interpreted the Halakha, whereas the Synedrion, described in Josephus and the Gospels, was composed of the aristocracy of the state, including Pharisees and Sadducees, and served only as the secular state council of the high priest. The trials of Jesus and the Apostles as portrayed in the New Testament were before the priestly state Synedrion, sanctioned by Pontius Pilate. Jesus was crucified by the Romans and not by the Great Sanhedrin as "king of the Jews." Though the Jews were allowed to administer capital punishment, this right was restricted to religious law.

In biblical days justice was administered by the kings (such as David or Solomon) or by the chieftains (*shofetim*). In early postexilic days (4th and 3rd centuries B.C.E.) the priests with their *gerousia* (council of elders) served as the judges. However, in 141 B.C.E., with the Hasmonaean victory over the Syrian Greeks, a new commonwealth was established. The Great Sanhedrin was then instituted as a specialized body of Halakha to interpret Jewish law. Ritual matters of the Temple were left to the council of priests, and the government administration belonged to the monarchs and city officials in their executive *boule* (council).

Among the functions of the Great Sanhedrin were the enactment of decrees for religious observances, judging violations thereof, serving as the court of higher appeal, supervising smaller courts and controlling the priestly ceremonials in the Temple. Particularly did the body uphold the sanctity of the traditional law and its oral interpretations as based upon the written law of the Torah. The functions and procedure of the Great Sanhedrin are discussed in the talmudic tractate Sanhedrin.

The first heads of the Sanhedrin were known as *zugot* (pairs). They were not merely president and vice-president of the body, but majority and minority leaders, representing the conflicting opinions current in the institution. The Sanhedrin was dissolved in 66 C.E., four years before the destruction of Jerusalem by the Romans in 70 C.E.

Among the leaders of the Great Sanhedrin were such men as

Simon ben Shetah, who enacted laws for universal education, for rights of women, and for the administration of trial courts and acceptance of testimony; he was a contemporary of Alexander Jannaeus (*c.* 100 B.C.). Another head was Hillel (*q.v.*), whose dictum, "That which is hateful to you, do not do unto your neighbour," is considered as the basis for the similar maxim found in the Sermon on the Mount. Hillel's leniency in halakhic interpretation illustrates the mode of Jewish harmonization of law and life. His descendants established the patriarchate in Palestine.

In the course of Jewish history many rabbinic institutions sought to exercise the power of this traditional Sanhedrin. Such were the patriarchate in Palestine (100–415 C.E.) and the gaonate (*see* GAON) of Babylonia (660–1040 C.E.), where various academies of learning thrived. A bold attempt to reinstitute the body was made by Rabbi Jacob Birab and Rabbi Joseph Qaro in the early 16th century, after the expulsion of the Jews from Spain, with the direct purpose of receiving the marranos back to Judaism. Napoleon Bonaparte also, in 1806, sought to organize a Sanhedrin to decide the conduct of laws for the French Jews. The Paris Sanhedrin met in February 1807 and agreed that the principles of a liberal, secular state were compatible with the laws of the Jewish religion. With the establishment of the state of Israel in 1948, hopes rose among some Orthodox Jews for the revival of the Great Sanhedrin. Many groups within Orthodoxy and outside its ranks oppose any such effort.

BIBLIOGRAPHY.—S. B. Hoenig, *The Great Sanhedrin* (1953); S. Zeitlin, *Who Crucified Jesus?*, 2nd ed. (1947); J. Newman, *Semikhah (Ordination)* (1951). (S. B. Ho.)

SAN ILDEFONSO (LA GRANJA), a town and summer resort in the province of Segovia, Spain, seat of the former summer palace of the kings of Spain, lies at the foot of Pico de Peñalara surrounded by a dense forest of pines, firs, and birches, 7 mi. (11 km.) SE of Segovia city. The original *granja* ("grange" or "farm") was purchased in 1720 from Hieronymite monks by Philip V, the first Bourbon king of Spain, as the site for a summer palace to rival those of Versailles and Parma. The original design by Teodoro Ardemáns was Herreran in its simplicity, but it was modified by French and Italian artists, notably F. Juvarra and G. B. Sacchetti. The palace chapel, with a fine dome and two towers, has frescoes by F. Bayeu y Subías and contains the tomb of Philip V and his wife, Isabella Farnese. The gardens, laid out by E. Boutelou, have 26 fountains, mostly by R. Frémin and J. Thierri. The royal apartments contain a splendid collection of tapestries, some Flemish and some from cartoons by Goya. La Granja was the scene of many important events in Spanish history including Philip V's abdication (1724), the signing of various treaties (notably in 1796 whereby Spain was tied to the French republic), and the revocation of the Pragmatic Sanction (1830) by Ferdinand VII. The palace was damaged by fire in 1918. (M. Fu.)

SANITATION: *see* HYGIENE; PREVENTIVE MEDICINE; PUBLIC HEALTH; and such specific related articles as PLUMBING; SEWAGE DISPOSAL; etc.

SANJAR (1086 or 1084–1157), Seljuk prince of Khurasan from 1096 to 1157, was born on Nov. 5, 1086, or, according to some authorities, on Nov. 27, 1084. In the Persian historical tradition his fame almost eclipses that of the "great Seljuks" because of the length of his reign, his power and victories in its first half, his disasters in the second, and the fact that he was the last real Seljuk sultan in Iran, after whom came only chaos and misery.

Appointed governor of Khurasan in 1096 by his half brother Barkiyarok, who succeeded Malik Shah (*q.v.*) as sultan, Sanjar in fact acted as an independent prince throughout his reign and after the death of his full brother Mohammed in 1018 was regarded as the head of the Seljuk house. His longevity saved Khurasan from the internecine struggles which destroyed the other Seljuk lines and enabled him to maintain the authority of an organized government (of which valuable documents have survived) in spite of the growing dangers which gathered round him.

In the first part of his reign Sanjar established his suzerainty over the Turkish Qarakhanid princes of Transoxiana and even over the Ghaznavids of the Indian borderland. He entered Ghazni itself in 1117 and there installed his own nominee on the throne. Later, however, he was faced with problems he could neither solve nor escape. First, there was the insubordination of his viceroy Atsiz in Khorezmia (modern Khiva). In 1138 Sanjar defeated Atsiz and occupied Khorezmia, but Atsiz returned and renewed his rebellion. Second, a new and dangerous enemy appeared in Transoxiana: this was the recently founded confederacy of Central Asian tribes under the Khara-Khitai, with whom the Turkish Karluks of Transoxiana made common cause. Sanjar suffered a terrible defeat near Samarkand in 1141; Transoxiana was lost and the Khara-Khitai established a distant suzerainty over Khorezmia. Sanjar maintained his hold over Khurasan in spite of Atsiz, but he had suffered a great loss of prestige and power; the fame of his defeat even reached Europe, where it took the form of the legend of Prester John (*q.v.*), the Christian priest-king who was to destroy Islam (there were Nestorian Christians among the Khara-Khitai). Finally there was a general uprising of the Oghuz (Ghuzz) tribes in Sanjar's realm. Although these tribes had originally been the instrument of the Seljukid conquests they had never become reconciled to a centralized administration. In 1153 they captured the old sultan and, although bestowing on him every kind of respect, kept him prisoner for two years. He escaped but died on May 8, 1157, without having restored order in Khurasan. *See* also SELJUKS.

(H. A. R. G.; CL. CA.)

SANJŌ SANETOMI (1837–1891) was one of the court noble statesmen in the Japanese imperial government established in 1868. Sanjō's service in high office helped emphasize the importance of the throne and the imperial court, whose power the feudal lords had usurped for so long. He held the post of first minister of the Council of State during most of the period from 1871 to 1885. His most important function was to serve as spokesman for the bureaucracy which ruled in the name of the emperor Meiji. For example, it was Sanjō who promulgated the imperial rescript of Oct. 12, 1881, promising a parliament and constitution. The most important and dramatic moment in his career occurred in 1873, when the faction which advocated war with Korea pressed him to secure imperial approval. Unable to bear the pressure of decision, he turned his post over to his colleague, Iwakura Tomomi, who was able to defeat the plans of the war party. Finally, in 1885, when the modern cabinet system was instituted in preparation for constitutional government, Sanjō was elevated to the post of lord keeper of the privy seal. (GE. M. B.)

SAN JOSÉ, a department in southern Uruguay. Pop. (1963) 77,284. Area 2,688 sq.mi. A major steel railroad bridge permits easy communication with Montevideo, about 60 mi. away. There are also road, sea, and air routes to the national capital. As elsewhere in southern Uruguay, closeness to Montevideo's markets encourages dairying and agriculture. Poultry and swine are increasingly important. San José is a ranching region and its breeding establishments service a wide area; both cattle and sheep are raised. The departmental capital is San José (pop. [1963] 17,706). (M. I. V.)

SAN JOSÉ (SAN JOSÉ DE COSTA RICA), the capital of the Republic of Costa Rica, is located on the Meseta Central, 3,880 ft. above sea level. It is an important point on the Inter-American Highway and the junction of the Northern Railway from Limón and the Pacific Railway from Puntarenas. Pop (1963) 101,162. The year-round climate is moderate, divided into a wet and a dry season. San José developed very slowly in the Spanish colonial era; it was called Villa Nueva when it was founded in 1736. Its early source of wealth was the tobacco trade. Following independence in 1821, San José citizens briefly fought those of Cartago and in 1823 the capital of the Republic of Costa Rica was moved from Cartago to San José.

In the 1840s San José emerged as the centre of coffee production, chief source of Costa Rican wealth throughout the 19th century. The political, social, and economic centre of Costa Rica and an episcopal see, San José grew very rapidly in the 20th century, especially in its suburbs. After 1950 the number of indus-

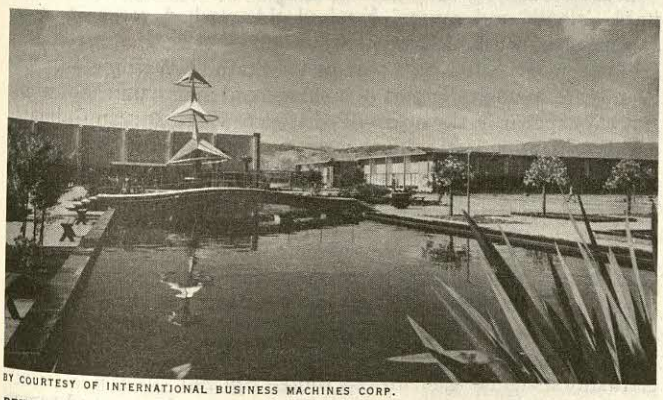
trial establishments more than doubled. Commerce is carried on mainly by a large number of small operations. Costa Rica's substantial import trade is centred in San José.

The city has electrically lighted paved streets, a large central market, and excellent hospitals, schools, and parks. The University of Costa Rica is in San José as are the 18th-century cathedral and the imposing national theatre. The city is the capital of San José Province (2,008 sq.mi.), a fertile coffee- and livestock-raising area. The population of the province increased 85% between 1927 and 1963. Serving the province is the international airport, El Coco, about 12 mi. from San José. Just outside the city is the beautiful plain known as La Sabana, lined with lovely homes. The National Stadium occupies one section of the Sabana. The city is increasingly popular with foreign tourists.

(T. L. K.)

SAN JOSE, known as the "Garden city," in west central California, U.S., is the principal city and county seat of Santa Clara county. Located on the level floor of the Santa Clara valley between the Diablo range and the Santa Cruz mountains, it is 50 mi. S. of San Francisco and 30 mi. N.E. of Monterey bay. Pop. (1960) city 204,196; standard metropolitan statistical area (Santa Clara county) 642,315. Included within the metropolitan area are the cities of Palo Alto, Santa Clara and Sunnyvale (*qq.v.*). For comparative population figures *see* the table in CALIFORNIA: *Population.*

Founded on Nov. 29, 1777, as El Pueblo de San José de Guadalupe by José Joaquin Moraga under orders from Felipe de Neve, Spanish governor of Alta California (Upper California), and named for St. Joseph, California's patron saint, it was California's first civil community. During the Spanish and Mexican periods it supplied wheat, vegetables and cattle to the garrisons of the presidios in Monterey and San Francisco. Located 3 mi. from Mission Santa Clara (founded 1777) and 16 mi. from Mission San José (founded 1797), San Jose also became the centre for ecclesiastical activities in the area. Some of this rich heritage is retained in the colourful Spanish place names for streets and districts.



BY COURTESY OF INTERNATIONAL BUSINESS MACHINES CORP.

REFLECTING POOL, SCULPTURE, AND LANDSCAPED GARDEN PROVIDE THE SETTING FOR AN INDUSTRIAL EDUCATION, RESEARCH, ENGINEERING, AND MANUFACTURING COMPLEX IN SAN JOSE

The U.S. flag was raised above San Jose during the Mexican War on July 14, 1846, and it remained a U.S. city. It became California's first state capital, and the first state legislature ("the legislature of 1,000 drinks") convened there on Dec. 15, 1849. It was also the home of Peter H. Burnett, the state's first elected governor. However, San Jose was not destined to be the seat of government for long; in Jan. 1852 the capital was removed to Vallejo. One of California's first cities, San Jose was incorporated in March 1850, and by this date had changed from a drowsy little Spanish pueblo to a bustling trading centre and quicksilver depot for the gold fields. Most of California's quicksilver, used in the amalgamation process of extracting gold from ores, came from New Almaden, 13 mi. S.

In 1864 the coming of the railroad from San Francisco gave San Jose improved trade connections and new industries began to vie with the agriculture of the valley. The area soon developed into a fruit-producing region with French prunes (introduced by Louis Pellier, 1856) and apricots predominating. San Jose was long the centre of the world's dried-fruit and canning industry and until 1940 most of its industry was concerned with food processing or preserving and with manufacturing orchard supplies and food machinery. After World War II, however, there was a meteoric rise in the manufacture of durable goods such as electrical machinery, ordnance, aircraft parts and automobiles. During this period the population of San Jose doubled and thousands of new single-story, single-family homes began to replace the orchards and farms. Displaying the better features of suburbia and without the worst features of a metropolis, San Jose's newer districts contain dispersed shopping facilities in several subcentres like Willow Glen, Valley Fair and East San Jose, each a complete community for family living within the confines of the city. With a moderate climate and only one hour's drive from San Francisco, San Jose also became an attractive suburban settlement for many workers in the bay area.

The council-manager type of government came into effect in 1916. The city's public-school system includes a large modern junior college, established in 1921. San Jose State college (founded 1857) is the oldest and the largest California state college. Two universities, Santa Clara (Roman Catholic) and Stanford (private), are nearby. The civic auditorium, city symphony, Alum Rock park, the municipal rose garden, the Egyptian museum and numerous parks and playgrounds are other noteworthy community assets of San Jose.

(D. T. M.)

SAN JUAN, a city of Argentina and capital of San Juan Province, lies on the San Juan River, 97 mi. (156 km.) N of Mendoza and 650 mi. (1,046 km.) WNW of Buenos Aires. Pop. (1960) 106,564. The original settlement was founded in 1562, 4 mi. (6.4 km.) N of the present city, but was abandoned in 1593 because of its liability to floods. The existing location, 2,165 ft. (660 m.) above sea level, is defended from inundation by an embankment. A devastating earthquake on Jan. 15, 1944, killed thousands in the city and destroyed 90% of its buildings. San Juan was the birthplace of the educator and statesman Domingo Sarmiento. It is an important administrative, ecclesiastical, commercial, and industrial city, processing the products of the province.

SAN JUAN PROVINCE, one of the Andean provinces, is bounded on the north and east by La Rioja, on the south by Mendoza, and on the west by Chile, from which it is separated by the Andean Cordillera. The mountains on the frontier exceed 10,000 ft. (3,000 m.) and several peaks rise above 20,000 ft. (6,100 m.). Pop. (1960) 352,387. Area 33,257 sq.mi. (86,136 sq.km.). It is one of the three parts of the old Argentinian province of Cuyo (San Luis and Mendoza are the others), an Araucanian word meaning "land of sand," indicating the aridity of large stretches of the province.

Most of the terrain is mountainous, snow-fed rivers from the Andes dissecting its western margins. The largest of these rivers are the Bermejo, Zanjón, and San Juan, all of which are used for irrigation. In the southeast of the province they discharge into swamps and lagoons which ultimately drain by the Desaguadero into the Salado River. The climate is hot and dry in summer, but the winters are mild with a light rainfall, which rarely exceeds 5 in. (127 mm.) annually. Stock raising is of some importance, and the irrigated valleys produce excellent grapes and other fruits. Wheat, maize (corn), olives, and alfalfa are also grown, the latter for feeding cattle supplied to Chilean markets. The province contains much mineral wealth, including gold, silver, lead, copper, iron, coal, mica, asbestos, and lime, but their exploitation is limited. Industrial activity in the urban centres is concentrated on the processing of food products.

Four roads across the Andes link San Juan with the Chilean provinces of Coquimbo and Atacama, and much of San Juan's trade is carried on via these routes. Rail and road communications southward to Mendoza and to the trans-Andean line and eastward to Córdoba unite the province to the rest of Argentina. Jachal on the Zanjón River, 90 mi. (145 km.) N of San Juan, is an important agricultural and coal-mining centre. The province

suffered severely in 1944 from the earthquake that destroyed San Juan city. (G. J. B.)

SAN JUAN, the capital of the island of Puerto Rico, is the oldest city under the U.S. flag. Pop. (1960) 451,658. In 1508 Ponce de León founded the original settlement, called Villa de Caparra, near the shore of a perfectly protected harbour opposite the present site of San Juan. The unhealthful conditions forced the Spaniards to move in 1521 to the present location on a very small island protecting the entrance to the harbour (*see* PUERTO RICO: *History*). Since the city was subject to frequent foreign attacks the Spanish constructed several large fortifications and a massive wall, two parts of which still stand, with moats, gates and bridges. On a high bluff guarding the entrance to the harbour is the formidable El Morro fortress; and to the east overlooking the Atlantic is the great fortress of San Cristóbal.

Other buildings of historical interest include La Fortaleza, the home and office of the governors, the construction of which was

BY COURTESY OF PUERTO RICO NEWS SERVICE

EL MORRO FORTRESS LOCATED AT THE ENTRANCE TO SAN JUAN HARBOUR

started in 1533; the Casa Blanca, built for the descendants of Ponce de León (1523); the cathedral, originally constructed in 1512 but rebuilt in 1549; and the city hall, built on the principal plaza in 1602. The government of Puerto Rico, through the Institute of Puerto Rican Culture, has undertaken in every way possible the restoration of the historical aspect of old San Juan, with its narrow cobblestone streets, overhanging balconies, cool porticoes and 19th-century lights.

In the 20th century the city expanded rapidly beyond its walled confines, incorporating such suburban areas as Miramar, Santurce and El Condado along the coast and Río Piedras and Hato Rey inland. In 1960 the standard metropolitan area of San Juan, with a population of 588,805, included the urban areas of Bayamón, Cataño, Guaynabo and San Juan. In these newer areas are found beautiful modern buildings, such as the Lawyers' Association building in Santurce, the Roman Catholic church of Cataño and in Río Piedras the library of the University of Puerto Rico with its famous mural by the Mexican painter Rufino Tamayo.

Politically, culturally, socially and commercially the metropolitan area is the centre of Puerto Rico. The governor's home and office are still in the Fortaleza in old San Juan. A marble capitol of the classic type houses the bicameral legislature and nearby, in the same area of Puerto de Tierra, is the modern building of the supreme court of the island. In an effort to decentralize the metropolitan area many government offices and agencies have been moved back across the bay to a location not too distant from the original site of Caparra.

The Institute of Puerto Rican Culture, Carnegie library, the Atheneum and the School of Tropical Medicine are centrally located near old San Juan. In addition to the University of Puerto Rico an excellent bicultural education is offered by such schools as the College of the Sacred Heart and Robinson school. The Casa de España, the Puerto Rico casino, the Yacht club and a number of private country clubs offer social activity for their members. Entertainment facilities include horse racing at a large modern hippodrome between Río Piedras and Carolina and night baseball during the winter season with big league players.

San Juan has one of the largest and best protected harbours in the West Indies. Fully equipped with modern docking facilities and a dry-dock service, the harbour receives freight and passengers from the Atlantic, Gulf and Pacific ports of the U.S., from South and Central America, the countries of Europe and the other West Indian islands. Most of the people coming to the island arrive by air at the San Juan International airport. The airlines of three continents and the West Indies make San Juan a regular stop. Most of those arriving for the first time, whether by plane or boat, are tourists staying for short periods at the ultramodern tourist hotels located for the most part along the Atlantic coast between old San Juan and the airport to the east. In the commercial centres of San Juan, Santurce and the other suburban areas many U.S. chain stores, banks and important corporations have local offices and distributing centres. (T. G. Ms.)

SAN JUAN DEL NORTE (also called GREYTOWN), at one time the chief port of Nicaragua on the Caribbean Sea, is situated at the mouth of the northern channel in the delta of the San Juan River. Pop. (1963) 599. During the large movement of people from the eastern United States to California between 1850 and 1870, when the Nicaragua route was a relatively comfortable line of travel, San Juan del Norte was a terminus for Atlantic steamers and the starting point for the small boats that went up the San Juan River and across Lake Nicaragua, whence travelers took a stage for 12 mi. to the Pacific port of San Juan del Sur. San Juan del Norte lost its importance as a port because coastal currents moved sand into the northern delta entrance. In 1850 the San Juan del Norte channel was 25 ft. deep but by 1875 it was only 5 ft., eliminating it as an ocean port. (C. F. J.)

SAN JUAN (HARO) **ISLANDS,** an archipelago of 172 habitable islands and several hundred tide-washed rocks in upper Puget Sound south of Georgia Strait and east of the Strait of Juan de Fuca; politically it is a part of the State of Washington. The islands are geologically part of a submerged mountain chain whose summits appear in the ocean-filled trough where British Columbia and Washington meet. They were first explored and named during the expedition of Francisco Eliza in 1790–92. They were also visited by Capt. George Vancouver in 1792 and Charles Wilkes of the U.S. Navy in 1841. They were occupied for a time by the Hudson's Bay Company, then subjected to a dispute between Great Britain and the United States over their ownership. In 1859 troops of both nations landed on San Juan Island. For a few weeks there was imminent danger of war but trouble was averted when both nations agreed to arbitration. In 1872 the emperor of Germany assigned them to the United States.

The islands are used extensively for summer homes and camps. The highest point in the group is Mt. Constitution on Orcas Island, at 2,408 ft. The rainfall of the islands is light, averaging less than 30 in. a year. Most of the islands have been grouped together as San Juan County, which has an area of 172 sq.mi.; the population of the county declined from 3,245 in 1950 to 2,872 in 1960. The three largest islands are San Juan (71 sq.mi.), Orcas (83 sq.mi.), and Lopez (55 sq.mi.).

See David Lavender, *Land of Giants* (1958); Dorothy O. Johansen and Charles M. Gates, *Empire of the Columbia* (1957). (K. A. M.)

SAN JUAN RIVER, in the southwestern United States, the second most important tributary of the Colorado River system, rises in the San Juan Mountains of southwestern Colorado on the west side of the continental divide in Mineral County. The river flows west and is 360 mi. long; it empties into the Colorado 80 mi. upstream from Lee Ferry, Ariz. Important tributaries of the San Juan in northwestern New Mexico are the Animas, Los Pinos, Piedra, La Plata, and Mancos rivers. In this area the river valley widens and some irrigation agriculture is practised. At "Four Corners," where the boundaries of New Mexico, Utah, Arizona,

and Colorado meet, the San Juan enters the Colorado plateau into which it has carved numerous S-shaped canyons over 1,000 ft. deep. This section of the river is known as the Goosenecks. From the Goosenecks the San Juan flows through wild, rugged, desert country in a relatively straight, deep canyon to the Colorado. The San Juan is one of the important rivers in the multiple-purpose development of the upper Colorado River, discharging almost 2,000,000 ac-ft. of water annually into the Colorado. The Navajo Dam is an irrigation and flood-control project on the San Juan in northwest New Mexico. (M. J. L.)

SANKA, a pariah group in Japan, one of a series of so-called tribes or ethnic enclaves against whom the Japanese developed a marked sense of prejudice and discrimination. These groups, commonly designated as the *senmin,* a term referring to their low social status, became in effect outcastes, living at the very bottom of the rigidly structured social system of feudal Japan. The Sanka are sometimes called the Japanese gypsies, being small bands of wandering people traditionally limited to the mountainous regions of Honshu. Their descendants are generally located in the mountains behind Niigata and in the area of Mt. Chausu. Although such people are mentioned in Japanese chronicles from the 11th century A.D., much of the information about them is vague, being dependent in some measure on Japanese folklore. There seems no reason to equate the Sanka with the aboriginal Japanese Ainu; indeed, they are not distinguishable in either physical type or language from the Japanese proper. In general, the Sanka may be appraised along with such other outcaste elements in Japan as the Hinin and Eta. The fact that they were landless people, living isolated lives, may have served to establish their unfortunate reputation (*see* ETA; AINU).

When it is remembered that traditional Japanese society viewed the nonagriculturalist with contempt, the position of the Sanka may become clearer. Little is known of Sanka organization. Like other depressed castes in Japan, they had chiefs through whom they dealt with feudal authority and who were responsible for the conduct of the group. Socially they were forced into endogamy. There is no evidence to support the common Japanese claim that the Sanka were a wild people who lacked houses and lived in caves. In their mountain habitat they seem to have been wood gatherers and charcoal burners as well as hunters. Although the Japanese in 1869 legislated against social discrimination, the feelings of contempt still applied to the descendants of the Sanka in the 1960s as they did to the Eta. (R. F. SR.)

SANKARAN NAIR, SIR CHETTUR (1857–1934), Indian jurist, rose to high positions in the government rarely open to Indians of his time and was noted for his robust independence and frank expression of views. Born in Malabar on July 11, 1857, he was educated at the Madras Presidency College. A member of the Madras legislature and a prominent delegate to the Indian National Congress for a number of years, he was a keen social reformer; he presided at the Amrovati session of the Congress (1897) and at the Indian Social Reform Conference, Madras. He became advocate general of Madras in 1907 and judge of the Madras High Court in 1908. As a judge he expressed himself fearlessly even against the government, and in a famous judgment upheld conversion to Hinduism and decided that such converts were not outcastes. In 1915 he became a member of the viceroy's council, and as such had many conferences with the secretary of state for India in connection with constitutional reforms. Holding that martial law was continued too long in the Punjab, he resigned; however, for his sympathies with the Montague-Chelmsford reforms he was appointed in 1920 to the council of the secretary of state for India in London. He resigned in 1921 to take office in Indore. In his book *Gandhi and Anarchy* (1922) he attacked both the noncooperation movement and the government actions under martial law; a costly libel action brought by Sir Michael O'Dwyer, then governor of the Punjab, followed. In 1925 he was elected to the Council of State, and in 1928 was appointed chairman of the All-India Committee to sit with the Simon Commission to report on constitutional progress. He was founder and editor of the *Madras Review* and the *Madras Law Journal.* He was knighted in 1912. He died at Madras on April 24, 1934. (L. R. S.)

SANKEY, JOHN SANKEY, 1ST VISCOUNT (1866–1948), British lord chancellor, was born at Moreton, Gloucestershire, on Oct. 26, 1866. Educated at Lancing College and at Jesus College, Oxford, he was called to the bar at the Middle Temple in 1892. He took silk in 1909 and from that time advanced rapidly in his profession. He became a judge in the King's Bench Division in 1914 and a lord justice of appeal in 1928. He was chairman of the Royal Commission on the coal industry in 1919. In 1929 he was raised to the peerage and appointed lord chancellor in the second Labour government, retaining the appointment in the national government formed in 1931. He was created a viscount in 1932 and retired in 1935. He died in London on Feb. 6, 1948.

SANKHYA (SAMKHYA), the oldest system of Indian philosophy, its founder, Kapila, having been born probably a century before Buddha's birth. *See* INDIAN PHILOSOPHY: *Sankhya.*

SANKT GALLEN (SAINT-GALL), a canton in northeast Switzerland and the name of its capital town. The name derives from that of the Celtic missionary St. Gall (*c.* 550–645), who with St. Columban left Bangor, Ire., as a missionary and in 612 made a hermitage in the valley of the Steinach River on the site of Sankt Gallen. Disciples joined him and about 720 the foundation became a Benedictine abbey under Abbot Otmar. Until the 11th century the abbey school, to which laymen were admitted, was the most important educational institution north of the Alps, and in its scriptorium were laid the foundations of the world-famed library.

Sankt Gallen town (pop. [1960 est.] 76,279) stands 7½ mi. (12 km.) S of the Lake of Constance at an elevation of 2,198 ft., the Steinach Valley there extending east-west between hills. To the south of the town centre the abbey church and former monastic buildings form an imposing block. The church (1755–67) is one of the finest Baroque structures in Switzerland and is now the Roman Catholic cathedral. The library (1758–67) with its unique rococo hall, contains about 2,000 precious manuscripts, many showing Celtic influence and with elaborate illumination, as well as numerous incunabula and books, including psalters, gospels, and antiphonals dating from the Carolingian and Ottonian empires.

BY COURTESY OF THE SWISS NATIONAL TOURIST OFFICE

THE 18TH-CENTURY BAROQUE ABBEY CHURCH AT SANKT GALLEN. THE TWIN-TOWERED EAST FRONT WAS DESIGNED BY JOHANN MICHAEL BEER

Other notable features of the town include the old quarter with bay windows in Gothic Renaissance and later styles, the Baroque and modern churches, the botanic gardens, and the Peter and Paul wildlife reserve. The Commercial University is a degree-granting institution, and other cultural establishments include schools of textiles, embroidery, and fashion as well as museums, a theatre, and concert hall. Sankt Gallen had a long association with linen and cotton textiles and early in the 20th century was a leading world centre of embroidery. The industry still flourishes but has been balanced by the introduction of factories for ready-made clothing, textiles, glass, and metalworking. Most of these factories lie outside the town.

The extensive network of communications includes rail and road bridges west of the town of which the highest in Europe spans the Sitter River 325 ft. above the water. Important local events include the biennial children's summer festival, the biennial international horse show, and the Swiss National Fair for agriculture and dairying.

THE ROCOCO HALL OF THE ABBEY LIBRARY, DESIGNED BY PETER THUM; CEILING PAINTINGS ARE BY JOSEF WANNENMACHER

The town of Sankt Gallen evolved from the settlement associated with the abbey. The abbots, who after 1206 were princes of the Holy Roman Empire, governed the town and its environs, and in 1454 abbey and town were affiliated to the eight cantons of the Swiss confederation.

Clerical rule ended with the introduction by Mayor Vadian of the Reformation in the 16th century. The abbey was disendowed when the canton of Sankt Gallen was established in 1803. The town then became a municipality and the capital of the canton. Its outlying parishes were incorporated in 1918, when a communal constitution was adopted.

SANKT GALLEN CANTON, with an area of 778 sq.mi., is bounded north by the Lake of Constance; east by the Rhine Valley, separating it from the Austrian *Bundesland* (federal province) of Vorarlberg and from Liechtenstein; south by the cantons of Graubünden, Glarus, and Schwyz; west by the canton of Zürich; and northwest by that of Thurgau. The canton of Appenzell forms an enclave in northern Sankt Gallen.

Topographically the canton exhibits great variety. The Fürstenland in the northwest is rolling country, and in the east the Rhine Valley forms an extensive plain between Rorschach and Bad Ragaz. At Sargans the valley of the Seez branches westward to the Walensee (Lake of Walenstadt) from that of the Rhine, with the Churfirsten Range to the north and Alpine peaks to the south. Beyond the Walensee the Seez flows through the Linth plain (*see* LINTH) to enter the Lake of Zürich. The valley of the Thur is known as the Toggenburg; its upper part, noted as a holiday and winter-sports region, lies between the Churfirsten and Alpstein ranges and it then curves northward toward Wil.

Much of the hilly region in the canton is covered by glacial debris deposited in the Ice Age by the glaciers of the Rhine, Linth, and Säntis. These shaped the existing river valleys and the Lake of Constance, and the upland owes its fertility to their debris. More than one-fifth of the area is afforested and most of the rest is meadowland and alpine pastures. North and west of the Alpstein Range the climate is similar to that of the prealpine Swiss plateau, but foehn winds (especially in spring) create warmer conditions in the Rhine Valley.

The canton has a population of 339,489 (1960), three-quarters of whom are Roman Catholics, and all are German-speaking. The chief towns besides Sankt Gallen are Rorschach, Altstätten, Buchs, Sargans, Bad Ragaz, Rapperswil, Wattwil, Wil, and Gossau. The predominant farming activity is dairying, with stock raising in the uplands, but there is also a substantial production of orchard fruit and of wine in the Rhine and Seez valleys, with some mixed farming.

Iron ore and manganese are mined near Sargans. The principal industry, textiles and embroidery, is widely distributed, and includes cotton and silk weaving, the production of artificial silk (Widnau, Rorschach), and textile machinery (Sankt Gallen, Wattwil). Many peasant families engage in home weaving or embroidery.

Other industries in the canton include the production of chemicals, pharmaceuticals, chocolate, foodstuffs, pyrotechnics and matches, optical goods, felt, and paper. Numerous holiday resorts in the canton include those in the Toggenburg, the Flumserberge and Pizol district with winter-sports facilities and the national ski schools, the thermal spa of Bad Ragaz, and many other health resorts and sanatoriums.

Important rail connections are the lines Zürich–Sankt Gallen–Munich, Zürich–Sargans–Buchs–Vienna, and Basel–Zürich–Sargans–Chur. The motorway past the Lake of Walenstadt from Zürich joins at Sargans the route linking St. Margrethen through Sargans, Chur, and the San Bernardino Tunnel with Ticino and Milan. Within the canton rail and road networks are adequate. Rorschach on the Lake of Constance is the cantonal port.

The canton, which was formed in 1803, is divided into 14 administrative districts. The cantonal legislature of 193 members and its executive of 7 members are popularly elected quadrennially; the *Landammann* presides over the executive. The constitution prescribes which financial decisions of the legislature are obligatory and which are facultative, that is, requiring a referendum to the people. Any petition for revision of the constitution requires 8,000 signatures. The Protestant, Roman Catholic, and Jewish confessions are recognized officially and form public corporations. The canton administers two agricultural colleges, a teach-

ers' training college, a commercial university, the cantonal school at Sankt Gallen with secondary, trade, and technical departments and a branch at Sargans, and the training school for postal, railway, and public administration. (A. Mr.)

SANKT INGBERT, a town of West Germany in the Saarland, Federal Republic of Germany. It lies 8 mi. (13 km.) NE of Saarbrücken by road. Pop. (1961) 28,352, mostly Roman Catholic. Situated amid hilly woodland country on the Rohrbach, an affluent of the Saar, the town is the district headquarters and is important industrially, with coal mining and brewing, and the production of iron, steel, machinery, glass, and foodstuffs. The art gallery contains paintings by the Sankt Ingbert artist Albert Weisgerber (1878–1915), who was then a leader of the Munich school. Sankt Ingbert, first mentioned in documents in 888, became a municipality in 1829. (M. U.)

SANKT PÖLTEN, a town of Lower Austria, lies on the Traisen River between the foothills of the Alps and the Danube, 37 mi. (60 km.) W of Vienna. Pop. (1961) 40,112. Notable buildings include the cathedral and the town hall, both of medieval origin but restored in the 18th century; and the convent of the Institute of the Blessed Virgin Mary and the Prandtauer Church, both by the Sankt Pölten architect Jacob Prandtauer (1660–1726). Other institutions include a seminary and a teachers' training college. The old town is surrounded by blocks of flats and factories. Paper, machinery, twine, and furniture are produced, and the town is an important rail junction.

The Roman settlement of Aelium Cetium occupied the site of the town, which grew around an abbey dedicated to St. Hippolytus, whose name in corrupted form became Sankt Pölten. The town's charter dates from 1159 and it became an episcopal see in 1785. (K. Gu.)

SAN LEANDRO, a city of Alameda County, Calif., U.S., bordered by Oakland on the north and Hayward on the south, a part of the San Francisco-Oakland standard metropolitan statistical area. The city lies on a coastal plain 47 ft. above sea level, adjacent to San Francisco Bay. It forms part of the East Bay metropolitan strip characterized by suburban developments, commercial trading centres, and waterfront industries. Manufacturing includes tractors, calculating machines, electrical appliances, paper products, hosiery, and processed foods. The area also has a large cut-flower business.

José Joaquin Estudillo established the first residence in 1837 and named the site after St. Leander, a former bishop and patron saint of Seville, Spain. From 1855 to 1871 the town was the county seat of Alameda County. It was incorporated in 1872. It has a council-manager form of government, in effect from 1928. Pop. (1960) 65,962. (R. M. W.)

SANLÚCAR DE BARRAMEDA, a fortified seaport of southern Spain in the province of Cádiz, lies 27 mi. (43 km.) by sea from Cádiz, on the left bank of the Guadalquivir estuary, and on the Puerto de Santa Maria–Sanlúcar and Jerez de la Frontera-Bonanza railways. Pop. (1960) 40,335 (mun.). Sanlúcar or *sant lugar* was the "holy place" of the Tartessian temple dedicated to the morning star, Venus. *Barrameda* is an Arabic word signifying "sandy gateway," and alludes to the sandbank which obstructed the passage of boats up the Guadalquivir as far as Seville, of which Sanlúcar was the anteport in the days of Seville's monopoly of trade with the Spanish American colonies. The first lord and the builder of a castle was Guzman the Good. Later the town was the court of the dukes of Medina Sidonia. From this port Columbus sailed across the Atlantic in 1498 (his third voyage), and Magellan started in 1519 to circumnavigate the world. The 14th-century church and the palace of the dukes of Medina Sidonia contain many valuable pictures. The hospital of St. George was established by Henry VIII of England. The town produces the famous aromatic white wine of Andalusia known as manzanilla. On the other bank of the Guadalquivir lies Coto de Doñana, held by the German archaeologist Adolf Schulten to be the site of Tartessus. (M. B. F.)

SAN LUIS, a central Argentine province and the name of its capital town. Area 29,632 sq.mi. (76,747 sq.km.). Pop. (1960) 174,251 (province). The province is bounded on the west by the Desaguadero (Salado) River, and is mostly less than 2,000 ft. (600 m.) above sea level, but some mountain ridges exceed 6,000 ft. (1,800 m.), the Sierra de San Luis dominating the relief of the north. The climate is warm and dry, San Luis city having 22 in. (559 mm.) of rain annually. The moister areas support quebracho forests and there is some lumbering and charcoal burning, but cattle, sheep, and goat raising on the extensive plateau country is more important. In the Conlara and Quinto river basins irrigation permits crops of grapes, maize (corn), alfalfa, wheat, and fruit. The processing of these products, including meat packing, tanning, and woodworking, provides most of the industrial employment in the towns of San Luis and Mercedes.

The province's mineral resources are extensive, the Sierra de San Luis containing rich deposits of silver, lead, and zinc, with tin at Quines on its northern flank, gold at San Francisco, Cañada Honda, and Las Carolinas on its western margins, and copper, sulfur, mica, and nickel at Trapiche in the southeast. Tungsten is produced from ore mined in the northeastern sierras of El Morro and Comechingones, particularly at the Los Cóndores mine in Concarán; and gypsum is quarried in the Sierra del Alto Pencoso, a spur of the Sierra de Córdoba. Granite and onyx deposits are worked at Cuatro de Junio, and salt at El Balde.

The capital, San Luis (pop. [1960] 28,024), was founded in 1596 by Martín de Loyola, governor of the captaincy-general of Chile; until 1776 the province (together with San Juan and Mendoza) was administered by Chile. Although an old colonial town, San Luis has modern industries based on hydroelectric power and is an important point on the Pan-American Highway from Mendoza to Buenos Aires, and on the Trans-Andean rail link with Santiago de Chile. (G. J. B.)

SAN LUIS POTOSÍ, a central state of Mexico, bounded north by Coahuila, east by Nuevo León, Tamaulipas, and Veracruz, south by Hidalgo, Querétaro, and Guanajuato, and west by Zacatecas. Area 24,266 sq.mi. Pop. (1960) 1,048,297. The state comprises the high plateau region with the exception of a small area in the southeast angle, where the tableland breaks down into the tropical valley of the Pánuco. The surface is comparatively level, with some low mountainous wooded ridges. The mean elevation is about 6,000 ft., ensuring a temperate climate. The rainfall is light and uncertain and the state is poorly provided with rivers. The soil is fertile and in favourable seasons large crops of wheat, maize, beans, and cotton are grown on the uplands. In the low tropical valleys, sugar, coffee, tobacco, peppers, and fruit are staple products. Stock raising is an important industry and hides, tallow, and wool are exported. Fine cabinet and construction woods are also exported to a limited extent.

San Luis Potosí ranks among the leading mining states of Mexico. The Catorce District, which includes Matehuala and the once-important mining station of Real de Catorce, has some of the richest silver mines in the country. Other well-known silver-mining districts are Peñón Blanco, Ramos, and Guadalcázar. The development of Guadalcázar dates from 1620 and its ores yield gold, copper, zinc, and bismuth as well as silver. In the Ramos District, Cocinera lode is said to have had a total yield of more than $60,000,000. The state has good air, rail, and highway connections. Río Verde, an agricultural centre with a national agricultural experiment station in its vicinity, is 65 mi. ESE of the state capital, San Luis Potosí. (J. A. Cw.)

SAN LUIS POTOSÍ, a city of Mexico and capital of the state of the same name, 215 air miles (327 mi. via rail; 409 mi. via paved highway) NW of Mexico City. Pop. (1960) 159,980. Its altitude, 6,168 ft. above sea level, ensures a temperate climate.

San Luis Potosí is the hub of a rich silver-mining and agricultural region and a leading manufacturing centre. The city produces a variety of products including rope, brushes, shoes, cotton and woolen textiles and clothing. There are several large plants for the smelting and refining of various ores and crude metals brought from adjacent states. It has a large arsenic plant. The state-supported Instituto Científico offers courses in law, medicine and science. Notable buildings include the cathedral, conspicuous for its typical Churrigueresque style; the state capitol,

noted for its façade of rose-coloured stone; the churches of Nuestra Señora del Carmen, San Francisco and Guadalupe; and the mint.

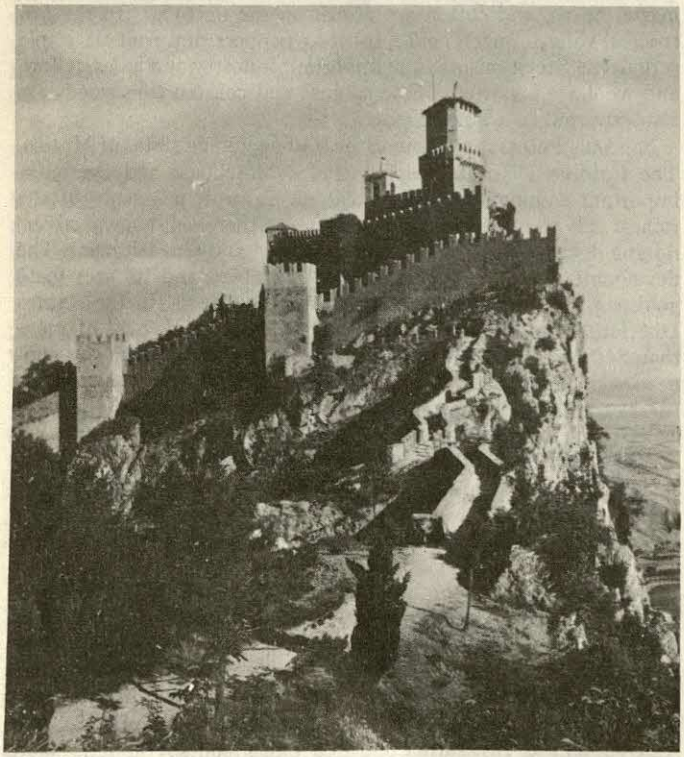
The city dates from the founding of the Franciscan mission of San Luis Rey by Diego de la Magdalena in 1583, and takes its name from the Cerro de Potosí, a nearby hill of silver, said to resemble the famous Potosí mines of upper Peru (Bolivia). It was the centre of the region's colonial administration and played an important part in the political disorders following Mexican independence. For a brief time in 1863 it was the seat of the government of Benito Juárez. Imprisoned there by Porfirio Díaz in June 1910, Francisco I. Madero drew up his famous "Plan of San Luis Potosí" (Oct. 7) which contained the political and social goals for the Mexican revolution launched Nov. 20, 1910.

(R. B. McCk.)

SAN MARCOS, the department in western Guatemala that borders Mexico. Area 1,464 sq.mi. Pop. (1964) 332,303. Its capital is San Marcos (pop. [1964] 10,557). In the highlands the Maya Indian farmers raise maize, beans, and wheat. On the south-facing slopes there are plantations of coffee. On the coastal lowland there are bananas, sugarcane, and rice. A branch of the Inter-American highway passes through San Marcos to the Mexican border. Ayutla is the railroad terminus opposite the end of the Mexican railroad. Ocós is the port. (P. E. J.)

SAN MARINO, an independent republic in northern Italy, bounded to the north and east by the Emilia-Romagna region and to the south and west by the Marches. Area 24 sq.mi. (61 sq.km.); pop. (1963 est.) 17,000. San Marino occupies the slopes of Mt. Titano, 2,421 ft. (738 m.), in the northern Apennines; the three peaks of Mt. Titano, each surmounted by a castle, are represented on the coat of arms of the republic. San Marino consists of nine parishes and ten districts (*castelli*). The largest town is San Marino. To the east Serravalle, given to San Marino in 1463 by Pope Pius II as a reward for the republic's help in the war against Sigismondo Malatesta, is the only other major centre. San Marino is connected by road with the Italian city of Rimini, about 14 mi. (22.5 km.) distant on the Adriatic shore, and there are secondary roads leading to the surrounding Italian villages.

According to tradition, the republic was founded by Marinus, a Dalmatian stonecutter and a native of the island of Arbe (Rab), probably about the middle of the 4th century. He was a Christian, and was said to have fled there from Rimini, where he was working, to escape religious persecution. The *Castellum Sancti Marini* is mentioned in 755; the oldest document in the republican archives mentions the abbot of San Marino in 885. The republic, as a rule, avoided the factional fights of the Middle Ages but joined the Ghibellines and was interdicted by the pope in 1247–49. After this it was protected by the Montefeltro family (later dukes of Urbino) and the papacy and successfully resisted the attempts of Sigismondo Malatesta against its liberty. It fell into the hands of Cesare Borgia in 1503 but soon regained its freedom. Other attacks failed, but civil discords increased. Its independence was recognized in 1631 by the papacy. In 1739 Cardinal Alberoni attempted to deprive it of its independence, but this was restored in 1740 and was respected by Napoleon. In 1849, San Marino gave asylum to Garibaldi. It put itself under the protection of the kingdom of Italy in 1862. In World War II San Marino remained neutral but suffered a severe bombing raid and other infringements of its neutrality. It had a Communist government from 1945 to 1957.



PAUL ALMASY

ROCCA GUAITA, ONE OF THREE FORTRESSES OVERLOOKING THE COUNTRYSIDE FROM THE TOWN OF SAN MARINO

The Grand and General Council of 60 members is elected by popular vote every five years. Its functions are deliberative and legislative. The executive functions of the government are exercised through the Congress of State, which comprises ten departments and two *capitani reggenti* (captains regent) who are appointed every six months (April 1 and Oct. 1). The peaceful revolution of March 25, 1906, restored the original system of election to the council (which had become a close corporation, renewed by co-option) by the *Arengo*, or assembly of heads of families, one-third of the council being thereafter renewable every three years. In 1909 the household suffrage was replaced by universal male suffrage. Women received the vote in 1960. Residence in the republic is not necessary for voting.

The available armed forces of the republic include about 1,200 men, all citizens able to bear arms being technically obliged to do so from 16 to 55 years. The language spoken is Italian and the inhabitants are Roman Catholics. Italian and Vatican City currencies are used, but the republic also issues its own coins. A considerable part of the revenue is drawn from the Italian government in exchange for an acknowledgment of the Italian state monopolies in tobacco, playing cards, etc. Only in 1922 did San Marino introduce an income tax. A fruitful source of revenue is found in the frequent change of postage stamps (first issued in 1877); other chief exports are building stone from Mt. Titano, wine, textiles, tiles, and ceramics. The main occupation is agriculture.

There are traces of three different circles of walls surrounding the three peaks of Mt. Titano and dating from the 14th, 15th, and 16th centuries. The town of San Marino is on the most northerly peak. The old church, first mentioned in 951, was rebuilt as a Franciscan church in the 14th century. The principal church (Pieve), in classical style, dates from 1826 to 1838 and contains the body of St. Marinus. The museum contains among other curiosities the banner of Garibaldi's "Italic Legion" which sought refuge at San Marino in 1849. The archives were rearranged and described by C. Malagola.

SAN MARTÍN, JOSÉ DE (1778–1850), South American soldier and statesman, whose heroic efforts together with those of Simón Bolívar (*q.v.*) helped to make South American independence a reality, was born on Feb. 25, 1778, in Yapeyú, a Jesuit village at the northern frontier of Argentina. He was the son of an aristocratic Spanish family which, when he was seven, returned to Spain. His upbringing therefore was European. His biographer, Ricardo

Rojas, divides San Martín's life into three periods: 1778–1817, the years of initiation; 1817–22, the years of achievement; 1822–50, the years of renunciation.

San Martín served 22 years in the Spanish army, attaining the rank of lieutenant colonel. When in 1812 he learned that a movement for the independence of his native Argentina had flared up in Buenos Aires, he offered his services to the revolutionary government. On his return to Argentina he found his homeland in chaos. No stable government had emerged, nor had the ties with Spain been severed by a formal declaration of independence. San Martín did not aspire to political power. He was a soldier first and foremost, though he expressed a preference for constitutional monarchy. His primary purpose was to defeat the Spanish forces and establish the independence of the Americas. He was convinced that the Spanish hold on America would not be broken until Peru should be liberated: "The war," he said, "will not end until we are in Lima." His plan therefore was to train a small, disciplined army in western Argentina, then go to Chile and clear out the Spaniards, establish a friendly and stable government there, and finally lead his army across the sea to Peru.

THE BETTMANN ARCHIVE INC.

JOSÉ DE SAN MARTÍN, PORTRAIT REPRODUCED FROM A PAINTING PRESENTED BY THE ARGENTINE GOVERNMENT TO THE UNITED STATES MILITARY ACADEMY

Argentina proclaimed its independence in 1816, while San Martín patiently bided his time. For three years he organized and drilled his army and then, at the beginning of 1817, crossed the Andes at two points, Los Patos and Uspallata, catching the Spanish off guard. He defeated them at Chacabuco and entered Santiago de Chile on Feb. 15, 1817. Naming his friend and collaborator Bernardo O'Higgins as political director of Chile, he braced himself for the next step. A second victory over the Spaniards at Maipú sealed the independence of Chile.

The conquest of Peru, however, was another matter. San Martín spent nearly two years in assembling a fleet for the transportation of his army. At last, in August 1820, he set sail for Lima, and entering the city on July 9, 1821, he proclaimed the independence of Peru. But the Spanish forces retreated into the Peruvian Highlands, and San Martín was unable to cope with them. It was natural that his mind should turn toward Bolívar, who was then moving southward in his campaign to liberate Ecuador. The two men met in Guayaquil in July 1822. The content of their conversation is one of the most debated issues in Hispano-American history. One thing is certain: no agreement was reached on a plan to liberate Peru or to design a political future for Latin America that would be pleasing to both. Disappointed, San Martín left Guayaquil, confessing that Bolívar was "not the man we imagined him to be." In September 1822 he presented his resignation to the Peruvian Congress. Whether he took this action to give Bolívar a free field or because of his own blighted hopes will never be completely clear. His farewell to America was a silent one. He wrote to O'Higgins: "I am tired of being called a tyrant . . . of having the people say that I want to be king, emperor, or even the devil." His life in exile was spent first in Belgium, later in Paris and finally in Boulogne-sur-Mer. He died at Boulogne on Aug. 17, 1850.

San Martín's influence on the South American independence movement is not so great as Bolívar's, nor have his political ideas found acceptance. He favoured a centralized constitutional monarchy, which most Latin-American nations believed unsatisfactory. As soldier and human being, he reaches a place among South America's great men. For San Martín one precept was essential: "Be what you must be or you will be nothing." By this principle he lived, in action as well as in exile, taciturn, proud, stoic, selfless. The victories of Chacabuco and Maipú are landmarks in the independence of Argentina, Chile, and Peru, but even so, the final triumph over the Spanish forces was obtained only after San Martín had retired from the struggle.

BIBLIOGRAPHY.—B. Mitre, *Historia de San Martín y de la emancipación sudamericana*, 4 vol. (1890; Eng. trans., *The Emancipation of South America*, 1893); J. de San Martín, *Correspondencia* (1925); R. Rojas, *San Martín, Knight of the Andes* (1945); J. C. Metford, *San Martín, the Liberator* (1950). (G. S. M.)

SAN MARTÍN, a department in northeastern Peru, bounded on the north by Amazonas and Loreto, on the east by Loreto, on the south by Huánuco and on the west by Libertad and Amazonas. Area 20,488 sq.mi. Pop. (1961) 162,602. The department was created from a part of Loreto in 1906. The chief centre of settlement is around the capital, Moyobamba (pop. [1961] 8,308). Most of the inhabitants are farmers, whose products include sugarcane, cacao, coca, rice, maize, coffee, tobacco, cassava, and fruit. San Martín is known to contain mineral resources such as gold, salt, gypsum, lignite, lime, and petroleum, but these resources are little developed. The warm, rainy climate supports dense forests in which there are sources of rubber, balata, vanilla, and cabinet woods. At Moyobamba straw hats are woven and *aguardiente* or sugar brandy is distilled. (P. E. J.)

SAN MATEO, in San Mateo County, a city on the shore of San Francisco Bay, 18 mi. S of San Francisco, Calif., U.S., and a part of the San Francisco-Oakland standard metropolitan statistical area; it is served by the San Francisco International Airport. Sheltered by hills from ocean wind and fog, San Mateo enjoys a mild marine climate.

A Spanish exploring party (1776) named the creek at this place after St. Matthew. Later a mission outpost was established there, and in the 1850s an American village appeared, surrounded by farms. After a railroad was built (1863), men with gold-rush fortunes bought up farms to establish their country "estates," surrounding the village and preventing its expansion but supplying much of its economic sustenance.

The village was incorporated in 1894 and by 1900 had a population of 1,832. Some estates were then being subdivided and the number of "commuters" to San Francisco was growing, a trend that continued until about 1950. Thereafter the proportion of commuters in the city's population declined because of employment opportunities presented by the increasing number of administrative offices, mercantile businesses, and light industries there.

Cultural and recreational facilities include a public library with neighbourhood branches, a two-year public junior college, two museums, a little theatre, a city park system, a county-owned beach and yacht harbour, and a municipal golf course. The city has a council-manager form of government, in effect from 1923.

Pop. (1960) 69,870. For comparative population figures *see* table in CALIFORNIA: *Population.* (F. M. ST.)

SANMICHELI, MICHELE (1484–1559), architect of the Italian Renaissance, noted for his original treatment of military fortifications, was born in San Michele near Verona. He was a pupil of his father, Giovanni, and his uncle Bartolommeo, both architects at Verona, and went at an early age to Rome to study Classical sculpture and architecture. Among his first works are the *duomo* of Montefiascone, the church of S. Domenico at Orvieto, several palaces, and a fine tomb in S. Domenico. He was also employed by the *signoria* of Venice as a military architect and designed elaborate fortresses for Venice, Cyprus, and Crete. One of his most graceful designs is the Cappella Pellegrini in the church of S. Bernardino at Verona. He built a number of fine palaces at Verona, including those of Canossa, Bevilacqua, and Pompei, as well as the graceful Ponte Nuovo. In 1527 Sanmicheli began to transform the fortifications of Verona according to the newer system of corner bastions which he did much to advance. His last work (1559) was the round church of the Madonna di Campagna, 1½ mi. from Verona. He also wrote a work on Classical architecture, *I cinque ordini dell' architettura*, printed in 1735.

SAN MIGUEL, a department in east central El Salvador and its capital city. Pop. of department (1961) 231,821. Extend-

ing from the Pacific Ocean to the Honduran border, the department has some large lowlands along the Río Grande de San Miguel, the second river in the country, and also some of the country's highest mountains, including San Miguel Volcano, 6,957 ft. Important agriculturally, the department produces sesame, cattle, poultry, cheese, corn, tobacco, cotton, and swine.

San Miguel City (pop. [1961] 82,974) was founded in 1530 by Spanish settlers near the right bank of the Río Grande. Near it are the ruins of an ancient Indian town. It is 80 mi. SE of San Salvador (*q.v.*) on the Inter-American Highway and the International Railways of Central America, and 29 mi. by road from La Unión (*q.v.*), its port. Because of these transportation facilities it is an important commercial centre for eastern El Salvador. It possesses handsome municipal buildings, several churches, law courts, well-equipped hospitals, and schools. It has cotton-textile, vegetable-oil, meat-processing, grain-milling, clothing, clay-product, leather, cordage, and tobacco factories. (C. F. J.)

SANNAZZARO, JACOPO (1456–1530), Italian poet whose *Arcadia* was, until the rise of the Romantic movement, one of the most influential and popular works of Italian literature, was born at Naples on July 28, 1456. He spent his early years in San Cipriano Picentino. Returning to Naples at the age of 20, he became court poet of the kings of the House of Aragon, whom he served devotedly. In 1501 when Frederic, last king of the dynasty, lost his throne, Sannazzaro accompanied him into exile in France. During this period he brought to light several lost Latin works, including Ovid's *Halieutica* and Nemesianus' *Cynegetica*. After Frederic's death in 1504 Sannazzaro returned to Naples, where he spent the rest of his life and died on April 24, 1530.

Sannazzaro wrote both in Italian and in Latin. His Italian works include a *canzoniere* in Petrarchan style, but he is remembered chiefly for *Arcadia* (1504; critical edition, 1926), a pastoral romance, partly autobiographical, partly allegorical, consisting of eclogues linked by prose narrative. Its hero, Sincero, wishing to forget his unrequited love, decides to leave Naples and retire into Arcadia. There he shares the simple life of the shepherds, joining in their poetical contests and pagan festivals. To this central part of the work, written between 1480 and 1485, was subsequently added a second part, more erudite and elaborate, describing how Sincero, unable to find in Arcadia the peace he desires, returns through underground caves, guided by a nymph, to Naples. The success of *Arcadia* is due not so much to Sannazzaro's use of many formal artifices as to his delicate and introspective analyses of the impulses of the human mind and to his fanciful creation of a dream world which introduced a new type of poetic sensibility. Less important were his works in Latin, including the *Eclogae piscatoriae* (1526; Eng. trans., 1726; critical edition, 1914) in which he revived the Classical bucolics, substituting the world of fishermen for that of shepherds, and the *De partu virginis* (1526; critical edition, 1948), a poem in hexameters in which Sannazzaro, a sincere Christian, celebrates in a Classical and sometimes pagan form the birth of the Redeemer. His best achievement in Latin was, however, the *Elegiae* and *Epigrammata,* in which he expressed his upright and tender personality.

See F. Torraca, "Jacopo Sannazzaro" in *Scritti critici* (1907); E. Percopo, "Vita di Jacopo Sannazzaro" in *Archivio Storico per le Provincie Napoletane,* vol. 56 (1931); E. Carrara, *La poesia pastorale* (1908); A. Momigliano, *Studi di poesia* (1938). (G. P. G.)

SAN NICOLÁS, a town and river port of Argentina, in the province of Buenos Aires, on the west bank of the Paraná, 150 mi. NW of the city of Buenos Aires by rail. Pop. (1956 est.) 30,179. It is a flourishing commercial town and a port of call for both river and oceangoing steamers of medium tonnage. It is a rail station on the main line from Buenos Aires to Rosario and the north, and also the terminus of a branch line running from Pergamino. It exports wheat, flour, wool, and meat. During the Perón regime San Nicolás was chosen as the site for a large thermoelectric station (which now provides electric power to Buenos Aires and the province of Santa Fe) and for the construction of a completely integrated steel plant. These have greatly increased the town's importance. It was founded in 1748 as San Nicolás de Bari y de los Arroyos. (Ge. P.)

SAN PABLO, a chartered city in Laguna Province, Philippines, 45 mi. SSE of Manila. The city was created May 7, 1940. Its 52.6 sq.mi. constitute a single municipality divided into 43 barrios (villages) and a *población* (administrative centre). Pop. (1960) 70,680, about 43% of which was in the *población*. The main line of the Manila Railroad traverses the city, while four important highways radiate from the *población*. The city lies in a fertile pocket of volcanic soil and is almost surrounded by quiescent cones. Within the city are seven small crater lakes. The *población* is an important copra-processing and shipping centre as well as the trading centre for a well-populated hinterland. (R. E. He.)

SAN PEDRO, a department of central Paraguay, drains toward the Paraguay River which forms its 100-mi.-long western boundary. Area 7,723 sq.mi. A well-watered lowland of savanna and forest, it is one of the principal maté (Paraguayan tea) producing areas. Lumbering, cattle raising, and a little agriculture (oranges and petitgrain) provide for the department's 90,991 population (1962). There are several small river ports and centres processing the region's products; San Pedro is the largest town and the departmental capital. There are no railways or all-weather roads.

Limestone is quarried for cement in the south and there are also iron-ore deposits. (G. J. B.)

SAN PEDRO DE MACORÍS, a province and its capital city in southeastern Dominican Republic. Area 450 sq.mi. The province occupies a wide strip of the southern coastal plain and a part of the rolling interior (to 950 ft. elevation) that slopes gently southward from the centre of the country. It is a region given over chiefly to sugarcane cultivation. The province is the nation's leading sugar producer, accounting for one-fourth of the national output. Cattle raising is important in the drier parts. Lumbering of tropical hardwoods is also significant. The province was established in 1908. Pop. (1960) 68,953.

The capital city is situated at the mouth of the wide estuary of the Higuamo River, 38 mi. E of Santo Domingo. As the chief city of the southeastern region of the sugar industry, the most vital economic activity in the country, it serves actively as a commercial and industrial centre. The port has been developed along modern lines and handles about one-fifth of the nation's exports, including sugar, molasses, cattle, and timber. Its industries include corn milling, manufacture of clothing, and soap and alcohol distilling. Its international airport signifies its importance as a transport centre. Pop. (1960) 22,935. (D. R. D.)

SAN PEDRO SULA, capital of the department of Cortés, Honduras. Pop. (1961) 58,632. San Pedro Sula, the second city of Honduras, is the centre of an important agricultural area, producing bananas for export, and sugar, rice, plantains, bananas, corn, sweet potatoes, yuca, cattle, swine, and poultry for domestic consumption.

Located 48 mi. by railway from Puerto Cortés (the leading port of the country), 182 mi. by the Inter-Ocean Highway from Tegucigalpa and with other railway and road connections, San Pedro Sula is a financial and distributing point for northern and western Honduras. It manufactures foodstuffs, clothing, hats, beer, soap, candles, cigarettes, shoes, brick and other clay products, and furniture, and it has fine public buildings and some beautiful private residences. (C. F. J.)

SANQUHAR, a royal and small burgh of Dumfries County, Scot., lies on the Nith, 57 mi. SW of Edinburgh by road. Pop. (1961) 2,182. Sanquhar Castle, on a hill overlooking the Nith, is now in ruins. The town has a tollbooth, built in 1735. Sanquhar was reerected a burgh of barony in 1484 and was created a royal burgh by James VI in 1598. The first "declaration of Sanquhar" was affixed to the market cross (now replaced by a granite monument) in 1680 by the Covenanter Richard Cameron, the second in 1685 by James Renwick (*qq.v.*). The town is a summer resort and the principal coal mart in the county. Industries include coal mining and iron- and brickworks. The Riding of the Marches (the confirmation of the town boundaries) is celebrated each year in August.

SAN RAFAEL: *see* Estrelleta.

SAN REMO, a seaport and resort in Imperia province, Liguria, Italy, on the Riviera di Ponente, 10 mi. (16 km.) E of Ventimiglia and 91 mi. (146 km.) SW of Genoa by road. Pop. (1961) 56,945 (mun.). The town lies in an amphitheatre on the slopes of the Maritime Alps, which protect it on the north. Its mild climate has made it popular as both a summer and a winter resort. The old town on the hillside contains narrow, steep streets with tall houses connected by arches, the Cathedral of S. Siro (12th–14th centuries), and the Church of the Madonna della Costa (17th–18th centuries). In contrast is the new town on the coast, with the casino, theatre, villas, hotels, gardens, and fine promenades. The small harbour is sheltered by a 4,000-ft. mole. The Raccolta Rambaldi art gallery is in the neighbouring village of Coldirodi. San Remo became a popular resort after the visit of Frederick III of Germany in 1887–88. The town's cut-flower market, the most important in Italy, provides a major part of cut-flower exports to continental Europe. Olives and lemons are also cultivated. San Remo is connected by road and rail to Ventimiglia and to Genoa.

SAN REMO, CONFERENCE OF, one of the international meetings in the period of peacemaking after World War I. It was held at San Remo, on the Italian Riviera, from April 19 to 26, 1920. This conference was preceded by a meeting of the Supreme Allied Council in London (Feb. 12–23, 1920), where the main lines of the future treaty with Turkey were laid down and where the draft treaty with Hungary (*see* TRIANON, TREATY OF) and the question of Fiume (*see* RIJEKA) were also discussed. At San Remo, Great Britain was represented by David Lloyd George, France by Alexandre Millerand, Italy by Francesco Saverio Nitti (all three were prime ministers), and Japan by K. Matsui, ambassador in Paris. They were joined by Eleutherios Venizelos, the Greek prime minister, in connection with the Turkish treaty, and by Paul Hymans, the Belgian foreign minister, because certain aspects of the German problem were also on the agenda of the conference.

The Turkish treaty was the principal business, and its framework was finally approved. At the same time the conference decided that Syria (with Lebanon) and Iraq should become independent but subject to a mandatory power till they were able to stand alone; and that the mandates for Iraq and for Palestine should be assigned to Great Britain and for Syria to France.

An Anglo-French oil agreement was signed on April 24–25, covering not only the Middle East but also Rumania, as well as the British and French non-self-governing colonies.

The most controversial matter was the strength of the German armed forces. Because of disorders the German government had sent troops into the Ruhr Valley in excess of the maximum permitted there by the Treaty of Versailles (*q.v.*), whereupon the French had reacted by occupying Frankfurt, Darmstadt, and Homburg (April 6–7); and Germany now asked the conference to permit the increase of the total strength of the *Reichswehr* to 200,000 (double that permitted by the treaty). This request was refused, and Germany was charged with default in respect both of reparations and of disarmament. As soon, however, as the German troops in the Ruhr Valley were reduced to the permitted strength, the French withdrew from the newly occupied towns (May 17, 1920). (K. SM.)

SAN SALVADOR, a department near the centre of El Salvador, extending from near the Pacific ocean on the south to the deep Lempa valley on the north. Pop. (1961) 463,228, of which about 75% was urban. Population is concentrated in the highland portion of the department, the southern lowlands and the slopes to the Lempa valley having few people. In the western part of the department rises the massive volcano San Salvador, 6,399 ft. high. The department produces tobacco, sugar, fruits and cotton and also has considerable manufacturing. (C. F. J.)

SAN SALVADOR, the capital of the republic of El Salvador, is situated in Las Hamacas Valley, a tributary of the Río Acelhaute, at an altitude of 2,115 ft. Pop. (1961) 255,744, about one-fourth of the urban population of the country. It is connected by modern highways with all principal cities of the country and with the ports of La Libertad (24 mi.), Acajutla (53 mi.), and La Unión (116 mi.), and is served by International Railways of Central America, which connects it with Guatemala and La Unión, and by the older El Salvador Railway to Acajutla.

San Salvador was founded in 1524 at a spot near the present site, to which it was transferred in 1528. It served as capital of the colonial province of Cuscatlán and of San Salvador Province of the United Provinces of Central America, and except for the period 1854–59 it has been capital of El Salvador since 1841. It was temporarily ruined by earthquakes in 1854 and 1873.

San Salvador has sturdy government buildings, a modest cathedral, a handsome national university, an academy of science and literature, several theatres, a national astronomical observatory, a national library, several modern hospitals and charitable institutions, a country club, excellent botanical gardens, several beautiful parks and plazas, and a modern water system. Among its several rapidly growing residential suburbs are Mejicanos and Villa Delgado in the hills to the northeast and Soyapango to the east. Six miles to the east is beautiful Lake Ilopango, the largest lake in the country, in an ancient volcanic crater. With shores dotted with private homes, resort hotels, and older fishing villages, the lake is San Salvador's playground.

San Salvador is the leading financial, commercial, and industrial centre of the country. It manufactures cotton and silk textiles, clothing, hosiery, hats, foodstuffs, leather goods, wood products, liquors, clay products, cement, soap, matches, cordage, cigarettes, and cigars. (C. F. J.)

SAN SEBASTIÁN, a port and seaside resort of northern Spain, capital town of the Basque province of Guipúzcoa, and the seat of a bishopric, lies at the mouth of the Urumea River in the Bay of Biscay, 10½ mi. (17 km.) W of Irún on the French frontier by rail. Pop. (1960) 135,149 (mun.). The old town and harbour occupy the isthmus between the mainland and Mt. Urgull (425 ft. [129.5 m.]), on whose summit stands the 16th-century Castillo de la Mota. A broad avenue, the Alameda, has replaced the landward defenses (demolished 1863), and beyond it the well-planned modern town extends on both banks of the Urumea. A coastal promenade encircles Mt. Urgull, and another borders the broad sandy beaches of La Concha Bay to the west. In the old town are the Gothic Church of San Vicente (1507), the Baroque Church of Santa María (1743–64), and the former convent of San Telmo (1531–51), now a museum with a Basque ethnographic section. In the Gros district on the right bank of the Urumea are the Kursaal and the Plaza de Toros (bullring). The principal industries are fishing and the manufacture of cement, chemical and metallurgical products, beer, chocolate, and phonograph records.

San Sebastián, first mentioned in a document of 1014, was granted privileges by Sancho the Wise of Navarre about 1160–90. In 1813 it was devastated when Anglo-Portuguese troops set fire to it after taking it from the French. It was formerly the summer residence of the Spanish court.

SAN SEVERO, a city and episcopal see of Apulia, Italy, in the province of Foggia. It lies 17 mi. (27 km.) N of Foggia in the north of the Tavoliere Plain between Monte Gargano on the east and the main Apennine chain on the west. Pop. (1961) 47,756. It is a commercial and industrial centre (mainly agricultural produce) for the surrounding region. San Severo was a flourishing market town in the 12th century. Frederick II ceded it to the Templars but it was restored to the secular rulers when the order was suppressed; it passed to several succeeding owners and finally to the Sangro family until the end of feudalism. Of the medieval city, parts of the walls and two gates remain. In 1627 the town was badly damaged by an earthquake. (M. T. A. N.)

SANSEVIERIA, a genus of herbaceous perennials of the lily family, commonly known as bowstring hemp or snake plant. The genus is important in the production of a strong fibre. Sansevierias, native to Africa, are commonly grown as porch and house plants in colder climates and out-of-doors in warmer regions, requiring little direct sun and doing best in a rather heavy soil. Propagation is by division or by leaf cuttings, about three inches long, set in sand. The plant is frequently called old-woman's tongue or mother-in-law's tongue, though the latter name is applied also to *Dieffenbachia,* or dumb cane.

SANSKRIT LANGUAGE, the classical language of the Hindu inhabitants of India. Its records begin in the 2nd millennium B.C. (probably not before 1500 B.C.), and it is still written in the present day. When Sanskrit ceased to be spoken as a mother or home tongue is a matter on which the evidence is not exact. The earliest records—the Vedas, the Brāhmaṇas, and their allied texts —undoubtedly were representatives of a spoken language, at least during their earliest period; no fixed chronology can be given. Toward the end of the Vedic record the language of the texts began to approximate that which was later described and standardized in Pāṇini's grammar of the 5th century B.C. However, it is known that the Buddha, who may be placed about a century before Pāṇini, required that his doctrines be preached in popular vernaculars and not in "Vedic." This implies that Sanskrit was no longer a mother tongue but was already the language of the learned schools, taught there and used in religious and other discussions. Pāṇini's grammar would have been the final codification of this school language.

Even at this early period, in everyday life Middle Indo-Aryan dialects would have been spoken, such as those found in Aśoka's inscriptions (3rd century B.C.), in the Buddhist scriptures in Pali and other Middle Indo-Aryan languages, in the Prakrit languages of the Jain scriptures, and in the Prakrits of the later dramas and grammarians. That Middle Indo-Aryan tendencies are much older than the period of the Buddha is clear from certain grammatical forms already found in the Ṛgveda (Rigveda), the earliest of the Vedic texts. During the latter part of the millennium or more during which the Vedic literature was composed, the Vedic dialect and the Sanskrit which superseded it were already school languages into which vernacular forms could intrude. No date at all can be suggested for the time when Sanskrit can be said to have ceased being a home vernacular.

History.—The Vedic language and classical Sanskrit are two closely related dialects of Old Indo-Aryan (*see* INDO-ARYAN LANGUAGES), belonging to the Indo-European family of languages, most of whose members are European (Greek, Latin, Germanic, Slavic, etc.). The nearest relative of Indo-Aryan is Iranian (Persian, Avestan, etc.; *see* IRANIAN LANGUAGES); the two together are Aryan or Indo-Iranian. The assumed history is that of a migration of the Indo-Aryan branch of Indo-Iranian speakers into northwestern India at some time during (probably) the first half of the 2nd millennium B.C. Several dialects may have been represented in the migrations; or, on the other hand, dialect divergences may have resulted chiefly from changes that took place as time passed and migrations went eastward within India. The early Vedic dialect is placed in northwestern India and the Punjab; by the end of the Vedic period the Ganges Valley and some areas south of it were already aryanized in speech and there is evidence of much dialect variation. From this diversity arose the great diversity of the Middle Indo-Aryan languages and of the Modern Indo-Aryan languages derived from them—Hindī, Bengali, Marathi, etc., in India; Sinhalese in Ceylon; and the Gypsy languages of western Asia, Europe, and the rest of the world (*see* INDIAN LANGUAGES; ROMANY LANGUAGE).

After the standardization of Sanskrit by Pāṇini the language in the classical form described by him was that used by learned Hindus in all their writings. Much of their literature has not survived, and in fact there is a long gap between Pāṇini and the earliest texts of the classical Hindu literature surviving and even approximately datable, viz., the poems and plays of Kālidāsa (perhaps 4th–5th centuries A.D.). The gap is partly bridged by the grammarians Kātyāyana and Patañjali and by the Buddhist author Aśvaghoṣa, whose poems are in the same stylistic tradition as those of Kālidāsa and who probably belongs around the 1st century A.D.; the ascription of Bhāsa's plays to a period earlier than Kālidāsa is disputed. Other classes of writing that survive may preserve material from the period between Pāṇini and Kālidāsa, but scarcely any is identifiable as so early; that the work on statecraft called the *Kauṭilīya Artha Śāstra* is genuinely a work of the minister to Chandragupta Maurya (end of 4th century B.C.) has been much discussed, and the question is still uncertain.

For secular purposes such as official inscriptions, Prakrit was used commonly for centuries, until it was finally generally superseded by Sanskrit in these uses in about the 4th century A.D.; the earliest inscription known in Sanskrit dates from about A.D. 150. The two epics, the Mahābhārata and the Rāmāyaṇa, in the forms of text which can be reached by the methods of textual criticism, belong probably to the first centuries after Christ. Their language is essentially that of Pāṇini; differences from his norms probably result from the fact that these works spring from a tradition of oral poetry which was practised in schools and lines of transmission somewhat apart from those represented by the Pāṇinean and classical tradition.

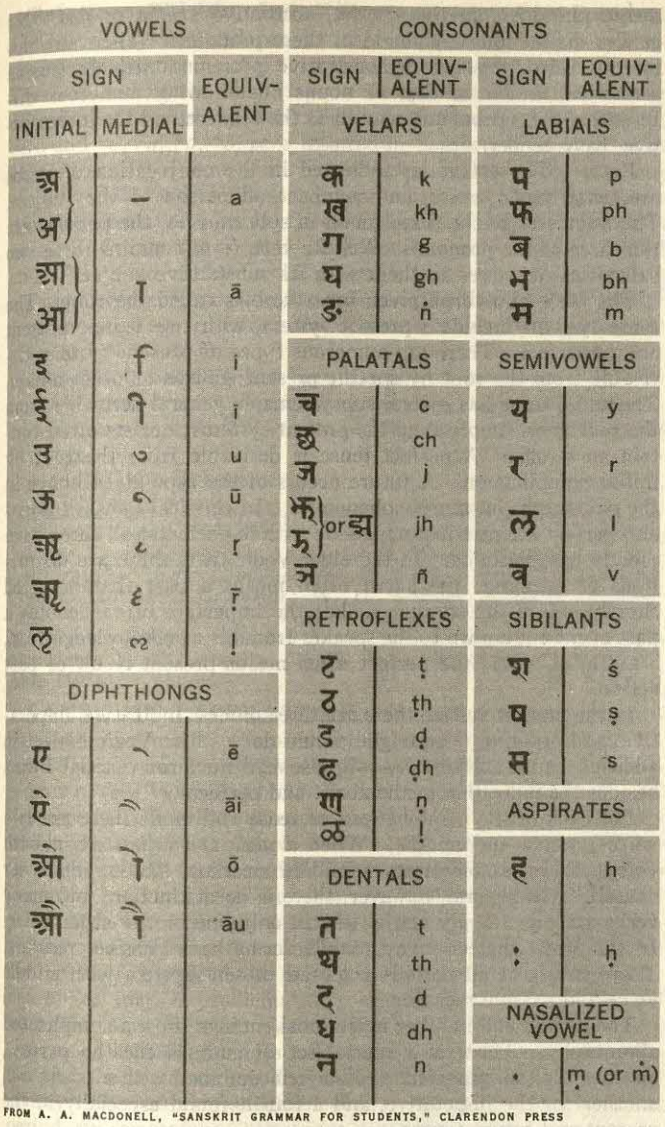
The Sanskrit of Pāṇini was carried outside India by colonial expansion, especially into Indonesia and southeastern Asia (Champa, Cambodia, Siam), in the 1st millennium A.D. The Sanskrit used by some Buddhist doctrinal schools was carried into central and eastern Asia. The Buddhists, however, in their expansion from India more commonly used Middle Indo-Aryan languages, Pali especially in Ceylon and southeastern Asia, Buddhist Hybrid Sanskrit in central and eastern Asia. The political expansion of the Kushan empire into central Asia carried a Prakrit there as official language.

The Grammar of Pāṇini.—This grammar, called the *Aṣṭādhyāyī,* "the work in eight chapters," was the culmination of a long tradition of work in phonetics and morphological analysis. It has been judged by far the best grammar ever written. The analysis of Sanskrit that it presented was never thereafter challenged or reexamined seriously in India; most later Indian grammatical work merely attempted to rearrange its statements so that they should not be so concisely and intricately ordered. Pāṇini himself does not give a phonetic description of the language, relying for this on earlier works (the Prātiśākhyas of the Vedas). He deals with a set of phonemes. With these he states morphemes in basic forms and from these morphemes derives their various allomorphs by means of morphophonemic statements. On the basis of the allomorphs he states the forms of the language up to the sentence. The morphology is stated in great detail, the syntax is less completely stated. This type of description is labeled in modern linguistics "item and process" statement. For a language so complex in its morphology it yields very transparent, though still complex, statements. All modern grammars of Sanskrit are essentially based on translation and adaptation of Pāṇini's grammar, with paradigms added to ease the student's task.

It was the discovery of Sanskrit as taught traditionally in India by the old methods that gave the impetus to modern linguistic studies in the Western world. Sir William Jones in 1786 was led by his study of Sanskrit in India to a recognition of the Indo-European family of languages. From this developed Indo-European comparative grammar in the 19th century. The phonetic part of Hindu grammar led to the exact observations of Western phoneticians. The method and style of grammatical analysis seen in Pāṇini was assimilated in the West by such scholars as Otto von Böhtlingk, William Dwight Whitney, and Leonard Bloomfield, and finally led to modern descriptive methods in linguistics. (*See* also SANSKRIT LITERATURE: *Scientific and Technical Literature: Grammar* [*Vyākaraṇa*].)

Writing.—It is unknown when writing was first reintroduced into India after the loss of the writing system of the pre-Indo-Aryan Indus Valley culture; guesses have ranged from the 8th to the 5th century B.C. The Vedic period was without writing, as were the early grammarians. Pāṇini knew of writing but seems not to have used it. Two forms of Semitic writing were introduced into India, one at least through intercourse with the Persian empire of the Achaemenids. One of these, Kharoṣṭhī, remained in use down to the 5th century A.D. in northwestern India. The other, Brāhmī, was the source of all later Indian alphabets, including the Devanāgarī illustrated in the table, in which Sanskrit is usually written and printed at the present time.

Originally, it seems, writing was used chiefly for affairs of business and administration. Only rather late, perhaps in the last few centuries B.C., did it come to be used for literary purposes. In spite of this, the earliest known writing surviving in India, that of Aśoka's inscriptions, already shows that the borrowings from



FROM A. A. MACDONELL, "SANSKRIT GRAMMAR FOR STUDENTS," CLARENDON PRESS

SANSKRIT ALPHABET (DEVANĀGARĪ SCRIPT)

Semitic sources had been thoroughly worked over by grammarians and adapted to the phonemic system found in the grammars of Sanskrit. This is a notable advance over Semitic writing systems in general, but a trace of Semitic origin is still seen in Devanāgarī. Semitic alphabets did not usually write vowels. Devanāgarī writes them, but only as appendages to the consonants, and the commonest vowel, short *a*, is not written but is understood as inhering in the consonantal characters. The system is in fact syllabic rather than strictly alphabetic. It is, however, strictly representative of the phonemes, and in this respect probably surpasses every other writing system known.

Phonemes.—*Vowels.*—Vowels are *a, ā, i, ī, u, ū, r̥, r̥̄, l̥;* diphthongs are *ē, ō, āi, āu.* The *r̥, r̥̄,* and *l̥* are syllabic trills (short and long) and syllabic liquid. The alphabet gives also a long syllabic liquid (*l̥̄*), but this is only the result of striving for symmetry. The "short" diphthongs *ē* and *ō* are phonetically pronounced as long vowels but are morphophonemically equal to *ai* (*ay*) and *au* (*av*), just as the "long" diphthongs are *āi* (*āy*) and *āu* (*āv*).

Consonants.—There are five series of stops and nasals: velar (*k, kh, g, gh, ṅ*); palatal (*c, ch, j, jh, ñ*); retroflex, otherwise called cerebral, domal, or lingual (*ṭ, ṭh, ḍ, ḍh, ṇ, ḷ*); dental (*t, th, d, dh, n*); and labial (*p, ph, b, bh, m*). The combinations written with *h* are voiceless aspirated stops (*e.g., kh*) and voiced aspirated stops (*e.g., gh*), respectively. Semivowels are *y, r, l, v.* Sibilants are palatal *ś* (in old style transcribed *ç*), retroflex *ṣ,* and dental *s.* Aspirates are voiced *h,* voiceless *ḥ* (called *visarga*). Nasalization of vowel (or optionally nasal in the position of the following consonant when it is a stop) is *ṃ* (called *anusvāra;* also transcribed *ṁ*).

Accent.—In some of the Vedic texts an accent is marked, and Pāṇini's grammar gives rules for the accent. This was a pitch or tone accent, in which some syllables in the sentence had a higher pitch than the others. This accent was phonemic, in that its place in the word was not mechanically predictable. The rules for its position are partly stated in the morphology, partly in the lexicon. In the classical period of the writing of Sanskrit the pitch accent was ignored and replaced in pronunciation by a mechanically fixed stress accent. Sanskrit poetry at all periods depended on lengths of syllables or on syllable counting or on a combination of the two principles; the accent, whether pitch or stress, was entirely ignored in verse construction.

Distribution of Phonemes and Morphophonemics.—The palatal nasal *ñ* appears only before and after palatal stops and should not properly have been treated as a phoneme. The velar nasal *ṅ* is almost restricted to position before velar stops but is a phoneme since it appears also at the ends of words after morphophonemic loss of a following velar stop in that position.

The distribution of consonant phonemes in general shows many restrictions. Long consonant clusters occur between vowels, with up to five or six consonants. Initially in a word there are shorter clusters. In final position in a sentence a word can end only in one consonant, which can be only *k, ṅ, ṭ, ṇ, t, n, p, m,* or *ḥ;* within the sentence a word can end in a larger range of consonants or even in a cluster of two consonants, but there are still many restrictions. One of the important restrictions found in the makeup of consonant clusters is that adjoining stops must be either both voiced or both voiceless. Another is that a cluster of stops may contain an aspirated stop only last in the cluster. Another restriction is that (with a few exceptions) only one aspirated stop may occur in a syllable and that only one of two successive syllables may begin with an aspirated stop; for the statement of this restriction, *h* is classed with the aspirated stops. The palatal stops and sibilant are very much restricted in occurrence, never occurring final in a word or followed by a stop.

Since morphemes are stated in basic forms—*i.e.,* one allomorph of a morpheme is given as basic—much complicated morphophonemic statement is necessary to achieve the analysis of forms which show these restrictions in the occurrence of phonemes. In fact, many morphemes have numerous allomorphs, all of which are related to the basic morphemes by morphophonemic statements which in effect relate an almost unlimited distribution of consonant phonemes in the basic morphemes to a more severely limited distribution in the actual form as uttered. For example, *vac-* "to say" has other allomorphs *vak-, vag-;* there occur such forms as *vacmi* "I say," *vakti* "he says," *vakṣyati* "he will say," *vagdhi* "say!" The grammarians recognized also morphophonemic relationships of similar kinds between vowels or between vowels and various combinations of semivowels and vowels. These are exemplified by further allomorphs of *vac-,* such as *uc-, uk-, vāc-, vāk-;* for example, *uvāca* "he said," *ūcuḥ* "they said" (which is analyzed as containing *uc-* with a prefixed reduplicating vowel *u; u-uc-* is represented by *ūc-*), *ucyatē* "it is said," *uktam* "that which was said," *vācyam* "that which must be said," *vāk* or *vākyam* "speech." These examples do not by any means show the most complicated types of morphophonemics in the description.

The vowel relationships are perhaps the most interesting of the morphophonemic statements worked out by the grammarians. They go a long way toward the *ablaut* relationships (systematic variations, as in English "sing," "sang," "sung," "song") discovered in Indo-European comparative grammar, as far in fact as one could go within Sanskrit itself without knowledge of the related languages. A sample of the statements is that *a, i, u,* and *r̥* are related in the way called *guṇa* to *a, ē* (= *ay*) or *ya, ō* (= *av*) or *va, ar* or *ra* respectively, and in the way called *vr̥ddhi* to *ā, āi* (= *āy*) or *yā, āu* (= *āv*) or *vā, ār* or *rā* respectively. The relationships *u, va, vā* are seen in the allomorphs of *vac-* given above. Whether a morpheme shows *ō* or *va* (*ē* or *ya,* etc.) must be stated for each morpheme; the Hindu grammarians stated it in a practical way that is slightly different from that implied here.

This section of the morphophonemics about vowels is used very

extensively in the description of the morphology. An example (with some simplification) is the description of one of the types of future in the verb: it is described as having *guṇa* of the basic morpheme and a suffix *-sya-, e.g.,*

i- "to go": *ē-ṣya-ti* "he will go" (*ṣ* is related to *s* in the basic form of the future suffix by a morphophonemic statement);
duh- "to milk": *dhōk-ṣya-ti* "he will milk" (*dhōk-* is related to *duh-* by a complicated set of morphophonemic statements, one of which is the *guṇa* relationship *u: ō;* another involves the restrictions on the occurrence of aspirated stops to only one in a syllable);
nud- "to push": *nōt-sya-ti* "he will push."

In one of the types of present tense of the verb there is found a suffix *-nu-* which has *guṇa, i.e.,* has the allomorph *-nō-,* in the singular of the active voice of the indicative mode; *e.g., āpnōti* "he obtains," *āpnuvanti* "they obtain." Certain noun derivatives of the basic verb morphemes have *guṇa* and the suffix *-a-; e.g.,*

vid- "to know": *vēda-* "knowledge";
plu- "to float": *plava-* "raft, boat."

Some nouns and adjectives are derived from other nouns with *vṛddhi* and the suffix *-ya-* which replaces a final *a* or *i* of the basic noun; *e.g.,*

dēva- "god": *dāivya-* "divine";
kavi- "poet": *kāvya-* "poetry."

Morphology.—Sanskrit grammar is of the type of the older Indo-European languages (*e.g.,* Latin, Greek). Words fall into two major classes—substantives, including nouns, adjectives, and pronouns, and verbs—and several minor classes—adverbs, conjunctions, interjections. The substantive and verb classes are distinguished by two different types of inflection, called respectively declension and conjugation.

Nouns and Adjectives.—The declension of these subclasses shows large paradigms in which the forms are classifiable by three categories: number, case, and gender. Much complication is introduced by the fact that nouns, and adjectives parallel to them, fall into a fairly large number of subclasses which have little or nothing to do with these categories but are strictly formal; these are referred to as declensions. There are three numbers—singular, dual, and plural. With very few exceptions forms in these three numbers express natural number; a few words are found only in the plural; *e.g., dārās* "wife," *āpas* "water." Eight cases are found—nominative, accusative, instrumental, dative, ablative, genitive, locative, vocative. It is only in the singular of the commonest declension that all eight cases have different forms. In the other declensions and in the other numbers various of the cases coincide in form; *e.g.,* in the dual there are only three different forms.

Nouns fall into three gender classes, called masculine, feminine, and neuter. The gender class of a noun is on the whole better distinguished through the form of an adjective accompanying it than through its own form. Most adjectives have three sets of number and case forms, one set for each of the genders, and the form of the adjective and the gender class of the noun are in agreement. Gender corresponds with sex only for those nouns that denote persons and animals. Nouns denoting males belong to the masculine class, those denoting females to the feminine class; there are very few exceptions such as *mitram* "friend," which is neuter. All other nouns are divided among the three gender classes (as in the Latin or the German system).

The Vedic dialect differs from classical Sanskrit in numerous details of form; the system is the same.

Some forms from a paradigm are: singular nominative *dēvás* "god," accusative *dēvám,* genitive *dēvásya;* dual nominative-accusative *dēvā́u,* Vedic *dévā́;* plural nominative *dēvā́s,* Vedic *dēvā́sas,* accusative *dēvā́n.*

Compounds of noun and adjective stems are found in Sanskrit as in other Indo-European languages. In the Vedic period they seldom have more than two members, but in the epic longer ones occur and later in the classical literature they often attain inordinate length.

Pronouns.—As in other Indo-European languages, the first and second personal pronouns have many unique forms based on a complicated stem allomorphy; *e.g.,* first personal singular nominative *ahám,* accusative *mā́m,* or *mā,* dual nominative-accusative *āvā́m,* plural nominative *vayám,* accusative *asmā́n* or *nas.* No gender distinctions are found in these pronouns. There are numerous third personal demonstrative pronouns with declension somewhat similar to that of nouns but showing numerous differences; these pronouns, as well as the relative and the interrogative, have gender.

Verbs.—The categories indicated in the conjugation of verbs are tense, mode, voice, and number and person of the subject. The numbers are the three found in substantives, the persons are the three of the pronouns. A finite verb form contains these two categories or agrees in them with its substantive subject.

The basic allomorph given for a verb is called the root. The tense systems include a present system, with two tenses, present and imperfect. There are numerous types of present system, derivable from the root by specific present suffixes or other affixes. The aorist tense has several subsystems, in general derivable from the root more simply than the present systems; aorists often contain an *s*-suffix. A perfect tense is derivable from the root by initial reduplication. A future occurs of the type given above in the paragraphs on morphophonemics. In classical Sanskrit aorist and perfect are rare in comparison with imperfects; all three have merely past meaning. In the older Vedic texts there are distinctions of meaning: the aorist often means a past that occurred shortly before the speaker spoke; the imperfect often denotes a past event not known to the speaker from his own knowledge (*e.g.,* a mythical past); the perfect often means present result of past action.

In the present system there are three modes: indicative, imperative, and optative ("he might, would do"). The Vedic dialect in addition had a subjunctive. It also had numerous modal forms besides the indicative in the aorist and perfect.

For each of the combinations of tense and mode there are two voices, active and middle. When a verb is conjugated in both voices, there is sometimes a middle meaning, "action done for oneself." In general, however, there is no distinction, and many verbs are prevailingly conjugated in only one or the other voice. In the Vedic dialect many middle forms have passive meaning. There is also at all periods a special present system with middle voice and passive meaning.

The person and number inflectional endings show a complicated allomorphy. There is a special set of endings for the perfect, another for the imperfect and aorist (combined with a prefix *a-*), another for the imperative, and a fourth found especially in the present and future tenses.

Besides these types of conjugation there are also intensive, desiderative, and causative stems, which occur usually in forms of the present system.

Adjective forms, *i.e.,* participles, are found in the present, perfect, and future systems, and also in the aorist in the Vedic dialect. There are also past participles, active for intransitive verbs and passive for transitive verbs, and future passive participles, the meaning of which usually includes necessity, "which must be done."

Nonfinite forms are an infinitive, usually denoting purpose, "in order to do," and a gerund (also called absolutive, indeclinable participle, etc.), which means "having done."

In general, the Vedic dialect has a much more complex and richer verb morphology than classical Sanskrit.

Verb roots are very frequently compounded with adverbial prefixes. The meaning is sometimes a simple combination of the elements; more often it is much specialized (*cf.* English "understand," which in meaning is not a simple combination of "under" and "stand").

Syntax.—Much of the syntax is concerned with the construction of noun cases with verbs and other nouns. Word order is somewhat free, but statements can be made, *e.g.,* that there is a normal order of subject + oblique cases + direct object (accusative) + verb; or that the demonstrative with *sa-/ta-* tends to occur as first word in the sentence, no matter what its case. Along with simple predications, there occur also subordinate predications which contain subordinating conjunctions or relative pronouns; such complex predications do not attain the complexities familiar in Latin.

Relations Within Indo-European.—The Indo-European (IE) vowel system underwent considerable simplification in Sanskrit. The sounds **a, *e, *o* coalesced as *a*, and **ā, *ē, *ō* as *ā*. This resulted in the obscuring of the qualitative section of the IE morphophonemic system called *ablaut;* the sets **e, *o, *ē, *ō,* zero and **a, *o, *ā, *ō,* zero resulted in Sanskrit *a, ā,* zero. The IE consonant phonemes were in part better preserved, in that Sanskrit *t, d, dh* (and similar sets) represent three IE phonemes (a contrast preserved also in Greek and partly in Latin and Germanic). On the other hand, IE labiovelars and velars coalesced and, when followed by the IE palatal vowels, were palatalized at a period before **e* became Sanskrit *a*. The IE voiceless palatal stop remained separate from the velar and labiovelar in some contexts (IE **k̂:* Skt. *ś*).

In general, Sanskrit has been considered to preserve the IE morphological system somewhat better than the other languages, and to this extent it deserves its old reputation as an archaic IE language.

SANSKRIT LITERATURE. Literature in Sanskrit (*see* SANSKRIT LANGUAGE) was produced by the Aryan peoples who entered India from the northwest, probably during the 2nd millennium B.C. (*see* INDIA-PAKISTAN, SUBCONTINENT OF: *History*), and developed as the vehicle of expression for the brahmanical society which gradually established itself as the main cultural force throughout India in the period before the Muslim conquest. Beginning *c.* 1500 B.C., with the era of the Vedic hymns, the Classical period of Sanskrit literature drew to a close *c.* A.D. 1000. Throughout this period of two and a half millennia the dating of most literary works (as, indeed, of most historical events), even to the nearest century, is problematical; the difficulty is aggravated by such factors as the tendency traditionally to ascribe authorship to famous or legendary names. Two main periods in the development of the literature are discernible: the Vedic period, approximately 1500–200 B.C.; and, somewhat overlapping it, the Classical period, approximately 500 B.C.–A.D. 1000.

THE VEDIC PERIOD

General Outline

The following outline of the literature of the Vedic period leads to a more detailed study, below, of some of the main texts.

Vedas.—The peoples who entered India from the northwest in 2000–1500 B.C., and who gradually spread over the Gangetic plain, brought with them a religion which had close affinities with that of the Iranian Avesta (*see* ZOROASTRIANISM). Their earliest literary products are the *Vedas,* sacred hymns extolling the Aryan deities and forming a liturgical corpus which grew up around the Vedic sacrifices (*see* VEDIC RELIGION). The foremost collection, or *saṃhitā,* of such hymns, from which the *hotar* (chief priest) drew the material for his recitations, is the *Rigveda.* Sacred formulas known as *mantras* (some probably more ancient in origin than the hymns; *see* MANTRA) were recited by the *adhvaryu,* the priest responsible for the sacrificial fire and the offering of oblations; these *mantras* and verses in time were collected into *saṃhitās* known as *Yajurveda.* The *hotar* and his group spoke aloud or intoned their utterances, while the *adhvaryu* for the most part moved about his tasks, helped by assistants, uttering prayers in a low voice. A third group of priests, headed by the *udgātar* ("chanter"), performed melodic recitations linked to verses which, although drawn almost entirely from the *Rigveda,* came to be arranged as a separate *saṃhitā,* the *Sāmaveda* ("*Veda* of the Chants"). To these three *Vedas—Rig-, Yajur-,* and *Sāma-,* known as the *trayi vidyā* ("threefold knowledge")—is added a fourth, the *Atharvaveda,* a collection of hymns, magic spells, and incantations which represents a more domestic level of religion and remains outside the Vedic sacrifice.

Fundamental to the performance of all these religious ceremonies was the belief that if they were performed correctly in every detail the sacrificer would gain control over the gods, who must reward him with religious merit and success in worldly endeavour.

The sacrifices themselves grew so complex that manuals (*paddhatis* or *prayogas*) relating to particular sacrifices were devised to help the priests remember their tasks. These manuals, together with the role of the fourth main priestly office, that of the *brahman,* grew in importance as the sacrificial tradition weakened. The performance of certain of these ceremonies still continues, the oral tradition being particularly strong in certain parts of southern India (Madras, Godavari district, and Kerala), while elsewhere a greater reliance on the *prayogas* and the assistance of the *brahman* is apparent.

Brāhmaṇas.—Attached to the *saṃhitās* are prose works, called *brāhmaṇas,* written to explain the significance of the *Vedas* as used in the sacrifices, as well as the symbolical import of the actions performed by the priests. (*See* also BRAHMANAS.)

Āraṇyakas and Upanisads.—These are connected with the *brāhmaṇas,* often forming part of them. The *āraṇyakas* ("forest treatises") represent philosophical speculations suitable only for the initiated (ascetics who lived as hermits in the forest) and therefore not taught openly in the village. The more mystical *upaniṣads* (Upanishads; *q.v.*) treat of the metaphysical questions already vaguely formulated in the later hymns of the *Rigveda.* Although more than 200 *upaniṣads* are extant, probably not many more than a dozen are intimately connected with the *Veda.* These are conjecturally dated between 800 and 200 B.C.

Evolution of Different Schools.—On the basis of locality, differences of tradition arose within each *Veda,* and in time these differences gave rise to schools, or *śākhās* ("branches"), at one time numerous. The works were transmitted orally from teacher to pupil, a tradition still widely continued despite the existence of manuscripts and printed books.

Vedāṅgas.—Since it was the sacred duty of a Brahman to hand down the texts faithfully, considerable discussion arose on linguistic problems, the beginnings of which may already be observed in the *brāhmaṇas.* As a result of these and other inquiries there developed a sixfold group of texts known as *vedāṅgas* ("members [or limbs] of the [body of the] *Veda*"). In contrast with the other texts of the *Veda,* called *śruti* ("divine revelation"), these *vedāṅgas,* representing in some cases a link between the literatures of the Vedic and Classical periods, are regarded as of human origin and are termed *smṛti* (*smriti;* "tradition"). Their more scientific content is also indicated in their style, some being composed in abbreviated language or aphorisms known as *sūtras* ("threads"), so that they would be easier to remember. The *vedāṅgas* fall into six groups:

Śikṣā ("*Instruction [in Recitation]*").—To ensure faithful transmission, *padapāṭhas* ("word recitations") were instituted at an early date and taught orally with the *saṃhitās.* In the *padapāṭhas* the words of the *saṃhitās* are recited one by one, each being followed by a short pause, so that the phonetic combinations that occur between words in continuous utterance (the normal method of recitation) are separated. A further safeguard against error in transmission existed in the *kramapāṭhas,* in which words are recited in pairs (*ab, bc, cd,* etc.). These exercises, with other still more elaborate combinations, are still practised. The *prātiśākhyas* (instruction "according to the *śākhā*") were composed in conjunction with these *pāṭhas.* Their primary aim was to discuss the phonetic relationship between the *padapātha* and the *saṃhitā* ("continuous utterance") and to give rules for the conversion of the *padapātha* into the *saṃhitā.* In addition, there are numerous smaller texts, the *śikṣās,* designed to aid the young pupil, or to deal with particular difficulties of pronunciation encountered in different regions.

Kalpa ("*Ritual*").—*Kalpa sūtra* is a general term denoting the manuals on religious practice which emerged within the different Vedic schools. The *śrauta sūtras,* based on *śruti,* were devised to guide the priest, each according to his own school, in his func-

tion at the sacrifice (which was so complex that as many as 17 priests might be involved, thus giving rise to many points of difference). The *gṛhya sūtras,* based on *smṛti,* were related to the householder's domestic rites—*e.g.,* birth ceremonies, name giving, investiture with the sacred cord, and marriage, as well as the five daily sacrifices (*mahāyajña*) and certain offerings (*pākayajña*).

Chandas (*"Metre"*).—The Vedic metres, as distinct from those of Classical Sanskrit, are dealt with in the last three chapters of the *Ṛk Prātiśākhya,* and those of the *Sāmaveda* are also discussed in the *Nidāna Sūtra.* A *vedāṅga* by tradition is the *Chandaḥ Sūtra* of Piṅgala (which exists in two recensions, ascribed to the *Rig-* and *Yajurvedas*); but this is, in fact, a late work and treats other metres as well as Vedic.

Vyākaraṇa (*"Grammar"*).—The *sūtras* of Pāṇini, who lived *c.* 5th century B.C. (*see* also *Grammar,* below), are known as the *Aṣṭādhyāyī* ("Eight Chapters") and are considered the foremost *vedāṅga.* While recording fully many features of Vedic, the *Aṣṭādhyāyī* is devoted chiefly to the post-Vedic language, testifying to a long grammatical tradition outside the Vedic schools.

Nirukta (*"Etymology"*).—Yāska's *Nirukta,* of the same era as Pāṇini's work and the only extant etymological *vedāṅga,* reveals the existence of word lists, *nighaṇṭus,* traditionally threefold, consisting of synonyms, obscure words, and names of gods. Possibly owing to a broken exegetical tradition, since reciters of the *Vedas* were not *ipso facto* scholars, even at that period these words were not clearly understood. Yāska comments on one such list, quoting 16 forerunners and giving many illustrations, chiefly from the *Rigveda.*

Jyotiṣā (*"Astronomy"*).—Two recensions of a brief, and possibly post-Vedic, metrical work survive, attached to the *Rig-* and *Yajurvedas.* They deal with the positions of the sun and moon at the solstices, and with that of the new and full moon with regard to the constellations.

The Four Vedas and the Upaniṣads

Rigveda.—The *Rigveda* (properly *Ṛgveda*) *Saṃhitā,* which has come down in the recension of the Śākala school, consists of 1,028 hymns, including 11 so-called *Vālakhilyas,* probably of later date. The hymns, composed in a great variety of metres, consist, on an average, of rather more than ten verses each; there are about 10,600 verses altogether. This body of sacred lyrics was subdivided by ancient authorities in two ways: either artificially into eight *aṣṭakas* of about equal length; or, more naturally, according to the origin of the hymns, into ten books, or *maṇḍalas,* of unequal length. The latter is the method adopted by European scholars. Tradition has handed down the names of the reputed authors, or, rather, the inspired "seers" (*ṛṣis*), of most of the hymns. These indications have enabled scholars to form some idea as to the probable way in which the *Rigveda* originated, though much remains to be clarified.

Maṇḍalas ii–vii are each ascribed to a different family of *ṛṣis,* whence they are usually called the six "family books": ii, the *Gṛtsamadas;* iii, the *Viśvāmitras* or *Kuśikas;* iv, the *Vāmadevyas;* v, the *Atris;* vi, the *Bharadvājas;* and vii, the *Vasiṣṭhas.* These books all follow a similar plan, each beginning with hymns addressed to Agni, the god of fire, followed by hymns to Indra and to minor deities—the Viśve Devās ("all-gods"), the Maruts (storm-gods), etc. Again, the hymns addressed to each deity are arranged in descending order, according to number of verses.

Maṇḍala i, the longest in the whole *saṃhitā,* contains 191 hymns ascribed, with a few isolated exceptions, to 16 poets of different families. They consist of one large collection (of 50 hymns) and nine shorter collections. The hymns of each author are arranged on the same principle as that used for the "family books."

Maṇḍalas viii and ix have a special character. They contribute a much larger proportion of verses to the *Sāmaveda* than do any of the other *maṇḍalas.* The hymns of the eighth book are ascribed to a number of different *ṛṣis,* mostly belonging to the Kāṇva family. The chief peculiarity of this *maṇḍala,* however, consists in the strophic character of its composition and in the numerous repetitions throughout. It is closely connected with the first half of the first *maṇḍala;* these two books were evidently added as beginning and end to the collected ii–vii. The ninth *maṇḍala* consists entirely of hymns (114) addressed to Soma (*q.v.*) and ascribed to poets of different families. They are called *pāvamāni* ("purificational") because they were to be recited by the *hotar* while the juice pressed from the soma plant was clarifying. These hymns and those of *maṇḍalas* ii–vii were composed by poets of the same families, and it is evident that when the collection was made the soma hymns were taken out and put into a single group. There are also a few soma hymns in some of the later books (i, viii, and x).

Maṇḍala x contains the same number of hymns (191) as the first *maṇḍala,* which it nearly equals in actual length. In the second half of the book the hymns are clearly arranged according to the number of verses, in decreasing order; occasional exceptions to this rule can easily be adjusted by removing a few apparently added verses. There is evidence that this *maṇḍala* came into existence after the other nine were in their present form. It shows considerable uniformity, and all of it is older than the latest insertions in the other books.

It is usual to call the *Rigveda* (and also the *Atharvaveda*) a historical collection, as compared with the other two *saṃhitās,* which were compiled for purely ritualistic purposes. The *Rigveda* contains additional material, some of it secular, which the collectors must have thought worth preserving despite its lack of liturgical purpose.

Brāhmaṇas of the Rigveda.—Of the *brāhmaṇas* that were handed down in the schools of the Bahvṛcas ("possessed of many verses"), as the followers of the *Rigveda* are called, two have been preserved: that of the Aitareyins and that of the Kauśītakins. The *Aitareya Brāhmaṇa* and the *Kauśitaki* (or *Śāṅkhāyana*) *Brāhmaṇa* evidently have for their basis the same stock of traditional exegetic matter; they differ considerably in arrangement, however. The *Kauśitaki* is, on the whole, far more concise in style and systematic in arrangement—features that suggest that it is probably the later of the two works. Sāyaṇa, in the introduction to his commentary on the *Aitareya,* ascribes it to the sage Mahidāsa Aitareya, and it seems likely that he arranged the *brāhmaṇa* and founded the school of the Aitareyins. About the authorship of the *Kauśītaki* there is no definite statement. Probably it is what one manuscript calls it—the *brāhmaṇa* of Śāṅkhāyana, composed in accordance with the views of Kauśītaki.

Āraṇyakas.—Each of these two *brāhmaṇas* is supplemented by an *āraṇyaka.* The *Aitareya Āraṇyaka* consists of five books (*adhyāya*), the first and last two of which are liturgical, treating the ceremony called *mahāvrata* ("great vow"). The last, composed in *sūtra* form, is, however, probably of later origin. The second and third books are purely speculative. The last four chapters of the second book are usually distinguished as the *Aitareya Upaniṣad,* ascribed, like its *brāhmaṇa* (and the first book), to Mahidāsa Aitareya; and the third book is also referred to as the *Saṃhitā Upaniṣad.*

The *Kauśītaki Āraṇyaka* consists of 15 *adhyāyas.* The first two (treating the *mahāvrata* ceremony) and the seventh and eighth correspond to the first, fifth, and third books of the *Aitareya Āraṇyaka* respectively, while the four *adhyāyas* usually inserted between them constitute the interesting *Kauśītaki Upaniṣad,* of which two different recensions exist. The remaining portions (9–15) of the *āraṇyaka* discuss the vital airs, the internal *agnihotra,* and end with the *vaṃśa* ("succession of teachers").

Of *kalpa sūtras* (manuals of sacrificial ceremonial), composed for the use of the *hotar* priest, two different sets are extant: the *Āśvalāyana* and the *Śāṅkhāyana Sūtra.* The former follows the *Aitareya,* the latter the *Kauśitaki,* and both consist of a *śrauta* and a *gṛhya sūtra* (see *Vedāṅgas: Kalpa,* above).

Sāmaveda.—The term *sāman,* of uncertain derivation, denotes a solemn tune or melody to be sung or chanted to a *ṛc* ("verse text"). The set chants (*stotra*) of the soma sacrifice are generally performed in triplets, consisting either of three different verses or of two verses which, by repetition of certain parts, are made to form three. The three verses are usually chanted to the same tune; but, in certain cases, two verses sung to the same tune are separated by a different *sāman.* One and the same *sāman* may thus

be sung to many different verse texts; but, as in teaching and practising the tunes, the same text was invariably used for a particular tune, the term *sāman,* as well as the special technical names of *sāmans,* are sometimes applied to the verse texts with which they were generally connected.

In accordance with the distinction between *ṛc* ("text") and *sāman* ("tune"), the *sāman* hymnal consists of two parts: the *Sāmaveda Saṃhitā*—or collection of *ṛc* used for making up *sāman* hymns—and the *Gāna* ("tune books," "song books"). The textual matter of the *saṃhitā* consists of rather fewer than 1,600 different verses, all selected from the *Rigveda* except for about 75 verses, some of which have been taken from *Khila* hymns while others (some of which also occur in the *Atharva-* or the *Yajurveda*) may have formed part of some other recension of the *Rigveda.* The *Sāmaveda Saṃhitā* is divided into two main parts: the *Pūrva* ("first") and the *Uttara* ("second") *Ārcika.* The second part contains the texts of the *sāman* hymns, arranged in the order in which they are actually required for the chants of the various soma sacrifices. The first part contains the body of "tune verses" (verses used for practising the several *sāmans*), the tunes themselves being given in the *Grāma-geyagāna* (*i.e.,* songs to be sung in the village), the tune book specially belonging to the *Pūrva Ārcika.*

The title *brāhmaṇa* is given by the Chandogas, or followers of the *Sāmaveda,* to a considerable number of treatises. The majority of the *brāhmaṇas* of the *Sāmaveda* present, however, none of the characteristic features of other *brāhmaṇas;* they are rather of the nature of *sūtras* and kindred treatises and probably belong to the same period.

Yajurveda.—This, the sacrificial *Veda* of the *adhvaryu* priests, exists in an earlier and a later form, usually called the Black (*Kṛṣṇa*) and the White (*Śukla*) *Yajurvedas.*

The Black Yajurveda.—There are three recensions of the earlier form: the *Kāṭhaka,* the *Maitrāyaṇīya,* and the *Taittirīya Saṃhitā.* The *Kāṭhaka* and *Maitrāyaṇīya* are mentioned together, and from them various schools seem to have branched off fairly early, each with its own recension of the text. The *Taittirīya Saṃhitā,* too, in time gave rise to a number of different schools, the text handed down being that of the Āpastamba school.

The four extant collections of the early *Yajurveda* texts, while differing fairly considerably in arrangement and verbal points, have most of their textual matter in common. This consists both of sacrificial prayers (*yajus*), in verse and prose, and of exegetic or illustrative prose portions (*brāhmaṇa*). A prominent feature of these early texts, as compared with the other *Vedas,* is the constant intermixture of the textual and exegetic portions. Thus Carakas and Taittirīyas do not recognize the distinction between *saṃhitā* and *brāhmaṇa,* in the sense of two separate collections of texts: they have only a *saṃhitā* ("collection") which includes the exegetic (or *brāhmaṇa*) portions. The Taittirīyas seem to have been impressed eventually with their lack of a separate *brāhmaṇa* and to have supplied the deficiency rather awkwardly. Instead of separating the textual and exegetic portions of their *saṃhitā,* they merely added to the latter a supplement (in three books), which is also a mixture, and called it the *Taittirīya Brāhmaṇa.*

The White Yajurveda.—The defective arrangement of the *Yajurveda* texts was finally remedied by a different school of *adhvaryus,* the Vājasaneyins. The reputed originator of this school and its text recension is Yājñavalkya Vājasaneya (*i.e.,* son of Vājasani). The result of the rearrangement of the texts was a collection of sacrificial *mantras,* the *Vājasaneyi Saṃhitā,* and a *brāhmaṇa,* the *Śatapatha.* Because of the greater clarity of this arrangement, the Vājasaneyins called their texts the White (or clear) *Yajurveda*—the name of Black (or obscure) *Yajurveda* being applied by them to the Caraka texts. Both the *saṃhitā* and the *brāhmaṇa* of the Vājasaneyins have been preserved in two different recensions, those of the Mādhyaṃdina and Kāṇva schools. In several points of difference the Kāṇva recension agrees with the practice of the *Rigveda,* and there probably was some connection between the Yajus school of Kāṇvas and the famous family of *ṛṣis* of that name to which the eighth *maṇḍala* of the *Rigveda* is attributed.

The *Vājasaneyi Saṃhitā* consists of 40 *adhyāyas.* The first contains the formulas of the ordinary sacrifices. The last 15 (or even 22) *adhyāyas* are probably a later addition. The last *adhyāya* is commonly known as the *Īśā Upaniṣad.*

Atharvaveda.—The *Atharvaveda* was the last of the Vedic collections to be recognized as part of the sacred canon. That it is also the latest is proved by its language, which in vocabulary and grammar marks an intermediate stage between the main body of the *Rigveda* and the *brāhmaṇa* period. In the nature of its contents and the spirit pervading it, this collection occupies a position apart. While the older *Vedas* seem to reflect the recognized religious notions and practices of the upper classes of the Aryan tribes, jealously watched over by a priesthood deeply interested in maintaining the traditional observances, the fourth *Veda* deals mainly with superstitious practices. The character of the old gods, too, has changed; they are required merely to promote the votary's cabalistic practices and to avert the malicious designs of his mortal enemies and of the demoniac influences to which he ascribes his fears and failures as well as his bodily ailments. The fourth *Veda* may thus be said to supplement in a remarkable way the picture of the domestic life of the Vedic Aryan presented in the *gṛhya sūtras* ("house rules"). While the latter deal only with the daily duties and periodic observances in the life of the respectable householder, the *Atharvaveda* provides insight into "the obscurer relations and emotions of human life"; and it may be said that "the literary diligence of the Hindus has in this instance preserved a document of priceless value for the institutional history of early India as well as for the ethnological history of the human race" (M. Bloomfield; see *Bibliography*). The *Atharvaveda* is practically unknown in southern India.

This body of spells and hymns is traditionally associated with two ancient and mythical priestly families, the Atharvans and the Aṅgiras. Their names, in the plural, are used, either singly or combined (*Atharvāṅgirasas*), as the oldest name of the collection. Both families, or classes, of priests are by tradition connected with the service of the sacred fire; but while the Atharvans seem to have devoted themselves to the auspicious aspects of the fire cult and the performance of propitiatory rites, the Aṅgiras were mainly engaged in sorcery and exorcism. The current text of the *Atharvaveda Saṃhitā*—apparently the recension of the Śaunaka school—consists of some 750 different pieces, about five-sixths of which are in various metres, the rest being in prose. The whole is divided into 20 books. The principle of distribution is for the most part merely formal. In books i–xiii pieces of the same, or about the same, number of verses are placed together in the same book. Of the next five books (xiv–xviii), each has its own subject: xiv treats of marriage and sexual union; xv, in prose, of the *vrātya* ("religious vagrant"); xvi consists chiefly of prose formulas of conjuration; xvii is a lengthy mystic hymn; and xviii contains all that relates to death and funeral rites. Of the last two books no account is taken in the *Atharva Prātiśākhya* (a linguistic treatise —*śikṣa*—relating to the *Atharvaveda,* and treating books i–xviii), and they are clearly supplements to the original collection. The 19th book is evidently a later anthology; and the 20th, consisting almost entirely of hymns to Indra taken from the *Rigveda,* is merely a liturgical manual of recitations and chants required at the soma sacrifice. Its only original portion is the ten so-called *kuntāpa* hymns (127–136), consisting partly of riddles and didactic material. The *saṃhitā* of the Paippalāda school, previously known only from a corrupt Kashmiri manuscript, in the late 1950s was found current in the Singhbhum district (southeastern Bihar), but the manuscripts had not been edited in the mid-1960s.

The only *brāhmaṇa* of the Atharvan, the *Gopatha Brāhmaṇa,* is one of the latest and least important of its class. The *kalpa sūtras* comprise both a manual of *śrauta* rites, the *Vaitāna Sūtra,* and a manual of domestic rites, the *Kauśika Sūtra.* The teacher Kauśika is repeatedly referred to in this on points of ceremonial doctrine. The last *sūtra* work to be mentioned in connection with the *Atharvaveda* is the *Śaunakīya Caturādhyāyikā* ("four lectures"—*catur-adhyāya*), which is a *prātiśākhya* of the *Atharva Saṃhitā.*

Upaniṣads.—Another class of writings traditionally connected with the *Atharvaveda* are the numerous *upaniṣads* which do not specially attach themselves to one or other of the *saṃhitās* or

brāhmaṇas of the other *Vedas*. The *Ātharvaṇa Upaniṣads*, mainly composed in *ślokas* ("epic couplets"), may be roughly divided into two classes: those of a purely speculative or general pantheistic character, treating chiefly of the nature of the Supreme Spirit, and the means of attaining union with it; and those of a sectarian tendency. Of the former, a limited number—such as the *Praśna*, *Muṇḍaka*, and *Māṇḍūkya Upaniṣads*—must probably be assigned to the later period of Vedic literature; while the others presuppose more or less distinctly the existence of some fully developed system of philosophy, especially the Vedanta or the Yoga. The sectarian *upaniṣads*, on the other hand—identifying the Supreme Spirit either with one of the forms of Viṣṇu (Vishnu; *e.g.*, the *Nārāyaṇa, Nṛsiṃha Tāpanīya, Rāma Tāpanīya, Gopāla Tāpanīya Upaniṣads*), or with Śiva (Shiva; *e.g.*, the *Rudra Upaniṣad*), or with some other deity—belong to post-Vedic times. *See* also VISHNUISM; SHIVAISM.

THE CLASSICAL PERIOD

The Classical literature of India is almost entirely of artificial growth, in the sense that it is written not in the language of the people but in that of a small educated class. It would scarcely be possible to fix, even approximately, the date when the literary language ceased to be understood by the people (*see* SANSKRIT LANGUAGE). It is only known that in the 3rd century B.C. there existed several dialects in different parts of northern India which differed considerably from Sanskrit. But there is no reason why, even with the development of local dialects, the literary language should not have kept in touch with the people in India, as elsewhere, except that, from a certain period, this language remained stationary, allowing the vernacular dialects increasingly to diverge from it. Although linguistic research had been successfully carried on in India for centuries, the actual grammatical fixation of Sanskrit seems to have taken place at about the same time as the first spread of Buddhism; and that popular religious movement undoubtedly exercised a powerful influence on the linguistic development of India.

POETRY

The Hindus possess two great national epics, the *Mahābhārata* and the *Rāmāyaṇa* (*qq.v.*).

The Mahābhārata.—The *Mahābhārata* (*i.e.*, "the great [poem or tale] of the Bharatas") is not so much a unified epic poem as a great collection of poetry, consisting of a mass of legendary and didactic matter, worked into and around a central heroic narrative. The authorship of this work is aptly attributed to Vyāsa ("the arranger"), the personification of Indian recension. Only a bare outline of the leading story can be given.

The Story.—At Hastināpura (near modern Delhi) in the Bharata country, Dhṛtarāṣṭra, the elder of two princes, because he was blind, was passed over for his brother Pāṇḍu on their father's death. On Pāṇḍu's death, however, Dhṛtarāṣṭra assumed the government, assisted by his uncle Bhīṣma. Pāṇḍu had five sons, Yudhiṣṭhira, Bhīma (*q.v.*), and Arjuna (*q.v.*), by his chief wife, Kuntī; and the twins Nakula and Sahadeva by his wife Mādrī. From their great-grandfather, Kuru, both families are called Kauravas; but for distinction that name is more usually applied to the sons of Dhṛtarāṣṭra, while their cousins, as the younger line, are named Pāṇḍavas after their father. The Pāṇḍavas were brought up at their uncle's court like his own sons. The rivalry and varying fortunes of these two houses form the main plot of the epic. The Pāṇḍu princes soon proved themselves greatly superior to their cousins; and Yudhiṣṭhira, the eldest, was to be appointed heir apparent. But they were forced to leave the country to escape the plots of their jealous cousins. In their exile Draupadī, daughter of King Drupada of Panchāla, won by Arjuna in open contest, became the wife of the five brothers. At the contest they met their cousin, the famous Yādava prince Kṛṣṇa (Krishna; *q.v.*) of Dvārakā (Dwarka), who ever after remained their faithful friend and confidential adviser.

Dhṛtarāṣṭra divided the kingdom between the two houses; whereupon the Pāṇḍavas built themselves the city of Indraprastha (on the site of modern Delhi). After a time of great prosperity, Yudhiṣṭhira, in a game of dice, lost everything to Duryodhana (the eldest son of Dhṛtarāṣṭra), and it was settled that the Pāṇḍavas should retire to the forest for 12 years and should be restored to their kingdom if they succeeded in passing an additional year in disguise. During their forest life they met with many adventures, among which may be mentioned their encounter with King Jayadratha of Cedi, who had carried off Draupadī from their hermitage. After the end of the 12th year they left the forest, and, assuming various disguises, took service at the court of King Virāṭa of Matsya. There they lived at peace until the queen's brother, Kīcaka, a great warrior and commander of the royal forces, fell in love with Draupadī and was slain by Bhīma. The Kauravas, profiting by Kīcaka's death, thereupon invaded the Matsyan kingdom. The Pāṇḍavas sided with King Virāṭa, and there ensued, on the field of Kurukṣetra, a series of fierce battles which lasted for 18 days and ended in the annihilation of the Kauravas. Only the Pāṇḍavas and Kṛṣṇa survived on the victorious side. At last Yudhiṣṭhira became *yuva-rāja* ("heir apparent"), and, eventually, king—Dhṛtarāṣṭra having resigned and retired with his wife and Kuntī to the forest, where they soon perished in a fire. Learning of the death of Kṛṣṇa (who had withdrawn to the forest, where he was accidentally shot by a hunter), Yudhiṣṭhira tired of life and resigned his crown; and the five princes, with their faithful wife and a dog that had joined them, set out for Mt. Meru to seek admission to Indra's heaven. On the way one by one fell away, until Yudhiṣṭhira alone, with the dog, reached the gate of heaven; but, the dog being refused admittance, the king declined to enter without it. The dog then turned out to be no other than the god of justice himself, who had assumed the form to test Yudhiṣṭhira's constancy. But, finding neither his wife nor his brothers in heaven, and being told that they had been sent to the nether world to expiate their sins, the king insisted on sharing their fate. This, too, proved to be a test, and at last they were all reunited to enjoy perpetual bliss.

The complete work consists of more than 100,000 couplets, its length thus being nearly eight times that of the *Iliad* and *Odyssey* combined. It is divided into 18 books, with a supplement, entitled *Harivaṃśa* ("genealogy of the god Hari"; *i.e.*, Kṛṣṇa-Viṣṇu). The part relating to the feud of the rival houses constitutes somewhere between a fourth and a fifth of the work; and it is by no means improbable that this portion once formed a separate poem, the *Bhārata*. While some of the episodes are so loosely connected with the story as to be readily separated from it, others are so closely interwoven with it that their removal would seriously injure its texture. This, however, only shows that the original poem must have undergone some kind of revision, or perhaps repeated revisions, by Brahmans, for sectarian and caste purposes.

The Date.—In time, the *Mahābhārata* became a great treatise on duty (*dharma*), inculcating the divine origin of Brahman institutions, the caste system, and the superiority of the priestly caste not only over the people but over kings. From inscriptions it is known that by the end of the 5th century A.D. the *Mahābhārata* was appealed to as an authority on matters of law, and that its extent was practically what it now is, including its supplement, the *Harivaṃśa*. Indeed, everything points to the probability of the work's having been complete by *c.* A.D. 200. But while Bharata and Kuru heroic lays probably go back to a much earlier age, it seems hardly possible that the Pāṇḍava epic in its present form can have been written before the Greek invasion of India (*c.* 300 B.C.). Moreover, it is possible that the epic narrative was originally composed—like some other parts of the work—either in continuous prose or in prose mixed with snatches of verse. The leading position occupied in the existing epic by Kṛṣṇa (as a result of which it is actually called the *Kārṣṇaveda*, "the *Veda* of Kṛṣṇa"), and the Vaiṣṇava spirit pervading it, make it probable that it assumed its final form under the influence of the Bhāgavata sect with whom Vāsudeva (Kṛṣṇa), originally apparently a venerated local hero, came to be regarded as a god and the incarnation of Viṣṇu. This sectarian feature attains its culminating point in the *Bhagavad Gītā* (*q.v.*; "Song of the Holy One"), the famous theosophic episode of the *Mahābhārata*, in which Kṛṣṇa, in lofty and poetic language, expounds the doctrine

of devotion (*bhakti*) and claims adoration as the incarnation of the Supreme Spirit. Of the purely legendary material incorporated with the poem's main narrative, much is probably at least as old as this story itself. Some of these legendary episodes—especially the story of Nala and Damayantī, and the touching legend of Sāvitrī—themselves form epic poems of great literary merit.

The Rāmāyaṇa.—The other great epic, the *Rāmāyaṇa* (poem "relating to Rāma"), is ascribed to the poet Vālmīki; and, allowing for some later additions, it presents the appearance of being the work of an individual genius. In its present form it consists of some 24,000 *ślokas, i.e.,* 48,000 lines, each of 16 syllables, and is divided into seven books.

The first book tells how King Daśaratha of Kośala, reigning at Ayodhyā (Oudh), has four sons born to him by three wives: Rāma (*q.v.*), Bharata, and the twins Lakṣmaṇa and Śatrughna. Rāma wins for his wife Sītā, daughter of Janaka, king of Videha. The second book describes how, on his return to Ayodhyā, Rāma is to be appointed heir apparent; but Bharata's mother persuades the king to grant her a long-promised boon, and insists on his banishing Rāma for 14 years and appointing Bharata heir apparent instead. Separation from his favourite son soon breaks the king's heart, whereupon the ministers call on Bharata to assume the government. He refuses, and, going himself to Rāma's retreat on the Chitrakūṭa Mountain (in Bundelkhand), he implores him to return. Unable to shake Rāma's resolve to complete his exile, Bharata agrees to take charge of the kingdom until the 14 years are over.

In the third book, after Rāma and Sītā have lived happily in the forest for 14 years, together with Lakṣmaṇa, who always stays by his brother's side, Rāvaṇa, the *rākṣasa* ("demon-king"), of Ceylon, carries off Sītā to his capital, Laṅkā, while her two protectors are away in pursuit of a golden deer sent to mislead them. While she resolutely rejects Rāvaṇa's addresses, Rāma and his brother set out to rescue her. In the fourth book, after numerous adventures, they enter into alliance with Sugrīva, king of the monkeys; and, with the assistance of the monkey-general, Hanumān, and Rāvaṇa's own brother, Vibhīṣaṇa, they prepare to attack Laṅkā. The fifth book tells how the monkeys, tearing up rocks and trees, construct a passage across the straits—the so-called Adam's Bridge (*q.v.*), still called Rāma's Bridge in India. In book vi, Rāma crosses this bridge with his allies, slays the demon-king, and captures the stronghold. Sītā, by undergoing an ordeal by fire, clears herself of the suspicion of infidelity; and together they return to Ayodhyā, where, after a triumphal entry, Rāma is installed. In book vii, Rāma, seeing that the people are not yet satisfied of Sītā's chastity, decides to send her away. Then in the forest, she meets the sage Vālmīki himself (the reputed author of the *Rāmāyaṇa*), and, at his hermitage, gives birth to two sons. While growing up there, they are taught by Vālmīki the use of the bow, as well as the *Vedas,* and the *Rāmāyaṇa* as far as the capture of Laṅkā and the entry into Ayodhyā. Ultimately Rāma discovers and recognizes them by their wonderful deeds and their likeness to himself, and takes his wife and sons back.

The first and last books are later additions by which the poem has been turned to the glory of Viṣṇu. In these, Rāma has become deified and identified with the god Viṣṇu, although in the main part of the poem he is merely a perfect man and model hero. The background of the epic is purely mythological. Rāma represents the god Indra, and Sītā (in accordance with the meaning of the name), the personified "Furrow," as which she is already invoked in the *Rigveda.* She is thus a tutelary spirit of the tilled earth, wedded to Indra. Rāvaṇa thus corresponds to the demon Vṛtra of the *Rigveda.*

One version of the story, with, however, many important variations of detail, forms an episode of the *Mahābhārata,* the *Rāmopākhyāna.* The relation of this to Vālmīki's work is uncertain. In both versification and diction the *Rāmāyaṇa* is of a more refined character than the *Mahābhārata;* and, indeed, Vālmīki already cultivates some of that artistic poetic style which was carried to excess in the later artificial poems (the *kāvyas; see* below). For this reason the title of *ādikavi* ("first poet") is generally applied to him. The *Rāmāyaṇa* itself contains a prophecy that it will always live on the lips of men, and this has been fulfilled. No story in India has attained such popularity. It has been translated into many vernaculars, and through the version of Tulsi Das (*q.v.*) has exerted a great influence on spiritual life.

Purāṇas and Tantras.—The term *purāṇa* means "ancient," and by tradition a *purāṇa* treats five subjects: the creation of the world, its destruction and renewal, the genealogy of gods and seers, the great ages of mankind, and the history of the dynasties. The *purāṇas* are popular encyclopaedias of useful knowledge, mostly with a Vaiṣṇava tendency. They are connected in subject with the *Mahābhārata* and have some relationship to the law books (*see* below), going back to a common source. They are almost entirely written in epic couplets and are in much the same easy, flowing style as the epic poems, to which, however, they are generally greatly inferior poetically. (*See* also PURĀṆAS.)

According to the traditional classification, there are 18 *mahā* ("great") *purāṇas* and 18 *upa* ("subordinate") *purāṇas.* The former are divided by some authorities into three groups of six, according to which of the three primary qualities of external existence—goodness, darkness (ignorance), and passion—is supposed to prevail in them. These are: (1) the *Viṣṇu, Nāradīya, Bhāgavata, Garuṇa, Padma,* and *Varāha;* (2) the *Matsya, Kūrma, Liṅga, Śiva, Skanda,* and *Agni;* and (3) the *Brahmāṇḍa, Brahmavaivarta, Mārkaṇḍeya, Bhaviṣya, Vāmana,* and *Brahma Purāṇas.* The 18 principal *purāṇas* are said to consist of altogether 400,000 couplets. In northern India the Vaiṣṇava *purāṇas,* especially the *Bhāgavata* and the *Viṣṇu,* are much the most popular. The *Bhāgavata* is held in the highest esteem and, especially through the vernacular versions of its tenth book, treating the story of Kṛṣṇa, has powerfully influenced the religious beliefs of India. From the little known about the *upa purāṇas,* their character does not seem to differ very greatly from that of the main sectarian *purāṇas.*

Besides these two main classes, there is a large number of so-called *sthala purāṇas,* chronicles recounting the history and merits of some holy place, or shrine, at which their recitation usually forms an important part of the daily service.

The *tantras* must be considered as partly a collateral and partly a later development of the sectarian *Purāṇas,* although, unlike the *purāṇas,* they have little intrinsic poetic value. The Śaktas—worshipers of the female energy (*see* SHAKTISM)—look upon them as their sacred writings. This worship of a female representation of the divine power appears already in some of the *purāṇas;* but in the *tantras* it assumes an unusual character, being much intermixed with magic performances and mystic rites.

Artificial Epics and Romances.—At about the beginning of the Christian era, a new class of epic poems began to appear, differing greatly from those that had preceded it. These later poems are very artificial in character and must have been beyond the understanding of any but the most highly educated. They are, on the whole, lacking in incident and invention, their subject matter being almost entirely derived from the older epics. Nevertheless, they are not without interest, and a number of them show considerable descriptive powers and genuine poetic sentiment. In them, the simple epic couplet has been largely discarded for various more elaborate metres; and, as a result, the diction has become gradually more complicated.

The generic name for these epic works is *kāvya,* a term which, with the meaning "poem," or "the work of an individual poet (*kavi*)," had already been applied to the *Rāmāyaṇa.* Six poems of this kind are singled out by Indian rhetoricians as standard works, under the title *mahākāvya* ("great poems"). Two are ascribed to the famous dramatist Kālidāsa (*q.v.*), the most outstanding figure of this period of Indian literature and a master of the art of poetry. Of the main *kāvya* poets whose works have been preserved, he seems to be one of the earliest; but he was probably preceded in this, as in other kinds of poetic composition, by many lesser poets who have been eclipsed by his fame and forgotten. Thus, the *Buddhacarita*—a Sanskrit poem on the life of the Buddha, which was translated into Chinese *c.* A.D. 420 and of which the author, Aśvaghoṣa, is placed by Buddhist tradition as early as the time of Kaniṣka (whose reign began in A.D. 78)—describes itself

as a *mahākāvya;* and the panegyrics (in both verse and ornate prose) contained in some of the inscriptions of the 4th century A.D. also show many of the characteristic features of the *kāvya* style.

Of the six generally recognized *mahākāvya,* the two first and finest are those attributed to Kālidāsa. The first, the *Raghu-vaṃśa* ("Race of Raghu"), celebrates the ancestry and deeds of Rāma. Consisting of 19 cantos, it is clearly incomplete; but no copy has been discovered of the six additional cantos which are supposed to have completed it. The second, the *Kumāra-sambhava* ("The Birth of [the war-god] Kumāra" [called Skanda or Karttikeya; *q.v.*], the son of Śiva and Pārvatī), consists of 17 cantos, the last 10 of which are regarded as spurious by some scholars, mainly because of their erotic character. There is no doubt that the eighth canto is by Kālidāsa, but he cannot have written much of the other nine.

The third *mahākāvya,* the *Kirātārjunīya,* describing the combat between the Pāṇḍava prince Arjuna and the god Śiva, in the guise of a Kirāta ("wild mountaineer"), is a poem in 18 cantos, by Bhāravi, who is mentioned, with Kālidāsa, in an inscription dated A.D. 634. The fourth, *Śiśupāla-vadha* ("Slaying of Śiśupāla"), who, being a prince of Cedi, reviled Kṛṣṇa, who had carried off his intended wife, and was killed by him at the inauguration sacrifice of Yudhiṣṭhira, consists of 20 cantos, and is attributed to Māgha (9th century A.D.), for which reason it is also called the *Māgha Kāvya.* The fifth, Bhatti's *Rāvaṇavadha* ("Slaying of Rāvaṇa"), more commonly called *Bhaṭṭi Kāvya* (7th century A.D.), was written for the practical purpose of illustrating the less common grammatical forms and the figures of rhetoric and poetry.

The sixth, the *Naiṣadhīya,* or *Naiṣadha-carita* (the life of Nala, king of Niṣadha), is ascribed to Śrī-Harṣa (son of Hīra), who is supposed to have lived in the latter part of the 12th century.

In addition to these there are further self-styled *mahākāvyas.* The *Nalodaya* (the seventh) deals with the story of Nala; its author's main aim is to show his skill in stylistic and metrical devices. The eighth, the *Jānakī-haraṇa* of Kumāradasā (8th century), takes its subject (the rape of Sītā) from the *Rāmāyaṇa,* and, although strongly imitative of Kālidāsa, is clearly the work of a poet of considerable ability. The stanzas of the *Rāghavapāṇḍavīya* (the ninth *mahākāvya*) are so ambiguously worded that the poem may be interpreted as relating to the main narrative of either the *Rāmāyaṇa* or the *Mahābhārata.* Less ambitious in composition, though styling itself a *mahākāvya,* is the *Vikramāṅka-devacarita,* a panegyric written *c.* A.D. 1085 by the Kashmir poet Bilhaṇa in honour of his patron the Calukya (Chalukya) king Vikramāditya of Kalyāṇa. It contains valuable information about the history of the dynasty.

There may also be mentioned here, as being composed in accordance with the Hindu poetic canon, Kalhaṇa's *Rāja-taraṅginī* ("River of Kings"; *c.* A.D. 1150), a chronicle of the kings of Kashmir, and the only important historical work in Sanskrit, although even in this considerable allowance must be made for poetic licence and fancy.

Under the general term *kāvya* Indian critics include, as well as compositions in verse, certain kinds of prose works written in highly rhetorical language. Worthy of mention among them are Daṇḍin's *Daśa-kumāra-carita* ("The Adventures of the Ten Princes"; *c.* 6th century A.D.); the *Vāsavadattā* of Subandhu (early 7th century); and, especially, the *Kādambarī* and *Harṣa-carita* of Bāṇa, of about the same time, or slightly later.

The feature generally regarded by writers on poetics as the chief mark of excellence in this ornate prose style is the frequency and length of its compound words; but in metrical compositions, use of long compounds is discouraged by some schools of rhetoric.

Drama.—Sanskrit writers regard drama as *kāvya:* it may therefore be considered under the heading of poetry.

The Hindus ascribe the origin of dramatic representation to the sage Bharata (a word meaning also "actor" in Sanskrit). It is known that treatises on the dramatic art existed at the time of Pāṇini (see *Grammar,* below), as he mentions two authors of *naṭa sūtras* ("rules for actors"), Śilālin and Kṛśāśva. The words *naṭa* and *nāṭya* (as well as *nāṭaka,* the usual term for "drama") are derived from the root *naṭ* (*nṛt*), "to dance," and this seems to suggest a pantomimic or choral origin of the dramatic art. (*See* also DANCE: *The Orient;* THEATRE: *The East.*) However, Patañjali (see *Grammar,* below) in his "Great Commentary" speaks of the actor as singing and of people going "to hear the actor." He even mentions two subjects, taken from the cycle of Viṣṇu legends, the slaying of Kaṃsa (by Kṛṣṇa) and the binding of Bali (by Viṣṇu), which were represented on the stage both by mimic action and declamation. Judging from these allusions, theatrical entertainments in this period (the centuries B.C.) seem to have been much like the more spectacular European mystery plays (*see* DRAMA: *Medieval*).

The long-disputed possibility of Greek influence on Sanskrit drama is not now maintained, although there are some superficial resemblances. The Hindu dramatist has little regard for the three classical unities of space, time, and action, though he is rarely extravagantly disregardful of them. It is an invariable rule of Indian dramaturgy that every play, however much of the tragic element it may contain, must have a happy ending. A death never takes place on the stage, nor is anything indecorous allowed. The dialogue is in prose, interspersed with neatly turned lyrical stanzas typically Indian in their depiction of some aspect of nature, or of some temporary physical or mental condition. The outstanding feature of the Hindu play, however, is the mixed nature of its language. While the hero and leading male characters speak Sanskrit, women and inferior male characters use various Prakrit dialects, which at the time when they were first used in this way were probably local vernacular dialects. In time, however, these became permanently fixed for special dramatic purposes, just as Sanskrit, long before, had become fixed for general literary purposes. Thus it happened that these Prakrit dialects, having once become stationary, were soon left behind by the spoken vernaculars, until the difference between them was as great as that between the Sanskrit and the Prakrits (*see* also PRAKRIT LANGUAGES).

Sanskrit drama proper begins with Bhāsa, author of several plays, of which the most noted are *Svapnavāsavadattā, Pratijñāyaugandharāyaṇa,* and *Pratimānāṭaka,* the last named deriving its theme from the *Rāmāyaṇa.* Bhāsa's date is uncertain, but he lived probably a century before Kālidāsa (for whom the generally accepted date is A.D. 400). Bhāsa shows a firm mastery of dramatic technique, but it is in Kālidāsa's three plays, *Śakuntalā, Vikramorvaśīya,* and *Mālavikāgnimitra,* that the dramatic *kāvya* reaches its height. *Śakuntalā,* relating the story of the love of King Duṣyanta for a hermit girl of high birth, was the earliest Sanskrit drama to become known in Europe and is superior, in some respects, to the *Vikramorvaśīya.* The latter treats the theme, old as the *Veda,* of Purūravas' passion for the celestial maiden Urvaśī. The *Mālavikāgnimitra,* a tale of courtly intrigue, is of less importance.

Of Kālidāsa's successors, the most important are Bhavabhūti (*q.v.*), author of three plays, two drawing their themes from the *Rāmāyaṇa;* and Harṣadeva (*see* HARSHA), to whom have been ascribed the *Ratnāvalī,* the *Nāgānanda,* and the *Priyadarśikā.* Though Bhavabhūti's verses are sometimes marred by prolixity, he has the best claim to rank with Kālidāsa, and by Indian critics has been credited with deeper insight into human nature. Apart from the plays ascribed to King Harṣa, the other outstanding Sanskrit dramatic works are the *Mṛcchakaṭikā,* the *Veṇīsamhāra,* the *Mudrārākṣasa,* and the *Prabodhacandrodaya.* The date of the first is uncertain, but in describing the love of a noble Brahman for the courtesan Vasantasenā it recreates the plot of one of Bhāsa's dramas. The *Veṇīsamhāra* and the *Mudrārākṣasa* were written in the 9th century, or possibly somewhat earlier. The former takes its plot from an incident in the *Mahābhārata,* and the latter is an extremely able exposition of a political intrigue. Whether *Prabodhacandrodaya,* an allegorical drama written by Kṛṣṇamiśra *c.* A.D. 1100, represents the final flowering of a tradition of mystery plays is uncertain, for the only other evidence of it consists in the few fragments of an allegorical drama by Aśvaghoṣa surviving from the 1st century.

Lyrical, Descriptive, and Didactic Poetry.—The medieval Indian poets had a marked predilection for depicting in a single stanza some particular physical or mental situation. Secular

lyrical poetry consists chiefly of these little poetic pictures, which form a prominent feature also of dramatic compositions (see *Drama*, above). Numerous poets, both men and women, are known only through such detached stanzas, preserved in native anthologies and manuals of rhetoric and enshrining a vast quantity of descriptive and contemplative poetry. An excellent specimen of a longer poem of a partly descriptive, partly erotic character is Kālidāsa's *Megha-dūta* ("Cloud Messenger"), in which a banished *yakṣa* ("demigod") sends a love message across India to his wife in the Himalayas. This poem describes, in verse pictures written in the stately *mandākrāntā* ("slow-stepping") metre, the places over which the "cloud messenger" will sail. More directly in this tradition are the collections composed by Bhartṛhari on the themes of love, detachment, and wise conduct—the *Śṛṅgāra, Vairāgya,* and *Nīti Śatakas.*

Religious lyrics inspired by sectarian fervour include the large collection of hymns and detached stanzas extolling some special deity that could be made from the *purāṇas* and other works. Of independent productions of this kind only a few of the more important can be mentioned here. Śaṅkara Ācārya (*see* SHANKARA), the great Vedāntist, is credited with several devotional poems, notably the *Ānanda-laharī* ("Wave of Joy"), a hymn of 103 stanzas in praise of the goddess Pārvatī. The *Sūrya Śataka* ("Century of [Stanzas in Praise of] Sūrya," the Sun) is ascribed to Mayūra, the contemporary (and, according to a tradition, the father-in-law) of Bāṇa (early 7th century).

The particular branch of didactic poetry in which India is especially rich, however, is that of moral maxims, or *subhāṣitas,* in single stanzas or couplets, and forming the chief means of expression of *Nīti Śāstra* ("ethic science").

Fables and Narratives.—For popular instruction, ethical stanzas were early added to existing prose fables and popular stories. A collection of this kind, "A Mirror for Princes," was translated into Pahlavī (Middle Persian) in the reign of the Persian King Khosrau I Anushirvan (A.D. 531–579), but neither this translation nor the original is extant. A Syriac translation exists, however, made from the Pahlavī in the same century. The Sanskrit original, which probably consisted of 14 chapters, was later recast, the result being the *Pañcatantra* ("Five Chapters [or Headings of Wisdom]"), of which several recensions exist. A popular but late summary of this in four books, the *Hitopadeśa* ("Good Counsel"), has been shown to have been composed by one Nārāyaṇa (*see* also PERSIAN LITERATURE; BIDPAI, FABLES OF; FABLE). Other popular collections of stories and fairy tales, interspersed with sententious verses, are the *Śuka-saptati* ("Seventy [stories related] by the Parrot"), the author and date of which are unknown; and the *Vetālapañcaviṃśati* ("Twenty-Five [stories] of the Vetāla"), which must be earlier than the 11th century since it was used by two 11th-century authors: Somadeva, who composed the *Kathā-sarit-sāgara* ("Ocean of Streams of Story"), a collection of tales in some 22,000 couplets; and Kṣemendra, author of a smaller compilation of tales, the *Bṛhat-kathā-mañjarī.*

SCIENTIFIC AND TECHNICAL LITERATURE

Law (Dharma).—Among the technical treatises of the later Vedic period, certain portions of the *kalpa sūtras* (the manuals of ceremonial; *see* above) peculiar to particular schools are the earliest attempts at a systematic treatment of law subjects. These are the *dharma sūtras* ("rules of [religious] law"), which consist chiefly of strings of terse rules containing the essentials of the science of law and intended to be committed to memory and expounded orally by the teacher—thus forming, as it were, epitomes of class lectures. These rules are interspersed with *gāthās* ("stanzas") in various metres, either composed by the author himself or quoted from elsewhere, each generally giving the substance of the rules immediately preceding it. It can be easily understood why such couplets should have become increasingly popular and should ultimately have led to the appearance of works entirely in verse. Such metrical lawbooks did spring up in large numbers, not all at once but over a long period. These are the metrical *dharma śāstras,* or as they are usually called, the *smṛti* ("recollection, tradition"), a term which, as has been seen, belongs to the whole body of *sūtras* (as opposed to the *śruti,* "revelation") but which has become the almost exclusive title of the versified institutes of law (and of the few *dharma sūtras* still extant). About 40 metrical *smṛtis* are known to exist, but their total number probably amounted to at least 80. The *Mānava Dharma Śāstra,* the most widely known, consists of 12 books, the first and last of which, treating the processes of creation, transmigration, and final beatitude, are, however, generally regarded as later additions. In them the legendary sage Bhṛgu (described as a Mānava) is introduced as a disciple of Manu (*q.v.*), through whom the great teacher's work is promulgated. Except in these two books, this work as a whole shows no special relation to Manu, for, though he is occasionally referred to in it, he is mentioned also in other *smṛtis.*

The oldest existing commentary on the *Mānava Dharma Śāstra* is that by Medhātithi, who is usually supposed to have lived in the 10th century. The most highly esteemed is that by Kullūka Bhaṭṭa, written at Benares (Varanāsī) in the 15th century.

Of importance also is the *Yājñavalkya Dharma Śāstra.* Based on the *Manu Smṛti,* it represents a more advanced stage of legal theory and definition. Yājñavalkya is regarded as the founder of the Vājasaneyins, or White Yajus (*see* above), and as the author of the *Śatapatha Brāhmaṇa.* The work bearing his name bears some resemblance to the *Pāraskara Gṛhya Sūtra* of the White *Yajurveda,* but a connection between it and the *Mānava Gṛhya Sūtra* seems also evident. As in the *Manu Smṛti, ślokas* are quoted in various works from a *Bṛhat* and a *Vṛddha Yājñavalkya.* The *Yājñavalkya Smṛti* consists of three books, corresponding to the three great divisions of the Indian theory of law: *ācāra,* the rule of conduct (social and caste duties); *vyavahāra,* the civil and criminal law; and *prāyaścitta,* penance or expiation. (*See* also CASTE [INDIAN].)

Whether any of the *dharma śāstras* were ever used in India as actual codes of law for the practical administration of justice is doubtful. No doubt they were regarded as being of the highest authority as laying down the principles of religious and civil duty; but it was not so much any single text as the whole body of the *smṛti* that was regarded as the embodiment of the divine law. Hence, the moment the actual work of law codification began, in the 11th century, jurists were engaged in showing practically how the *smṛtis* confirm and supplement one another and in reconciling seeming contradictions between them. This new phase of Indian jurisprudence begins with Vijñāneśvara's *Mitākṣarā,* which, although primarily a commentary on Yājñavalkya, is so rich in original matter and in illustrations from other *smṛtis* that it is far better adapted to serve as a code of law than is the work it professes to explain. This treatise is greatly esteemed all over India, except by the Bengal or Gauriya school of law, which recognizes as its chief authority the digest of its founder, Jīmūtavāhana, especially the chapter on succession, called the *Dāyabhāga.* (*See* also INDIAN LAW.)

Philosophy.—The contemplative Indian mind shows at all times a strong disposition toward metaphysical speculation. This may be seen in the earliest religious lyrics. As well as in the abstract nature of some of even the earliest Vedic deities, this tendency is shown in a certain mystic symbolism, which inclines to refine and spiritualize the originally purely physical character and activity of some of the more important gods and to impart a deep and subtle significance to the rites of the sacrifice. The primitive worship of more or less isolated elemental forces and phenomena had evidently early ceased to satisfy the religious wants of more thoughtful minds. Various syncretist tendencies show the drift of religious thought toward some kind of unity of the divine powers, whether in the direction of pantheism, organized polytheism, or even monotheism. In the latter age of the Vedic hymns the pantheistic idea rapidly gained ground, and found expression in various cosmogonic speculations; and by the *brāhmaṇa* period it was fully developed. The fundamental conception of this doctrine is expressed in the two synonymous terms *brahman* (neuter), probably originally meaning "mystic effusion, devotional utterance," and later "holy impulse"; and *ātman* (masculine), meaning "breath, self, soul."

The recognition of the essential sameness of individual souls, all equally emanating (whether actually or imaginarily) from the ultimate spiritual essence (*parama-brāhman*) "as sparks issue from the fire," and destined to return thither, involves important problems. Considering the infinite diversity of individual souls of the animal and vegetable world, exhibiting various degrees of perfection, is it conceivable that each of them is the immediate efflux of the Supreme Being, the All-Perfect, and that each, from the lowest to the highest, could reunite directly with this Being at the end of its existence on earth? The difficulty implied in this question was at first met by the assumption of an intermediate stage of expiation and purification, a kind of purgatory; but the whole problem found at last a more comprehensive solution in the doctrine of transmigration (*saṃsāra; see* METEMPSYCHOSIS). This doctrine, not found in the *Rigveda,* was probably aboriginal and adopted by the Aryan invaders. The idea of *saṃsāra* has become an axiom, a universally conceded principle of Indian philosophy. Thus this philosophy has never risen to the heights of pure thought; its object is indeed *jijñāsā,* the search for saving knowledge; but it is an inquiry (*mīmāṃsā*) into the nature of things, undertaken not only for the attainment of the truth but with a view to a specific object—the discontinuance of *saṃsāra,* the cessation of mundane existence after the present life. The task of the philosopher is to discover the means of attaining *mokṣa* ("release") from the bondage of material existence, and union with the Supreme Self—in fact, salvation. Desire results from ignorance or from incorrect understanding of the true nature of things, and is the cause of transmigration.

The purpose of each philosophical school is to attain true and saving knowledge. As intense self-contemplation was the only way of attaining this all-important knowledge, this doctrine left little or no room for those mediatorial offices of the priest which are so indispensable to ceremonial worship. Indeed the *Upaniṣads* speak of Brahman sages resorting to Kṣatriya (warrior caste) princes to hear them expound the true doctrine of salvation. But in spite of their antihierarchical tendency, these speculations continued to gain ground; and in the end the body of treatises propounding the pantheistic doctrine, the *upaniṣads,* were admitted into the sacred canon, as appendages to the ceremonial writings, the *brāhmaṇas.* The *upaniṣads* thus form literally "the end of the *Veda,*" the *Vedānta;* but their adherents claim this title for their doctrines in a metaphorical rather than in a material sense, as "the ultimate aim and consummation of the *Veda.*"

Later—*i.e.,* very roughly, between the *upaniṣadic* period (*c.* 800–200 B.C.) and the first extant writings of the philosophers in about the 5th or 6th century A.D.—the radical distinction between these speculative appendages and the bulk of the Vedic writings was strongly accentuated in a new classification of the sacred scriptures. According to this scheme they were supposed to consist of two great divisions—the *karma kāṇḍa* ("the work section"), or practical ceremonial (exoteric) part, consisting of the *saṃhitās* and *brāhmaṇas* (including the ritual portions of the *āraṇyakas*), and the *jñāna kāṇḍa* ("the knowledge section"), or speculative (esoteric) part. These two divisions are also called respectively the *pūrva* ("former") and the *uttara* ("latter," or higher) *kāṇḍa;* and when the speculative tenets of the *upaniṣads* came to be formulated into a regular system it was thought desirable that there should also be a special system corresponding to the older, and larger, part of the Vedic writings. Thus there arose the two systems: the *Pūrva* (or *Karma*) *Mīmāṃsā* ("prior [practical] speculation"), and the *Uttara* (or *Brāhma*) *Mīmāṃsā* ("higher inquiry" into the nature of the godhead), usually called the Vedānta philosophy. (For the further development of Indian philosophy, *see* INDIAN PHILOSOPHY: *Six Systems.*)

Grammar (Vyākaraṇa).—*Pāṇini.*—Linguistic inquiry, phonetic as well as grammatical, was early resorted to, both to elucidate the meaning of the *Veda* and to settle its textual form. The work that came ultimately to be looked upon as the *"vedāṅga"* representative of grammatical science, and that has remained the standard authority on Sanskrit grammar in India, is Pāṇini's *Aṣṭādhyāyī* (5th century B.C.), so-called from its consisting of eight lectures (*adhyāya*), each of four *padas.* For a comprehensive grasp of linguistic facts and a penetrating insight into the structure of the vernacular language, this work is probably unrivaled in the literature of any nation—though few other languages afford such facilities as Sanskrit for scientific analysis. Pāṇini's system of arrangement differs entirely from that usually adopted in Western grammars, that is, arrangement according to the parts of speech. As the work is written in aphorisms intended to be learned by heart, economy of memory matter was the author's chief consideration. This is attained mainly by grouping together all cases showing the same phonetic or formative feature, whether or not they belong to the same part of speech. For the same reason he also makes use of a highly artificial and ingenious system of algebraic symbols, consisting of technical letters (*anubandha*), used chiefly with suffixes, and indicative of the changes which the roots or stems have to undergo in word formation. (*See* also SANSKRIT LANGUAGE: *The Grammar of Pāṇini.*)

Perhaps the most important of Pāṇini's predecessors was Śākaṭayana, also mentioned by Yāska—the author of the *Nirukta* (see *Vedāṅgas,* above), who is also supposed to have preceded Pāṇini—as the only grammarian (*vaiyākaraṇa*) who held with the etymologists (*nairukta*) that all nouns are derived from verbal roots.

Kātyāyana.—The earliest of Pāṇini's successors whose work has been preserved (though perhaps not in a separate form) is Kātyāyana, author of a large collection of concise critical notes, called *vārttika,* intended to supplement and correct the *sūtras* or to give them greater precision.

Patañjali.—Kātyāyana was followed by Patañjali (*q.v.*), author of the (*Vyākaraṇa*) *Mahā Bhāshya* ("Great Commentary"), who lived *c.* 150 B.C. For the great variety of information it incidentally supplies about the literature and manners of the period, his is, from a historical and antiquarian point of view, one of the most important works of Classical Sanskrit literature. The *Mahā Bhāshya* is not a continuous commentary on Pāṇini's grammar but a recollection of the critical comments (*kārikās*) on 1,713 of Pāṇini's 4,000 rules.

Other Grammarians.—The successors of Pāṇini and Patañjali continued to flourish with random distinction until as late as the 17th century, but for originality of approach to the subject of Sanskrit grammar, mention must be made of Bhartṛhari (7th century), whose *Vākyapadīya* made a notable contribution to philosophical inquiry into the nature of language.

Lexicography.—Sanskrit dictionaries (*kośa*), always in verse, are either homonymous or synonymous, or partly one and partly the other. There are occasional attempts at alphabetical order in the homonymous dictionaries, but not in the synonymous. Many, intended for use by poets, are collections of rare words and synonyms rather than lexicons of the language. The great dictionary is the *Amara-kośa* ("Immortal Treasury") by Amarasiṃha, who probably lived early in the 6th century. This consists of a synonymous part and a short homonymous part. In the first part the words are arranged in sections according to subjects, such as heaven and the gods, time and the seasons, etc.; in the second part, they are arranged according to their final letter, without regard to the number of syllables.

Prosody (Chandas).—The earliest treatises on prosody are referred to above in the account of the technical branches of later Vedic literature. Among later treatises the most important is the *Mṛta-sañjīvanī,* a commentary on Piṅgala's *Sūtra,* by Halāyudha. Sanskrit prosody, which is probably unsurpassed in variety of metre and harmoniousness of rhythm, recognizes two classes of metres: those consisting of a certain number of syllables of fixed quantity; and those regulated by groups of breves, or metrical instants, this second class being also of two kinds, according to whether or not it is bound by a fixed order of feet.

Music (Saṅgīta).—The art of music has been practised in India from early times. The extant theoretic treatises on music are, however, quite modern productions. The two most highly esteemed works are the *Saṅgīta-ratnākara* ("Jewel Mine of Music"), by Śārngadeva; and the *Saṅgīta-darpaṇa* ("Mirror of Music"), by Dāmodara. Each consists of seven chapters, treating: (1) sound and musical notes (*svara*); (2) melodies (*rāga*);

(3) music in connection with the human voice (*prakīrṇaka*); (4) musical compositions (*prabandha*); (5) time and measure (*tāla*); (6) musical instruments and instrumental music (*vādya*); (7) dancing and acting (*nṛtta* or *nṛtya*). (*See* also INDIAN MUSIC; MUSIC IN ANCIENT CIVILIZATIONS.)

Rhetoric (Alaṃkāra Śāstra).—There are numerous treatises on the theory of literary composition. Indeed, a subject of this kind—involving fine distinctions as regards the various kinds of poetic composition, the particular subjects and characters adapted to each, and the different sentiments or mental conditions capable of being both depicted and called forth by them—is naturally congenial to the Indian mind. The *Nāṭyaśāstra* of Bharata is possibly as early as the 4th century. Not much later is the *Kāvyadarśa* ("Mirror of Poetry") by Daṇḍin, author of the novel *Daśa-kumāra-carita* (*see* above). The *Kāvyadarśa* consists of three chapters: (1) on the two different local styles (*rīti*) of poetry, the Gauḍī, or eastern, and the Vaidarbhī, or southern (to which later critics add four others, the Pāñcālī, Māgadhī, Lāṭī, and Āvantikā); (2) on the graces and ornaments of style, as, for example, tropes, figures, and similes; (3) on alliteration, literary puzzles, and 12 kinds of faults to be avoided in composing poems. Other important works are the *Kāvyamīmāṃsā*, by Rājaśekhara, and the *Kāvyalaṅkāra*, by the Kashmiri Rudraṭa (9th century); the *Daśarūpa* ("Ten Kinds of Drama"), by Dhanaṃjaya (10th century); the *Sarasvatīkaṇṭhābharaṇa* ("Neck Ornament of Sarasvati," the goddess of eloquence), a treatise in five chapters on poetics generally (11th century); the *Kāvyaprakāśa* ("Lustre of Poetry"; 12th century), by Mammaṭa, a Kashmiri; and the late but important *Sāhityadarpaṇa* (*c.* 1450).

Medicine (Āyurveda, Vaidya Śāstra).—Though early knowledge of medicine is attested by frequent allusions in the Vedic writings, it was probably not till much later that medical practice advanced beyond a certain degree of empirical skill and pharmaceutical routine. From the mention of the "three humours" (wind, bile, phlegm) in a *vārttika* to Pāṇini, some kind of humoral pathology seems, however, to have been prevalent among Indian physicians several centuries before the Christian era. The oldest existing medical work is thought to be the *Caraka Saṃhitā*, a bulky encyclopaedia in *ślokas* mixed with prose sections. It consists of eight chapters and was probably written for the most part in the early centuries of the Christian era. Of equal authority, but somewhat later, is the *Suśruta* (*Saṃhitā*), which Suśruta is said to have received from Dhanvantari, the Indian Asclepius. (*See* also SCIENCE, HISTORY OF: *Indian Science: Medicine.*)

Astronomy and Mathematics.—Early Indian astronomical knowledge is summed up in the *Jyotiṣa Vedāṅga*. A more scientific approach is marked by the appearance of the five original *siddhāntas* (partly extant in revised redactions and in quotations), even the names of two of which suggest Western influence. These are the *Paitāmaha, Vasiṣṭha, Romaka* (*i.e.,* Roman) and *Pauliśa Siddhāntas*. Based on these are the works of the most distinguished Indian astronomers: Āryabhaṭa (probably b. 476); Varāhamihira (probably 505–587); Brahmagupta, who completed his *Brāhma-sphuṭa Siddhānta* in 628; Bhaṭṭa Utpala (10th century), distinguished as the commentator of Varāha-mihira; and Bhāskara Ācārya (b. 1114) who finished his course of astronomy, the *Siddhānta Śiromaṇi*, in 1150. In the works of several of these writers, from Āryabhaṭa onward, special attention is paid to mathematical (especially arithmetical and algebraic) computations.

For the development of vernacular Indian literatures and their connection with Sanskrit literature, *see* INDIAN LITERATURE and articles there cited: HINDĪ LITERATURE; URDU LITERATURE; TAMIL LITERATURE; BENGALI LITERATURE; etc. *See* also articles on some Indian languages, where literature may be treated: *e.g.,* GUJARATI LANGUAGE; MARATHI LANGUAGE; etc.

SANSOVINO, ANDREA (*c.* 1467–1529), Florentine architect and sculptor, the outstanding sculptor of the transition from early to high Renaissance, was born at Monte San Savino, probably between 1467 and 1470. His earliest great work was the marble altar of the Sacrament in S. Spirito, Florence, executed for the Corbinelli family between 1485 and 1490, where the fineness of detail, high emotional pitch, and lively narrative quality are typical of his early style. After several years, said by Vasari to have been spent in Portugal, Sansovino was again in Florence in 1502, when he began the marble group of the "Baptism of Christ," now above the central door of the baptistery. The calm and dignified poses, the strong but suppressed emotion, and the generalized beauty of the bodies mark this as one of the first works in the style of the high Renaissance.

In 1505 Sansovino went to Rome and was commissioned by Pope Julius II to execute the almost identical tombs of cardinals Ascanio Sforza and Girolamo Basso della Rovere in S. Maria del Popolo. These tombs, completed by 1509, were the most influential of all Sansovino's innovations with their adaptation of the triumphal arch form and the novel sleeping attitude of the deceased cardinals. Sansovino's last great charge was to supervise (1514–27) both the decoration of the Santa Casa (Holy House of the Virgin) and the construction of several buildings at Loreto. His marble relief of the "Annunciation" on the shrine there is a composition of great richness which still has some of the narrative charm of his very early work. He died at Monte San Savino in 1529.

The influence of Sansovino's suave and graceful style acted as a counterbalance to Michelangelo's titanic and muscular sculpture throughout the 16th century. His most important follower was Jacopo Tatti, called Sansovino after his master.

See J. Pope-Hennessy, *Italian High Renaissance and Baroque Sculpture* (1963), for critical bibliography. (G. H. HY.)

SANSOVINO, JACOPO (1486–1570), Italian sculptor and architect, whose palaces and churches determined the Renaissance character of Venice, was born in Florence on July 2, 1486. In 1502 he entered the Florence workshop of the sculptor Andrea Sansovino, and soon thereafter, as a sign of admiration, he adopted his master's name in exchange for his own family name of Tatti. In 1505 he accompanied Giuliano da Sangallo to Rome, studying there ancient architecture and sculpture while employed by Pope Julius II in the restoration of ancient statues. Back in Florence he carved, from 1511 to 1518, the statue of St. James the Elder as the first of 12 statues of the apostles for the piers under the dome of the cathedral; these had been commissioned originally in 1503 to Michelangelo, who only began one of them, the St. Matthew. It is the influence of this St. Matthew as well as that of Andrea Sansovino which inspired the "St. James." The "Bacchus" in the Museo Nazionale, Florence, created during the same period, was entirely un-Michelangelesque, full of the uncomplicated movement and gaiety of Hellenistic bronzes. From 1518 Jacopo worked in Rome, first on the Madonna and Child in S. Agostino and, prob-

ably slightly later, on the St. James (Sta. Maria di Monserrato), building at the same time the churches of S. Marcello in Corso and S. Giovanni dei Fiorentini.

In 1527, after the sack of Rome by the troops of Emperor Charles V, he fled to Venice, where he remained the rest of his life. Appointed chief architect of the city, he built, on the Grand Canal, the Palazzo Corner (1532), still very austerely Tuscan with two stories of doubled half columns over a rustic base; in 1536 he began the library of S. Marco, with an open loggia on the ground floor and that free and festive decoration which the spirit of Venice demanded; at the same time he built the adjoining mint, with sombre rusticated half columns. The Loggetta, an open porch at the foot of the campanile of S. Marco, was built in 1540 and decorated with four bronze statues of Apollo, Mercury, Minerva, and Peace, symbols of the city's power in war and in the peaceful pursuit of trade and the arts. These figures, elegant, sprightly, strongly moved within themselves, continued an older Venetian tradition that took its inspiration from Titian. The solemn portrait style of the mature Titian is found in a late work, the bronze portrait of the physician Tommaso Rangone over the entrance door to the church of S. Giuliano (1554), which Jacopo also built. The colossal statues of Mars and Neptune in the court of the ducal palace show the severe style of Jacopo's old age (1554–56), as does the monument to the doge Francesco Venier in S. Salvatore (1556–61). Among earlier works are the bronze statuettes of the four evangelists and the bronze door of the sacristy in S. Marco (1540s). The marble statue of the youthful St. John the Baptist (1554) in Sta. Maria de' Frari shows the transition from this style to that of Jacopo's old age. He died in Venice on Nov. 27, 1570.

SANTA ANA, in area the largest department in El Salvador, bordering Guatemala. Area 768 sq.mi. Pop. (1961) 259,155, about half rural and concentrated in the southern third of the department. Most of the department is rough land; in the southern third there are several volcanoes, including Volcán de Santa Ana (altitude 7,724 ft.), the highest mountain in the country. The northern part has many deep valleys, tributaries of Lempa valley. Santa Ana produces a substantial portion of El Salvador's coffee, mostly on fertile soils on slopes of volcanoes at altitudes between 1,800 and 4,000 ft. It also produces beans, livestock, vegetables, corn, fruits, and cheese. The city of Santa Ana (*q.v.*) is the departmental capital. (C. F. J.)

SANTA ANA, capital of the department of Santa Ana, El Salvador, 44 mi. by Inter-American highway and 50 mi. by railway NW of San Salvador. Pop. (1961) 121,095. It is situated at 2,120 ft. altitude in a rich agricultural area and a few miles north of several high volcanoes and Lake Coatepeque, famous for its beauty, mineral waters, bathing, fishing, and sailing. Santa Ana has modern schools, hospitals, theatres and public buildings, and a colonial cathedral of fine Spanish Gothic architecture. It is important in commerce and industry. Textiles, clothing, foodstuffs, leather goods, liquors, cigars, pottery, and wood products are manufactured. Nine miles west of Santa Ana is the city of Chalchuapa, in the midst of extensive archaeological remains. (C. F. J.)

SANTA ANA, a city in the coastal region of southern California, U.S., 35 mi. SE of Los Angeles (*q.v.*), 10 mi. inland from the ocean shore line, and approximately 40 mi. from the mountain ranges to the north and east; the county seat of Orange County, which comprises the Anaheim-Santa Ana-Garden Grove standard metropolitan statistical area. Santa Ana is on the Los Angeles-San Diego freeway that bears its name; it is also served by the Orange County Airport and the Los Angeles International Airport. The city is within driving range of beach, mountain, and desert resorts. The mixing of cool breezes from the ocean and drier winds from the desert over the coastal plains gives it an ideal climate. The public school system includes facilities through junior college, with special provision for the training of exceptional children. The rich Santa Ana Valley is noted for its oranges, avocados, dairy products, beans, and cattle. The city also possesses some industry. Santa Ana was laid out in 1869 on land procured from Rancho Santiago de Santa Ana, an old Spanish land grant, and was incorporated in 1886. It has a council-manager form of government, in effect from 1952.

Pop. (1960) 100,350. For comparative population figures *see* table in CALIFORNIA: *Population.* (WM. H. K.)

SANTA ANNA, ANTONIO LÓPEZ DE (1794–1876), Mexican army officer and political figure, the storm centre of Mexican history for half a century, was born the son of a petty colonial official in Jalapa, Veracruz, on Feb. 21, 1794. He became a cadet in the Spanish colonial army in 1810 and for several years served on the northern frontier against Indians and border ruffians. In 1821 he supported the Plan de Iguala, from which emerged independent Mexico (*see* MEXICO: *Colonial Period*). Rebuffed for preferment under the new emperor Agustín de Iturbide—he was already considered a dangerous man—Santa Anna pronounced for the republic which overthrew the empire. After more frontier service he commanded the abortive effort to effect a revolution in Cuba from Yucatán. After helping to overthrow the president he continued his military service in 1829 by defeating an invading Spanish force at Tampico. Following a short retirement he seized power and began the first of five personal administrations, three times as representative of one party and twice as spokesman of the opposition. In 20 years he veered from liberal to ultra-conservative.

He led Mexican troops to suppress the Texan revolt but was captured at San Jacinto in east Texas in 1836. He returned to retirement in Mexico through Washington, D.C., but emerged to fight the French occupation forces at Veracruz. Wounded, he lost a leg; a hero, he again became president until he was exiled to Cuba for incompetence and extravagance. In the Mexican War, after a secret agreement with U.S. Pres. James K. Polk, he assumed the Mexican presidency, but as commander he prematurely rushed his troops to the north, where desert campaigning, complicated by a drawn battle with Gen. Zachary Taylor, cost him an army. Back in Mexico City he re-formed the demoralized government, then engaged Gen. Winfield Scott, who was advancing from Veracruz. He was defeated, his capital was lost, and he returned to exile in Jamaica and New Granada. In 1853 governmental chaos again recalled him to become president, but age had exaggerated his shortcomings and he was again banished in 1855. Ten years later he sought United States support with which to oust Maximilian, whom French forces had placed on the Mexican throne; at the same time he had offered his services to Maximilian. Santa Anna had prostituted his

talents too often; both proposals were refused. A decade later still, a blind and broken old man, he was permitted to return to Mexico City, where he died in poverty on June 21, 1876.

Santa Anna possessed a magnetic personality and real qualities of leadership, but his lack of principles, his pride, love of military glory and extravagance, coupled with disregard for and incompetence in civil affairs, led his country into a series of disasters and himself into obloquy and tragedy.

See also references under "Santa Anna, Antonio López de" in the Index. (W. H. Cr.)

SANTA BÁRBARA, a department in northwestern Honduras, bordering Guatemala, and its capital city. Pop. (1961), department, 146,909; city, 4,915. Area (department) 1,975 sq.mi. The population is chiefly in the Ulúa and tributary mountain valleys in the southern third of the department and in the Chamelecón lowland across the north central part; the mountainous areas in the northern and central portions are sparsely settled. Modern highways connect some settled areas with railways and with the Inter-Ocean highway near San Pedro Sula. About 50% of the area of the department is in farms. Products include coffee and corn, tobacco, sugar, beans, poultry and rice. (C. F. J.)

SANTA BARBARA, a seaside resort and residential city of California, U.S., 97 mi. N.W. of Los Angeles; the county seat of Santa Barbara county. While the city lies on a coastal shelf, it spreads like a fan from curving beaches to the mesas, slopes and oak-covered canyons of the Santa Ynez mountains. Protected by the Channel Islands and the mountains, Santa Barbara has a mild climate throughout the year.

The city's Museum of Natural History has artifacts recording the area's early Indian cultures, and the Santa Barbara Historical society's holdings describe the beginnings of the Spanish presidio in 1782 and the story of the construction of the neoclassical "Queen of the Missions," which was founded in 1786. The mission is now the Franciscan headquarters for the Pacific coast. John Charles Frémont (*q.v.*) raised the U.S. flag at the presidio in 1846, claiming the area for the U.S. (*see* California: *History*). In 1850 Santa Barbara was incorporated as a city and in 1887 the railroad reached it. Descendants of original Spanish, Mexican and Yankee settlers participate in the annual Old Spanish Days *fiesta,* recalling Santa Barbara's early history. The city is the centre of a rich orchid, citrus, walnut and cattle-raising area with oil fields and light manufacturing.

Nearby are the Vandenberg air force base and many research industries; a campus of the University of California and the Center for the Study of Democratic Institutions, directed by Robert M. Hutchins under the auspices of the Fund for the Republic, are located there. Attractions include an art museum, a music academy, botanical gardens and theatre arts, with multiple opportunities for outdoor recreation and sports. Pop. (1960) 58,768; standard metropolitan statistical area (Santa Barbara county), 168,962. For comparative population figures *see* table in California: *Population.*

See *Santa Barbara, a Guide to the Channel City and Its Environs* in the "American Guide Series" (1953). (W. R. J.)

SANTA BARBARA ISLANDS, a chain of four islands lying parallel to the southern coast line of California, at an average distance of 20 mi. from the mainland. The term Channel Islands is sometimes used to designate these islands and four others, including Santa Catalina (*q.v.*). All are part of the state of California.

Santa Cruz is the largest of the Santa Barbara Islands, covering nearly 98 sq.mi. The terrain varies from sea-level valleys to sharp-sloped wooded peaks which exceed 2,400 ft. Two ranches and a small military installation have constituted its maximum population. Sheep and cattle raising are the primary enterprises; the island abounds with wild and semiwild sheep which are descendants of former domestic flocks. Prior to the advent of prohibition in 1920 the island was also noted for its fine wines.

Anacapa, the smallest of the group, is a razorbacked volcanic ridge which stretches 4½ mi. but averages less than ½ mi. in width. It is broken into three segments, one of which supports a coast guard station and lighthouse.

Santa Rosa, a cattle ranch, shows a marked change in topography. Its 84 sq.mi. are mostly open grasslands, intersected by numerous spring-fed canyons.

San Miguel is a rapidly eroding uninhabited island made up of 15 sq.mi. of weather-cut ravines and shifting sands. It was once valuable for raising livestock, but heavy overgrazing in the mid-1800s surrendered its soil to the ever-present winds. There are large sea elephant and sea lion colonies on the westernmost tip.

The island chain has plant and animal life not found on the mainland, and there are often differences in characteristics of a plant or animal on one island as compared with the same type on another island.

Juan Rodríguez Cabrillo, who explored the coast of California in 1542–43, is believed to have been buried on one of these islands. He found them populated with the now extinct Canaliño Indians. Two of the eight islands termed Channel Islands, Santa Barbara and Anacapa, were included in the Channel Islands National monument established in 1938. (Ea. W.)

SANTA CATALINA, an island near the coast of California, 24 mi. S.S.W. of Los Angeles harbour. The most highly developed of the eight Channel Islands off the coast of southern California, it is 20 mi. long, 8 mi. wide at its greatest width, and has an area of 74 sq.mi. Structurally, Santa Catalina is a small mountain range rising from the continental shelf to a maximum elevation of 2,125 ft. above sea level at Mt. Orizaba. Mountain spurs and canyons transverse to the main range form many interesting headlands and protected coves at the shore line. The climate is of Mediterranean type with warm, dry summers, mild winters and light winter rains. It is generally cooler in summer and milder in winter than the adjacent mainland.

Santa Catalina has been a tourist centre for decades, drawing tens of thousands of visitors annually to its gentle climate, beaches, boating and scenery. Notable attractions are the famous undersea "gardens" near Avalon bay, where luxuriant marine life may be viewed from glass-bottomed boats, and Catalina Bird park. The island's waters, visited throughout the year by thousands of boating enthusiasts and sportfishermen from nearby mainland ports, are noted fishing grounds. Avalon, near the southeastern end of the island, is the only city (population about 1,500) and is the centre of the tourist industry. It has frequent boat and air service from both Long Beach and Los Angeles.

Santa Catalina was discovered in 1542 by Juan Rodríguez Cabrillo, Portuguese navigator in the service of Spain. Sebastián Vizcaíno, also sailing under the flag of Spain, rediscovered the island in 1602 on the eve of the feast of St. Catherine and named it Santa Catalina in honour of the saint. A part of the republic of Mexico after 1822, it became part of California with the signing of the Treaty of Guadalupe Hidalgo ending the Mexican War in 1848. Its development as a tourist centre dates from 1919, when it was purchased by William Wrigley. (R. A. K.)

SANTA CATARINA, a southern state of Brazil, bounded on the north by Paraná, on the east by the Atlantic ocean, on the south by Rio Grande do Sul and on the west by the Argentine territory of Misiones. Area 37,060 sq.mi. Pop. (1960) 2,146,909.

Immediately behind the coast the Great Escarpment rises like a mountain wall, and the state contains very little level land. Only along the lower Itajaí river and around Joinvile and São Francisco are there narrow bits of wet lowland. Santa Catarina Island, on which the state capital, Florianópolis (*q.v.*), is situated, is a ridge of steep hills. The Great Escarpment in the state is broken into a series of steps, deeply dissected by the Itajaí-Açu and its tributaries. Above the scarp, the surface of the Paraná plateau slopes gently westward, drained by the Uruguai river. The coastal zone is hot and rainy, but on the plateau frosts are sometimes experienced in the winter. The southernmost extension of the tropical rain forest occurs along the coast, but in the frost zone at higher altitudes the forest comprises a mixture of broadleaf deciduous trees and taller *Araucaria* pines. Among the latter are grassy openings, originally covered with tall prairie grasses.

The first settlements by the Portuguese from São Paulo were on the prairies of the highlands and on Santa Catarina Island off the shore. The dense coastal forests were left empty until the

arrival of German colonists after 1850. Blumenau, in the valley of the Itajaí, was one of the first German towns, and Brazilians of German origin have now spread out from Blumenau throughout the coastal zone and in the valleys of the plateau. Colonies of Italians and Poles also settled in this state.

The economy of the area is varied. The farmers grow maize, to be fed to hogs, and also wheat, potatoes, tobacco, rice and a variety of fruits and vegetables. The chief industries include meat processing, vegetable and fruit canning, textile milling, maté processing (from the leaves of the yerba maté tree), sawmilling and brewing. A paper factory is in operation at Blumenau. The best coal in Brazil is mined 69 mi. N.W. of Tubarão along the southern coast.

(P. E. J.)

SANTA CLARA (locally VILLA CLARA), capital of Las Villas province, Cuba, about 160 mi. ESE of Havana. It is situated near the geographic centre of the island on the Central Highway and is the junction point of the main railroads of Cuba. Initially dependent on the livestock industry, it flourished on sugar and tobacco in the 20th century. Pop. (1953) 77,398.

The city was founded in 1689 by 18 families from Remedios, escaping constant dangers of pirates. It occupies the site of the ancient Indian Cubanacán, which according to some authorities Columbus mistakenly took to be the headquarters of Kublai Khan.

(D. R. D.)

SANTA CLARA, a city of Santa Clara County in west-central California, U.S., 48 mi. S of San Francisco and immediately adjacent to the city of San Jose (*q.v.*) on the southeast; a part of the San Jose standard metropolitan statistical area. Santa Clara has a mean temperature of 57° F (about 14° C) and an annual rainfall of 15.19 in. Founded in 1777 as the eighth of the Spanish Franciscan missions in California—hence its title "the Mission city"—it was incorporated as a city in 1852 and adopted the council-manager form of government in 1952. The Spanish influence is evident in place names, architecture and the restored mission. The city's economy historically rested upon the processing of prunes, apricots, and other fruits and vegetables of the rich Santa Clara Valley. In 1941, however, manufacturing for the first time surpassed agriculture in importance and World War II accelerated the industrial trend; after 1950 the population increased considerably. Leading classes of products from the manufacturing plants include glass fibre, millwork, electrical machinery, chemicals, fabricated metals, processed foods, and paper products. The University of Santa Clara, the oldest institution of higher learning in the west, was founded by the Jesuits in 1851 as a college and became a university in 1885.

Pop. (1960) 58,880. For comparative population figures *see* table in CALIFORNIA: *Population.* (J. J. HA.)

SANTA CRUZ, ÁLVARO DE BAZÁN, MARQUÉS DE (1526–1588), the most famous and successful Spanish admiral of his time, who was responsible for the preparation of the Spanish Armada (*q.v.*), was born at Granada on Dec. 12, 1526. From an early age he fought against the Turks in the Mediterranean. He was given the command of the galleys of Naples in 1568 and was created marqués de Santa Cruz in 1569. In the Lepanto campaign (1571) against the Turks he was Don John of Austria's principal Spanish adviser, and in the Battle of Lepanto (*q.v.;* Oct. 7, 1571) he commanded the reserve and intervened decisively when the Turks threatened to outflank the Christian fleet. In 1580 he commanded the fleet which supported the duque de Alba's successful conquest of Portugal for Philip II of Spain. Meanwhile Antonio, the Prior of Crato, the pretender to the Portuguese throne, still held the Azores with the help of warships sent unofficially from France. Santa Cruz defeated the superior French squadron at Terceira (1583) and thus captured the Azores for Philip II. Despite the protests of his own soldiers he executed all his prisoners "for the service of God, of the king our master and of the king of France," as he reported to Spain. His excuse for this action was that France and Spain were not officially at war. Philip II accepted the argument and made him captain-general of the ocean.

From 1583 Santa Cruz urged on Philip II the invasion of England and, in 1586, he presented a memorandum for a fleet of 556 ships and 94,000 soldiers and sailors. From then until his death, on Feb. 9, 1588, he was in Lisbon, fitting out the Armada and battling against shortages of money and materials and with the king's contradictory orders. It is unlikely that even his leadership would have made the Armada campaign (summer 1588) a success, but he had done much to develop the Spanish navy and had designed the great galleons which traded between Spain and the New World.

BIBLIOGRAPHY.—C. Fernández Duro, *La Armada Invencible,* 2 vol. (1884–85); A. Altolaguirre y Duvale, *Don Álvaro de Bazán* (1888); G. Mattingly, *The Defeat of the Spanish Armada* (1959).

(H. G. Ko.)

SANTA CRUZ, a very sparsely inhabited province of southern Argentina, composing a large part of the area generally known as Patagonia (*q.v.*). The province, which was created by a decree of the federal government in 1956 (with effect from Jan. 1, 1957), is bounded north and south by the 46th and 52nd parallels. It stretches from the Atlantic Ocean to the Chilean frontier in the cordillera of the Andes. Pop. (1960) 52,853. Area 94,186 sq.mi. Santa Cruz is a region of constant winds and dust storms which sweep over its dry table lands and its arid, precipitous coast. Rainfall is slight. In spite of the latitude, however, the climate is relatively mild, the temperature being moderated by the proximity of the ocean. The western rim of the province includes forested Andean foothills and a number of beautiful lakes, notably Lake Argentino, which can be reached by traveling up the Santa Cruz River from the port of Santa Cruz. Huge glaciers descend from the cordillera into this lake.

There are sheep ranches in the sheltered canyons that cross the desert, but little agriculture. The province's principal line of communication is the shipping service which links its Atlantic ports, where the produce of the interior (mainly wool and sheepskins) is collected for dispatch to Buenos Aires. The southernmost port is Río Gallegos, the provincial capital, which is a centre for the sheep trade and has a meat-packing plant and a tallow-making industry. It is also the outlet for Argentina's chief coalfield at Río Turbio (160 mi. inland), with which it is connected by railway. The other principal ports are Santa Cruz (about 135 mi. N of Gallegos) and Puerto Deseado (about 185 mi. N of Santa Cruz). A railway runs inland from Deseado to Colonia las Heras. Across the northern border, in the province of Chubut, are the military zone and the oil fields of Comodoro Rivadavia. (GE. P.)

SANTA CRUZ, a department in the lowland region of eastern Bolivia, bounded north by Beni, east by Brazil, south by Paraguay and Chuquisaca, and west by Chuquisaca and Cochabamba. It is a frontier area of extraordinary economic potential lying between the Andes and the Mato Grosso Plateau. Pop. (1961 est.) 314,000. Area 143,097 sq.mi. The topography is generally level, with a few gently rising elevations, notably the Chiquitos Highlands. Average annual rainfall, coming largely from October through March, ranges from 100 in. in the north to 50 in. in Santa Cruz city and less farther south. The department is drained by two river systems, flowing north, which converge in the northeastern corner of Beni. The first comprises the Rio Grande, Piray, Yapacani, and Maraco, upper tributaries of the Mamoré; the second comprises the San Miguel, Blanco, Baures, and Paraguá, tributaries of the Iténez (Guaporé). A few smaller streams flow eastward into the Paraguay. About 40% of the department is prairie and the remainder is woodland. Except for the northern part, which is flooded during the rainy season, the region is quite healthful and has an agreeable climate. The prairie affords good pasturage, and the cleared forest land is unusually fertile. Rice, sugarcane, coffee, cotton, manioc, corn, citrus fruits, vegetables, and tobacco are the most commonly produced items, but agriculture in the 1960s was still in an infant stage of development owing to the historic isolation of the area. The region supports 500,000 cattle and large numbers of horses. The population is about one-third of Spanish colonial descent and two-thirds mestizos and Indians.

Post-World War II developments included the completion of three important transportation facilities: a highway 317 mi. in length connecting the department with Cochabamba and the Altiplano; the Corumbá (Braz.)-Santa Cruz Railway, providing an outlet to the Atlantic ports of Brazil; and another railway extend-

ing from the Argentine frontier to Santa Cruz. Oil exploration and production in the Camiri area were significantly advanced by several foreign companies together with the Bolivian government corporation (Yacimientos Petrolíferos Fiscales Bolivianos). Pipelines extend to Sucre and Cochabamba. Petroleum deposits are found throughout much of the sub-Andean zone of Bolivia. Agriculture was enhanced by the introduction of immigrants, chiefly Okinawans and Japanese, and by land reform laws.

The city of Santa Cruz (pop. [1961 est.] 69,560), founded by the Spanish explorer Nuflo de Chávez in 1560, is the capital and only town of consequence in the department. It is situated on the Piray at 1,575 ft. elevation. Local industries comprise sugar mills, distilleries, sawmills, tanneries, furniture and leather goods factories, and food-processing plants. The railways converge on Santa Cruz; it is the terminus of the Cochabamba Highway, and air service facilities are available. (J. L. Tr.)

SANTA CRUZ, a city of California, U.S., 80 mi. S of San Francisco on the northern promontory of Monterey Bay; the county seat of Santa Cruz County. The scenic beauty of the area and its mild climate are its foremost attractions. The area is enhanced by clumps of redwoods which increase to forest proportions in the Santa Cruz Mountains just north of the city. The state of California has incorporated much of this area into a state park.

The city was founded by the Franciscans in 1791 and became one of the mission links whereby Spanish civilization was extended all the way from San Diego to San Francisco. The U.S. flag was raised over the town in 1846 and the town was chartered as a city in 1876. The city's growth has been steady with a marked increase after 1950 resulting from the increasing industrialization of the area. In agriculture, Santa Cruz has made marked progress, especially in horticulture. Strawberries are grown almost the year around, and loganberries thrive, having originated in the region (*see* Loganberry). Artichokes are produced in abundance, as are cherries, apples, and grapes. The area also excels in the production of bulbs.

One of the features of Santa Cruz attractive to thousands of tourists is its magnificent sweep of beach. To accommodate these crowds the city has built several facilities, including a long wharf which extends a half mile into the bay. The bay also affords a considerable income from fishing. Santa Cruz has a council-manager form of government, in effect from 1948, and a public junior college called Cabrillo. For comparative population figures *see* table in California: *Population.* (B. L. B.)

SANTA CRUZ DE TENERIFE, chief seaport and capital of Tenerife, one of the Canary Islands (*q.v.*), on the northeast coast. Pop. (1960) 133,100. The town occupies a small plain, mainly between two usually waterless ravines. Except where irrigated, the neighbourhood is arid and abounds in cacti and euphorbias. Santa Cruz was founded in 1494 but had only 16,689 inhabitants by 1877. Then the banana and tomato trade and, later, harbour improvements and the tourist trade caused rapid growth. The many notable public buildings include the fine parish church of the Concepción, two museums, a theatre, and a bullring. The water supply comes by aqueduct from the interior mountains. The well-planned seafront adjoins a harbour sheltered by two moles with, in parts, up to 40 ft. depth alongside. Santa Cruz is an important oil-bunkering port with an oil refinery. It is linked with the rest of the island by various roads and there is a railway service to La Laguna. The airport of Los Rodeos is 5½ mi. (9 km.) NW of the town.

A treasure fleet in Santa Cruz was largely destroyed by a British fleet under Robert Blake in 1657. Horatio Nelson lost his right arm there during an unsuccessful assault in 1797, and two British flags captured then hang in the parish church. Gen. Francisco Franco, then captain general of the Canaries, organized in Santa Cruz the national rising that led to the Spanish Civil War in 1936. (R. P. Be.)

SANTA ELENA PENINSULA, in southwestern Guayas Province, Ecuador. On the peninsula is Ecuador's one important oil field. Libertad has a small refinery. Also on the peninsula are salt-extracting works and a popular seaside resort. Ores of sulfur, platinum, and gold are said to exist but in the early 1960s had not been developed. The peninsula offers fine recreational facilities at Salinas, 75 mi. W of Guayaquil, which has ocean beaches and an arid climate. It is the northernmost extension of the west-coast desert of South America, only 2°12′ S of the Equator. (P. E. J.)

SANTA FE, a province of central Argentina, between the Chaco in the north and the province of Buenos Aires in the south. Pop. (1960) 1,865,537. Area 51,354 sq.mi. The two chief cities are the provincial capital, Santa Fe, and Rosario (*qq.v.*), which is the second largest city in the republic. The province lies almost entirely within the great humid pampas region and has no wooded land in the south except along the river courses. In the north there are extensive forests of commercially valuable woods, interspersed with grassy fields. The surface is a level alluvial plain and the soil is among the most productive in the country. The climate is healthy and moderate, with mean annual temperatures ranging from 63° F in the south to 68° in the north. Annual rainfall varies from 28 to 35 in. and is more abundant in the river littoral region than in the interior.

The leading crops are alfalfa (lucerne), maize, wheat, and flax (the order of importance changes according to world prices and government subsidies), together with oats, rye, and barley. In the northern part of the province peanuts, tobacco, sugarcane, and cotton are grown. Although agriculture is the chief source of wealth, the livestock industry is well developed. The ratio of agriculture to cattle raising varies with alterations in prices and subsidies, as both are competing for the same land. In addition to beef and dairy cattle, large numbers of pigs are raised. The principal industries are based on dairy and forest products, and there are large sugar refineries, flour mills, breweries, and distilleries.

The provincial capital has exceptionally good communications with the surrounding country. It is served by the Mitre and Belgrano railways (300 mi. to Buenos Aires) and is the centre of a highway network which includes roads southward to Rosario (100 mi.) and northward to Formosa (500 mi.). The capital has an airport. But the traditional line of communication is by the Paraná River. Oceangoing steamers can reach the town of Santa Fe, which has adequate docks to receive them, and the province's long littoral has many small ports where the farmers of the interior can load their products onto the steamers that ply up and down the Paraná. The ports are linked by regular river services with Buenos Aires (downstream) and Corrientes and Paraguay (upstream). (Ge. P.)

SANTA FE, Argentine city and capital of the province of the same name, located on a channel of the Paraná River approximately 300 mi. NW of Buenos Aires. Pop. (1960) 208,350. It was founded in 1573 by a group of settlers under Juan de Garay as Santa Fe de Vera Cruz, several years before the final establishment of Buenos Aires, as a supporting port for the Spanish settlement at Asunción, Parag. During the colonial period it served as a centre for Jesuit missionary activity; the Jesuit college and church date from 1660. Until mid-19th century the city marked the northern limit of provincial expansion and served as a strategic outpost against the Indians of the Chaco region. During the national period the city was one of the centres which attempted to counteract the growing dominance of Buenos Aires. The Argentine constitution was adopted by an assembly at Santa Fe in 1853. In the mid-1850s the first agricultural colonies of European immigrants in Argentina were established north and west of the city. The national University of the Littoral is a 20th-century addition to the culture of Santa Fe. Modernization of the port facilities in 1911 made it possible for oceangoing vessels to reach the city, and considerable river trade is carried on with Paraná, capital of Entre Ríos, across the Paraná River from Santa Fe. Railroads and highways link the city with the Chaco frontier and the provinces of Santiago del Estero and Córdoba. There is an airport at Sauce Viejo just outside the city. Although Rosario remains the major port of the province, Santa Fe serves as an outlet for the cotton, flax, and grain from the northern area. (Js. R. S.)

SANTA FE, capital of New Mexico, U.S., and seat of Santa Fe county, is located in the north central part of the state on

the Santa Fe river, a tributary of the Rio Grande, about 60 mi. N.E. of Albuquerque. Lying about 7,000 ft. above sea level at the foot of the southern extremity of the Sangre de Cristo mountains, the city has a dry, invigorating climate which makes it a popular summer resort, while skiing in the nearby mountains attracts winter visitors.

About half of the city's permanent residents are Spanish-speaking. (For comparative population figures *see* table in NEW MEXICO: *Population.*) In 1955 Santa Fe adopted a council-manager form of government.

The oldest continuously used seat of government and one of the earliest European settlements in North America, Santa Fe was founded about 1610 by Don Pedro de Peralta, governor of the "Kingdom of New Mexico," to serve as his capital. Officially named Villa Real de la Santa Fé de San Francisco de Asis ("Royal City of the Holy Faith of St. Francis of Assisi"), Santa Fe developed around a central plaza and along the still-extant irrigation ditches leading from the Santa Fe river, becoming a centre of Spanish exploration and Franciscan missionary work in New Mexico. In 1680 the Pueblo Indians revolted, and laid siege to Santa Fe, which was eventually evacuated. It remained in Indian hands until in 1692 Diego de Vargas reconquered New Mexico and secured the fresh submission of the Pueblos. The re-entry of the Spanish into the city is marked by an annual fiesta.

During the 18th century Santa Fe developed a trade in sheep, wool and pelts, chiefly with Chihuahua, Mex., and the Plains Indians. It was also administrative, military and ecclesiastical headquarters of a vast, sparsely populated Spanish frontier province. United States interest in Santa Fe was aroused by the report of Lieut. Zebulon M. Pike (*q.v.*) who was imprisoned there during his exploration of the southwest in 1806. After Mexican independence (1821) a brisk wagon-train commerce developed with the U.S. over the Santa Fe trail (*q.v.*) to Missouri. In Aug. 1846, during the Mexican War, the city was occupied without resistance by U.S. forces under Gen. Stephen Watts Kearny. The city's first English-language newspaper was established in 1847.

Bishop John B. Lamy, important in the cultural life of New Mexico and inspiration for "Bishop Latour" in Willa Cather's novel *Death Comes for the Archbishop,* was appointed first bishop of the diocese (archdiocese from 1875) of Santa Fe in 1851. Through his efforts schools were founded and a hospital built. In 1862 the city was occupied for two weeks by Confederate forces under Gen. H. H. Sibley. The railroad arrived in 1880 but the main line passed through Lamy, 18 mi. S. of Santa Fe, and in 1894 the last garrison troops were withdrawn. Brief mining booms in the nearby mountains toward the end of the 19th century did not materially enlarge Santa Fe, which remained a trading centre for ranchers, farmers and Indians.

The 20th century has seen much literary and artistic activity in Santa Fe, much of it with a regional character, as well as archaeological and anthropological research in the surrounding Indian country. By 1940 tourism had become the city's second largest source of income, exceeded only by government payrolls. Construction in the early 1940s of the Los Alamos Scientific laboratories for atomic research, 35 mi. N.W. of Santa Fe, brought new economic vitality to the area.

Santa Fe's charm resides chiefly in its narrow, irregular streets, the unexpected intrusion of greenery and its domestic architecture. Aside from the plaza, the main points of interest in the heart of Santa Fe are the Governor's palace (built by Peralta in 1610 and restored as a museum in 1914), continuously occupied by Spanish, Mexican and U.S. governors from 1610 to 1909; the chapel of San Miguel (mid-17th century, rebuilt in 1710, restored in 1955); the "Oldest House," believed to be partly of pre-Spanish Indian construction; the Prince patio, now devoted to shops; the Cathedral of St. Francis (1869), built by Bishop Lamy on the site of two earlier churches; and numerous private houses in the older section. Built of adobe brick, the traditional low, flat-roofed Spanish-American dwelling with its walled garden adds much to the foreign appearance of the city.

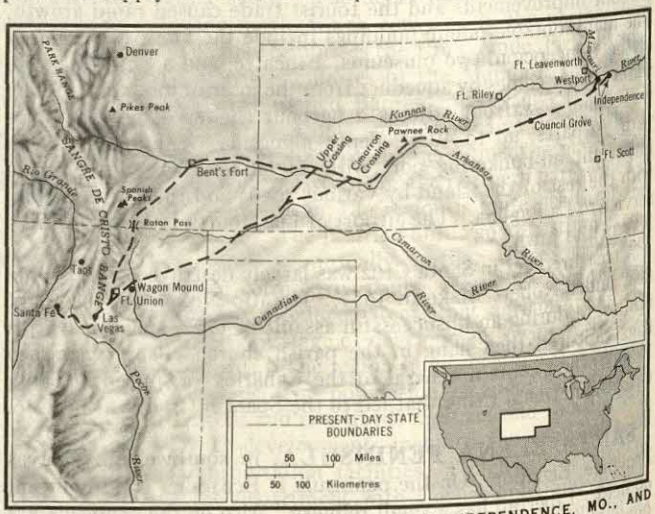
In the 20th century the native architectural idiom, often combined with Pueblo-Indian elements, has been adapted to larger buildings, including the Laboratory of Anthropology (1933), the regional headquarters of the national park service (1942) and the Church of Cristo Rey (1939), probably the largest adobe edifice in the U.S. With the traditional architectural character of Santa Fe threatened by a growing population, public action resulted in the passage of a historical zoning ordinance (1958) designed to protect the harmonious atmosphere of the older section of the city.

The absence of any important industry, the large Spanish-American population, the influence of numerous writers, artists, musicians and craftsmen, and the dignity associated with a state capital and an archdiocesan cathedral combine to give Santa Fe a diversified and sophisticated cultural life. The Museum of New Mexico occupies five buildings: the Governor's palace (archaeological and historical exhibits and historical library), the Hall of Ethnology, the Laboratory of Anthropology, the Museum of International Folk Art and the Art gallery. The privately endowed Museum of Navaho Ceremonial Art, the State School for the Deaf and an Indian school under the U.S. department of the interior are also located there. (J. B. JA.)

SANTA FE TRAIL, the famed wagon trail from Independence, Mo., to Santa Fe, N.M., and an important commercial route for 59 years, from 1821 to 1880, when the last section of the railroad was completed. It is possible that in 1541 the Spaniard Francisco Vázquez de Coronado traveled portions of what became the trail, and it is known that in 1806 Zebulon Montgomery Pike, the U.S. government explorer, passed over sections of it. A commercial venture was attempted by William Morrison, an Illinois merchant, who sent Jean Baptiste LaLande with trading goods to Santa Fe in 1804. Neglecting to account to Morrison, LaLande settled in Santa Fe, where Captain Pike saw him in 1807. That the Spaniards were hostile to foreign traders is shown by the reception given Robert McKnight's trading expedition of 1812. Arriving after a revolt against the Spaniards had been suppressed, McKnight and members of his party were imprisoned in Spanish jails until after Mexico won independence from Spain in 1821.

The earliest successful commercial expedition was that of William Becknell, who in 1821 made a profitable journey with $300 worth of goods on pack animals and returned the next year to open the trail with wagons. Although Becknell has been called father of the trail, a number of other traders, John McKnight, Hugh Glenn, Jacob Fowler and Stephen Cooper, followed close on his heels.

The Missouri river terminus was first Franklin, Mo., then Independence, and later Westport, now Kansas City, Mo. When the early traders set out in May of each year they at first used horses, but these were replaced in subsequent years by teams of mules or oxen, sometimes five or six pairs to a wagon. Though Santa Fe had gold and silver, together with furs, skins and a plentiful supply of wool, the simplest manufactured goods were



THE ROUTE OF THE SANTA FE TRAIL BETWEEN INDEPENDENCE, MO., AND SANTA FE, N.M.

in great demand. On the westward route the huge wagons were crammed almost to overflowing with hardware and assorted dry goods. After arriving in July and reaching an understanding with Mexican customs officials, most traders sold their cargoes and departed in August with a net profit that ranged from 20% to 40%, though there were some who sold for a loss.

A significant portion of the goods carried to Santa Fe was shipped on to interior parts of northern Mexico and to California. Before 1843 there were no yearly shipments of goods worth more than $450,000, according to Josiah Gregg. Yet it is safe to assume, from other records, that the trade increased.

From its terminus in Missouri the main trail followed almost a straight line for nearly 800 mi. The first of four sections of the journey was from Independence over grasslands to the green meadows and woods of Council Grove in what is now Kansas. Here the freighters organized their train for protection against marauding Indians and made any necessary repairs, aided by a resident blacksmith. From Council Grove to the river crossing west of the Big Bend on the Arkansas was a second division. The traders then moved from the ford on the Arkansas across the arid, desolate Cimarron desert, and finally, in the fourth section of the trip, to the more hospitable grasses and cedars east of Santa Fe.

An alternative route, to avoid the hot, dry Indian country of the Cimarron, was to follow the Arkansas river westward to an adobe stockade near modern La Junta, Colo., called Bent's Fort (*see* BENT, CHARLES), the leading trading post of the American southwest. Thence the mountain route turned southward through the Raton pass to meet the main trail. This route, though mountainous, had the advantages of better water supply, opportunities for trading at Bent's Fort and less danger from Indians. Yet there were few Indian attacks on any portion of the trail. Josiah Gregg reported that only 11 men were killed by Indians in the period before 1843. Traveling in parallel columns, the wagons could easily form a circle to protect livestock and repel attacking warriors.

The Santa Fe trail was not the one-way wilderness highway of the pioneer settler and his family. Rather it was the two-way route of international trade. Contemporaries have described in their journals the variety of merchants and frontiersmen who sought adventure and profit on the road to Santa Fe. These men opened and maintained a prairie thoroughfare that brought bullion into the United States (especially needed in the years following the panic of 1837), gave Missouri its celebrated mules and helped dispel the notion that the southwest was the great American desert. The traders came to know the varied routes of the southwest and reported weaknesses of the Mexican military forces. Indirectly they hastened United States expansion and prepared the way for assent to U.S. control which came in 1846, when Col. Stephen W. Kearny entered Santa Fe without opposition at the beginning of the Mexican War. Under U.S. rule the Santa Fe trade continued to flourish, especially after U.S. mail by stagecoach was instituted in 1849. In the period after the Civil War the yearly freight expeditions persisted until the tracks of the Santa Fe railroad in 1880 ended the wagon caravans.

See Josiah Gregg, *Commerce of the Prairies,* 2 vol. (1844 and numerous later editions), the classical account of the trail; R. L. Duffus, *The Santa Fe Trail* (1930), a readable and entertaining account.

(W. R. J.)

SANTAL, a tribal people of eastern India; in the 1960s the latest population figure available (from the 1951 census) was about 2,811,000. Areas of greatest concentration are: Bihar (districts of Santal Parganas, Hazaribagh, Manbhum, Singhbhum); Bengal (Midnapur, Burdwan, Bankura); Orissa (Mayurbhanj). Their language is Santali, a dialect of Kherwari, a Munda language. In physical type they belong to the proto-Australoid group, characterized by short stature, dark skin, wavy to curly hair, and broad flat nose. (*See* MUNDA LANGUAGES; MUNDA PEOPLES.)

Many Santal are employed seasonally or permanently in the coal mines near Asansol or the steel factories in Jamshedpur, while others work during part of the year as paid agricultural labourers. In the villages, where tribal life continues, the most important economic activity is the cultivation of rice. Each village has a hereditary headman who, assisted by a council of elders, administers the affairs of the village; he also has some religious and ceremonial functions. A special headman is charged with the supervision of morals. Two priests perform the duties of sacrificing on behalf of the villagers. Groups of villages are linked together in a larger territorial unit termed a pargana, which also has a hereditary headman. Traditionally men of the pargana met together annually to hunt and to settle disputes involving the members, and the custom persists where game may be found.

The Santal have a patrilineal exogamous clan organization. The clans, 12 in number, are each divided into a number of subdivisions, also based on descent. Membership in the clan and subclan carries certain injunctions and prohibitions with regard to style of ornaments, food, house type, and religious ritual. Marriage, endogamous with respect to the tribe as a whole, is normally arranged by the parents; payment of bridewealth (*q.v.*) and the marking of the bride's head with vermilion are essential features of the ceremony. Marriage is generally monogamous; polygyny, though permitted, is rare.

Religion centres around the worship of spirits by means of periodic public sacrifices to avert disease and ensure rainfall. The ancestral spirits of the headmen are objects of an important cult.

See also SANTAL PARGANAS.

Das Gupta, *Problems of Tribal Education and the Santals* (1963).

(D. M. SP.)

SANTALACEAE, the sandalwood family of dicotyledonous, semiparasitic shrubs, trees, and herbs of tropical and temperate regions. There are about 30 genera and about 400 species. *Santalum album* is the true sandalwood (*q.v.*). The bastard toadflax, a North American species of *Commandra,* is sometimes parasitic. Another North American species is oil nut or buffalo nut (*Pyrularia pubera*) of the Appalachian region. *Thesium humifusum,* also called bastard toadflax, is native to Great Britain and is a herbaceous root parasite.

SANTAL PARGANAS, a district of the Bhagalpur division of Bihar, India. Area 5,470 sq.mi. Pop. (1961) 2,675,203. It consists of three regions: a strip of alluvial country along the Ganges; a north-south, basaltic, forested, hilly tract (Rajmahal Hills) in the east-central part; and a rolling gneissic peneplain in the west and south. The Rajmahal Hills mark the eastern limit of the hot winds that sweep the Gangetic plain during the hot season. The administrative headquarters of the district are at Dumka (pop. [1961] 18,720). The main crops are rice, maize (corn), and oilseeds. Coal is mined in the small Jainti field. Pakur is the chief centre of the shellac industry.

The Santals (*see* SANTAL), numbering 829,029 in 1941, had begun to migrate from Chota Nagpur and adjoining districts in the late 18th century. The oppression of landlords, the exactions of moneylenders, and the consequent loss of land caused a rebellion (the Santal War) in 1855–56. This led to the setting up of a form of administration acceptable to the immigrants. The Daman-i-Koh ("the skirts of the hills"), a government estate of more than 1,000 sq.mi., was established as a reserve for them and other tribal peoples, such as the Paharias.

(E. AH.)

SANTA MARIA, the southeasternmost island of the Portuguese Azores Archipelago in the North Atlantic Ocean. Area 37 sq.mi. Pop. (1960) 13,164. Administratively it is part of Ponta Delgada District. Its capital, Vila do Pôrto (pop. 5,373), founded in the 1430s, is the oldest town in the Azores. Columbus, returning from his first voyage to America (1493), called at Anjos on its northern coast. Limestone found on Santa Maria is mixed with volcanic material and used for building. The people are engaged in whaling and cattle raising and grow cereals and vines. On the western plateau is an important international airport (originally constructed as a U.S. air base in 1944) for transatlantic flights. *See* also AZORES.

(J. AO.)

SANTA MARIA, a town in Rio Grande do Sul state, Braz., located near the head of the Jacuí Valley, 150 mi. W of Pôrto Alegre. Pop. (1960) 78,682. It is an important railroad centre

at the crossing of the main line running from São Paulo to the Uruguay border and the main line running from Pôrto Alegre to the Argentine border. It is also served by an airfield and is the junction of several major highways. Industries include railroad shops, breweries, tanneries and meat-processing plants. Santa Maria carries on a large trade in livestock, alfalfa, rice, wine, fruit, maté, coal and timber. The town was once called Santa Maria da Bocca do Monte (St. Mary of the Mountain's Mouth) because of its position at the foot of the Serra Geral. (P. E. J.)

SANTA MARTA, a Caribbean port city of Colombia, capital of the department of Magdalena, on a small bay 40 mi. E.N.E. of the mouth of the Magdalena river. Pop. (1961 est.) 62,650. Santa Marta was founded by Rodrigo de Bastidas in 1525 and is the oldest city of Colombia. From there Gonzalo Jiménez de Quesada led the celebrated expedition inland to found Santa Fe de Bogotá (*see* BOGOTÁ). Connected by swampy channels and lakes with the river, Santa Marta became a port for colonial New Granada. Like its more famous neighbour, Cartagena (*q.v.*), it was occasionally attacked and sacked by foreign corsairs. Simón Bolívar, hero of the independence wars, died at an estate on the edge of the town in 1830. Santa Marta's commerce overtook that of Cartagena in the mid-19th century but then experienced a decline, chiefly because the channels to the Magdalena were inadequate for steamboats. In the 1880s Santa Marta began shipping bananas grown in the hinterland to the south; the United Fruit company dominated the industry after 1899. Its success was especially striking after the completion of the Santa Marta-Fundación railroad. This industry was almost killed by the Sigatoka plant disease in the early 1940s but subsequently revived. The city is the seat of a bishopric and has a cathedral. (T. E. N.)

SANTA MAURA: *see* LEUKAS.

SANTA MONICA, an oceanside resort and residential city in northwestern Los Angeles county, Calif., U.S., and a part of the Los Angeles standard metropolitan statistical area. It is known throughout the state for its excellent ocean beaches and its suburban homes.

Santa Monica was given its name by Spanish soldiers, who applied it to a spring near the modern city. Between 1828 and 1872 it was a portion of a large ranch owned by Don Francisco Sepulveda. In 1872 the area was acquired by Col. R. S. Baker for use as a sheep farm.

The city appeared three years later, in 1875, as a result of the railroad craze of the 1870s. Santa Monica was selected as the Pacific coast terminus of the Los Angeles to Independence railroad, built to compete with the dominant Southern Pacific. The railroad advertised the advantages of the location as a resort area, an auction of land was held and the settlement of Santa Monica began. Although the only rails laid connected Santa Monica and Los Angeles, population continued to flow in. As early as Nov. 20, 1885, Santa Monica was incorporated as a sixth-class California city. It became a freeholder city through a charter ratified and approved in 1906. A council-manager form of government was established by freehold charter granted March 25, 1947. Industrial development has been limited, but the aircraft industry and various light industries were established.

Pop. (1960) 83,249. For comparative population figures *see* table in CALIFORNIA: *Population.* (J. M. Wo.)

SANTANDER, FRANCISCO DE PAULA (1792–1840), Colombian political figure, an able soldier and administrator with most of the gifts of a statesman, was born April 2, 1792, at Rosario de Cúcuta, near the Venezuelan frontier. At the inception of independence in 1810, Santander left law school to join the patriot army. Promoted rapidly, he escaped the Spanish reconquest of 1816 by fleeing to the eastern lowlands, and returned as brigadier general in the invading force of Simón Bolívar (*q.v.*). Santander was vice-president of Nueva Granada in the republic of Colombia from 1819 to 1821, at which time the constituent congress named him vice-president of Colombia. Re-elected in 1826, Santander continued to be the acting president of Colombia until Sept. 10, 1827. He shaped the government, and found the men, money and supplies for President Bolívar's campaigns in Colombia, Peru and Bolivia. His measures to hold Colombia together after the fighting had ended, however, were undercut by Bolívar, who returned from Peru late in 1826 to end the Venezuelan rebellion. Bolívar retained Venezuela in Colombia only on the basis of obedience to his person, a demand that ended relations between Santander and Bolívar. Santander was exiled in 1828 after the attempt to assassinate Bolívar, but evidence shows only that he knew of the plot, tried to dissuade the conspirators and gave no warning. After dissolution of Gran Colombia in 1830, Santander returned as president (1832–36) of the state of Nueva Granada and then served as senator until his death.

Proud, sensitive, exact in his accounting, Santander typified the best tradition of the colonial official. Legalistic yet flexible, regalistic and centralist, he helped form the tradition of nonmilitaristic governments in Colombia. Colombians justly call him the "man of laws." He was equally important as a defender and focus of Granadian nationalism, especially during 1816–19 and 1827–32. In his last years he restrained the liberal elements of Granadian society who viewed the electoral victory of centrists and conservatives in 1836 as the return of colonial evils. His death, on May 6, 1840, was followed promptly by outbreak of the major civil conflict of 1840–42. *See* also COLOMBIA: *History.* (R. L. GE.)

SANTANDER, an interior department of the republic of Colombia. Pop. (1961 est.) 860,550. Area 11,706 sq.mi. The topography is extremely rugged; the Eastern cordillera of the Andes traverses the department from north to south. Toward the west it includes an extensive area of rainy tropical lowlands, extending to the Magdalena River, that did not become subject to colonization till about mid-20th century. Santander is the principal petroleum-producing department of Colombia, with production centring around Barrancabermeja. Among the agricultural crops tobacco is outstanding, and the manufacture of cigars and cigarettes is an important industry. Coffee is grown on the temperate midslopes of the Andes. A railroad connects the capital city, Bucaramanga (pop. [1961 est., mun.] 208,640), with the Magdalena at Puerto Wilches. San Gil, Socorro, Málaga, and Vélez are other principal cities, all lying between 3,000 and 7,000 ft. above sea level. (Js. J. P.)

SANTANDER, a town on the north coast of Spain and the capital of Santander Province, is an episcopal see and one of the chief Spanish seaports. It is 316 mi. (509 km.) N of Madrid by rail. Pop. (1960) 118,435. The town lies on the southern shore of Cabo Mayor, a rocky peninsula extending eastward to shelter the Bay of Santander, which is an inlet of the Bay of Biscay.

The centre of the lower town (except for the 12th-century crypt of the cathedral) has been rebuilt since it was destroyed by a fire spread by a windstorm in 1941. The Magdalena Palace, with its park, stands near the extremity of Cabo Mayor; it was presented by the town to King Alfonso XIII. A special building houses the library of the writer Marcelino Menéndez y Pelayo (*q.v.*) and the provincial museum with important prehistoric collections from caves in the neighbourhood. The summer university, which meets yearly, is also named for Menéndez. Santander is linked by rail with Madrid, Bilbao, and Oviedo and by scheduled air services with Barcelona, San Sebastián, and Santiago de Compostela.

SANTANDER PROVINCE (area 2,042 sq.mi. [5,289 sq.km.]; pop. [1960] 432,132) is popularly known as La Montaña, being covered with hills and mountains increasing in height toward the south, where they lead up to the *meseta* province of Palencia. The Asturian border to the southwest is marked by the Picos de Europa ("peaks of Europe"), of which Peña Vieja (8,579 ft. [2,615 m.]) is the most noted; a few bears survive there. Rain is frequent throughout the province all the year round.

The prehistoric paintings and engravings of animals in the Altamira cave (*q.v.*) show unusual skill. Nearby, Santillana, with its Romanesque collegiate church containing the shrine of Santa Juliana, has streets of houses mostly of the 16th century with escutcheons over the doors, long abandoned by the families of their original owners. The province is noted for the family pride and indigence of its minor nobility.

The principal towns are Santander; Torrelavega, an industrial and mining centre (zinc, iron, lead); Reinosa, where steel is pro-

duced for the Spanish Society of Naval Construction; Castro Urdiales with its Templars' castle; Camargo; and Laredo. Much of the land in the province is divided into very small peasant holdings. There are some good fishing ports (Santoña, Laredo, San Vicente de la Barquera, Castro Urdiales). (C. D. L.)

SANTARÉM, a city of Brazil in Pará state, on the right bank of the Tapajós near its entrance into the Amazon. Pop. (1960) 24,924. It is the most important town on the Amazon between Belém and Manaus and is a port of call for all river steamers. Santarém is 434 mi. from Belém by air. The red tile roofs of the whitewashed buildings of the business district give the town an attractive appearance from the river. Most valuable exports of the region are rosewood oil, rubber, lumber and jute. Santarém is a noted distributing centre for native handicraft articles. A few miles south of the city the escarpment of the Santarém plateau rises to an elevation of 400 ft. This plateau, which is crossed by a motor road to Belterra, is one of the most active areas of agricultural colonization in the Amazon valley. Rice, corn, beans, mandioca and malva are the principal crops. The shallow strips of fertile black soils on this high surface also contain large numbers of aboriginal baked clay artifacts.

The Tapajós is navigable for steamers to the rapids 170 mi. above Santarém and for small boats nearly to Diamantino (Mato Grosso). A considerable trade comes from Mato Grosso state and the settlements along the river banks.

Santarém was founded in 1661 as the site of a Jesuit mission to a Tapajó Indian settlement (*aldeia*) and was formed around a fort built by Pedro Teixeira. It became a city in 1848. A group of Confederate exiles settled in Santarém after the U.S. Civil War; some of their descendants still live in the area, but most of the original settlers returned disillusioned to the United States. (Js. J. P.)

SANTARÉM, a city and river port on the right bank of the Tagus River, in the Ribatejo Province, Portugal, 51 mi. NE of Lisbon by rail. Pop. (1960) 17,276. The Portas do Sol are the ruins of Alcáçova Castle, a royal residence in the Middle Ages. Notable buildings are the former Jesuit seminary (1676), the late Gothic church of the convent of Graça (with the tomb of the navigator Pedro Álvares Cabral, *q.v.*), the early Gothic basilica of São João de Alporão (now housing the municipal museum), and the churches of Milagre (early Renaissance) and São Francisco (1240). Santarém, the Roman Scallabis (renamed Praesidium Iulium by Julius Caesar), was an important fortress in the wars between the Moors and Christians; it was recovered from the Moors in 1147.

The rich agricultural district of Santarém (area 2,583 sq.mi.; pop. [1960] 462,121) provides the city with produce for its processing industries. Santarém is also a tourist centre and its bullfights with parades of *campinos* (shepherds mounted and traditionally dressed) are well known.

SANTA RITA DURÃO, JOSÉ DE: *see* DURÃO, JOSÉ DE SANTA RITA.

SANTA ROSA, a department in southern Guatemala. Area 1,141 sq.mi. Pop. (1964) 155,488. Its capital is Cuilapa (pop. [1964, mun.] 12,621). In the highlands there are plantations of coffee, and the farmers raise maize (corn) and beans. In the Pacific lowlands the products include sugarcane, rice, and sesame. Large herds of beef cattle are fed on hay. In the northeast corner of the department is the beautiful Lake Ayarza. The capital is served by the Inter-American highway, and a branch descends to the coastal lowlands. (P. E. J.)

SANTA TECLA, officially NUEVA SAN SALVADOR, capital of the department of La Libertad, El Salvador. Pop. (1961) 40,817. It was founded in 1854 at the southern base of Volcán de San Salvador, at an altitude of 2,953 ft., to replace the national capital, San Salvador, devastated by an earthquake. It enjoyed that distinction only briefly, however, for in 1859 the government was moved back to a rebuilt San Salvador. Santa Tecla, 7½ mi. by Inter-American highway from San Salvador, is in the most densely settled part of the department and in an important coffee, livestock, corn, vegetable, and fruit producing area. (C. F. J.)

SANTAYANA, GEORGE (1863–1952), U.S. philosopher, poet, novelist and literary critic, combined the wisdom of the old world and the new and created his own many-sided world of the mind. He was born in Madrid of Spanish parents on Dec. 16, 1863, and went to the U.S. in 1872. He received his B.A. degree from Harvard university in 1886 and taught philosophy continuously at Harvard from 1889 until 1912, with the exception of a year spent as an advanced student at Cambridge university. In 1912 he resigned his Harvard professorship and returned to Europe, where for many years he traveled extensively. Having settled at a convent in Rome early in World War II, he remained there till his death, which took place on Sept. 26, 1952.

THE BETTMANN ARCHIVE INC.

GEORGE SANTAYANA, PHOTOGRAPHED DURING HIS PROFESSORSHIP AT HARVARD UNIVERSITY

Santayana's reputation rests chiefly on the richness and perceptiveness of his account of human experience in its ethical, social, religious and artistic aspects; on the skill with which he wove such diverse philosophical themes as naturalism, Platonic realism and idealism into the texture of his system; and on the exquisite, poetic quality of his prose style. His system, however, lacks speculative originality and the unity conferred by a single great speculative insight. The several themes of his philosophy are incongruous or perhaps even conflict with one another; his basic naturalism is difficult to reconcile both with his realism of essences (or universals) and with his idealistic interpretation of mind or spirit. Yet despite these weaknesses of structure his philosophy is comprehensive, penetrating and to a degree systematic. His greatness resides in the catholicity of his interests; in his sensitivity to values in diverse realms of human experience; and in the freedom of his imaginative powers.

Santayana's first published essay in philosophy was *The Sense of Beauty* (1896). It is a major contribution to aesthetics—perhaps the most important American work in this field. The essay is concerned with "the nature and elements of our aesthetic judgments"; "it is" he adds, "a theoretical inquiry and has no directly hortatory quality." The main thesis of the essay is that aesthetic judgments are the expression of artistic taste and that "to make a judgment is virtually to establish an ideal." Santayana's emphasis on the ideal or formal aspects of aesthetic judgment is combined with an appreciation of the importance of its material or sensuous aspect.

The Life of Reason (1905–06) is a major work consisting of five volumes: *Reason in Common Sense, Reason in Society, Reason in Religion, Reason in Art* and *Reason in Science.* "The life of reason," which Santayana describes as "a presumptive biography of the human intellect," is an interpretation of the role of reason in the manifold activities of the human spirit. The first suggestion for such a work occurred to Santayana in his student days as a result of reading Hegel's *Phenomenology of Spirit;* and, indeed, *The Life of Reason* resembles the *Phenomenology* of Hegel in its conception, though not in its execution. The life of reason, for Santayana as for Hegel, is not restricted to the rational in the sense of the purely intellectual activities of man (though it includes them). The recurrent theme of the five volumes comprising *The Life of Reason* is that reason in all its manifestations is a union of instinct and ideation; it is instinct become reflective and enlightened.

Scepticism and Animal Faith (1923) marks an important departure from his earlier philosophy and serves as "a critical introduction" to his new system developed in *The Realms of Being,* a four-volume work composed of *The Realm of Essence* (1927/28), *The Realm of Matter* (1930), *The Realm of Truth* (1937) and *The Realm of Spirit* (1940). Santayana displayed

in these later works the penetrating insight, the breadth of philosophical vision and the stylistic elegance characteristic of his earlier writings and, at the same time, enhanced his stature as a philosopher by achieving greater theoretical precision, clarity and coherence. *Scepticism and Animal Faith* conveys better than any other single volume of his works the essential import of his philosophy and can be commended as an introduction to and *résumé* of his later system. This essay formulates his skepticism and his theory of immediately apprehended essences and describes the role played by "animal faith" in various forms of knowledge.

"The realm of essence" is the domain of the mind's certain and indubitable knowledge. Essences are universals which possess being or reality but do not exist. The realm of essence comprises colours, tastes, odours and other data of sense as well as the ideal objects of thought and imagination. "The realm of matter" is the world of natural objects; belief in matter rests—as does all belief concerning existence—on animal faith. Naturalism, the dominant theme of his entire philosophy, appears in his later work in his insistence that the realm of matter is prior to the other realms of being.

Santayana's other writings include *Lucifer: a Theological Tragedy* (1924); *Interpretations of Poetry and Religion* (1900); *Three Philosophical Poets: Lucretius, Dante, and Goethe* (1910); *Winds of Doctrine* (1926); *Egotism in German Philosophy* (1940); *Philosophical Opinion in America* (1918); *Character and Opinion in the United States* (1920); *Soliloquies in England* (1922); *Poems* (1923); *The Unknowable* (1923); *Dialogues in Limbo* (1925); *Platonism and the Spiritual Life* (1927); *Some Turns of Thought in Modern Philosophy* (1933); *The Last Puritan*, a novel (1936); *Obiter Scripta* (1936); *Persons and Places*, 2 vol. (1944–45); *The Idea of Christ in the Gospels* (1946); *Dominations and Powers* (1951).

BIBLIOGRAPHY.—P. A. Schilpp (ed.), *The Philosophy of George Santayana* (1940); F. Thilly and L. Wood, *A History of Philosophy*, 3rd ed., pp. 618–623 (1957); Irwin Edman, *The Philosophy of Santayana*, new and enlarged edition (1953). (LR. W.)

SANTEE-WATEREE-CATAWBA RIVER SYSTEM, a 538-mi.-long inland waterway in the southeastern U.S., begins in North Carolina in the Blue Ridge mountains as the Catawba river. The headwaters of the Catawba originate near Mt. Mitchell (6,684 ft.), highest point in the United States east of the Mississippi river. The Catawba flows into South Carolina to Great Falls, a distance of 220 mi., where it becomes the Wateree river. Lakes or reservoirs formed by dams on the Catawba are Rhodhiss lake (15 mi. long); Hickory lake (10 mi.); Lake James (10 mi.); Lookout Shoals lake (10 mi.); Mountain Island lake (11 mi.); and Catawba lake (20 mi.). The Santee river is formed 30 mi. S.E. of Columbia, S.C., where the Wateree joins the Congaree river. The Congaree, in turn, is formed at Columbia by the junction of the Saluda and Broad rivers, both of which originate in the eastern segments of the southern Blue Ridge. The stream is known as the Wateree river between Great Falls and its junction with the Congaree river, a distance of 75 mi. The Wateree is navigable for 58 mi. below Camden, S.C. Eight miles northwest of Camden a hydroelectric dam forms Wateree pond (sometimes called Wateree reservoir; 15 mi. long). Near Stateburg, S.C., is Wateree swamp, a densely wooded area which abounds in mink, raccoon, otter, squirrel, opossum, deer, fox, quail and wild turkey.

The Santee, the most important river in South Carolina, flows 143 mi. S.E. into the Atlantic by two mouths, the North Santee and the South Santee, about 15 mi. S. of Georgetown. It flows through comparatively high hills which aid in the erection of dams and has been subjected to extensive navigational and hydroelectric development. Two large dams are Santee dam (48 ft. high, 7.5 mi. long), which forms Lake Marion or Santee reservoir (40 mi. long); and Pinopolis dam (140 ft. high, 2.2 mi. long), on the Cooper river, which forms Lake Moultrie, the latter receiving water diverted from Lake Marion. Lower sections of the Santee river, near its mouth, are lined by old rice plantations now devoted to cattle, vegetable, pulpwood and hunting activities.

(M. C. P.)

SANTIAGO, a province in north central Chile. Although one of eight provinces formed in 1826, Santiago has been subjected to several alterations in outline and administrative subdivisions. Area 6,727 sq.mi. Pop. (1960) 2,437,425, of whom 646,731 live in Santiago (*q.v.*), the provincial and national capital. The province embraces Andean cordillera, longitudinal valley and coastal range and valley terrain. Winter season rains and snow melt in the Maipo watershed supply the water used for power development and farm and urban needs. River canyons provide summer recreation areas and access to winter resorts (Farellones, Lagunillas and Refugio Alemán). Santiago is a major industrial and agricultural province; in the 1950s its factories employed more than half of Chile's industrial personnel and produced more than half the value of manufactured goods. The bulk of industrial and commercial activity is concentrated in the capital, but there are important farm supply, marketing and product-processing activities at San Bernardo, location of major railroad shops; Puente Alto, a paper and gypsum-processing centre; and Melipilla, Talagante and Buin. In agriculture, dairy and beef production are important, and the main crops (by acreage) are wheat, alfalfa, clover, barley, maize, grapes, potatoes and beans.

Marketing is facilitated by the proximity of urban centres and by the best-developed road system in Chile. Road and rail carriers make almost every point in the province accessible; service to other provinces is good.

San Antonio, the chief port and fishing centre, has a flourishing traffic in copper from O'Higgins province (*q.v.*) and such regional products as malting barley, wine and legumes. Nearby are such fashionable beach resorts as Santo Domingo, Cartagena and Algarrobo (Valparaíso province). Mining is conducted at Las Condes-Naltagua (copper), El Volcán (gypsum) and Polpaico (limestone for cement). Chacabuco and Maipú are famed battlefields of the war for independence. (J. T.)

SANTIAGO (SANTIAGO DE LOS CABALLEROS), a province and its capital city in northern Dominican Republic. A relatively large province (1,201 sq.mi.), it is bounded on the north by the Cordillera Septentrional (to 3,993 ft.) and on the south by the Cordillera Central (to 10,417 ft.). The heart is a wide, east-west plain, known as the Cibao region, which is intersected by the Río Yaque del Norte. This fertile and populous region makes the province a leading rice and corn producer and the centre of the nation's tobacco industry. Coffee growing and lumbering are also important. The province was established in 1845. Pop. (1960) 287,941.

The city of Santiago is situated at about 500 ft. elevation on the banks of the Río Yaque. Pop. (1960) 83,523. It was founded about 1500 by Bartholomew Columbus and was inhabited by 30 knights of the Order of St. James (Santiago). It was rebuilt near the original site after the 1564 earthquake. Its location near the centre of the Cibao, the most productive region of the nation, has made it a vital hub of communications and trade. Its factories manufacture cigars and cigarettes, coffee, pharmaceuticals, furniture, and other products. (D. R. D.)

SANTIAGO (SANTIAGO DE CHILE), capital of the republic of Chile and of the province of Santiago (*q.v.*), is the centre of the nation's political, economic, cultural and ecclesiastical life. The city's preponderance of power and prestige is suggested by its population. Pop. (1960) 646,731.

The city was founded by Pedro de Valdivia on Feb. 12, 1541. Its nucleus occupied a defensively advantageous position to the west of Cerro Santa Lucía and between the Mapocho river (north) and a periodic channel of the Mapocho (south), now the Avenida Bernardo O'Higgins, called the Alameda. The westward-sloping alluvial land over which the city has spread ranges in elevation from about 1,600 to 2,100 ft. Dominating the central city is Cerro San Cristóbal (2,779 ft.), which lies to the northeast of Cerro Santa Lucía and north of the Mapocho. A few miles to the west are the coastal ranges, remote and modest ridges compared to the 8,000-ft. cordilleran buttress which looms above the city on the east. The higher summits of the Andes form a massive backdrop.

Santiago, originally Santiago del Nuevo Estremo, was elevated

EWING GALLOWAY

ENTRANCE TO CERRO SANTA LUCÍA, ONCE THE CITADEL OF PEDRO DE VALDIVIA, WHO FOUNDED SANTIAGO IN 1541

to city status and given a coat of arms in 1552. In 1609 the royal *audiencia* was transferred to the community, and in 1651 an episcopal see was created. Few traces of early architecture have survived earthquakes and the pressures of city modernization. The 16th-century churches and convents were shattered in the earthquakes of 1647 and 1730. The cathedral, also damaged in the disasters, burned down in 1769. Only San Francisco among existing churches preserves part of the original colonial structure. The Valparaíso road was finished and the Mapocho bridged by mid-18th century. Efforts to control the river were nullified by the floods of 1609, 1684, 1779 and 1783.

The cathedral, completed in 1619, was reconstructed several times; the Moneda (since 1848 the executive residence), Aduana and Cabildo were finished between 1775 and 1807, and the Alameda was transformed from river bed to principal thoroughfare soon after independence. Nevertheless, major changes in the city's appearance did not occur until after mid-19th century, when wealthy miners and landowners began to build monumental houses. The municipal theatre was constructed in 1857 (reconstructed 1873). It and much of the contemporary architecture were French-inspired.

Broad-scale municipal improvements were notable in the 1870s. Streets were paved and lined with trees, streetcars were introduced, the water system was improved, and the central market was constructed. Numerous plazas were created, but the transformation of rocky Cerro Santa Lucía into a park was the finest gift to posterity. In the 1890s the Mapocho was effectively canalized and the splendid riverside Parque Forestal planted. Later urban improvements are notable in the middle- and upper-class residential districts, which spread upslope from the city nucleus, chiefly after 1930. Industrial development has been greatest in the western part of the city, where low-cost housing projects and spontaneous housing developments are commonly found. In this area city expansion has been greatest toward San Bernardo. In the nuclear part of Santiago, the *Centro*, modern structures of 8–12 stories are clustered. These buildings tend to combine several functions: shops, restaurants and theatres open to the street and to street-level galleries; offices, hotels and apartments occupy higher floors. The Plaza de Armas, with its bandstand, statuary and fountains, the flanking cathedral and old public buildings, is a link with the past. Nearby are the congress and supreme court buildings. To the southwest, in the civic centre, the Moneda is surrounded by tall ministry and commercial buildings. Groups of multistoried structures, chiefly residential, lie farther west; other clusters arise east of Cerro Santa Lucía and along major avenues. The pattern of public transportation is adequate, but peak period congestion is serious. Among the public services common to great cities Santiago's spirited volunteer fire department is unique.

City parks include San Cristóbal, which contains gardens, the zoological park, a funicular and the shrine to the Virgin of the Immaculate Conception. The once fashionable Cousiño park remains so only for the independence day military review (Sept. 18). The Quinta Normal de Agricultura contains a boating lagoon, exhibition and rodeo grounds and the museum of natural history. In the Parque Forestal is the Palace of Fine Arts. The museum of contemporary art is located on Cerro Santa Lucía; nearby is the national library building, where archives and historical and archaeological collections are housed.

The University of Chile (founded 1843), the Catholic university (founded 1888) and the military academy are the best-known educational institutions. There are good civilian and military technical schools.

Santiago is Chile's major and most diversified manufacturing centre. Textiles, food products, shoes and clothing and beverages represent about 60% of manufactures in value. Although the city is the chief market, rail and highway carriers reach most of the country. Passenger rail and bus service with other cities is good. There is a modern international airport.

Summers (October to March) are warm; winter temperatures are not excessively low, but the combination with the atmosphere's high relative humidity produces a penetrating cold. The warm month (January) mean temperature is 69° F.; cold month (July) mean temperature is 46.4° F. Fog is common in winter, and atmospheric pollution (smog) is noticeable most of the year. Precipitation, chiefly a winter phenomenon, averages 15.3 in. per year. Snow, uncommon in the lowlands, forms a mantle upon the cordillera in the winter.

See also references to "Santiago (Santiago de Chile)" in the Index. (J. T.)

SANTIAGO (SANTIAGO DE COMPOSTELA), a city, place of pilgrimage, and archiepiscopal see in the province of La Coruña, northwestern Spain, situated near the confluence of the Sar and Sarela rivers, 32 mi. (51 km.) SW of the city of La Coruña by road, and at the terminus of a railway from Madrid. Pop. (1960) 57,165 (municipal). "Santiago" is the Spanish for St. James, whose shrine the city possesses. In the first half of the 9th century a tomb discovered at Padrón was said to have been supernaturally revealed to be that of the apostle St. James the Great, martyred at Jerusalem some years after the crucifixion (Acts 12:2). According to legend his body was taken to Spain where he had formerly evangelized, according to a tradition not known before the 7th century. (This St. James was sometimes confusedly thought to be the same person as St. James the Less, the "brother of Jesus.")

The discovery of the relics provided a rallying point for Christian Spain, then confined to a narrow strip at the north of the Muslim-occupied majority of the peninsula. Alfonso II (791–842) of Asturias built over the tomb an earthen church which Alfonso III (866–910) replaced by a stone one, and the town that grew up around it became the most important place of pilgrimage after Jerusalem and Rome during the Middle Ages. The whole town, except the tomb itself, was destroyed in 997 by al-Mansur (Almanzor), military commander of the Caliphate of Córdoba, and it was not until 1078 that the present church was begun under Alfonso VI of León and Castile, whose introduction of Cluniac reforms to Spain through his marriage to the duke of Burgundy's daughter increased the flow of pilgrims by uniting his country more closely to the rest of Western Europe. This fine Romanesque building (consecrated 1128, completed 1211), at the east of the Plaza Mayor, has a Baroque west facade, the *Obradoiro*, above a flight of steps, built by Fernando de Casas y Novoa in 1738–47. An outstanding feature of the interior is the Pórtico de la Gloria (behind the facade), showing a Last Judgment, Romanesque but tinged with Gothic features, by Maestro Mateo. At the north of the Plaza Mayor is the Hospicio de los Reyes Católicos, built in 1501–11 by Enrique de Egas to receive the pilgrims. Other noteworthy secular buildings are the colleges of San Jerónimo (founded 1501), Fonseca (founded 1530), and San Clemente (founded 1601), and the university (founded 1532, though the building dates from 1750). The monastery of San Martín Pinario, now a seminary, was founded in the 10th century and rebuilt in the

17th. The church of Santa María Salomé and the collegiate church of Santa María La Real de Sar in the suburbs both date from the 12th century, with later facades.

Santiago's chief economic activities, apart from agriculture and the artistic industries of silverwork, jetwork, and wood engraving, include brewing and the distillation of spirits, foundries, and the manufacture of linen, paper, furniture, soap, and matches.

SANTIAGO DE CUBA, Cuban city and seaport which is second to Havana among the nation's cities. Pop. (1962 est.) 215,616. Santiago lies in a valley or basin of the same name located near the southeastern end of the island. The valley, which measures about 8 mi. from north to south and 19 mi. from east to west, is pierced by the great bay on which Santiago is situated and which gives the city much of its commercial importance. The bay, a safe and commodious anchorage approximately 6 mi. long and 2 mi. wide, is of the pouch shape characteristic of the Cuban coast. The overall width of the entrance channel is only 300 yd., and it is only 60 yd. between the 5-fathom marks; the entrance is nearly invisible from a distance offshore, cutting as it does into the high bluffs which rise from the sea. The chief bluff, about 200 ft. high, is the Morro, crowned by a colonial fortress, Morro Castle. The channel entrance depth is 32 ft. and anchorage depths within the harbour are 26 ft., although there is considerably less water (about 14 ft.) alongside some of the piers. There are seven principal wharves, some with railroad sidings; the Malecón, or concrete quay, is also used for handling cargoes and fuel oil.

Santiago, capital of the province of Oriente, is the hottest city of the island, the annual mean temperature in winter being 28° C (82° F) and in summer 31° C (88° F). This condition is caused in part by the fact that the city is cupped in by outlying ranges of the Sierra Maestra Mountains, which rise around the basin to heights of 3,000 ft. Because of the hilliness of the city it affords interesting panoramas of mountains and ocean. Its relative isolation until the 20th century has resulted in an air of colonial antiquity, provided by the red-tiled roofs of the low houses which line the narrow streets of the older sections. The city has suffered occasional severe earthquakes, the most recent in 1932.

In the mountains of the region are substantial mineral deposits—iron, manganese, and copper—which have stimulated shipping activity at the port; near or within the city there are also distilleries, textile mills and other types of factories, and an oil refinery. In addition to ores, sugar (of which Santiago in recent years has exported approximately 5% of Cuba's total exports), rum, tobacco, and cocoa beans are the principal exports. There are good rail, road, and air connections with other parts of the island, including Havana, 540 mi. WNW, and there is also ship service to foreign countries.

Santiago was founded in 1514 by Diego Velázquez, first governor of Cuba; it was moved a few miles to the present site in 1522. Commanding as it did a strategic location upon the northern Caribbean in the early colonial period, the city was until 1589 the capital of Cuba. In that year, with the shift of settlement toward the western end of the island, Santiago lost its leading position to Havana and sank to a secondary role. Cortés was the first alcalde, or mayor, of Santiago, and it was from there that he set out in 1518 on the expedition which culminated in the conquest of Mexico. The growth of the city was slow in the colonial period (when pirates harassed the port) and in the 19th century, and the principal additions to the population and progress of the municipality came as a result of the settlement in the city in the mid-17th century of Spaniards driven out of Jamaica when that island was captured by the British, and again by the settlement in the first decade of the 19th century of several thousand French refugees from nearby and newly independent Haiti.

Santiago was a focal point of the Spanish-American War, and many historic reminders of that conflict are found in the area. Near the city, on the hills of El Viso (at the village of El Caney) and San Juan, decisive engagements were fought; the harbour of the city was partially blocked by the scuttled collier, *Merrimac*; and the principal naval action of the war was fought along the coast near the port.

On July 26, 1953, Fidel Castro led an attack of 165 young revolutionists against the Moncada army barracks in the city. The attack was defeated by the government troops of the dictator, Fulgencio Batista. Castro and his remaining followers were tried in Santiago and sentenced to prison. But a name—the 26th of July Movement—had been given to Castro's cause and in 1956, after his release from prison, he led a handful of men back into the Sierra Maestra Mountains west of Santiago. This group of rebels gradually isolated the city from the rest of the island, although it remained in the hands of Batista forces until Castro's victory on Jan. 1, 1959. (T. F. McG.)

SANTIAGO DEL ESTERO, a province in northern Argentina, separated from Tucumán in 1820. It is bounded by the provinces of Salta and Chaco in the north and Córdoba in the south. Pop. (1960) 477,156. Area 52,222 sq.mi. Santiago del Estero lies within the Argentine section of the Gran Chaco (*q.v.*) and has the general characteristics of that region. Almost the entire surface is a lowland plain, a large part of which is covered with scrub forest. Some of the trees, notably the quebracho, are of considerable commercial value. There are extensive saline areas in the southwest. The climate is extremely hot in summer, the temperature rising to 118° F. Frosts occur occasionally in winter. Rainfall is slight (about 20 in. a year) and quickly evaporates. Therefore agriculture is possible only where the land can be irrigated from the rivers Salado and Dulce, or where seasonal flooding by the rivers takes place. The existence of large swamps (*esteros*) bordering the Dulce in the vicinity of the provincial capital, Santiago del Estero, explains the name of town and province. The main crops in the irrigated districts are maize, wheat, linseed, and cotton. Cattle are raised on the rough Chaco pastures.

The province is crossed by several railways which connect it with many parts of Argentina and with Bolivia and Chile. The railway via Salta to the Chilean port of Antofagasta on the Pacific coast was designed to facilitate exchange of the products of the Chaco for the minerals of Chile's northern desert (copper and nitrate). (GE. P.)

SANTIAGO DEL ESTERO, Argentine city, capital of the province of the same name, located 700 mi. NW of Buenos Aires. Pop. (1960) 103,115. Although the climate is extremely hot and dry, the surrounding plains produce considerable wheat, cotton, flax, corn, and alfalfa. Founded in 1553 by Spaniards arriving from Peru and moved to its present location on the Dulce River three years later, it is the oldest continuous settlement in Argentine territory. Highways and excellent rail connections link the city with Córdoba, Tucumán, and the Argentine northwest and with the ports of Santa Fe and Rosario. (JS. R. S.)

SANTIAGO MOUNTAINS, a narrow range in the southwestern U.S., extending southeastward across central Brewster County in the Big Bend section of Texas. Formerly the entire 90-mi. chain from near Alpine to the Boquillas Canyon of the Rio Grande was mapped as Santiago Mountains, but increasing usage restricts the name to the 35-mi. range between Del Norte Gap and the Del Norte Mountains to the northwest and Dog Canyon and the Dead Horse Mountains to the southeast, with the portion continuing from Dog Canyon across the Boquillas into Mexico frequently known as the Sierra del Carmen. Santiago Peak (6,521 ft.), a truncated butte of intrusive rocks, rises about 1,500 ft. above the mountain crest of vertical and overturned Cretaceous limestone strata, which averages about 1,500 ft. above the Marathon Basin on the east. Annual precipitation, ranging from 5 to 15 in., supports an open arid scrub on the lower slopes and a piñon-juniper association higher up. The drainage system of Maravillas Creek practically surrounds the range. Intermittent arroyos and a few springs help support sheep and cattle.

A U.S. highway from Marathon crosses the range at Persimmon Gap (through which went the Comanche Trail) to enter the Big Bend National Park. (D. D. B.)

SANTIAGO RODRÍGUEZ, a province in northwestern Dominican Republic. Area 394 sq.mi. Pop. (1960) 40,730. It occupies the northern slope and foothills of the Cordillera Central and is drained by several tributaries of the Río Yaque del Norte, the nation's largest river. Because of semiarid conditions in much of the region, livestock raising rather than cultivation is a principal activity. Crops include cassava, plantains, peanuts, coffee and tobacco. Some lumbering is done in the mountains. The province was created in 1951 from Montecristi province.

The capital, Santiago Rodríguez (pop. [1960] 3,620), was called Sabaneta until 1936. (D. R. D.)

SANTILLANA, ÍÑIGO LÓPEZ DE MENDOZA, MARQUÉS DE (1398–1458), Spanish poet and one of the great figures of his time in both politics and literature, was born at Carrión de los Condes, Palencia, Aug. 19, 1398, and died at Guadalajara, March 25, 1458. As lord of the vast Mendoza estates, he took a leading part in opposing John II and led expeditions against the Moslems. He found time, however, to manage his lands benevolently, patronize the arts, build up an important library and write poetry of high quality. In part his poetry is typical of the 15th century, didactic and stoical in outlook, Latinized in style, often allegorical. He showed originality in collecting proverbs and in writing 42 sonnets, the first in Spanish; these, although angular and uncertain, have an occasional fine line and great historical importance. He is chiefly read for his ten *serranillas,* charming light lyrics in the traditional manner, describing encounters between the knight and the shepherdess; and for his *Proemio,* or preface to his collected works, the first document of literary history and poetic principle in Spanish.

See R. Lapesa, *La obra literaria del Marqués de Santillana* (1957). (C. C. SH.)

SANTINIKETAN (Hindi "abode of peace"), a university town in Birbhum district, West Bengal, India, lies about a mile from Bolpur and 96 mi. (154 km.) NW of Calcutta by rail. It has grown out of Santiniketan Asrama, a place for meditation in peaceful seclusion, founded and endowed in 1863 by Maharshi Devendranath, the father of the poet Rabindranath Tagore (*q.v.*). The latter, in turn, set up a school called the Brahma Vidyalaya, with the object of imparting sound education in a religious atmosphere. In 1901 Tagore started another experimental school at Santiniketan to provide for children an education which would not be divorced from nature, where the pupils could feel themselves to be members of a large community, and where they could acquire knowledge and grow up in an atmosphere of joy, freedom, and mutual trust. Since 1921 Santiniketan has been the seat of the Visva-Bharati University (also founded by Tagore), which seeks to develop a basis on which the cultures of east and west may meet in common fellowship. The university draws students and teachers from all over India, and also from other countries. It is a residential university (incorporated by an act of 1951) with hostels and extensive grounds. The teaching departments include a college of fine arts and crafts, a college of music and the dance, an institute for Sino-Indian studies and research, a teachers' training college, and colleges of technology and of postgraduate studies and research. At the nearby settlement of Sriniketan an institute of rural reconstruction was started in 1922 by Tagore with the help of L. K. Elmhirst. (S. P. C.)

SANTO DOMINGO, a geographic name of several usages in the island of Hispaniola, West Indies. This was the original name of the capital of the Dominican Republic, the oldest European city in the western hemisphere. Christopher Columbus established the first European settlement in the new world on the northern coast of Hispaniola on his second voyage in 1493. After he returned to Spain, his brother Bartholomew founded the city of Santo Domingo on the southern coast in 1496. This name, officially changed in 1936 to Ciudad Trujillo, was restored in 1961 after the assassination of Rafael Trujillo Molina.

Santo Domingo is also the name sometimes given to the entire island of Hispaniola. During the colonial period it was the name given to the Spanish portion, and when the French occupied the western third of the island they called their colony St. Domingue. Also during the colonial period both Spanish and French names were applied to the whole island. The name was frequently corrupted incorrectly to San Domingo in English-speaking countries. The former Spanish colony, officially the Dominican Republic since 1844, is still frequently referred to as Santo Domingo. The former French colony became the Republic of Haiti in 1804.

Santo Domingo is the official name of the federal district of the Dominican Republic, comprising the wide coastal plain and hilly interior region surrounding the capital city of the same name. This district was set up in 1935 out of the former Santo Domingo province and corresponds to the old commune of Santo Domingo. Its 570 sq.mi. area consists of sugarcane plantations and cattle estates, as well as the capital city, and its population (1960) was 464,970. Boca Chica beach resort is located about 20 mi. E. of the capital. *See* also DOMINICAN REPUBLIC; HAITI; HISPANIOLA. (D. R. D.)

SANTO DOMINGO, capital of the Dominican Republic, on the southeast coast of the island of Hispaniola. Pop. (1960) 369,980. It was founded in 1496 when Bartholomew Columbus moved the first Spanish settlement in Hispaniola to the Ozama river on the south coast. It was called Santo Domingo until 1936, when the name was changed to Ciudad Trujillo in honour of Rafael Leonidas Trujillo Molina; its original name was restored in 1961 after Trujillo was assassinated and his regime was overthrown. It is the oldest permanent city founded by Europeans in the new world and the seat of the oldest archbishopric; it claims the oldest university (St. Thomas Aquinas, now Santo Domingo university) in the western hemisphere. Until the conquest of Mexico and Peru, Santo Domingo was the centre from which the Spanish possessions in the Americas were governed, but by the end of the colonial period it was a relatively unimportant provincial town. In 1655 its inhabitants defeated a force which was sent by the British government to seize the colony and which later conquered Jamaica.

It has retained in part many of the aspects of a Spanish colonial town, with straight, narrow streets intersecting at right angles and low houses abutting on the sidewalk. The cathedral, in Spanish Renaissance style, dates from 1514 and contains the reputed tomb of Christopher Columbus. There are remains of the city walls, with their fortified gates, and of the palace of Diego Columbus. (*See* COLUMBUS, CHRISTOPHER.)

Santo Domingo has grown rapidly since World War II, and there was much reconstruction after the devastating hurricane of 1930. There are fine public buildings and parks and luxurious tourist hotels. It is the chief seaport of the Dominican Republic; and the harbour, at the mouth of the Ozama river, has been improved so that large vessels can tie up at the dock. It also has modern airports and is connected by air services with the United States and other foreign countries.

See also DOMINICAN REPUBLIC; HISPANIOLA. (D. G. MO.)

SANTORIN: *see* THERA.

SANTOS, a city and seaport of Brazil, in the state of São Paulo, 210 mi. S.W. of Rio de Janeiro and 49 mi. by rail S.E. of São Paulo city. Pop. (1960) 262,048; (1950) 198,405. Santos covers an alluvial plain on the inner side of an island (São Vicente) formed by a tidal channel called the Santos channel or Guarujá river. The commercial district is several miles from the mouth of the channel, but the residential sections extend across the plain and line the beach facing the sea.

Santos is only a few feet above sea level, and its swampy island is drained by deep cement conduits. The channel is free from obstructions, and in front of the city it widens into a bay deep enough for the largest vessels. The water front, once beds of mud and slime and source of many fever epidemics, is faced by a wall of stone and cement. The docks are 4 mi. long and can accommodate about 50 steamers at one time; belt conveyors load several thousand bags of coffee per hour. The British-built but Brazilian-government-owned railway to São Paulo transports the bulk of the state's coffee to Santos. The trains of this profitable railway are hauled up and down the steep coastal range (the Serra do Mar) by cables. A paved highway, including the magnificent Via Anchieta, links Santos with São Paulo.

Santos, the world's leading coffee port, is dominated by its

leading export, the aroma of which permeates the city. Its chief public building houses the Coffee exchange, a stock company in which the state government is liable for a part of its liquidating commitments. Santos exceeds Rio de Janeiro in annual tonnage of shipping. Each year 8,000,000 to 13,000,000 bags of coffee are shipped. The warehouses can store about 5,000,000 bags, and many have modern machinery. Other exports include cotton, sugar, bananas (grown near Santos), castor oil, beef, oranges, hides and some manufactures.

An annual rainfall of about 77 in. and a mean temperature of 69° F. combined formerly to create unhealthful conditions, but the building of drainage canals, extension of sanitation, paving of streets, construction of better houses and port improvements have made Santos a healthful city. A suburban seaside resort, Guarujá, attracts many visitors from inland parts of Brazil.

The first settlement on the São Paulo coast was made in 1532 at São Vicente, about 6 mi. S. of Santos on the island. Other settlements followed, including Santos (1543), and later a small fort was built at the harbour entrance as a protection against Indian raids from the north. The name of the city was taken from the Hospital dos Santos, established by the city's founder, Brás Cubas, and named after a hospital in Lisbon, Port. São Vicente did not prosper, and was succeeded by São Paulo as the capital (1681) and by Santos as the seaport of the colony. Santos was sacked by the English privateer Thomas Cavendish in 1591. (R. M. M.)

SANTOS-DUMONT, ALBERTO (1873–1932), Brazilian aviation pioneer, was born in the state of Minas Gerais, Braz., on July 20, 1873. Educated in France, he spent most of his life in that country. Becoming interested in aerial flight, he made a balloon ascent in 1897 and then began to construct dirigible airships. After many failures he built one which in 1901 won the Deutsch Prize and a prize from the Brazilian government for the first flight in a given time from Saint-Cloud to the Eiffel Tower and return. In 1903 he erected at Neuilly the first airship station, where he kept his fleet of dirigibles. Shortly after the successful flight by the Wright brothers in 1903, Santos-Dumont turned his attention to heavier-than-air machines. After experimenting with a vertical-propeller model, he built in 1906 a machine on the principle of the box kite. With it he won the Deutsch-Archdeacon Prize in October, and in November he flew 220 m. in 21 sec. In 1909 he produced his famous "demoiselle" or "grasshopper" monoplane, the forerunner of the modern light plane. In 1928, after many years of residence in France, he returned to Brazil. He died July 24, 1932.

See his autobiography, *My Airships: a Story of My Life* (1904).

SANTOS MONTEJO, EDUARDO (1888–), Colombian newspaper editor and political figure, was born Aug. 28, 1888, at Bogotá. He received his law degree from the National University of Colombia and then studied literature and sociology for two years at the University of Paris. In 1913 he founded *El Tiempo,* Colombia's leading newspaper. Santos began his political career in 1921 as a Liberal and thereafter remained a major party figure. He held every elective office, including the presidency (1938–42), as well as many diplomatic and cabinet posts. Politically, he represented the more conservative element of the Liberal Party and long headed the most uncompromising Liberal opposition to the Conservative Party. Although he did not play an active political role after 1954, he strongly supported, through *El Tiempo,* the national front. *See* also COLOMBIA: *History.* (R. L. GE.)

SANUDO, MARINO (1466–1536), Venetian historian whose *Diarii* are an invaluable source for the history of his period, was born at Venice on June 22, 1466. In his enthusiasm for historical and classical learning, he collected a notable library of manuscripts, rare books, maps, and ethnographical drawings. He began his *Vite dei Dogi c.* 1490 (published in *Rerum Italicarum Scriptores,* vol. xxii, 1733; *ibid.,* vol. xxii, iv, edited by G. Monticolo, 1900). It covers the period from the origins of Venice to September 1494, and includes material from his earlier writings. In his unpublished *La spedizione di Carlo VIII,* he brought the story up to 1495. On Jan. 1, 1496, he began his diaries. These are his most important work, and constitute a kind of universal history, written from the Venetian point of view. They contain many letters, original documents, and firsthand accounts, as well as detailed digressions on culture, trade, public works, and social customs. After he became a senator in 1498, Sanudo was able to continue his diaries with even greater efficiency, because he not only observed but took part in the events he was describing. In 1531 he was given a pension to continue the work, which thenceforward was semiofficial in character, and he carried it on until 1533; the result was 40,000 closely written pages published as *I Diarii,* 58 vol. (1879–1902).

Sanudo possessed a certain vigour of style but lacked the true historian's sureness of touch and sense of the relationship between particular events and general causes. He died at Venice on April 4, 1536.

See M. R. Brown, *Ragguagli sulla vita e sulle opere di M. Sanudo,* 3 vol. (1837–38); *Archivio Muratoriano,* I, pp. 153 ff. (1904). (G. Go.)

SAN VICENTE, a department in El Salvador, bordering the Pacific Ocean, and its capital city. Area 466 sq.mi. Population of the department (1961) 112,920, of which two-thirds was rural; population is concentrated in the highland valleys of the western part of the department. On the southwestern border rises San Vicente volcano, altitude 7,156 ft. The department produces rice, sugar, cotton, livestock, cheese, and vegetables.

SAN VICENTE CITY (pop. [1961] 34,723), about 30 mi. E of San Salvador in an area of volcanic hot springs and geysers, was founded in 1635 on the site of Tehuacán, an ancient Indian settlement. An important commercial city, it manufactures leather goods, textiles, liquors, and hats. (C. F. J.)

SAO (So), an extinct African people who left traces of an important pre-Islamic civilization in Chad, northern Cameroons, and Nigeria (*see* CHAD, REPUBLIC OF: *History*). The name Sao cannot be attributed with certainty to any ethnic group; it includes Negroid and some non-Negroid elements from the north and east who apparently settled (starting about the 9th century A.D.) in successive waves on the banks of Lake Chad and the lower valleys of the Yobe, Shari, and Logone rivers as far as the 11th parallel. At the end of the 14th century the neighbouring kingdom of Kanem was invaded by the Bulala, and the Kanem peoples fled to Bornu in Sao territory to reestablish their empire. The northern Sao struggled against Kanem authority for two centuries until the king of Kanem-Bornu, *mai* Idris Alooma, overcame and largely exterminated them. In the south the Sao managed to hold out until the country was converted to Islam at the end of the 18th century. Local tradition has made them a people of giants, whose exploits are legendary (*see* BORNU: *History;* KANEM).

Archaeological data show that the Sao were hunters and farmers, later joined by fishermen; they introduced weaving and metalworking (iron and bronze) to the region. Their villages were built on semiartificial mounds originally (Sao I) protected by wooden palisades, replaced in more recent times (Sao II) by wide earthen ramparts. Urn burials with the body in fetal position, bronzes, and pottery date from Sao II. Remarkable examples of craftsmanship are jewelry and ritual objects made by the lost-wax method (*see* SCULPTURE TECHNIQUES: *Bronze Casting*), and clay figurines representing men and animals.

Direct descendants of the Sao are the Kotoko who keep their settlements on the ancient sites. In spite of conversion to Islam, most Sao religious beliefs (*e.g.,* a peculiar form of totemism) have been retained. The Buduma and Kuri (*see* CHAD, LAKE), the Mobber (*see* KANURI) of the banks of the Yobe, the Ngouma of the valley of the Yadseram, and the Ngizim of Bornu, although very much mixed with Kanuri elements, may all be traced to the same Sao origin. In the south, far beyond modern Kotoko country, the Guéwé, the Njei, Bata, and Holma, in the region of Benue, and the Gamergu living in the region around Mandara, also regard the Sao as their ancestors. The ancient Sao should not be confused with contemporary Saho (*see* SAHO-AFAR), who are also sometimes called Sao, nor with the So people living in the Congo Basin.

Soc. Afric.,* vol. xii (1942); F. R. Wulsin, "An Archaeological Reconnaissance of the Chari Basin," *Harv. Afr. Stud.,* iii–xi (1932). (A. M. D. L.)

SÃO FRANCISCO, a river of eastern Brazil, rises in the Serra da Canastra, southwest Minas Gerais. It flows in a general north-northeasterly direction across the great central plateau of Brazil and turns northeastward through the *sertão* (semiarid interior plains) and then southeast in a great bend, entering the Atlantic about 60 mi. N.E. of Aracajú, Sergipe state. Along its course the São Francisco forms the Pernambuco-Bahia and Alagôas-Sergipe state borders. The river has a total length of 1,988 mi. and a fall of 2,700–2,800 ft. It is navigable from Pirapora, in the state of Minas Gerais, for more than 1,000 mi. to a point downstream from Juàzeiro, Bahia, and from Piranhas, in the state of Alagôas, 172 mi. to the sea. The upper and lower sections of the river are separated by a stretch of nearly 300 mi. in which the São Francisco drops, first gradually and then abruptly, from the plateau toward the coastal plain. The upper portion of this stretch, nearly 100 mi. long above Petrolândia, comprises a series of rapids known as the Sobradinho, navigable at high water. In the lower portion are the spectacular São Francisco falls, where the river plunges through a narrow gorge—in one place only 51 ft. wide—and over three successive falls, altogether 265 ft. This obstructed part of the river is about 190 mi. long, and consists of a series of rapids above the falls and a deep canyon with whirlpools for some distance below. The Paulo Afonso falls are about 193 mi. from the river mouth. Sandbars at the mouth prevent the entry of deep-draft ocean vessels. The river is nearly 1 mi. wide at Penedo, 22 mi. from the Atlantic. Above Juàzeiro its width varies from a narrow channel during drought periods to several miles at flood stage in the rainy season (December to March). Below Pirapora the only bridge spanning the São Francisco connects Juàzeiro with Petrolina, in Pernambuco state.

The principal tributaries of the São Francisco are: to the south and east, the Paraopeba, Velhas and Verde-Grande; to the north and west, the Indayá, Abaeté, Paracatú, Urucuia, Carinhanha, Corrente and Grande. Several of these are navigable for long distances by small boats. Estimates of the aggregate navigable channels of the São Francisco river system range from about 1,000 mi. to over 4,000 mi.

The São Francisco river has been a major artery of travel between northeastern and central Brazil since colonial times. Along most of its course it flows through a sparsely settled pastoral region, frequently subject to prolonged drought. It serves to link the highway and railroad that converge at Pirapora with routes running north and east from Juàzeiro and Petrolina. However, river transport is slow and difficult because of shifting channels and great variations in depth and current speed in different seasons. During the dry season steamboats may take two weeks to run from Pirapora to Juàzeiro and over a month to return.

The Brazilian government has undertaken a series of related, long-range development programs in the São Francisco valley designed to improve navigation on the river, to reduce disease in the area, to provide flood control and irrigation to make the valley more attractive for agricultural settlement, and to harness the great hydroelectric potential of the Paulo Afonso falls. A major accomplishment was the virtual elimination of malaria, formerly endemic in the upper valley. Construction on the Paulo Afonso hydroelectric project began in 1949, and the Tres Marias dam and power station was completed in 1960. It is expected that the power available from the project will eventually be distributed throughout most of the states of northeastern Brazil. (R. E. P.)

SÃO LEOPOLDO, a city in Rio Grande do Sul, Braz., located 20 mi. N. of Pôrto Alegre. Pop. (1960) 41,023. This was the first German colony (1824) established in southern Brazil. It is now a rail centre with factories producing pig iron, tanned leather, matches and aluminum ware. São Leopoldo is also served by river boats and is on the main all-weather highway that connects Pôrto Alegre with São Paulo. It is located in the midst of an agricultural country producing rice, hogs, cattle, maize, potatoes, beans, manioc, tobacco and a great variety of old world fruits and vegetables. There are Jesuit and Protestant seminaries in the city. (P. E. J.)

SÃO LUÍS, chief city and capital of the state of Maranhão, Braz., is located on the west side of São Luís Island 300 mi. E.S.E. of Belém. Pop. (1960) 124,606. The island is really a long narrow peninsula between the drowned mouths of the Mearim and Itapecurú rivers (São Marcos bay on the west and São José bay on the east), and it is cut off from the mainland by a shallow side channel, the Canal do Mosquito. It was founded on this strategic site in 1612 by a French naval officer, Daniel de la Touche de La Ravardière, and named in honour of Louis XIII. It was captured by the Portuguese in 1615; from 1641 to 1644 it was held by the Dutch. Because of its position where two systems of navigable rivers converge, São Luís has long controlled the commerce of the main part of Maranhão, and it is the chief port for the products of Teresina in Piauí, with which it is connected by rail. Its exports include babaçu (babassu) oil, castor beans, balsam, hides and skins, lumber, cotton, sugar, rice and maize. In the city there are sugar refineries, a brandy distillery (*caxaça*) and plants for the processing of babaçu oil and cacao, for the preserving of fruit and for the manufacture of hammocks and margarine. Since 1679 it has been the seat of a bishopric, and its buildings preserve much of the Portuguese colonial atmosphere, especially the large 17th-century cathedral. Its Institute of History and Geography is one of the oldest in Brazil. São Luís has been the birthplace of many distinguished Brazilian writers and poets. The city was formerly called São Luiz do Maranhão or simply Maranhão. (P. E. J.)

SAÔNE, a river of eastern France, 298 mi. (480 km.) long, rises in the Faucilles hills of Lorraine at 1,300 ft. (400 m.), 15 mi. SW of Épinal, and joins the Rhône River at Lyons. It flows south into the wide structural depression between the plateau of Langres and the Massif Central and the Jura. It receives important left-bank tributaries, the Ognon and Doubs, which drain the Gate of Burgundy (Belfort Gap). Near Allerey the Saône unites with the Doubs (left), which rivals it in volume and exceeds it in length at this point. At Chalon the Saône turns south and closely follows the margin of the Massif Central past Mâcon. The slopes to the west form the great wine district of Burgundy; to the east the fertile plain of Bresse stretches to the foot of the Jura, but it is succeeded farther south, toward the Rhône confluence, by the ill-drained moraine country of the Dombes. The Saône is canalized above Lyons for a distance of 233 mi. to Corre, where it is connected with the Canal de l'Est. It is also linked by canals with the Rhine (via the Doubs), the Marne, the Seine (Burgundy canal), and the Loire (Canal du Centre). (Ar. E. S.)

SAÔNE-ET-LOIRE, a large *département* of east-central France, formed in 1790 of part of the ancient province of Burgundy (*q.v.*). It is bounded north by Côte-d'Or, east by Jura, south by Ain and Rhône, southwest by Loire, west by Allier and Nièvre, and includes part of the Saône plain, the floor of a Pliocene lake, with the crystalline highlands that border it to the west. Area 3,331 sq.mi. (8,627 sq.km.). Pop. (1962) 535,772.

The Saône Valley and the Plain of Bresse, which stretches to the east, crossed by the Seille, Reyssouze, and Veyle from the Jura, support rich agriculture, with wheat and maize (corn), sugar beet, tobacco, and fodder crops on the calcareous loams that cover the old lake floor. Large numbers of poultry are kept. West of the Saône the limestone foothills constitute the rich vinegrowing district of Mâconnais, where Pouilly, Fuissé, and Brouilly provide well-known vintages. The crystalline highlands of the western part of the *département* are concerned with poorer farming, mainly cattle rearing, but the flanking Jurassic sediments give richer pastures, used for fattening. There the ancient region of Charolais (*q.v.*) is the home of one of the most famous breeds of French cattle. Between the Morvan and the Beaujolais highlands, each rising to about 3,000 ft. (900 m.) in the extreme northwest and south of the *département,* a synclinal groove makes an important break. There the watershed between the Dheune tributary of the Saône and the Bourbince tributary of the Loire is low, and the easy route provided is used by the Canal du Centre, linking the

Saône at Chalon with the Loire at Digoin, and by one of the earliest of French railways. Along this valley patches of Coal Measures have been preserved in the synclinal structure, and these are worked at Blanzy and Montceau-les-Mines. The coal is of high quality, including coking type, though the amount produced is small and is now declining. The district had the first coke-fired blast furnaces in France. The famous Schneider works were established at Le Creusot in 1837. Although the old iron industry once used local ores, all the ore is now imported, and the district is mainly concerned with finishing processes and the manufacture of special steels and associated engineering. Refractory materials are also produced from the coalfield, and farther north oil shales are worked at Épinac, near Autun. To the west uranium ore is produced at Gueugnon.

Mâcon is the *préfecture* of the *département*, which is divided into five *arrondissements*, centred upon Autun, Charolles, Chalon, Louhans, and Mâcon. The *département* forms the diocese of Autun, and comes under the court of appeal and the *académie* at Dijon. At Autun there are considerable remains of the Roman wall and gates, as well as the isolated tower known as the Temple of Janus. The cathedral of St. Lazare is a magnificent example of Burgundian Romanesque architecture and is especially noteworthy for the sculpture of its main portal. Another Romanesque cathedral is at Chalon, and Cluny (*q.v.*) has the remains of an abbey that was for long the largest Christian church in the world. Solutré, near Mâcon, is famous for the extensive remains of Paleolithic man that were found in its limestone caves. (AR. E. S.)

SÃO PAULO, a state of Brazil, bounded north by Mato Grosso and Minas Gerais, east by Minas Gerais, Rio de Janeiro and the Atlantic, south by the Atlantic and Paraná and west by Mato Grosso. Pop. (1960) 12,974,699. Area 95,713 sq.mi. The state has a coast 373 mi. long, skirted by the well-wooded western slopes of the Serra do Mar. The narrow coastal zone is broken by lagoons, tidal channels and mountain spurs. Above is an extensive plateau with wide grassy plains, 1,500 to 3,000 ft. above sea level. Isolated ranges of low elevation break the surface in places, but in general the state may be described as an undulating tableland sloping toward the Paraná river, its western boundary. The extreme eastern part, however, has an eastward slope and belongs to the Paraíba basin. A number of large rivers flow westward to the Paraná, including the Grande (part of the state's northern boundary), Tietê (traversing the whole state), Aguapeí, Peixe and Paranapanema (part of the southern boundary). The Pardo and Turvo are important tributaries of the Grande. Much of western São Paulo is still unsettled. The coastal zone has a hot climate and a heavy rainfall. On the plateau rainfall is ample, but the air is drier and more bracing, the sun temperature being high and the nights cool.

São Paulo is the heartland both for coffee planting and for industry in Brazil; it has been called a locomotive pulling the other states like empty freight cars. Brazil's most populous state, São Paulo in the mid-20th century contained more than 17% of the nation's population, although only 3% of its area. The value of São Paulo's agricultural production was 40%, that of its industrial production 60%, of the total for Brazil. It grew more than half of the country's leading crop, coffee. It accounted for almost half of Brazil's foreign trade. Figures for income, hydroelectric power, banks, motor vehicles and daily newspapers ranged between 30% and 40% of the national total. The literacy rate was appreciably higher than the average for Brazil. The dynamic capital, São Paulo, dominates the life of the state; with a population of more than 3,000,000 it overtook Rio de Janeiro in the 1950s as Brazil's largest city.

Political importance came with São Paulo's economic growth. The nation's first three civilian presidents after the downfall of Emperor Pedro II in 1889 were Paulistas. Later, São Paulo and Minas Gerais reached a "rotation" agreement regarding the presidency. This broke down in 1930 when Wáshington Luís from São Paulo, tried to impose a Paulista successor during the severe coffee crisis that accompanied the world depression. Getúlio Vargas from Rio Grande do Sul was then swept into office with army backing. Paulistas resented his measures against their state and rose against his regime in July 1932. Although São Paulo's industry was swiftly converted to military production, and 50,000 men were placed in the field, the revolt was put down in three months. Thereafter the state recouped only a part of its political influence.

In the mid-19th century, intensive coffee planting began near Campinas, northwest of the capital. The coffee frontier then moved steadily northward, westward and, in the 20th century, southward into Paraná. The best land occurs in the streaks of *terra roxa* (red-purple earth), a deep, porous soil containing humus. Periodic overproduction of coffee and exhaustion of the older coffee lands led to land subdivision and diversification of agriculture after the 1930s. The other leading crops include cotton, rice, corn, sugar, beans, potatoes, tomatoes, bananas, peanuts, oranges and manioc. Cereals are grown despite somewhat unfavourable climatic conditions. Cotton enjoyed a boom during the American Civil War; then, after nearly disappearing, the industry revived to meet the demand of Brazilian cotton factories. Sugar cane was planted with the first Portuguese settlement and remained the leading crop until the advent of coffee. Stock raising is important in northern and western parts of the state. After 1929 much coffee land was converted to pasturage, and the number of cattle increased fivefold within 25 years. Herds have been improved by imported stock, and horses and mules are also bred; another profitable animal industry is the breeding of swine. Truck farming and dairying have developed with urbanization. The state has excellent agricultural schools and experiment stations at Piracicaba and Campinas and a zootechnic station in the capital.

Immigration is one of the keys to São Paulo's economic progress. Coffee was first cultivated by Negro slaves. When these were emancipated in 1888, European workers were already arriving as replacement, aided by private and official subsidies. Between 1870 and 1952 over 2,500,000 immigrants entered, half of them as permanent residents. The principal foreign groups were Italians, Portuguese, Spaniards and Germans. After federal immigration restrictions were imposed in 1934, migration from other Brazilian states met São Paulo's labour needs. Many immigrants were attracted from farms to cities, especially the capital, where they furnished industrial labour. Nearly 200,000 Japanese arrived in the 20th century; they showed greater cohesion as rural settlers, as evidenced by their efficient agricultural co-operative at Cotia, near the capital.

São Paulo is the industrial centre of Brazil, with most of the state's factories located in the capital or within 75 mi. of it. Manufacturing was stimulated during World War I, and Paulistas used their political influence with the federal government to obtain a tax exemption for the port of Santos and protective tariffs. In the 1960s the state had over 52,000 industrial firms employing more than 900,000 persons; although the vast majority were small enterprises, more than 200 plants had 500 or more employees. The output of pig iron, cast iron and steel was over 600,000 tons annually. Other heavy industries included the assembly of motor vehicles and manufacture of farm machinery. Raw materials for many industries, such as textiles, ceramics, cement, furniture and food processing, are locally available. The principal source of power is hydroelectric. South America's first nuclear energy power plant was purchased for São Paulo in England in 1957. Although poor in minerals, São Paulo produces significant quantities of alumina, mineral water and dolomite.

The state has an extensive network of federal, state and private railroads of varying gauges. These converge upon the capital and upon the cable railway of the pioneer Santos-Jundiaí line which links São Paulo with its port. Santos in the 1960s was the nation's busiest port and the largest coffee-shipping port in the world. Cananéia, Iguape, São Sebastião and Ubatuba are engaged in the coasting trade only; the first two are known for the rice grown in their vicinity. In addition to 4,600 mi. of railroads, São Paulo has 63,000 mi. of highways and 46 airports.

São Paulo was settled in 1532 by the Portuguese under Martim Afonso de Sousa, who established a colony near Santos at São Vicente, now a resort town. It was originally called the *capitania* of São Vicente (organized 1534) and included the whole of Brazil south from Rio de Janeiro. After the founding in 1554 of São

Paulo city (which succeeded São Vicente as capital of the captaincy in 1681), the Paulista plateau was for a long time the main region of inland settlement in Brazil. Seventeenth-century expeditions (*bandeiras*) roaming the interior from bases on the plateau were largely responsible for the boundaries of the modern nation. From time to time parts of São Vicente were cut off to form other captaincies, from which developed the present southern states. After national independence, São Paulo was a province under the Brazilian empire (1822–89). (R. M. M.)

SÃO PAULO, the largest city of Brazil, capital of the state of the same name, largest industrial centre of the nation and seat of an archbishopric, is on the Tietê river 49 mi. by rail N.W. of the port of Santos and 308 mi. by rail S.W. of Rio de Janeiro. Pop. (1950) 2,017,025; (1960) 3,164,804. São Paulo is connected by rail and highway with Rio de Janeiro and many inland cities. It is connected with Santos, its port, by a cable railway and a four-lane highway over the steep coastal escarpment. Its airport is one of the busiest in the world. São Paulo is surrounded by many functionally specialized satellite towns, and it dominates a vast agricultural hinterland. Part of the city occupies ridges that command broad vistas, and part is on alluvial land along the Tietê and smaller rivers. The elevated regions provide healthful residential districts. Although the surrounding lands are clayey with sandy deposits, they are extensively used for truck farming. Nearby hills and reservoirs and the beaches at Santos and Guarujá provide pleasant resort areas. The city is just within the tropics and has high sun temperatures in summer, but its elevation (2,400 ft. above the sea) gives it a temperate climate which occasionally reaches freezing in winter.

São Paulo grew rapidly in modern times. Its population of less than 25,000 in 1872 reached 250,000 in 1901 and 1,000,000 in 1933. To create an adequate source of hydroelectric power, nearby rivers were dammed and their waters pumped over the coastal mountains to supply the Cubatão power plant. Because of its great activity, the city has been called the "Chicago of South America." In the 1950s the annual number of licences issued for new buildings averaged more than 16,000. The historic Triangle, or city centre, contains only a portion of São Paulo's characteristic skyscrapers. Traffic is handled by viaducts and by a loop-and-spoke system of broad radial and perimetric avenues; but in general urban growth has been swift and uncontrolled. A municipal department of urbanism was created only in 1947. Residential districts of the well-to-do, such as Avenida Paulista and Jardim América, are attractively laid out, the more recent of them by private firms influenced by English town planning. They contrast sharply with the crowded slums of the industrial Braz and Moóca districts. Recreation facilities include a stadium seating 80,000 spectators, the Jockey club racecourse and an autodrome, one of the world's largest.

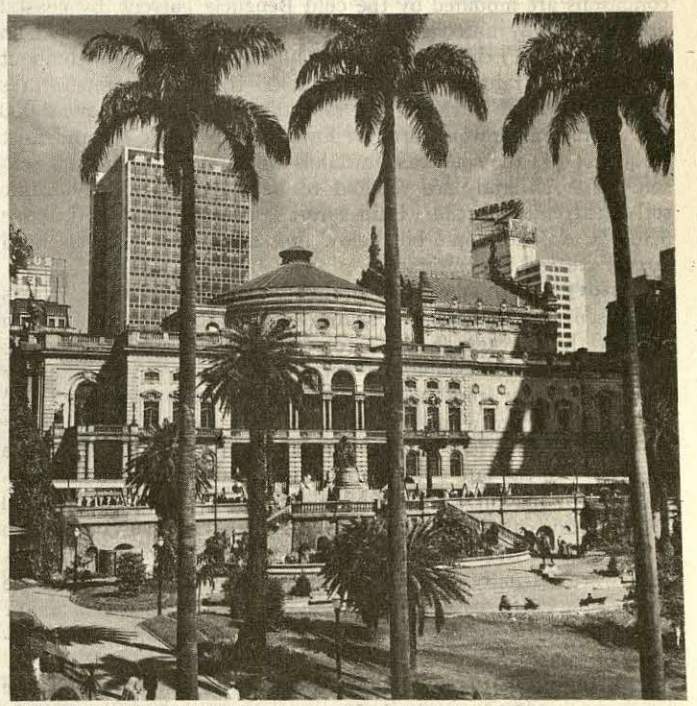
São Paulo has a long history, few traces of which are visible in the modern metropolis. The Jesuits under Manuel da Nóbrega founded it as an Indian settlement in 1554, on the anniversary of the conversion of St. Paul. From this saint the city takes its name. The site was a hill at the confluence of two streams which could be defended against hostile Indians. Three 16th-century paths on the hilltop formed the Triangle which permanently identified the city centre. In the 17th century São Paulo was a base for expeditions (*bandeiras*) that searched the continent for Indian slaves and precious minerals. Although it succeeded São Vicente as capital of the captaincy in 1681 and was raised to the status of city in 1711, São Paulo remained an agrarian town into the 19th century. In 1822 Emperor Pedro I declared national independence there, at a site marked by the museum and monument of Ipiranga. Traditions of the *bandeiras* and colonial autonomy were invoked in 1932, when São Paulo became the seat of an unsuccessful revolt against the regime of Pres. Getúlio Dornelles Vargas.

The city's modest fortunes before the mid-19th century derived from commerce, sugar growing and diversified agriculture. At that time the spread of coffee planting to the rich red soil of the province opened a source of wealth which contributed to the city's sudden growth after 1880. Favoured by its climate, its strategic location in the transportation network and the availability of a port, São Paulo became a centre for commerce, banking and industry. Immigrants arrived in large numbers as workers and entrepreneurs. For a time Italians outnumbered native Brazilians in the city. Other prominent groups were Portuguese, Spaniards, Germans, east Europeans, Levantines and Japanese. Although immigration fell off after 1934, many foreign quarters have kept their identity. Only about 7% of the inhabitants are Negroes, in contrast to the heavy Negro population of northeastern Brazil.

Industrial development began in the late 19th century. In a few decades, São Paulo with its neighbouring municipalities, notably Santo André, became the foremost industrial centre of South America. Southern Brazil, more prosperous and densely settled than the north, furnished a market for manufactures. The territory within easy commercial reach of São Paulo contains only 20% of the area of the nation but roughly 50% of its population, 75% of its highways and railways and 90% of its electric power. In the 1960s São Paulo state produced nearly two-thirds of the value of Brazilian manufactures and the city alone about one-third. Some heavy industry existed—for producing steel, manufacturing plant equipment and assembling trucks and automobiles, for example—but was secondary to the production of light consumer goods. Most of the firms had no more than 20 employees. The branch of industry employing most workers was textiles, followed by mechanical and electrical appliances, building and furniture, foodstuffs and chemical and pharmaceutical products. Except for foreign subsidiaries, industries tend to be owned by families and small groups. In 1952 Brazil's first intercity oil pipeline was opened between Santos and São Paulo, and in 1955 the Cubatão oil refinery, the nation's largest, began operation.

Throughout the 19th century São Paulo was a prominent cultural and intellectual centre. This was largely because of the opening in 1827 of a law academy, one of the first two in Brazil, where many of the nation's most eminent men were educated. This cultural leadership continued in the 20th century. In 1922 Modern Art week, celebrated by a group of young writers, artists and musicians in the Municipal theatre, introduced modernism in the arts to Brazil. The municipal department of culture, founded in 1934, won international recognition for its many activities. São Paulo is a leading centre for libraries (which include the skyscraper municipal library), publishing houses, theatres and museums.

The Museum of Modern Art organized the first Biennial exhibition in the Americas (1951). The permanent fairgrounds



DAVIS PRATT—RAPHO GUILLUMETTE

THE OPERA HOUSE, SÃO PAULO

for the fourth centennial of the city (1954) are distinguished for their modern architecture.

São Paulo has a well-developed system of primary and secondary schools, public and private, and a variety of vocational schools. The literacy rate for persons over six years of age rose from 45% in 1887 to 85% in 1946. The state university, established in 1934, incorporated pre-existing schools of law, polytechnic training, pharmacy and dentistry, agriculture, medicine and others. Faculties of economics, architecture and engineering were added later. An affiliated institution is the school of sociology and politics, founded in 1933 by industrialists and civic leaders as the first advanced course in the social sciences in South America. Another is the Butantã institute, a world-famous research centre for the study of snakes and the production of antitoxins and antivenins. A Catholic university was created in 1946.

Roman Catholicism is the prevailing religion, although Protestant, Jewish and spiritist groups are of some importance.

(R. M. M.)

SÃO PAULO DE LUANDA, Angola: *see* LUANDA.

SÃO SALVADOR, Brazil: *see* SALVADOR.

SÃO TOMÉ E PRÍNCIPE, a Portuguese overseas province on the Equator in that part of the Gulf of Guinea called the Bight of Biafra, off the west coast of Africa. It consists of the islands of São Tomé (137 mi. [220 km.] WNW of Cape Lopez, Gabon) and Príncipe (93 mi. [150 km.] NNE of São Tomé). The area of the province is 372 sq.mi. (963 sq.km.), of which São Tomé occupies 330 sq.mi.

Physical Characteristics.—São Tomé, which is about 21 mi. broad and about 32 mi. from northeast to southwest, is volcanic and has many craters and old lava flows. It rises centrally to 6,640 ft. (2,024 m.) (Pico de São Tomé) and in the west-centre has ten peaks of over 3,500 ft., some of which culminate in phonolites resembling upward-pointing fingers. From these peaks the land falls sharply to the often sheer west coast, but there are a number of bays on the other coast. The southern lowlands have much volcanic ash and cinder and the off-lying Gago Coutinho islet (which is crossed by the Equator) is of basalt, with two craters. Príncipe is rectangular, measuring about 5 mi. across and 11 mi. (18 km.) from northeast to southwest. It rises to 3,110 ft. and is largely basaltic.

Climatically the islands belong to the southern hemisphere, as the drier season (*gravana*) is from June to September. Equatorial conditions are modified by the cold Benguela current, by coastal breezes, and by altitude. Four regions can be distinguished on both islands: (1) the hot and humid northeast lowlands with about 40 in. annual rainfall; (2) above 1,300 ft., where temperatures are lower, though variable, and rainfall heavier; (3) above 2,000 ft., where temperatures are yet lower, the nights cold, and mist frequent; (4) the southeast lowlands where there is no drier season. The lowlands are reputed to be malarial. The volcanic soil is extremely fertile. Rain forest is densely developed above 3,200 ft. on São Tomé but below that height the land has been largely cleared for cultivation. (R. J. H. C.)

History.—São Tomé was probably uninhabited when it was first discovered by European sailors in the 1470s. In the late 15th century the Portuguese began to settle convicts and exiled Jews on the island and established sugar plantations. This industry used slave labour from the mainland, and for some years São Tomé became important as a slave entrepôt. In the 17th century the island was held briefly by the Dutch. Thereafter its importance declined. In the late 19th century the colony recovered its prosperity with the introduction of cocoa, but by 1909 British and German chocolate manufacturers were boycotting São Tomé cocoa on the ground that the indentured labourers used on the plantations were virtually slaves. In the 1960s São Tomé e Príncipe remained a Portuguese overseas province; it played only a minor role in the initial conflicts between African nationalism and Portuguese resistance. (D. Bi.)

Population and Administration.—The population of the province was 60,159 at the 1950 census and in 1960 was 63,485; of the total, 4,605 live on Príncipe. São Tomé has developed clusters of population in and around the provincial capital, São Tomé, in the more level northeast. In the west there are fewer people. Of the total population about 1,200 are Europeans and about 4,300 of mixed ancestry. Among the Negroes, men outnumber women because of the presence of numerous immigrant plantation labourers, recruited largely from Angola or Mozambique on long contract. In the 1950s fairly successful efforts were made to encourage fixed labour by making land grants on new roads south of São Tomé town and by improved education and housing. In Príncipe, Santo António on the east coast is the chief settlement.

With other Portuguese colonies, São Tomé e Príncipe was in 1951 given the status of an overseas province. The governor resides at São Tomé, which is also the residence of the *curador*, the legal guardian of the *servicaes* (labourers). The province has more than 20 elementary schools, a secondary school, and a technical school.

Economy.—The earliest crop on São Tomé was sugar, but this was ruined by Brazilian competition in the late 16th century. Agriculture was not revived until coffee was introduced in 1800 and cocoa in 1822. Most agriculture is on plantations, one estate alone occupying one-tenth of São Tomé. Coconuts and oil palms grown in the coastal belts yield respectively about 20% and 5% of the exports by value. Between about 650 and 1,300 ft. elevation, especially on the northeast of both islands, cocoa is dominant, and until about 1905 the islands were the world's leading cocoa producers. Production has since declined but cocoa still makes up about two-thirds of the exports by value. Coffee, grown on higher ground, accounts for almost all remaining exports. Subsistence crops include yams. Fishing, especially for sharks, has some importance.

Communications.—A 12-mi. state-owned railway connects São Tomé with Trinidade in the interior. There are about 160 mi. of roads. São Tomé has a sheltered harbour on Ana de Chaves Bay and clears about 200 vessels with a net tonnage of 800,000 annually. Several shipping lines call regularly. São Tomé is linked by scheduled air services with Lisbon, Portuguese Guinea, Fernando Pó, and Príncipe. (R. J. H. C.)

SAPIEHA (originally SOPIHA), a Polish princely family, descended from Ruthenian (Russian) boyars under Lithuanian rule.

LEW (1557–1633) was a Calvinist and a supporter of the Radziwills in his youth, but later turned Catholic and adhered to King Sigismund III of Poland. Chancellor of Lithuania from 1589 to 1623, he approved the Polish intervention in Russian affairs in 1609–11, and promoted the unfortunate expedition of 1617–18 with the aim of making the king's son Wladyslaw tsar in Moscow. His first cousin, JAN PIOTR (1569–1611), fought well against the Swedes and, in 1608, took service under the second False Dimitri (*q.v.*), whose hetman he became. He died in the Moscow Kremlin. Jan Piotr's son PAWEL JAN (*c.* 1610–1665) took part in the wars against the Muscovites, the Cossacks, and the Swedes; as hetman of Lithuania (1656), he combated King John Casimir's plans for strengthening the royal authority.

Pawel Jan's sons KAZIMIERZ JAN (1637–1720; hetman in 1682) and BENEDYKT (d. 1707; grand treasurer from 1676 to 1703) sought to make themselves predominant in Lithuania and resisted the Polish king John III Sobieski; but a confederation of nobles was formed against them, the brothers were defeated in battle at Olkienniki (1700), and Kazimierz's son MICHAL was murdered.

KAZIMIERZ NESTOR (1757–1798), descended from a brother of Lew's great-grandfather, became general of the Lithuanian artillery in 1773. He was one of the magnates in opposition to King Stanislaw II Poniatowski. Marshal of the Lithuanian Confederation during the Four Years' *Sejm* (1788–92), he joined the partisans of the Constitution of May 3 in 1791. His first cousin ALEKSANDER (1773–1812), a traveler and an ethnographer of the Slavs, was in close contact with Napoleon Bonaparte from the time of the Consulate in France and was a member of the provisional government of Lithuania in 1812, when Napoleon attacked Russia.

Aleksander's son LEON (1803–1878) forfeited his lands for par-

ticipating in the anti-Russian insurrection of 1830. Settling in Galicia, he was active in political and economic life there; from 1861 to 1875 he was speaker of the Galician *Sejm*. His memoirs appeared in 1913. Leon's son ADAM (1828–1878), called "the Red Prince," was a parliamentarian and a journalist who wanted insurrection in Russian Poland and the restoration of an independent Poland with Austrian help. His youngest son, ADAM (1867–1951), from 1925 archbishop of Cracow, was created cardinal in 1946.

EUSTACHY (1881–1963), in the seventh generation from Kazimierz Jan, was Polish envoy to London (1919–20) and foreign minister (June 1920–May 1921), becoming later one of the leaders of the monarchist movement.

See A. Prochaska, *Archivum Domus Sapiehanae* (1892).

(EM. R.)

SAPINDACEAE, the soapberry family, a large family of dicotyledonous plants, with about 150 genera and 2,000 species, chiefly tropical, consisting of trees, shrubs, and vines. The leaves are mostly alternate and compound, occasionally simple, while the flowers, mostly small, are irregular or unsymmetrical and the fruits various. Important fruit trees include the litchi (*q.v.*) of China; longan (*Euphoria longana*) of China and India; the rambutan (*Nephelium lappaceum*) and pulasan (*Nephelium mutabile*) of the Indo-Malayan region; the akee (*q.v.*) of Africa; and others. The seeds of *Schleichera oleosa* yield macassar oil, while the aril surrounding the seeds is edible. Other species yield important timbers, and the bark of still others is rich in saponin. The golden-rain tree (*q.v.*) is cultivated in Europe and North America as an ornamental.

SAPIR, EDWARD (1884–1939), U.S. linguist and anthropologist, who made important contributions in the field of American Indian languages, was born on Jan. 26, 1884, in Lauenburg, Pomerania. His parents took him to the United States in 1889 and he was educated at Columbia university (Ph.D., 1909). In 1910 he was named chief of the division of anthropology at the Canadian National museum; in 1925 he joined the staff of The University of Chicago; and in 1927 he moved to Yale university, New Haven, Conn., where he remained as professor of anthropology and general linguistics until his death on Feb. 4, 1939.

Sapir early became interested in linguistics and, chiefly through the influence of Franz Boas (*q.v.*), in American Indian languages, the study of which he continued widely and intensively most of his life. His profound grasp of problems in the Indo-European languages, his quick recognition of contrasts in structure and his ability to abstract the essential characteristics from masses of complex data enabled him to maintain a detached, synoptic view of language even while at work on minute linguistic problems in languages widely different from one another both genetically and structurally. His mind was vigorous, poetic and searching, his style crisp and lucid; by personal contact as well as through his published words he was often productive of work in others. Sapir was a scientist of extraordinary breadth who kept the study of linguistic phenomena in proper perspective as part of the study of man. His book *Language* (1921) is one of the most stimulating ever written on the subject.

A collection of Sapir's essays, edited by David G. Mandelbaum, appeared in 1949 under the title *Selected Writings in Language, Culture, and Personality*. *See* also LINGUISTICS: *History of Linguistic Studies: Descriptive and Structural Linguistics*.

(MY. F.)

SAPODILLA, a tropical evergreen tree, *Achras sapota* (*zapota*), of the sapote family (Sapotaceae), and its delicious fruit. Sapodilla, the name used in southern Florida (the only part of the U.S. where this tree can be grown successfully), doubtless is an adaptation of the Spanish *zapotillo*, "small zapote." In Spanish-speaking countries the name *chicozapote* is commoner, and in certain English-speaking countries, notably India, naseberry (a corruption of *nispero*, Spanish for the medlar; *q.v.*) is used.

While the fruit is of no great commercial importance in any part of the world, it is much appreciated in many tropical and subtropical areas. It is spheroid to ovoid in shape, rusty brown on the surface and two to four inches in rough diameter. The flavour, very sweet and difficult to describe, has been compared to a combination of pears and brown sugar. The seeds, two to five in number, shining black and the size of flattened beans, are surrounded (when the fruit is ripe) by translucent, yellowish-brown, juicy flesh. When immature, the flesh contains tannin and milky latex and is quite unpalatable. The milky latex, chief source of gum chicle (*q.v.*), once important in the chewing-gum industry, is extracted by tapping the trunk.

Sapodilla trees occur wild in the forests of southern Mexico and northern Central America. As a cultivated species the tree is medium-sized and of slow growth. The reddish wood is very hard and durable (elaborately carved lintels a thousand years old are still to be seen in some Mayan ruins). The leaves, two to five inches long, are glossy and light green in colour, ovate to elliptic in outline; the flowers are small and inconspicuous. Propagation is usually by means of seed, but superior trees can be reproduced by grafting.

Although sapodilla is probably the best of its family in economic importance, many other economically promising members—among them the star apple and the popular zapote, sapote or marmalade plum—are found in the Sapotaceae. (W. Po.)

SAPONINS AND SAPOGENINS. Saponins are water-soluble plant substances characterized by special properties, namely, the ability to lower the surface tension of water and hence to cause foaming, the ability to destroy red blood corpuscles (hemolysis) and the ability to kill fish, all at relatively low concentrations. They probably are present in all plants, having been identified in more than 75 families and more than 500 species. They may be distributed throughout the plant or occur in high concentration in one part of the plant; *e.g.*, the root or bulb, leaves, bark, flowers, fruit flesh or seeds. Their function in the plant is not known. Some appear to serve as a storage form of carbohydrates (sugars and starches) in the plant, whereas others seem to be waste products of plant metabolism.

Common names for plants containing high concentrations of saponins are soaproot, soapwort, soapbark, soap plant and amole. These names are indicative of their use as cleansing agents by peoples throughout the world since ancient times. They do not form a scum in hard water, and even in comparatively modern times were preferred to soap for laundering fine fabrics, such as silk shawls. They formerly were used as foaming agents in foam-type fire extinguishers and as wetting agents in agricultural sprays, but were displaced for these purposes by the less expensive synthetic detergents and wetting agents. Saponin solutions are used in photographic emulsions to permit even spreading on the base, and in multilayered coatings to permit spreading and adhesion of successive layers.

Aboriginal peoples throughout all parts of the world have used saponins for catching fish. A quantity of a plant having a high saponin content is crushed and stirred into a pool. After a short time the fish rise to the surface and are taken easily. It is estimated that from 300 to 400 species of plants have been used for this purpose. As early as the 13th century, in order to prevent extermination of fish, laws were passed forbidding the use of fish poisons. Saponins cause death in fish probably by disabling the breathing mechanism of the gills. Although saponins are hemolytic and toxic to warm-blooded animals when injected into the blood stream, they are not absorbed from the intestines. Hence fish killed by saponins can be eaten with safety. The nontoxicity to man on ingestion is evident when one considers that the foaming properties of certain beverages, such as root beer, result from the presence of saponins.

Chemically the saponins belong to a large class of substances known as glycosides (*see* GLYCOSIDES, NATURAL). When a water solution of a saponin is heated in the presence of a strong acid, the saponin molecule is split into fragments with the addition of the elements of one molecule of water at every point at which scission takes place (hydrolysis). The products are a molecule of sapogenin and several molecules of one or more kinds of sugar. For example, in the hydrolysis of digitonin, one of three different saponins isolated from foxglove leaves, each molecule combines with five molecules of water to yield one molecule of a sapogenin,

called digitogenin, one molecule of xylose and four molecules of galactose.

Because several different saponins may occur in the same plant, and because the saponins are amorphous and not readily crystallized, it has been difficult to isolate them in a pure state, and at mid-20th century relatively little work had been done on the chemistry of the saponins themselves. The sapogenins, on the other hand, are crystalline compounds that are purified readily, and a large amount of work had been expended in attempts to determine the way in which the constituent atoms are linked together.

The sapogenins thus far isolated belong to two main types. One type contains 27 carbon atoms with varying numbers of hydrogen and oxygen atoms. They have at least one alcoholic function (hydroxyl group), and contain a carbon framework like that present in the animal and plant alcohols known as sterols. Hence they are called steroid sapogenins. The saponins from foxglove leaves, sarsaparilla root, yucca and agave belong to this class. Some steroid sapogenins, such as diosgenin, prepared commercially from a Mexican yam, have become valuable raw materials for the synthesis of the female hormone, progesterone, and the adrenal cortical hormone, cortisone. (*See* also STEROIDS: *Classes of Steroids: Sapogenins.*)

The second type of sapogenin contains 30 carbon atoms, along with varying amounts of hydrogen and oxygen. They are called triterpene sapogenins because there are three times as many carbon atoms in the molecule as in a terpene molecule (*see* TERPENES). Like the steroid sapogenins, they contain at least one alcohol function (hydroxyl group), but in addition they contain an acid function (carboxyl group) and sometimes are called acid sapogenins. Saponins yielding triterpene sapogenins appear to be more widely distributed than those yielding steroid sapogenins. Moreover, the same triterpene sapogenin may occur free, as well as combined with sugars as a saponin. A further point of interest is that the triterpene alcohols, which occur in plant resins, are related closely in structure to the triterpene sapogenins. By replacing the acid function, COOH, of oleanolic acid (which occurs free in clove buds) by the group CH_3, a compound is obtained which is identical with beta-amyrin, a triterpene alcohol isolated from Manila elemi and other resins. (C. R. N.)

SAPOTACEAE, the sapote family of tropical dicotyledonous plants, most of which are trees with leathery leaves. There are about 40 genera and about 600 species, many of which are of economic importance as sources of latex products and fruits.

Chrysophyllum cainito is the West Indian star apple. *Mimusops huberi* is the Brazilian milk tree. *Achras sapota* (*zapota*) of tropical America, cultivated in all tropical countries, yields the excellent fruit known as the sapodilla (*q.v.*) and the important chicle (*q.v.*), the basis of much chewing gum. *Lucuma nervosa* is the eggfruit or canistel of South America, now naturalized in Florida and the West Indies. The zapote, sapote, or marmalade plum is *Calocarpum mammosum* (*sapota*), one of the commonest fruit trees in Central America.

The important commercial product gutta-percha (*q.v.*) is chiefly derived from various species of *Palaquium* and *Payena* growing in the Malay Peninsula and Archipelago.

SAPPHICS, Greek lyric four-line stanza named after and presumably invented by Sappho and used by Alcaeus and, in Latin, by Catullus and Horace. The first three lines, each 11 syllables long, are each divisible into five poetic feet, all disyllabic (and commonly predominantly trochaic) except for the third foot, a (trisyllabic) dactyl; *e.g.*,

−∪|− ∪|−∪ ∪|∪ ∪|— —
otium Catulle, tibi molest(um) est

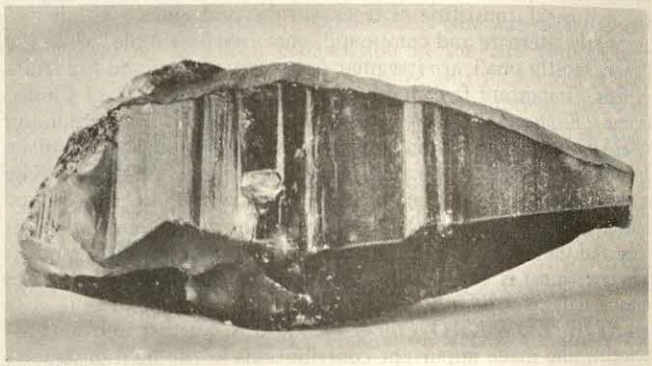
The fourth line, five syllables long, consists of a dactyl followed by a spondee; *e.g.*,

— ∪∪|— —
perdidit urbes

In the use of the Sapphic from Sappho to Horace it is possible to trace a growing tendency to insert a break or pause in the sense (caesura) after the fifth syllable of the 11-syllable (hendecasyllabic) line. About one-third of Sappho's hendecasyllables end a word after the fifth syllable, half of Alcaeus', and two-thirds of Catullus'; in Horace, Odes I–III, there is almost always a caesura after the fifth syllable. *See* also PROSODY, CLASSICAL.

SAPPHIRE, a transparent to translucent variety of corundum (*q.v.*), or native aluminum oxide, has been highly prized as a gem stone since about 800 B.C. Its colour normally ranges from very pale blue to deep indigo; the most valued is a medium deep cornflower blue. The colour is due mainly to the presence of small amounts of iron and titanium. Colourless, gray, yellow, pale pink, orange, green, violet and brown varieties of gem corundum also are known as sapphire. Ruby (*q.v.*) is essentially the same mineral, but this name is restricted to corundum that is deep pink, red or purple.

Sapphire generally occurs as pyramidal, rhombohedral, tabular or barrel-shaped crystals. Repeated twinning and lamellar parting are characteristic. The lustre is vitreous to adamantine, but



BENJAMIN M. SHAUB

UNCUT SAPPHIRE

somewhat pearly on parting surfaces. Most sapphire contains abundant inclusions of microscopic size, and reflections of light from these yield a faint whitish sheen, known as "silk." Tiny, regularly arranged mineral inclusions and elongate cavities are responsible for the asterism shown by star sapphire. Such translucent, milky appearing stones, when properly cut, seem to contain a floating luminous star with six rays.

Much sapphire is unevenly coloured in bands, zones or blotches. It also is dichroic, so that in most varieties the colour changes according to the direction of view in transmitted light. Alexandrite-sapphire appears blue in daylight and reddish or violet in artificial illumination, somewhat like true alexandrite (*q.v.*), a variety of chrysoberyl.

Sapphire is a primary constituent of many igneous rocks, especially syenites, pegmatites and various basic types, and also is found in schists and metamorphosed carbonate rocks. Most commercial production has come from alluvial gravels and other placer deposits, where the sapphire commonly is associated with ruby, garnet, spinel, topaz, tourmaline, zircon and other gem minerals. The best-known occurrences, including some lode deposits, are in Ceylon, Burma, Thailand, Australia (Victoria, Queensland, New South Wales), India, Madagascar, the U.S.S.R., South Africa and the United States (Montana, North Carolina).

Most transparent sapphire is facet cut, generally in the brilliant style (*see* GEM). Such gems have considerable sparkle, but they exhibit little fire because of their modest dispersion. Skilful cutting of unevenly coloured stones yields gems with a uniform appearance derived from only small portions of relatively deep colour. Star sapphire and other nontransparent varieties are cut *en cabochon* rather than faceted.

Despite its great hardness (9), some sapphire is carved or engraved, especially in the orient. Careful heating and cooling under various conditions can induce essentially permanent colour changes in sapphire; *e.g.*, from yellow to colourless or greenish blue and from violet to pink. Other colour changes result from exposure to certain kinds of intense radiation.

Synthetic Sapphire.—Synthetic sapphire has been produced commercially since 1902. Clear, sound material of various colours is manufactured in the form of carrot-shaped boules and slender rods. Much is consumed by the jewelry trade, but most synthetic

sapphire is used in place of natural sapphire and other materials for the manufacture of jewel bearings, gauges, dies, needle points, thread guides and other specialized components. Some also is used as a high-grade abrasive.

Synthetic star sapphire, with luminous stars more regular and distinct than in most natural stones, is made for gem uses. The asterism is obtained through controlled exsolution of impurities, generally rutile (titanium dioxide) in the form of tiny needles that assume preferred orientations within the host crystals of corundum. *See* also GEM: *Synthetic Gems.* (R. H. J.)

SAPPHO (spelled PSAPPHO by herself) (fl. *c.* 610–*c.* 580 B.C.), the celebrated Greek lyric poetess, was a native of the island Lesbos, off the northwest coast of Asia Minor. Her father's name is most commonly given as Scamandronymus; her mother's name was Cleis. She had three brothers, Charaxus, Larichus, and Erigyus; she is said to have been married to Cercolas, a wealthy man from the island Andros; she had at least one child, a daughter, named Cleis. There is just sufficient evidence to prove that her family belonged to the upper class of society.

Her poetry is composed in the local Lesbian-Aeolic dialect. She had at her disposal a variety of metres (*see* SAPPHICS), some of which may well be of her own invention. Except for the epithalamiums (which seem to have formed a small and relatively insignificant part of her work) her poems are almost invariably concerned with personal themes. Cult-song and mythological narrative are seldom if at all to be found, and there are only a couple of apparent allusions to the political disturbances of the time which are so frequently reflected in the verse of her contemporary Alcaeus. The tradition that she herself was banished and went to Sicily is likely to be true, but is not confirmed by the extant fragments of her poetry. Alcaeus himself appears to be the person addressed in a stanza which rejects indelicate advances. Her brother Charaxus was the subject of several poems: Sappho prays for him a safe return home from Egypt, and release from entanglement with the notorious courtesan Doricha (whom Herodotus calls Rhodopis); in other poems, according to Herodotus, she "taunted him considerably." These, however, are exceptional examples: most of Sappho's poems are concerned with her friendships and enmities with other women.

It was the fashion in Lesbos at this period for women of good family to assemble in informal societies and spend their days in idle, graceful pleasures, especially the composition and recitation of poetry. Sappho, the leading spirit of one of these associations, attracted a number of admirers, some from distant places abroad. The principal themes of her poetry are the loves and jealousies and hates which flourished in that sultry atmosphere. Rival associations are fiercely or contemptuously attacked: Atthis deserted from Sappho to Andromeda; Archeanassa becomes the darling of a hated rival, Gorgo. For other girls, some named (Anactoria, Gongyla) but much more often nameless, Sappho expresses her feelings in terms which range from gentle affection to passionate love. Ancient writers over a period of time, having a large volume of her work in front of them, allege that Sappho was addicted to Lesbianism. It must be admitted that her poetry shows that she entertained emotions stronger than mere friendship toward other women, but in the extant remains there is not a word to connect herself or her companions with homosexual practices and only half a word—but that decisive enough—to show her awareness of their existence.

The beauty of her writing has been greatly, and justly, admired in all ages. Her vocabulary, like her dialect, is for the most part vernacular, not literary. Her phrasing is concise, direct, and picturesque, sparing of the customary poetic artifices and embellishments, owing little to that Homeric tradition which is elsewhere almost all-pervasive. Definite pains are taken to achieve an effect of simplicity and spontaneity. She has the power of standing aloof and critically judging her own ecstasies and pains; but her emotions lose nothing of their force by being recollected in comparative tranquillity. Her simple, candid, and luminous language compels the listener not only to understand but also to participate —to recognize his potential in her actual experience. It is doubtful whether any other poet in the history of Greek literature, except Archilochus and Alcaeus, enters into so close a personal relation with the reader or listener. It is probable that, if the works of Anacreon and Ibycus were extant in much greater volume, it would be found that Sappho influenced them strongly; the only other Greek poet who owes much to her is Theocritus.

It is not known how her poems were published and circulated in her own lifetime and for the following three or four centuries. In the era of Alexandrian scholarship (especially the 3rd and 2nd centuries B.C.), what remained of her work was collected and republished in a standard edition comprising nine books of lyrical verse and one of elegiac (the latter, so far as the extant specimens permit a judgment, supposititious). The principles of book-division appear to have been purely metrical for the first eight; this is certain enough for the first four and the eighth, probable for the fifth; little or nothing is known of the sixth and seventh. The ninth book was arranged according to subject matter, comprising epithalamian poems, designed for recitation by choirs at weddings, in a variety of metres. The known lengths of books are 1,320 lines for book i, and about 130 (the last digit uncertain) for book viii.

This edition did not survive the early Middle Ages. By the 8th or 9th century A.D. Sappho was represented only by quotations in other authors, comprising one complete poem of 28 lines, the first 16 lines of another, and about 110 short one-line to four-line fragments. Since 1898 the fragments have been greatly increased by papyrus finds, though no complete and unmutilated poem has been recovered, and nothing equal in quality to the two longer pieces preserved in quotations. Fragments of 17 different papyrus copies of the Alexandrian edition have been found at Oxyrhynchus in Egypt (all of the 2nd or 3rd centuries A.D.), and valuable additions are made by an ostracon and a papyrus of Ptolemaic date and by two pieces of parchment from the 6th or 7th century A.D.

BIBLIOGRAPHY.—The first scholarly collection and edition of the remains of Sappho's poetry was that of C. F. Neue (1827), soon eclipsed by the masterly work of T. Bergk (*Poetae lyrici Graeci,* 1843; 4th ed. 1878–82). From 1898 onward the papyrus texts were edited and interpreted with incomparable skill by W. Schubart and U. von Wilamowitz-Moellendorff in Germany, and by A. S. Hunt and E. Lobel in England. In 1925 appeared *Sapphous Mele,* by E. Lobel, an edition of unprecedented acumen and accuracy, with an epoch-making introduction on the dialect. This edition was brought up to date by E. Lobel and D. L. Page in *Poetarum Lesbiorum fragmenta* (1955, 2nd ed. 1963; together with Alcaeus and complete indexes of vocabulary); the 12 more complete poems are reprinted with Eng. trans. and fully discussed by D. L. Page in *Sappho and Alcaeus* (1955; 2nd ed. 1959). These two publications supersede all other editions and essays published before 1954; of later works the most useful are the edition with German trans. by M. Treu (1954) and M. Fernández Galiano, *Safo* (1958, including the fullest extant bibliography, supplemented by the same author's *La Lirica griega,* 1958). (D. L. P.)

SAPPORO, the capital of the prefecture of Hokkaido, Japan, situated 43°4′ N and 141°21′ E, on the Ishikari River with Otaru as its outer port. With a population of 523,839 (1960), it is the largest Japanese city north of Tokyo. The average temperature is 43° F and the snow season lasts from October to April, making Sapporo a popular centre for skiing and winter sports. Sapporo is the administrative, business, and educational centre of Hokkaido.

The city was laid out in 1871 on the American plan, with wide treelined boulevards intersecting each other at right angles. Sapporo was made the prefectural capital of Hokkaido in 1886, and owed its early development chiefly to the colonization bureau of the government. Hokkaido University pays special attention to agricultural science. The manufacture of foodstuffs (including flour, dairy products, and "Sapporo beer"), sawmills, printing, and publishing constitute the chief industries. (R. B. H.)

SAPROPEL is an unconsolidated sedimentary deposit rich in bituminous substances. It is distinguished from peat in being rich in fatty and waxy substances and poor in cellulosic material. When consolidated into rock, sapropel becomes oil shale, bituminous shale, or boghead coal. The principal components are certain types of algae which are rich in fats and waxes. Minor constituents are mineral grains and decomposed fragments of spores, fungi, bacteria, and nonvascular plants. The organic materials accumulate in water under reducing conditions.

See also SEDIMENTARY ROCKS. (P. D. T.)

SAPRU, SIR TEJ BAHADUR (1875–1949), Indian jurist and scholar who played a prominent role in India's constitutional progress, was born on Dec. 8, 1875. Educated at Agra College, he was a member of the United Provinces Legislative Council (1913–16) and of the Imperial Legislative Council (1916–20). A liberal in politics, he was trusted both by the British government and the Indian intelligentsia for his integrity and wisdom. He was a law member of the Viceroy's Council (1920–23), and India's delegate to the imperial conference (1923) and to all the three round-table conferences (1930–32), as well as to the joint parliamentary select committee on Indian constitutional reforms. He was chiefly responsible for bringing about the Gandhi-Irwin Pact (1931) which enabled Gandhi to attend the second round-table conference, and the Poona Pact (1932), which resulted in the modification of the communal award and ending of Gandhi's epic fast. He died on Jan. 20, 1949, at Allahabad. (L. R. S.)

SAPSUCKER, the name applied to three aberrant forms of American woodpeckers that have acquired the habit of tapping trees for sap in the spring. They constitute the genus *Sphyrapicus*. The yellow-bellied sapsucker (*S. varius*) is black above, heavily spotted with white, and has a white rump and wing patch. Its crown and throat are bright red, bordered with black and white, forming a prominent face pattern. It drills its holes close together, usually in horizontal lines around a tree trunk, penetrating the bark to the wood, and visits them periodically to lap up the exuding sap and to eat the cambium. In trees that are visited frequently, permanent damage may result. Birch and maple are favourite trees, but about 250 species of trees and woody vines are attacked. Large quantities of sap are consumed: young captive sapsuckers have ingested eight teaspoonfuls of dilute syrup in a day. Insects, particularly ants, are also eaten. These birds hold the body away from the tree trunk on which they are feeding so that only the feet and tip of the tail touch the bark—unlike many woodpeckers which hug the trunk closely. Like some other woodpeckers, sapsuckers are expert aerial flycatchers. The call is a mewing note.

G. RONALD AUSTING FROM NATIONAL AUDUBON SOCIETY

YELLOW-BELLIED SAPSUCKER (SPHYRAPICUS VARIUS)

The yellow-bellied sapsucker breeds in northeastern North America, west to Alberta, and winters as far south as Central America. It lays four to six glossy white eggs in a gourd-shaped cavity in a tree trunk, which it excavates, generally leaving a very tight entrance hole. Williamson's sapsucker (*S. thyroideus*) is a species found in western North America; it lacks the white spotting of the back and the red on the head. The red-breasted sapsucker is a California race of *S. varius* with a completely red head and breast. (W. J. Be.)

SAQQARAH (Sakkara), an area containing part of the necropolis of the ancient city of Memphis (*q.v.*), 15 mi. (24 km.) SW of Cairo, Egypt; the modern Arab village of Saqqarah stands nearby. It has been suggested that the name derives from that of the hawk-headed god of the dead, Sokar (Gr. Sokaris), but not all scholars agree. The site extends along the edge of the desert plateau for about five miles from Abu Sir in the north to Dahshur in the south. The limestone rock is honeycombed with tombs of every age from the Archaic period to the Roman (for chronology, *see* Egypt: *History;* Chronology: *Egyptian*), and a number of royal pyramids break the horizon. Archaeologists of many nationalities have excavated at Saqqarah, and some of the finest examples of sculpture in the Museum of Egyptian Antiquities in Cairo were found there in Old Kingdom tombs.

The Royal Tombs.—The earliest remains at Saqqarah are those in the Archaic cemetery at the northernmost end of the site, where large mud-brick mastaba tombs have been found which date to the very beginning of Egyptian history. The superstructures of these tombs were ornamented with elaborate paneling; storage jars found in the magazines bore the names of kings of the 1st dynasty from Ahai onward. Similar royal tombs, somewhat smaller, were found by Sir Flinders Petrie at Abydos (*q.v.*), and it is uncertain which were the actual burials and which were cenotaphs. Sealings of officials of the kings' entourage were also found in the tombs.

South of the Archaic cemetery lies the so-called Zoser complex, in many respects the most remarkable of Saqqarah's antiquities. The second king of the 3rd dynasty, Zoser Neterikhet, and his architect Imhotep (*q.v.*) here devised a new form of burial in the shape of a pyramid in six stages, the 200-ft.-high Step Pyramid which dominates the area. (*See* Pyramid: *Early Forms.*) At its foot, the builders of this first of pyramids constructed a huge complex of halls and courts in which prototype structures of mud brick, wood, and reed were translated into fine limestone. Shepseskaf, one of the last kings of the 4th dynasty, was buried in the large tomb known as Mastabat Fara'un in South Saqqarah some 4 mi. (6½ km.) S of the Step Pyramid. Userkaf, at the beginning of the 5th dynasty, built his pyramid near the Zoser complex, but his successors moved to Abu Sir. The later kings of this dynasty, however, returned to Saqqarah. Unas, the last king, whose pyramid is to the west of the Zoser temple, was the first of five kings to inscribe on the walls of his pyramid chambers the Pyramid Texts, designed to protect the dead king and to ensure him life and sustenance in the hereafter. A limestone corridor 700 yd. (640 m.) long leads to his valley temple. Succeeding kings of the 6th dynasty built their pyramids to the south, and the most southerly is that of a 13th-dynasty king.

The Mastabas.—Around the pyramids of their sovereigns the nobles of the Old Kingdom were buried in mastaba tombs (*see* Egyptian Architecture: *Tombs*). On the walls of the corridors, store chambers, and chapels contained within these tombs are carved innumerable scenes from the daily life of the deceased, showing him inspecting the varied activities of peasants and workmen on his estate, and with his family engaged in the pursuits of leisure, fishing and fowling, or seated at home with his wife and children. Some scenes retain a little of their original colour, and they are full of lively detail and variety.

Later Tombs.—The decline in importance of Memphis during the Middle Kingdom is reflected in the comparatively few tombs of this period found in the Saqqarah necropolis, but in the New Empire Memphis became a garrison city and naval base, and a number of New Empire tombs have been found on the edge of the plateau near the pyramid of King Teti. The tomb of Horemheb is the best known of these. In the New Empire and after, the Apis (*q.v.*) bulls were buried in large subterranean galleries, three of which were found by Auguste Mariette; the latest, known as the Serapeum, is open to visitors. In the northwest of the necropolis,

A. F. KERSTING

THE STEP PYRAMID AT SAQQARAH

beneath a field of mastabas of the 3rd and 4th dynasties, another complex of underground passages, known in part to travelers in the early 19th century, has been re-excavated from 1964 onward by the Egypt Exploration Society in collaboration with the Egyptian Antiquities Service; the hypogeum contains thousands of ibis mummies of the Ptolemaic period, packed in jars. The shafts of imposing tombs of the Saite and Persian periods were sunk near the pyramid of Unas. The monastery of Apa Jeremias nearby dates from the 5th century A.D.

Saad, *Royal Excavations at Saqqara and Helwan 1941–45* (1947). (M. S. DR.)

SARABAND, a bawdy dance of medieval Spain, probably of Arabic-Moorish origin. Suppressed during the reign of Philip II, it was later revived in purer form, playing a prominent part in religious dramas. Transplanted to the French court early in the 17th century, it became a slow, serious, processional dance in triple rhythm. The music, of simple structure, was adapted as an important part of the suite (*q.v.*), in which it generally follows the Courante. *See* also DANCE FORMS IN MUSIC. (L. HT.)

SARACENS, a name best known for its use by Christians in the Middle Ages to identify their Muslim enemies, both Arab and Turkish. The name has survived until modern times. There are several references to Saracens (*Sarakenoi*) by late classical authors in the first three centuries A.D., the term being then applied to an Arab tribe living in the Sinai Peninsula. In the following centuries the use of the term was extended to cover Arab tribes in general, and after the establishment of the caliphate the Byzantines referred to all Muslim subjects of the caliph as Saracens. Through the Byzantines and the crusaders the name spread into western Europe where it was long in general use.

See J. H. Mordtmann, "Saracens," in *Encyclopaedia of Islam*, vol. iv (1934).

SARACOGLU, SHUKRU (1887–1953), Turkish statesman, prime minister of Turkey during 1942–46, was born at Odemish near Izmir in 1887. He was educated in Izmir, Istanbul, and in Switzerland. After his return to Turkey in 1918 he joined the nationalist movement led by Mustafa Kemal. Elected to the Grand National Assembly as deputy for Izmir in 1923, he was minister of education for a short period in 1925. Thereafter he became chairman of the Turkish delegation to the Greco-Turkish Population Exchange Commission. He was minister of finance (1927–30) in Ismet Inonu's government. In 1931 he was sent on a financial mission to the United States, and on his return he prepared a report which served as the basis for the reorganization of the Turkish cotton industry. He served as minister of justice (1933–38) and was then appointed minister of foreign affairs. In 1939 he concluded a treaty of alliance with Great Britain and France: France, as a prerequisite, ceded to Turkey, at Saracoglu's insistence, the Hatay province of Syria with the valuable port of Alexandretta (Iskenderun). His policy, nevertheless, was to maintain Turkey as a neutral power during World War II. He was appointed prime minister in 1942 on the death of Reyfik Saydam, and as prime minister he successfully continued this policy until Turkey's declaration of war on the Axis powers in February 1945.

Saracoglu was elected president of the Grand National Assembly in 1948 but lost his seat as deputy for Izmir after the Democratic electoral victory in 1950. He died at Istanbul on Dec. 27, 1953. (M. P. P.)

SARAGOSSA (ZARAGOZA), a city of northeastern Spain, capital of the province of the same name, and of the metropolitan archdiocesan see of Aragon, lies on the right bank of the Ebro River, 212 mi. (341 km.) NE of Madrid by rail. Pop. (1960) 326,316. Saragossa preserves much of the character of an old Aragonese city, especially in the area enclosed by the Calle del Coso, the curving highway which follows the line of the old fortifications and bounds the old town on the south. Between the Coso and the river is a network of narrow streets cut by two modern arteries. The easternmost, the Calle de Don Jaime I, connects the Coso with the seven-arched stone bridge, Puente de Piedra, dating from 1447, linking Saragossa with the suburb of Arrabal or Altabás. To the west is the Calle de Don Alfonso I, which runs down to the Plaza del Pilar, where stands one of the two cathedrals. The Coso runs into the Plaza de España and from there the broad Paseo de la Independencia leads to a well-planned late-19th-century residential area to the south. Newer suburbs have sprung up south and southwest of the town.

Saragossa has two cathedrals united into one by papal bull in 1675. One chapter serves both buildings. The older of the two is the Catedral de la Seo (Lat. *sedes*) or del Salvador, chiefly a Gothic building (12th–16th centuries) but showing some traces of the earlier Romanesque church built on the site of the first mosque erected in Spain, which itself had replaced an earlier church. The Catedral del Pilar, dedicated to the Virgin of the Pillar who is patron of all Spain, commemorates the traditional appearance on Jan. 2, A.D. 40, of the Virgin Mary standing on a pillar erected in honour of St. James the Great, whose shrine is at Santiago (*q.v.*). The miraculous image representing this appearance is preserved in the cathedral, which stands on the site of an earlier chapel. The cathedral was begun in 1681 to a design by Herrera el Mozo and contains some frescoes by Goya. The 14th-century Gothic churches of San Pablo and the Magdalena and the Renaissance church of Santa Engracia are also notable.

La Lonja, the exchange building, in Plateresque Gothic style, the palace of the counts of Luna, where the Court of Justice sits, and the palace of the Condes de Sástago y Argillo are notable public buildings. The Aljafería Palace, to the west of the town, contains an oratory dome and tower dating from the Islamic period, which are among Spain's most beautiful examples of Arab civil architecture. The University of Saragossa was founded in 1474, the medical school being its most famous faculty, but the buildings date from later periods.

Saragossa is an industrial centre, manufacturing agricultural machinery, railway rolling stock, textiles, glass, leather, chocolate, soap, paper, cement, and chemicals. The industries have expanded with the supply of hydroelectric power from the dams in the Aragonese Pyrenees and with oil from the pipeline from Rota (near Cádiz). It is also a trade centre for the agricultural products of Aragon, and an important railway junction, connected with Valladolid, Madrid, Valencia, the region of Catalonia, and the Basque Provinces, and France, via the Somport Tunnel.

History.—Toward the end of the 1st century B.C. the Cantabrian town of Salduba was taken by the Romans who made it a colony under Augustus with the name of Caesaraugusta (from which its Arabic name Sarakusta and its modern name Zaragoza were derived). The chief commercial and military station in the Ebro Valley, it was one of the first towns in Spain to which Christianity penetrated, and it had a bishop by the middle of the 3rd century A.D. The Latin poet Prudentius names 18 Saragossan martyrs. In 380 a church synod at Saragossa condemned the Priscillianist heresy. After falling to the Suebi and then to the Visigoths in the 6th century, Saragossa was taken by the Arabs *c.* 713. In 778 it was besieged by Charlemagne, who had to withdraw because of a Saxon rebellion. After being captured by the Almoravids in 1110 Saragossa was taken by Alfonso I of Aragon in 1118, and thereafter enjoyed three and a half centuries of prosperity as capital of Aragon. In the Peninsular War it was famed for the heroic resistance of its inhabitants under J. de Palafox y Melzi during a protracted siege (1808–09) by the French who finally took the city. Among the defenders was María Augustín, the "Maid of Saragossa," whose exploits are described in Byron's *Childe Harold*. In the Spanish Civil War (1936–39) Saragossa was on the Nationalist side. (L. G. L.; X.)

SARAGOSSA PROVINCE, together with the provinces of Huesca and Teruel, formed the old kingdom of Aragon (*q.v.*). The province extends north and south of the middle course of the Ebro River, its most northerly extension reaching the foot of the Pyrenees. It is bounded west by the provinces of Navarre, Logroño, and Soria, south by Guadalajara and Teruel, and east and northeast by Tarragona, Lérida, and Huesca. Area, 6,639 sq.mi. (17,195 sq.km.).

Pop. (1960) 656,772. The relief is mostly gently rolling tableland drained by the Ebro and its tributaries. The climate is continental with the average temperature in January 5° C (41° F), in July 24° (76°) at Saragossa city.

The annual rainfall of less than 15–18 in. (38–46 cm.) explains the importance of irrigation. All the main settlements are in the irrigated valleys, the Ebro being the chief link. Two canals border the Ebro, the Canal Imperial de Aragón (60 mi. [97 km.] long, watering 69,000 ac. [28,000 ha.]) on the right bank and the Tauste Canal (27 mi. [43 km.] long, watering 22,000 ac. [9,000 ha.]) on the left bank. The Jalón Valley is next in importance. Cereals, especially wheat and barley, are the mainstay of the economy, followed by alfalfa, stock rearing, industrial crops such as sugar beet, and horticulture. From Daroca down the Jiloca Valley into the Jalón Valley is an important fruit growing district. Apart from a sugar refinery at Calatayud, industry is largely concentrated in the capital, Saragossa. The second town is Calatayud (pop. 17,940), followed by Tarazona de Aragón (12,059), an episcopal see, Caspe (9,507), Ejea de los Caballeros (10,998), and Tauste (6,634). (J. M. Ho.)

SARAJEVO, capital of the Socialist Republic of Bosnia-Hercegovina, Yugos., lies in the Miljacka River Valley, 1,800 ft. above sea level at the foot of Trebevic Mountain, about 185 mi. (300 km.) SW of Belgrade (Beograd) by road. Pop. (1961) 198,914, including Serbs and Croats and a proportion of Muslims. The town retains a strong Turkish character and is very picturesque, with its many mosques, ancient Turkish bazaar, wooden houses, and cypress groves. Sarajevo is the seat of a Roman Catholic archbishop, a Serbian Orthodox metropolitan, and the Reis ul-Ulema, the highest Muslim religious authority in Yugoslavia. The town has three ancient mosques, Begova, Careva, and Alipasina. The Begova, founded in 1465, is considered the most beautiful building in Yugoslavia surviving from the days of Ottoman rule. Other notable buildings are the Roman Catholic and Orthodox cathedrals, the hospitals, the town hall, the museum, and the university (founded in 1946). Near the bazaar is the oldest church in Bosnia, the Orthodox Church of St. Archangel, containing a 14th-century icon of the Virgin.

Sarajevo is a road centre and is linked by rail with Brod and Dubrovnik (Ragusa). Industries include a steel mill, potteries, silk and flour mills, timber works, a sugar-beet refinery, a brewery, and factories producing railway coaches, tobacco, embroidery, and carpets. Weaving on hand looms is still important.

Near Sarajevo are the remains of a Neolithic dwelling. Under the Romans the 8th Legion (Augusta) was stationed there. In 1415 Sarajevo is mentioned for the first time as Vrh-Bosna, a citadel just above the present site of the town. The Turks later founded a town below the citadel, naming it Bosna-Seraj. In 1480 Hungarian forces plundered the town. The most prosperous period of history was between 1494 and 1591 when many of the mosques were built. In the second part of the 16th century the traders of Dubrovnik built their quarter called Latinluk. Sephardi Jews came to Sarajevo in the same century and founded their quarter, Cifuthani. In 1697 Prince Eugène of Savoy burned Sarajevo, which was several times devastated by fire between the 15th and 18th centuries.

Sarajevo was chosen in 1850 as the seat of the Turkish administration of Bosnia-Hercegovina instead of Travnik. In 1878 it became the seat of the Austro-Hungarian administration and subsequently of the first Bosnian diet, the Sabor, and under Austrian rule it was largely modernized. In this period it also became the centre of the Serbian national movement. Students at Sarajevo perpetrated the murder of the Archduke Francis Ferdinand in 1914. The Austro-Hungarian government used this event as a pretext for the attack on Serbia which led to World War I. In November 1918 the diet of Sarajevo proclaimed its union with Yugoslavia. During World War II it was nominally included in the Kingdom of Croatia and suffered considerable damage from Allied bombing. In 1944 it was reincorporated into Yugoslavia. (V. De.)

SARAN, a district in the west of Tirhut division, Bihar, India, is a wedge-shaped alluvial tract of light, well-drained loam between the Gandak River in the northeast and the Gogra (Ghaghara) and Ganges (Ganga) rivers in the south and southeast, all of which are perennially navigable. Area 2,669 sq.mi. Pop. (1961) 3,584,918. The important crops in this closely cultivated district are rice, barley, maize (corn), oilseeds, wheat, and sugarcane. Mango groves are common. Saran, with many sugar mills, is the leading district of Bihar in this industry. Notable developments since India's independence include several hundred tube wells, particularly in the west-central areas, and the remodeling of the flood protective embankment along the Gogra. The district headquarters are at Chapra (pop. 75,580), a rail and road junction. The district is served by the North Eastern Railway. (E. Ah.)

SARANAC LAKE, a village of northeastern New York, U.S., is located on Flower Lake in the Adirondack Mountains, 8 mi. NW of Lake Placid on the boundary line between Essex and Franklin counties. Nearby are the Saranac and St. Regis chain of lakes. It is a summer and winter resort with a considerable influx of visitors during the summer season. The U.S. Eastern Amateur Ski Association was originally formed there and skiing is a major winter activity. The Mt. Van Hoevenberg bobsled run, operated by the New York State Conservation Department, is located a short distance from Saranac Lake.

Settlement dates from 1819 and the village originated as an isolated lumbering community and a centre for Adirondack guides. Situated at an altitude of 1,600 ft., Saranac Lake became a pioneer area for the open-air treatment of tuberculosis. The Trudeau Sanitarium, founded in 1884 as the Adirondack Cottage Sanatorium by Edward L. Trudeau, was the first semicharitable institution of its kind in the U.S. Other sanitariums were established in the vicinity, one of the largest being the New York State Ray Brook Institution. In 1957 the American Management Association acquired the property of the Trudeau Sanitarium, consisting of 90 ac. and about 50 buildings, and established an academy where management personnel pursue advanced training. Robert Louis Stevenson spent the winter of 1887–1888 as a patient at Saranac Lake and it was there he began *The Master of Ballantrae.* Saranac Lake was incorporated in 1880 and in 1929 adopted the village-manager plan of government. For comparative population figures *see* table in New York: *Population.* (D. E. A.)

SARANSK, a town and the administrative centre of the Mordvinian Autonomous Soviet Socialist Republic of the Russian Soviet Federated Socialist Republic, U.S.S.R., stands on the upper Insar on the western flank of the Volga uplands. Pop. (1959) 91,034. The town was founded in 1641 as a stronghold on the Saransk defensive line, the eastern extension of the Belgorod line. It is an important focus with rail links to Ryazan and Moscow, Gorki, Kazan, Kuybyshev (Kuibyshev), and Penza. It acquired

machinery industries during World War II, and there is also a wide range of industries producing electric lamps, rectifiers, cables, rope and cord, footwear, clothing, and penicillin. Saransk has a university, founded in 1957, and a research institute of Mordvinian culture. (R. A. F.)

SARAPION (SERAPION), **SAINT** (fl. mid-4th century A.D.), bishop of Thmuis in Egypt, was a friend and correspondent of St. Athanasius and the author of an anti-Manichaean thesis and some liturgical prayers. The church historian Sozomen refers to him as "distinguished by the extraordinary holiness of his life and by the power of his eloquence," and Jerome records that the qualities of his mind earned for him the surname "scholasticus." The facts of his life are few and their dating uncertain. In his earlier life he was a monk in the desert and subsequently an abbot, becoming a close friend of St. Anthony. He had become bishop of Thmuis, a city in the Nile delta, by 339, to which year belongs the earliest of the four letters on the divinity of the Holy Spirit addressed to him by Athanasius. It has been asserted that Sarapion was present with Athanasius at the Council of Sardica (343), but evidence for this is inconclusive. In 353 he was chosen by Athanasius to lead a mission of Egyptian bishops and presbyters to the emperor Constantius II to refute the slanders of Athanasius' enemies and to conciliate the emperor. In 356, however, Athanasius and his supporters were declared to be enemies of the emperor. (*See* also ATHANASIUS, SAINT.) It seems likely that, in the violent measures taken against those Egyptian bishops who upheld the cause of Athanasius, Sarapion was banished from his see. Jerome describes him as "celebrated for his confession"; and in 359 an Arian, Ptolemaeus, claimed to be bishop of Thmuis. The manner and date of Sarapion's death are unknown. His feast day is March 21.

Jerome attributes to Sarapion the authorship of "an excellent book against Manichaeus" (Mani), which has survived; of another "on the titles of the Psalms," now lost; and of "useful letters on different subjects," of which only two have survived entire. There is the fragment of a Syriac version of another letter and one of a treatise on virginity. The name of "Sarapion bishop of Thmuis" is also connected with a collection of liturgical prayers for the Eucharist, baptism, ordinations, unction, and burial, and there is no reason to doubt its connection with Sarapion. The eucharistic prayer, entitled "Prayer of Oblation of Bishop Sarapion," is remarkable for containing a petition for the coming of the Logos (the Divine Word) upon the bread and wine to effect their consecration.

Lebon (1947) in *Sources chrétiennes,* and the Eng. trans. of the same by C. R. B. Shapland (1951). (E. C. RA.)

SARAPIS (SERAPIS), a Greco-Egyptian deity, first encountered at Memphis, where the dead Apis bull was worshiped underground as Osorapis, whereas the cult of Sarapis, originally a god of the underworld, was celebrated in the temple above. It was part of the religious policy inaugurated by Ptolemy I (323–285 B.C.), and continued by his successors, to mark the beginning of his dynasty by promoting the worship of a new deity, Sarapis, and by centring that worship on the new capital, Alexandria. No doubt Ptolemy felt his way at first, and the cult with its many Hellenic features took time to establish itself in the face of the deadweight of Egyptian religious conservatism. But its syncretism appealed to the Macedonians and Greeks among his subjects, and civil and military officials increasingly encouraged its spread.

The Sarapeum built to Parmeniscus' design at Alexandria was the largest and best known of the god's temples. It contained a famous cult statue by Bryaxis. Sarapis was represented as a majestic robed and bearded figure regally enthroned, a *modius* (a grain measure indicative of fruitfulness) on his head, his right hand resting on Cerberus, while his left held an upraised sceptre. Cerberus symbolized Sarapis' chthonian aspect; initially, like Osiris, he was Lord of the Dead. Countenance and posture were meant to be reminiscent of Zeus; "there is one Zeus Sarapis" was a ritual formula. From this it was an easy step to the assimilation of Sarapis to the sun-god. His temple at Alexandria was so sited that on the anniversary of its foundation the rays of the rising sun shone through a window and kissed the lips of the statue. The sceptre recalled not only Zeus but also Asclepius; Sarapis was a god of healing whose cures could be miraculous. Finally the *modius* suggested that Sarapis was a god of fertility, and as such he was equated with Dionysus.

BY COURTESY OF THE CAPITOLINE MUSEUM, ROME

MARBLE STATUE OF SARAPIS IN THE CAPITOLINE MUSEUM, ROME. DATING FROM THE 2ND CENTURY A.D., IT IS ROMAN WORK AND DERIVED FROM THE CULT STATUE BY BRYAXIS AT ALEXANDRIA

After some initial hostility the Roman emperors, especially in the 2nd and 3rd centuries, were well disposed; temples to Sarapis were built in Rome on the Campus Martius and the Quirinal. Along with the worship of Isis and the Egyptian gods, the Sarapis cult spread widely throughout the Mediterranean, following the trade routes and being particularly prominent in the great commercial cities; hence, perhaps, the frequent identification of Sarapis with Poseidon, king of the sea. Clearly this pantheistic all-embracing deity had a wide appeal in a cosmopolitan multiracial society. Among the Gnostics Sarapis was a symbol of the universal godhead. The destruction of the Sarapeum at Alexandria, in accordance with the edict of Theodosius I, by the patriarch Theophilus and his followers in 391 A.D. signaled the final triumph of Christianity not only in Egypt but throughout the empire.

See F. Cumont, *Les Religions orientales dans le paganisme romain,* 4th ed. (1929); M. P. Nilsson, *Geschichte der griechischen Religion,* 2nd ed., vol. 2 (1961). (D. E. W. W.)

SARASIN (SARRAZIN), **JEAN FRANÇOIS** (1614–1654), French author of elegant *vers de société,* best known for the mock epic *Dulot vaincu,* for the epic fragments *Rollon conquérant* and *La Guerre espagnole,* and for *La Pompe funèbre de Voiture.* The son of Roger Sarasin, the treasurer-general, he was born at Caen in December 1614. In 1648 he entered the household of the prince de Conti, in whose service he remained until his death at Pézenas on Dec. 5, 1654. As well as witty satiric poems, he wrote a *Discours de la tragédie* (1639) and historical works (*Histoire du siège de Dunkerque,* 1649; and the unfinished *La Conspiration de Walstein*).

BIBLIOGRAPHY.—The best modern edition of his *Oeuvres* (1656; *Nouvelles Oeuvres,* 2 vol., 1674) is by P. Festugière, 2 vol. (1926). *See* also A. Mennung, *J.-F. Sarasins Leben und Werke,* 2 vol. (1902–04). (R. A. SA.)

SARASOTA, a resort city on the west coast of Florida, U.S., is located 50 mi. S of Tampa on Sarasota Bay; the seat of Sarasota County. It is connected by causeways with white-sand beaches on four islands, lying between the bay and the Gulf of Mexico. Its origin is unknown; Sarasota, variously spelled, appeared on maps in the 1700s. Its development from a fishing hamlet began in 1885 when Scotch promoters, headed by Sir John Gillespie, induced 60 families from Scotland to settle there. A quarter of a century later Mrs. Potter Palmer, Chicago social leader, purchased several tracts of land, helped popularize it as a resort, and promoted the economy by establishing a model cattle ranch. The city was incorporated in 1914 and has a council-manager form of government in effect since 1946. The economy depends primarily on tourism, cattle raising, and the growing of winter vegetables.

Sarasota is the site of the Ringling museums consisting of a large gallery of Baroque art, including the most extensive collection in the Western Hemisphere of the works of Rubens; the Asolo Theatre (1790) brought from near Venice and used for dramatic and musical productions; the John Ringling home, a $1,000,000 replica of a doge's palace, containing rare Venetian art; and a museum of the circus. The first three were a bequest to the state by John Ringling; the museum of the circus was built by the state in 1948 as a memorial to him. Recreation and sports programs include fishing for tarpon and other saltwater fish, baseball, and golf. The city has a symphony orchestra and art schools.

For comparative population figures *see* table in FLORIDA: *Population.* (A. J. H.)

SARASVATI (SARASWATI), a river frequently mentioned in the Rigveda; although it was known to be located in the Punjab, its actual identity remains one of the fascinating problems of history. Its meaning, "abounding in pools," suggests that it was a large river. The ancient name still appears on maps as that of a tributary (otherwise the Sarsuti) of the Ghaggar, sweeping down in times of flood from the Siwalik Hills. (The Ghaggar loses itself in the desert sands toward Rajasthan but through dry channels may be traced to its former junction with the Indus.) Corresponding phonetically to the Iranian Haraqaiti (the modern Helmand), the name Sarasvati may have been applied to the Indus by the invading Aryans before they reached the eastern Punjab, but it soon ceased to refer to that river. It was most likely used for what is now the Ghaggar-Hakra-Indus channel, the lost river of the Indian Desert. With the Drishadvati, the Sarasvati formed the western boundary of Brahmavarta, and was the holy stream of Vedic India. It became personified as the goddess of eloquence, learning, and wisdom, and wife of Brahma. Another Sarasvati, in Gujarat, also loses itself in the sand. (L. D. S.)

SARATOGA, BATTLES OF, closely related engagements of the American Revolution (*q.v.*) that were fought in September and October 1777 and are often called the turning point of the war. The failure of the American invasion of Canada in 1775–76 had left a large body of surplus British troops on the St. Lawrence River, and under the British plan of campaign for 1777 they were to move south and join forces with Gen. William Howe's troops on the Hudson River. Gen. John Burgoyne, coming down from Canada via Lakes Champlain and George, was to meet at Albany a much smaller force under Col. Barry St. Leger advancing from Oswego along the Mohawk Valley. Burgoyne, with about 8,000 men, including seven regiments of British regulars and 3,000 Germans, reached Ticonderoga (July 1), which was evacuated by its weak garrison (July 6). He then marched his army through the woods and swamps to Ft. Edward on the upper Hudson; the fort was evacuated by the American commander, Gen. Philip Schuyler, who retreated across the Hudson to Stillwater, 30 mi. above Albany (July 31). Burgoyne's laborious march involved the construction of 40 bridges and required a long halt at Ft. Edward.

BY COURTESY OF THE LIBRARY OF CONGRESS

BRITISH SURRENDER AT SARATOGA, ENGRAVED BY FRANÇOIS GODEFROY FROM A DRAWING BY LOUIS FRANÇOIS SÉBASTIEN FAUVEL, ABOUT 1784

A German detachment was sent to Bennington, Vt., to seize horses and supplies, but was surrounded and almost annihilated by a force under Gen. John Stark (Aug. 16). Burgoyne now became uneasy: he had left nearly 1,000 men to garrison Ticonderoga; he had heard from Howe of his intention to invade Pennsylvania; and St. Leger was held up before Ft. Stanwix (actually St. Leger retreated Aug. 22). But he considered himself bound by his orders to press on to Albany. Having collected 30 days' rations, he crossed the Hudson (Sept. 13) and encamped near Saratoga. Gen. Horatio Gates, an experienced and trusted officer who had replaced Schuyler in command (Aug. 19), was encamped 4 mi. away, on Bemis Heights, with 12,000 men and was daily receiving reinforcements. Burgoyne advanced to the attack (Sept. 19); but, though successful in driving back the troops sent out by Gates and in holding the field of battle at Freeman's Farm, he failed to envelop or pierce Gates's lines. Moreover, he lost over 500 men, including a large number of officers, victims of Col. Daniel Morgan's sharpshooters, while Gates's losses were less than 400. Burgoyne heard (Sept. 21) from Gen. Sir Henry Clinton, who had been left in command at New York, that he was about to make a diversion up the Hudson. He sent a dispatch to Clinton (Sept. 27) asking for orders. The answer was never received. Clinton started with a small force (Oct. 3) and captured two forts on the west bank, but he never had any intention of penetrating to Albany.

Burgoyne now had less than 5,000 "effectives" left, and his supplies were running short. He reckoned that they might last till the 20th. He led out 1,500 men on reconnaissance (Oct. 7), but the Americans made a fierce counterattack, and, inspired by Gen. Benedict Arnold, inflicted a severe defeat upon the British Army. The next day Burgoyne began his retreat, but Gates, with 20,000 men, surrounded him at Saratoga. On Oct. 17 Burgoyne surrendered his entire army under an agreement (the Convention of Saratoga) that his troops might return to Great Britain by way of Boston on condition that they would not serve again in North America during the war.

Burgoyne's surrender, by inducing the French to recognize the colonies' independence and to give the Americans open military assistance, marked the turning point of the Revolution, virtually ensuring ultimate victory for the colonies.

SARATOGA SPRINGS, a city of Saratoga County, New York, U.S., is located in the Adirondack foothills about 30 mi. N of Albany and 12 mi. W of the Hudson River. The city is in a region of great historic interest, and is a health and pleasure resort noted since colonial days for the medicinal mineral springs which gave the community its name. Located in the city is Skidmore College for women (1911). Saratoga Lake (5 mi. long) is 3 mi. SE. The city is renowned for its thoroughbred and harness races, which attract thousands of summer visitors, and has a National Museum of Racing and a Hall of Fame containing mementos of great horses and riders of the past.

The name comes from an Indian word written in the original Saratoga patent as Ochserantongue or Sarachtogie and is believed to mean "at the beaver dam" or "the place of beavers." It has also been spelled Saraghoga and interpreted "place of swift water."

The 122 springs (heavily charged with carbonic acid gas and containing in varying proportions bicarbonates of lime, sodium, magnesium, chloride of sodium, and other minerals) are in a New York State reservation of 1,100 ac. The first iodine in the U.S. was discovered there in 1828. Sir William Johnson is said to have been the first white person who used the waters for medicinal purposes (1767). The therapeutic value of the springs had been known long before to the Indians. A log house for lodging visitors was built in 1771; in 1791 Gideon Putnam bought a large tract of land and put up the first inn; in 1793 Valentine Seaman published a book about the waters which spread the knowledge of their

BOB MAYETTE

THE RACE TRACK AT SARATOGA SPRINGS

curative properties. Other hotels were built early in the 19th century and by 1820 the springs had become a popular resort. The American Civil War cut off the patronage from the south and brought depression; but soon afterward, with the rebuilding of the United States Hotel and the establishment of racing (the August races of the Saratoga Association for the Improvement of the Breed of Horses, organized 1863, drew large attendances) Saratoga Springs again became popular. In the 1870s and 1880s it was one of the most fashionable watering places of North America ("the Queen of Spas"). Commercial exploitation of the springs (bottling the water and liquefying the carbonic acid gas) diminished their flow until they almost disappeared, and the resort was again depressed until the state intervened, first prohibiting pumping of the springs, later acquiring the property (1909) and placing it in charge of the conservation commission (1916).

The Saratoga country was a favourite camping ground of the Iroquois. It became a theatre of hostilities between the English and the French colonists with their Indian allies. In 1693 a French expedition was checked in a sharp conflict near Mt. McGregor by an English and colonial force. In 1745 the settlement on the Hudson directly east of the present city of Saratoga Springs (called Saratoga at first, later Old Saratoga, and now Schuylerville) was attacked by the French and Indians, who massacred many of its inhabitants. The battles of Saratoga (*q.v.*) in the Revolutionary War were fought at Bemis Heights, 12 mi. SE of Saratoga Springs. Most of the battlefield was acquired by the state of New York, and Congress in 1926 authorized its establishment as a national military park. Saratoga Springs was incorporated as a village in 1826 and as a city in 1915.

Industry is of minor importance and includes chemicals, wallpaper, clothing, and bait. For comparative population figures *see* table in NEW YORK: *Population.* (G. L. F.)

SARATOV, an *oblast* of the Russian Soviet Federated Socialist Republic, U.S.S.R., was formed in 1934 from the Lower Volga Krai (territory), originally as Saratov Krai; in 1936 it was converted to an *oblast.* Area 38,687 sq.mi. (100,199 sq.km.). Pop. (1959) 2,162,751. The *oblast* lies in the basin of the middle Volga, which bisects it from north to south. The greater part of the right (west)-bank area is occupied by the Volga Uplands, which reach a maximum height of 1,260 ft. (384 m.) in the Khvalynsk Hills. The uplands, which form a steep, high bank along the Volga, are greatly dissected by river valleys and their surface is cut up by a dense network of erosion gullies. Toward the west the uplands fall away to the Oka-Don Lowland, and this part is drained south to the Don by the Khoper and Medveditsa rivers. From 1954 to 1957 the extreme west formed part of Balashov Oblast, now abolished. The left bank of the Volga is a low, rolling plain drained partly by tributaries of the Volga and partly by the Bolshoi and Maly Uzen rivers, which form a basin of inland drainage. This left-bank area up to World War II formed the separate German Volga Republic (*q.v.*), dispersed for security reasons during the war.

The climate is sharply continental, with an annual range of 58° F (32° C), from a January average of 12° F (−11° C) to a July average of 70° F (21° C). Rainfall is low, about 15 in. (381 mm.) a year with a summer maximum at Saratov, and it decreases to the east. Droughts are frequent, occurring three or four years in five. Dry *sukhovei* winds, common in spring and early summer, do great damage to crops. Almost the entire *oblast* belongs to the steppe zone. Only in the extreme northwest is there forest-steppe, with rare surviving groves of oak. The right-bank steppe is almost wholly plowed up, the removal of the natural grass cover being the cause of the intensive erosion of this area. The left-bank area is dry steppe, with conditions becoming increasingly akin to semidesert to the southeast, where sage is more important in the vegetation than grass. Soils are fertile chernozems, except in the southeast, where chestnut soils are dominant and extensive areas of saline soils occur. Broad floodplain meadows fringe the left bank of the river.

In 1959, 54% (1,164,417) of the population were urban, living in 13 towns and 21 urban districts. Most of the larger towns lie along the Volga: the administrative centre, Saratov (581,071), Engels (90,724) on the opposite bank, and Volsk (61,792). The main centre of the west of the *oblast* is Balashov (64,349). In these larger towns is concentrated the heavy industry, oil refining, engineering, timber working, and manufacture of consumer goods. Other towns are chiefly concerned with processing agricultural products (flour milling, distilling, and the extraction of vegetable oil) or mineral extraction. The *oblast* contains the southwestern end of the Second Baku (*q.v.*) oilfield, and petroleum is found in relatively small quantities and natural gas in large quantities. Elshanka and Uvek near Saratov are the main centres of gas production. Oil shales are worked in the Trans-Volga. Agriculture, although affected by the recurrent droughts, is highly developed. More than three-quarters of the plowed area is under grains, chiefly spring wheat, maize (corn), and rye. Toward the east millet replaces rye. Sunflowers and mustard are important industrial crops, and melons, potatoes, and other vegetables are widely grown. The area under irrigation is constantly being extended, especially on the lower Trans-Volga, and the water supply for this is facilitated by the cascade of barrages on the Volga. Toward the drier eastern part of the *oblast* livestock husbandry becomes increasingly important and large numbers of beef and dairy cattle and sheep are kept. The *oblast* is crossed by east-west and north-south railways and Saratov town is the centre of a road network. (R. A. F.)

SARATOV, a town and *oblast* centre of the Russian Soviet Federated Socialist Republic, U.S.S.R., stands on the right bank of the middle Volga, 200 mi. (322 km.) SW of Kuibyshev. Pop. (1959) 581,071. The modern town, extending for nearly 30 mi.

TASS FROM SOVFOTO

STREET SCENE IN SARATOV

(48 km.) along the river, is a major river port and transshipment point. Since 1935 the railway crosses the river and runs east to Uralsk and Central Asia and south to Astrakhan, while on the west bank railways follow the Volga upstream to Syzran and downstream to Volgograd.

A large-scale and varied manufacturing industry produces ball bearings, combine harvesters, tractor parts, machine tools, mobile generating plant, precision measuring instruments, and lifting equipment. The large pre-Revolutionary industry, flour milling, is still important, and footwear, clothing, and foodstuffs are produced. Timber rafted down the Volga is processed in the sawmills and made into furniture.

Saratov lies at the southwestern extremity of the Second Baku (*q.v.*) oilfield and oil refining is part of its industrial activity. Natural gas deposits around the town supply power locally and are also linked with Moscow by pipeline. In the early 1960s a large barrage and hydroelectric station were under construction on the Volga immediately above Saratov. The town has a university (established in 1919), as well as several higher educational institutes, a musical conservatory, and an agricultural research institute.

After the campaign of Ivan IV "the Terrible" down the Volga in 1556 to take Astrakhan, a series of fortresses was built to protect the river. Saratov was established in 1590, halfway between the fortresses of Samara (Kuibyshev) and Tsaritsyn (later Stalingrad and then Volgograd). The original site is not exactly known, but in 1616 the fortress was moved to the left bank at the confluence of the small Saratovka stream. Destroyed in the rising of Stepan Timofeevich Razin (*q.v.*), the fortress was reestablished on the present site in 1674. In the 18th century its defensive function disappeared, but trade along the Volga brought great commercial importance and in 1750 Saratov became centre of a *guberniya* (province). In the 1870s a railway from Moscow was built to Saratov and the town developed rapidly.

(R. A. F.)

SARAWAK, a state of the federation of Malaysia, comprising, with Sabah, East Malaysia; it lies on the northwestern coast of the island of Borneo and was formerly a British colony. Pop. (1960) 744,529. The capital is Kuching (*q.v.*). With a coastline of 450 mi. (724 km.) on the South China Sea, Sarawak is bounded on the northeast by Brunei and Sabah and on the east and south by Indonesian Borneo (Kalimantan). *See* MALAYSIA.

SARCOPHAGUS, the name given by the Greeks and Romans to a stone coffin. The original term is of doubtful meaning; Pliny explains that the word denotes a coffin of limestone from the Troad (the region around Troy), which had the property of dissolving the body quickly (Gr. *sarx,* "flesh"; *phagein,* "to eat"). This explanation is doubtful; perhaps religious and folkloristic ideas are involved in calling a coffin a body eater. It came into general use as a word for a large coffin in Roman imperial times and is used in the 1960s as an archaeological term.

The earliest stone coffins in use among the 5th-dynasty Egyptians were designed to represent palaces of mud-brick architecture, with an ornamental arrangement of false doors and windows. Such is the coffin of Ra'wer in the Cairo museum. In 12th-dynasty times, boxlike sarcophagi of limestone were in use in Egypt and on the Lebanese coast at Byblos. These retain knoblike projections for the attachment of the ropes used in handling these heavy objects. By the 18th dynasty mummiform anthropoid coffins had come into use, usually of wood with a carved portrait head and sometimes plated with gold like that of Tutankhamen (*q.v.*).

In the Aegean world, terra-cotta, cistlike coffins (*larnakes*), with elaborate painted designs, came into general use in Middle Minoan times (*c.* 2200–1580 B.C.), but the custom was not generally adopted by the Mycenaeans of the Greek mainland. Sometimes these cists resemble houses, sometimes bathtubs with large handles. Bathtub coffins of bronze came into use in Mesopotamia in the Assyrian period. Painted terra-cotta coffins (6th century B.C.) from Clazomenae (western Asia Minor) resemble the Cretan cists.

The Phoenicians developed a white-marble anthropoid sarcophagus of Egyptian type in the 5th century B.C. (Sidon, Sicily, Cádiz) and in Hellenistic times specialized in making leaden coffins and elaborately carved marble sarcophagi. The most elaborate of these, found at Sidon (Lebanon) are the sarcophagi of the Satrap (*c.* 430 B.C.) and of the Mourners (*c.* 370 B.C.) and the later sarcophagus of Alexander the Great with its painted, sculptured friezes. Sculptured pieces of the same period are known from Greece, where the majority of sarcophagi date from the Roman period, however.

In Italy both stone and terra-cotta sarcophagi were in use by the Etruscans from *c.* 600 B.C. onward. These often have figures of the deceased reclining on the couch-shaped lids. The earliest

dated Roman sarcophagus is that of the consul Scipio Barbatus (298 B.C.), but after this date sculptured sarcophagi were in use throughout the empire by pagan and Christian alike.

See COFFIN; EARLY CHRISTIAN ART; ETRUSCANS; SCULPTURE, SEPULCHRAL; TERRA COTTA; *see* also references under "Sarcophagus" in the Index.

(WM. C.)

SARDANAPALUS (SARDANAPALLUS) was, according to the Greek historian Diodorus Siculus, the last of a line of 30 kings of Assyria, who exceeded all his predecessors in his sybaritic way of life. Arbaces, a Median chief, rebelled and besieged Sardanapalus in his capital. When, after three years, a flood breached the defenses, Sardanapalus made a pyre of his palace treasures and with his concubines perished in the flames. The figure of Sardanapalus apparently represents an amalgamation of two Assyrian kings: his name and status, but not his character, represent Ashurbanipal (*q.v.;* reigned 669–630 or 626 B.C.), while his fate recalls that of Ashurbanipal's brother, Shamash-shum-ukin, king of Babylon.

(H. W. F. S.)

SARDICA, COUNCIL OF, an ecclesiastical council held at Sardica (modern Sofia, Bulg.) in 342, or perhaps 343. Convened by the joint emperors Constantius II (Eastern, sympathetic to the Arian party) and Constans I (Western, sympathetic to the Nicene party) to attempt a settlement of the Arian controversies, the council in fact merely embittered still further the relations between the two great religious parties and those between

the Western and Eastern halves of the empire. As Athanasius (*see* ATHANASIUS, SAINT), whom the East had removed from his bishopric, appeared on the scene, and the Western bishops declined to exclude him, the bishops of the East absolutely refused to take part and contented themselves with formulating a written protest addressed to numerous foreign prelates. The Western bishops, presided over by Hosius of Córdoba, confirmed the restoration of Athanasius and acquitted Marcellus of Ancyra of heresy. Canons iii–v of this council invest the Roman bishop with a prerogative which became of great historical importance, as the first legal recognition of his jurisdiction over other sees and the basis for the further development of his primacy. *See* COUNCIL: *Councils to the 9th Century: Councils Between 325 and 381.*

SARDINE is a word with two more or less distinct usages: (1) it is the common name in various parts of the world for certain species of fish of the herring family; (2) it applies to these and a number of other small herringlike fish when preserved and canned in oil, often with special sauces. The fish most generally called sardines, sometimes with the adjective "true," regardless of size and whether or not they are canned, are the European *Sardina pilchardus* (called pilchard in Britain), the Pacific genus *Sardinops,* and a number of tropical fishes of the genus *Sardinella.* The common name of *Sardinops* is "sardine" in the United States and "pilchard" in British Columbia, southern Africa, Australia, and New Zealand.

The European sardine has a peculiar arrangement of scales, in which alternate oblique rows of small scales are covered by intervening rows of larger ones. It occurs from Spanish Sahara north to southern Norway, including the Mediterranean and part of the Black Sea as well as the Canary Islands, Madeira, and the Azores.

In *Sardinops* there is a normal arrangement of scales, and the gill covering, or operculum, is striated with grooves running obliquely downward. Five species have been recognized: *S. caerulea* of the west coast of North America, *S. melanosticta* of Japan, *S. sagax* of the west coast of South America, *S. neopilchardus* of New Zealand and southern Australia, and *S. ocellata* of southern Africa. These are so similar that some authorities consider that all should be classified as one species, *S. sagax,* with *neopilchardus* having subspecific rank. *Sardinops* associate according to size in dense schools or shoals, feed on plankton, and grow to be 10 to 12 in. long. They spawn principally in the spring. The eggs are extruded into the open sea and are fertilized there. Suspended near the surface, the fertilized eggs drift passively with the currents, then hatch within a few days into larvae, which continue to drift passively until they metamorphose into free-swimming fish. *Sardinops* migrate extensively along the coasts they inhabit, those in the Northern Hemisphere moving north in summer and south in winter.

Sardinella differ from *Sardina* and *Sardinops* in having strongly developed spiny shields along the belly, and in having a poorly developed fleshy eyelid. They are tropical and subtropical coastal fishes occurring in the Atlantic, Pacific, and Indian oceans.

Sardines of any species are commercially fished for a variety of uses—for bait; for fresh fish markets; for drying, salting, or smoking; for canning; and for reduction into fish meal and oil. The most important catching apparatus is an encircling net, of which there are many modifications, and of which the best known is the purse seine. In Maine and New Brunswick, the fishery for young herring to be canned as sardines is based almost entirely on fishing with traps or weirs, which are large impoundments near the shore, made of shrubs driven into the bottom. In eastern Asia similar traps, also used to catch sardines, are made of bamboo.

Around 230,000 tons of canned product are produced in the world annually from sardines, about half of it from European sardines, around 12% from young herring in northeastern North America, and the largest part of the remainder from *Sardinops* in southern Africa, Japan, and California. Fish meal, once used as fertilizer, has become an important ingredient of feeds for poultry, pigs, and cattle, because of its high content of protein and other essential nutrients. The oil has many uses, including the manufacture of paints, varnish, and linoleum; much of it is used in Europe for the manufacture of margarine. (L. A. WD.)

SARDINIA (SARDEGNA), the second largest island in the Mediterranean and politically part of Italy. It has an area of 9,301 sq.mi. (24,089 sq.km.), including the offshore islands, the largest of which are Asinara, San Pietro, Maddalena, and Caprera. Sardinia is separated from the French island of Corsica to the north by the 7½-mi. (12-km.)-wide Strait of Bonifacio; 120 mi. (193 km.) NE lie the islands of Capraia and Elba; 115 mi. (185 km.) S is the coast of Africa. The island is divided into three administrative provinces, Sassari, Nuoro, and Cagliari, which form the region of Sardegna. The capital is Cagliari.

PHYSICAL GEOGRAPHY

Geological Structure.—Sardinia is united geologically to Corsica, both being aligned along a mountain belt rising over 13,000 ft. (3,950 m.) from the surrounding sea floor, with a continental slope deeply fretted by submarine canyons. The island is a remnant of a Hercynian block known as the Tyrrhenian continent; its rocks are mostly Paleozoic. Cambrian slates predominate in the southwest, while Carbo-Permian granites comprise over a third of the total area of the island, chiefly in the eastern highlands of Gallura, Goceano, Nuoro, and Sarrabus. In Mesozoic times, at least, the island margins were below sea level; remnants of the eroded cover now remain only in the hills overlooking the Gulf of Orosei, the Sarcidano tableland, and La Nurra Hills. Tertiary limestones and marls (chiefly Miocene) outcrop in the hills of Arborea and Trexenta and in the Sassari Plain. Before the alpine fractures that dislocated the island, vulcanism occurred, and Oligocene volcanics are represented by the trachytes and tuffs of the northwest (Logudoro and Auglona), the middle Tirso Basin, and northern Sulcis. Subsequently the Campidano trough was fractured (in Tertiary times), and the Tyrrhenian continent was reduced to an archipelago, in which the Corso-Sardinia land mass was first separated from the mainland. Plio-Pleistocene volcanics explain the great spreads of basaltic lavas that form the trap relief of Macomer and Abbasanta, with smaller cappings in Arborea and north of the Gulf of Orosei. Since the mid-Quaternary, the Campidano and the drowned coastline of La Nurra area have emerged from the sea.

Relief and Drainage.—The island is mainly mountainous, but its relief is monotonous and rolling, with no clear ranges. More than one-third consists of plateaus rising between 600 and 1,300 ft. (183–396 m.) above sea level, and only 7% rises above 2,600 ft. (792 m.). The highest mountains, the Gennargentu (6,017 ft. [1,834 m.]), form the east central dorsal descending northward into the rugged granitic plateaus of Gallura and southwestward into the dissected Tertiary hills of Arborea and Trexenta. The twin mountain masses of the southwestern region of Iglesiente (Mt. Linas 4,055 ft. [1,236 m.], Caravius 3,661 ft. [1,116 m.]) drop sharply into the Campidano Plain, the only considerable lowland in Sardinia, which runs for about 60 mi. (97 km.) between the Gulfs of Cagliari and Oristano. The Tirso River flows through the major valley of Sardinia, which, overlooked to the north by the largest fault scarp of the island, unites three types of relief: in the upper course are the dissected Hercynian plateaus of Goceano; in the middle course the river cuts through volcanic tablelands in narrow defiles and flows through Lake Omodeo; in the lower course the river crosses the marshy Plain of Oristano. The other major rivers are the Flumendosa, draining southeastward from the Gennargentu Mountains to the east coast; and the Coghinas, flowing northward through Lake Coghinas into the Gulf of Asinara. Gradients are low in the Campidano trough, which is drained by many minor streams, including the Mannu and Mogoro.

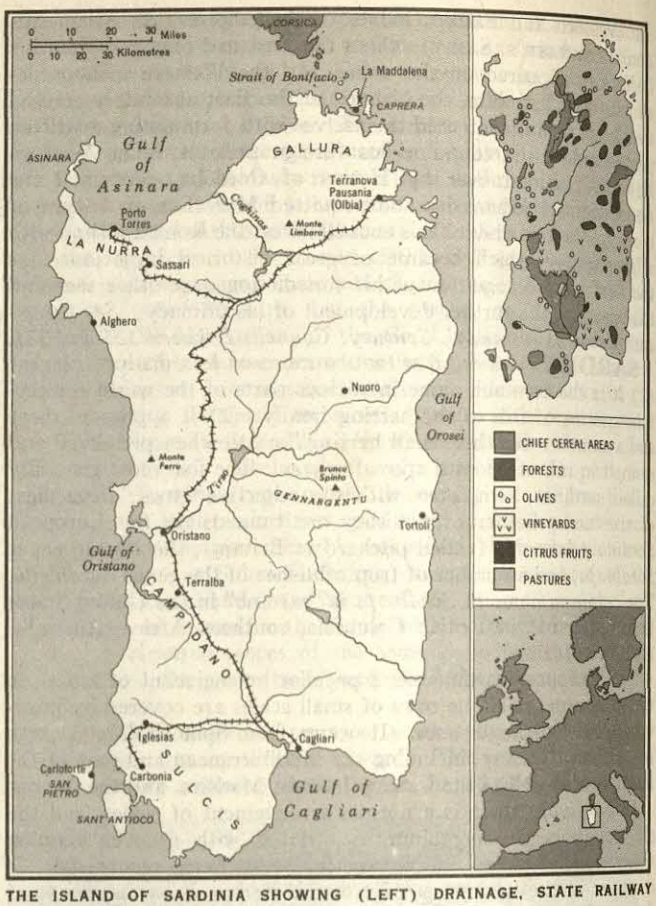
Geographical Regions.—Sardinia is rich in local district names. Its isolation, poor communications, archaic modes of life, and the formerly intensely developed tribal economy in part explain the human importance of these regional units. The core of the eastern highlands is the Gennargentu, flanked by three districts: Barbagia Ollolai, Seulo, and Belvi. Pastoralism dominates these highland communes, the *ogliastra,* which originally formed summer pastures for transhumant flocks. Settlements are markedly in large villages. Gallura to the north is a notable contrast, where lower granite plateaus have a dispersed set-

tlement pattern resulting from clearances of the wasteland; ridge and valley relief is characteristic. Iglesiente and Sulcis in the southwest also have Hercynian relief, but the coastline is less indented and the climate more arid. Hamlets with patches of wheat cultivation among sheep pastures are characteristic. Above the Oristano Plain the western regions are dominated by trachyte and basalt landscapes, bare, treeless, tabular skylines, across which snake the dark stone walls surrounding *tancas* (units of grazing land); remains of ancient nuraghi settlements are common. Around Sassari there is an abrupt change, the Miocene limestone tablelands favouring olive groves and denser settlement. In the northwest La Nurra Hills are scrub covered and sparsely settled with isolated farms. The Campidano Plain and its adjoining rich region of Arborea are in marked contrast, forming the economic axis of the island, with the most intensive agriculture, especially of cereals, and densest concentration of communal village life.

Climate.—The position of Sardinia at the western Mediterranean crossroads of cyclonic tracks and trajectories of cold northerly air explains its climatic characteristic of violent winds, especially the northwesterly mistral and the hot southern sirocco. Air masses crossing the northern Mediterranean are sufficiently modified in transit to create marked fluctuations in rainfall from year to year over Sardinia, falling chiefly in autumn and winter. The summer drought usually lasts for several months. The average precipitation for the whole island is 30.5 in. (775 mm.), with over 40 in. on the high plateaus, but only 15 in. on the Cagliari Plain. The January and July mean temperatures indicate a moderate annual range: in the north Sassari (735 ft.; 224 m.) has 47° F (8° C) and 75° (24°), respectively; in the south Cagliari (246 ft.; 75 m.) has 48° and 76°. Compared with these maritime conditions, those of the interior mountains are very different: Val Lecciola (3,314 ft.; 1,010 m.) has 38° (3°) and 66° (19°). There are three main climatic regions: the subtropical and semiarid conditions of the southern Campidano and coastal Sulcis; the hot temperate climate of all western and northern Sardinia; and the subhumid climate of the eastern highlands with altitudes over 1,500 ft. (457 m.). (J. M. Ho.)

Vegetation and Animal Life.—Sardinia belongs to the Sardo-Corsican group of the Mediterranean type of vegetation. The natural vegetation has largely been destroyed and given place to grass pastures, cereal cultivation, and fruit growing. A rich salt-loving vegetation is found along the shores and cliffs, and salty marshes extend along the coast. Inland from the littoral communities is the *garigue*, which covers a vast part of the island. The mastic tree, rockrose, myrtle, rosemary, headed thyme, scarlet oak, stoechas, and *Phillyrea* are common plants. In the regions of La Nurra and Sulcis and near Orosei, dwarf palm occurs. The *maqui*, with olive tree, mastic tree, *Phillyrea*, tree heath, and holm oak, is less widespread. In the east central part of the island are communities of junipers. In this belt, farther inland, woods of cork oak cover vast areas, chiefly in Gallura, but holm oak is the most common and attains a higher altitude. Also scattered communities of true, or bay, laurel and formations of wild olive tree are found. Oleander frequently occurs in the riverbeds. The submontane belt restricted to Mt. Gennargentu and a few other minor mountains consists of deciduous woods of oak or chestnut. The ancient Mediterranean montane vegetation is represented by small scattered areas of woods of holly or yew tree. The montane belt occurs in the highest parts and includes species of juniper, the Etna barberry, ground-cherry, and a currant, *Ribes sardoum*, endemic to Sardinia. (R. E. G. P.-S.)

Most of the mammals are like those found in Italy (*q.v.*), although many of the Italian mammals are not found in Sardinia; there are no bears, wolves, otters, squirrels, or moles, but boar, fox, marten, hare, and rabbit abound, especially in the Gennargentu uplands. Deserving special mention are a Sardinian weasel, a native wild cat, the mouflon (wild sheep), found only in Sardinia and Corsica, and the Cape hare, which belongs more properly to Africa. The birds are much the same as in Italy except that there is less variety. There are no magpies, and the Italian sparrow is absent, but the Spanish sparrow, found in Spain, southern Italy, and the Balkans, also lives in Sardinia. The Barbary or Sardinian partridge



THE ISLAND OF SARDINIA SHOWING (LEFT) DRAINAGE, STATE RAILWAY SYSTEM, AND TOWNS AND (UPPER RIGHT) LAND USE

is protected in the Golfo Aranci reserve. The birds of prey include the black and bearded vultures and the white-tailed eagle. There is only one kind of lizard, one newt (found also in North Africa), and one toad, the green or changeable toad. The trout are like those of Algeria, Asia Minor, and Iran. (MA. BU.)

ARCHAEOLOGY

The earliest evidence of human occupation in Sardinia dates from the time when metal was coming into use in the western Mediterranean. Although some stations, *e.g.*, Macomer in central Sardinia, have yielded lithic industries without metal, a pure Neolithic phase is not so far distinguishable from the Chalcolithic stage. The first habitations were perhaps cave dwellings, *e.g.*, San Bartolomeo and other grottoes near Cagliari and in western Sardinia, but the Proto-Sardinians soon began to live a farming life in hut villages. Cult places in caves (San Michele near Ozieri) and religious monuments (a square platform built of large stones at Monte d'Accoddi, northwest of Sassari) are known. The dead were buried in artificial grottoes, with an antechamber and one or more cells, generally rectangular, sometimes with pillars and roughly carved symbols or figures. These tombs are called by the Sardinians *domus de gianas* ("witches' houses") and are grouped in cemeteries, the best known of which was excavated at Anghelu Ruju near Alghero. Cist graves in stone circles were found in northern Sardinia (Arzachena), and the 40 or so small dolmens (megalithic graves) still existing in the island must go back to the same period. Menhirs (standing stones) are not infrequent and may be related to sanctuaries and burial places. A good idea of the material civilization and common life is furnished by the funerary equipment at Anghelu Ruju, which includes flint blades, stone axes, maceheads, arrowheads, copper daggers and implements, and personal ornaments. Stone "idols" are also present and may be interpreted as attendants of the dead; their schematized female forms recall similar although not identical figures from the Aegean. Pottery comprises undecorated, impressed, and incised wares, differing in shape and ornament; curvilinear and "spiral-

ribbon" patterns are frequent. The typical bell beakers demonstrate a direct link with the Spanish beaker culture.

This Sardinian Copper Age was still flourishing in the first half of the 2nd millennium B.C. and was apparently influenced and very slowly transformed by the older Bronze Age civilizations of the Near East. Minoan and Mycenaean influence was not so direct as in Sicily, but commercial contacts with Crete may be proved from the beginning of the Late Minoan period, toward 1500 B.C. (copper pig ingots with Minoan linear signs were found at Serra Ilixi, though some scholars would date these *c.* 1200 B.C.). A real Bronze Age culture in Sardinia cannot be perceived till near the end of the 2nd millennium, and in spite of the Oriental influence its substantial local ancestry seems indisputable. Its peak is not to be dated earlier than the 9th to the 6th century B.C., that is to say, in the period of historical Phoenician and Greek colonization in the western Mediterranean, and it survived in more or less degenerated forms down to the Carthaginian and Roman conquest of the island.

The monuments suggest a period of cultural flowering and prosperity hardly to be found in any later phase of the history of the island. About 6,500 stone towers, the so-called nuraghi (singular, nuraghe), are still a distinctive feature of the Sardinian landscape. They belong to the Sardinian Bronze Age civilization (hence called the nuraghi culture). These towers are in the shape of a truncated cone and built of large stones laid in more or less regular courses; they contain superposed round chambers capped by tall, pointed corbeled roofs and connected with a winding staircase. Such towers form the chief element of complex buildings comprising bastions and turrets with corridors, round chambers, and cisterns; *e.g.*, those excavated at Abbasanta (the so-called Nuraghe Losa), at Torralba, and at Barumini. The nuraghi are sometimes interlinked in defensive systems; *e.g.*, Giara di Gesturi. But in many cases fortified villages of partially stone-built round huts appear in close connection with the nuraghi, which may therefore have been the residential castles of chieftains, including storerooms, foundries, and even places for religious use. Other isolated buildings are in the form of rectangular temples (Serra Orrios), monumental wells (Sardara, Serri, Ballao), and fountains (Lomarzu). The graves show a development of earlier types. The subterranean chamber tombs become bigger, imitating more closely the internal structure of civil habitations. There are also grandiose megalithic grave monuments, deriving from simpler dolmen corridors or cists, with a rectangular cell covered by a corbeled roof and with a paneled portal slab in the centre of an exedra facade—the so-called giants' tombs. Objects for everyday life and for religion, found in buildings or hoards, include bronze implements and weapons, ornaments, and decorated and coarse pottery. There are noteworthy bronze votive statuettes, portraying men, chiefly warriors, women, animals, more infrequently mythological beings, and small models of ships or buildings.

The Phoenician and Carthaginian periods are chiefly represented by cemeteries and sacred sites; some of the latter were clearly used for human sacrifice. Trade with the Sardinians and influence on their culture are evident. Civil buildings are more available from the Roman period, at, for instance, Cagliari and Nora.

HISTORY

Prehistoric and Phoenician Settlement.—The race that built the nuraghi was probably a definite ethnic unity, having its roots in the first prehistoric population of the island, but its origins and affinities are uncertain, and it left no written records. It is possible that the Sherden, who with the Philistines and other sea peoples (*q.v.*) fought in Egypt in the 13th and 12th centuries B.C., either came from or, more probably, settled in Sardinia, to which they gave their name. Archaeological evidence from the nuraghi culture suggests a strongly organized power of tribal states. The working of metal from the local mines was presumably the chief source of wealth. However, the presence of Phoenician trade settlements along the Sardinian coasts since the 9th or 8th century B.C. must have vigorously contributed to Proto-Sardinian prosperity.

All figures in the Museo Archeologico Nazionale, Cagliari

The Phoenician shippers and traders were naturally interested in the Sardinian mines and founded trading posts, which became the important towns of Caralis (Cagliari), Nora and Bithia (both on the coast southwest of Cagliari), Sulcis (Sant' Antioco), and Tharros (Capo San Marco). Attempts at colonization by the Greeks in the early 6th century (Olbia in northeastern Sardinia) were unsuccessful because of the jealous opposition of the Phoenicians. After Carthage had attained leadership over the western Phoenicians, the struggle for supremacy in the west caused a more direct control to be exercised over the colonists on the island. After a long period of peaceful coexistence with the indigenous peoples, the Carthaginians began, about 500 B.C., the military conquest of the most productive parts of Sardinia, driving the Proto-Sardinians into the mountains.

Roman Period.—During the First Punic War the Romans tried to take Sardinia, but it was not until after the war that, in 238 B.C., they took advantage of a revolt of Carthaginian mercenaries to demand the surrender of the island. The native tribes opposed the Romans but were conquered after several bloody campaigns; the island became a province under a praetor or propraetor, to whose jurisdiction Corsica was added soon afterward (227). A rebellion in 215 B.C., fostered by the Carthaginians, was quelled by T. Manlius Torquatus. After this the island began to furnish considerable supplies of corn (grain); it was treated as a conquered country, not containing a single free city, and the inhabitants were obliged to pay a tithe in corn and a further money

contribution. There were saltworks as early as about 150 B.C. There were insurrections of the mountain tribes in 181 (crushed in 177–176) and in 114 B.C., but even in the time of Strabo there was considerable brigandage.

In the division of provinces made by Augustus, Sardinia and Corsica fell to the Senate, but in A.D. 6, Augustus, because of the frequent disturbances, took them over and placed them under a *praefectus*. In A.D. 67 Nero restored Sardinia to the Senate (but not Corsica) in exchange for Achaea, and the former was then governed by a *legatus pro praetore;* but Vespasian took it over again before A.D. 78 and placed it under an imperial procurator as *praefectus*. It returned to the Senate, not before A.D. 83 but certainly before the reign of Marcus Aurelius, when it was governed by a proconsul, as it was under Commodus; the latter, or perhaps Septimius Severus, took it over again and placed it under a procurator as *praefectus* once more. Caralis was the only city with Roman civic rights in Sardinia in Pliny's time (when it received the privilege is unknown). A Roman colony had been founded at Turris Libisonis (Porto Torres), and others, later on, at Usellis and Cornus (Santa Caterina di Pitinuri). Little is heard of the island under the empire, except as a granary and as remarkable for its unhealthiness and the audacity of its brigands. It was often used as a place of exile. (MA. P.; X.)

Vandal and Byzantine Rule.—After they had crossed over into Africa from Spain in 429, the Vandals occupied Sardinia *c.* 456. The Roman general Marcellinus reoccupied the island as a preliminary to the expedition sent against the Vandals by the emperors Leo I and Anthemius and led by Basiliscus (468), but on its failure the Vandals returned. Their rule was a period of cultural revival, largely the result of the enforced residence for about 20 years at Cagliari of 60 or even 120 North African bishops, who had been banished by King Thrasamund. Among them were St. Fulgentius and the bishop of Hippo, who had brought with him the relics of St. Augustine. From this "African" cultural renaissance in Sardinia date the remains of the monastery built by Fulgentius near the basilica of S. Saturnino, Cagliari.

In 533–534, following the defeat of the Vandals, Sardinia was recovered by the Byzantine duke Cyril. Under the Byzantine Empire it was one of the seven provinces of the praetorian prefecture of Africa. It was under a *praeses* for civil affairs and a dux for military. In 550–551 Sardinia was occupied by the Goths under Totila, but after his death in 552 it was recovered for the Byzantine Empire. Letters from Pope Gregory I written at the end of the 6th century denounce Byzantine misgovernment and mention attacks by the Lombards on the Sardinian coast. Between 663 and 668 Sardinia was heavily taxed by the Byzantine emperor Constans II; when it was finally separated from the Byzantine Empire is quite unknown.

The Arabs.—In the 720s the Lombard king Liutprand acquired St. Augustine's relics and removed them to Pavia, but the Lombards did not occupy Sardinia as they did Corsica. The first raid by the Arabs was in 711; these raids for loot and prisoners recurred throughout the 8th and 9th centuries. The Sardinians sent ambassadors in 815 to the Frankish emperor Louis I and cooperated with Leo IV and subsequent popes against the Arabs. The need for them to organize their own defense probably led to formation of the four self-governing *giudicati* (*see* below), though the history of this period is obscure.

The 10th century was comparatively peaceful, but in 1015 Mujahid al-'Amiri, ruler of Denia in Spain and the Balearic Islands, overran much of Sardinia. This, though not the last Arab attack, was the most serious, being a real attempt at conquest; in 1016, however, Mujahid was defeated at sea with the help of the fleets of Genoa and Pisa, and evacuated Sardinia.

The Giudicati and Italian Influence.—The four Sardinian *giudicati* of Cagliari, Arborea (capital Tharros, then Oristano), Torres, and Gallura (capital Olbia) appear clearly defined territorially and politically only in the 11th century. These self-governing divisions gradually became hereditary principalities under lifelong *giudici* (literally "judges"). After the defeat of Mujahid, Sardinia became a field for expansion for Pisa and Genoa, as well as for Marseilles and Gaeta, and was opened to the monastic immigration encouraged by the popes, who now claimed sovereignty over the island. Pisa and Genoa, through alliances with the *giudici*, secured politico-mercantile zones of influence—Genoa mostly in the north and west, Pisa in the south and east. The archbishop of Pisa was appointed apostolic legate and primate of Sardinia by Innocent II (1133). Subsequently Genoa, to counteract its rival, lent Barisone I, *giudice* of Arborea, the price of his coronation by the emperor Frederick I as king of Sardinia (1164), but he could neither subdue the other *giudicati* nor repay the loan. The peace of 1169 brought about a temporary truce between the two republics, soon broken by dissensions among the *giudici*. The *giudicati* of Cagliari and Gallura passed through marriage to Pisan families (Massa and Donoratico, and Visconti, respectively) and finally to the republic itself. The *giudicato* of Torres passed from the protection of Pisa to that of Genoa until the marriage (1238) of Adelasia, heiress of Gallura and Torres, to Enzio (*q.v.*), natural son of the emperor Frederick II. Enzio took the title of king of Sardinia, but he was seldom there, and his rule was carried on by vicars. In the wars after Enzio's imprisonment (1249), Pisa prevailed, but after the Battle of Meloria (1284) Pisan influence was limited to the districts of Cagliari and Gallura; Genoa controlled the other districts, also through its noble families (Spinola, Malaspina, Doria). Throughout the 11th, 12th, and 13th centuries, however, Pisan influence predominated in the arts, as shown by the many churches built at this time, especially the basilica of S. Gavino, Porto Torres, and the church of Sta. Maria del Regno, Ardara.

Aragonese Domination.—In 1297 Boniface VIII invested James II of Aragon as king of Sardinia and Corsica, but Sardinia was conquered by the Aragonese under the infante Alfonso (later Alfonso IV) only in 1323–24, with the help of the *giudicato* of Arborea, which, however, kept its independence and defended itself strenuously against the same Aragonese throughout the 14th century. A war that broke out about 1350 between the *giudice* Mariano IV and King Peter IV of Aragon was won by the latter, and peace was made at a meeting of the Sardinian *stamenti,* or Estates (1355). A few years later war was started again by Mariano and carried on after his death (1376) by his son, Hugo (d. 1384), and his daughter, Eleonora of Arborea. After the death of Eleonora (1404) the *giudicato* was reduced to a fief of Aragon (1410) and, after a last revolt had been suppressed at the Battle of Macomer (1478), brought wholly under the Aragonese crown. Under Aragonese rule the administration was unified and placed under a viceroy residing at Cagliari. Subsequently the three orders or branches—military, ecclesiastical, and royal—of the Sardinian *stamenti* began to meet at regular intervals. Despite the provisions extended by Alfonso V of Aragon to the whole island for the observance of the law code promulgated by Mariano IV of Arborea and perfected by Eleonora (1392)—the *Carta de Logu* (University Library, Cagliari)—the island's economy, flourishing under the *giudici*, declined. The population, oppressed by taxation, decreased, and the island fell into a state of lethargy. (R. DU.; X.)

Sardinia, which passed with Aragon to the unified Spanish monarchy, suffered in the 16th century from raids by the Barbary pirates. In 1527 a French fleet under Andrea Doria invaded the island and took Sassari but was driven off. Another French fleet, under the comte d'Harcourt, was also repulsed after taking Oristano in 1637.

Austria and Savoy.—During the War of the Spanish Succession (*q.v.*), Cagliari was bombarded by an English fleet and capitulated; Sardinia became Austrian (1708). Austria was confirmed in possession by the Treaty of Utrecht in 1713. Giulio Cardinal Alberoni (*q.v.*) hoped to make Sardinia a jumping-off point for the recapture of Spain's former Italian possessions, and in 1717 he dispatched a squadron from Barcelona, which recaptured the island, but in 1718 the Treaty of London compensated Victor Amadeus II of Savoy for his loss of Sicily by entitling him king of Sardinia. He took possession in 1720; from that time until 1861 he and his successors were known as kings of Sardinia, though the seat of their power was Piedmont.

The House of Savoy sought to establish its authority over the

feudal nobles (of mostly Spanish descent) and over the church. In 1726 Pope Benedict XIII confirmed the king in the right of presentation to bishoprics. Under Victor Amadeus II (1720–30) and Charles Emmanuel III (1730–73), some efforts were made to improve the social and economic conditions of Sardinia. In 1793, during the French Revolutionary Wars, the French attacked Sardinia and bombarded Cagliari but were attacked by the islanders and withdrew. The *stamenti* then presented a memorandum to the king asking for a measure of local autonomy and the opening of all posts, except that of viceroy, to all citizens. Their request was rejected, but the movement that it represented found support in a popular revolt arising out of the economic discontent of the people. The revolt, however, faded out on the flight to France of the popular leader Gian Maria Angioj (1796). In 1799 Charles Emmanuel IV took refuge for a few months in Sardinia after his expulsion from Piedmont by the French. His successor, Victor Emmanuel I, lived in Cagliari from 1806 till 1814. His brother Charles Felix, both as viceroy and, from 1821, as king, embarked on various reforms affecting agriculture, taxation, public health, and the administration of justice, but it was Charles Albert (1831–49) who took real account of Sardinia's needs. In 1836 he abolished the ancient seigniorial rights, and, though in practice some continued to exist, the ensuing division of lands among private owners and communes formed the basis of the 19th- and 20th-century agrarian economy of Sardinia. The problem was not only Sardinia's backwardness but also its isolation in language and culture from the Italian mainland. In 1847, at the request of the *stamenti*, Sardinia was united to the other provinces of Piedmont with the same standing in the kingdom; this position was confirmed by the constitution of 1848, and Sardinians sat in the Piedmontese Parliament.

Italy.—From 1861 Sardinia formed a part of the kingdom of Italy, but it remained something of a forgotten province. After World War I the Sardinian Action Party was formed to press for autonomy for the island, but the advent of Fascism obliged it to cease its activities.

On the outbreak of war between Italy and the Allies in 1940 (*see* WORLD WAR II), Sardinia had a garrison of between 200,000 and 250,000, including the 9th German Armoured Division. The island's airfields were used as bases for attacks in the Mediterranean. In 1943 Allied air attacks on the island began and increased in intensity as the time for the invasion of Sicily drew near. The Germans had increased the number of air squadrons in Sardinia, but in July Allied air attacks made many airfields unusable. On Sept. 18, 1943, Italian forces expelled the last of the German troops from the island. It was occupied by a small number of Allied troops.

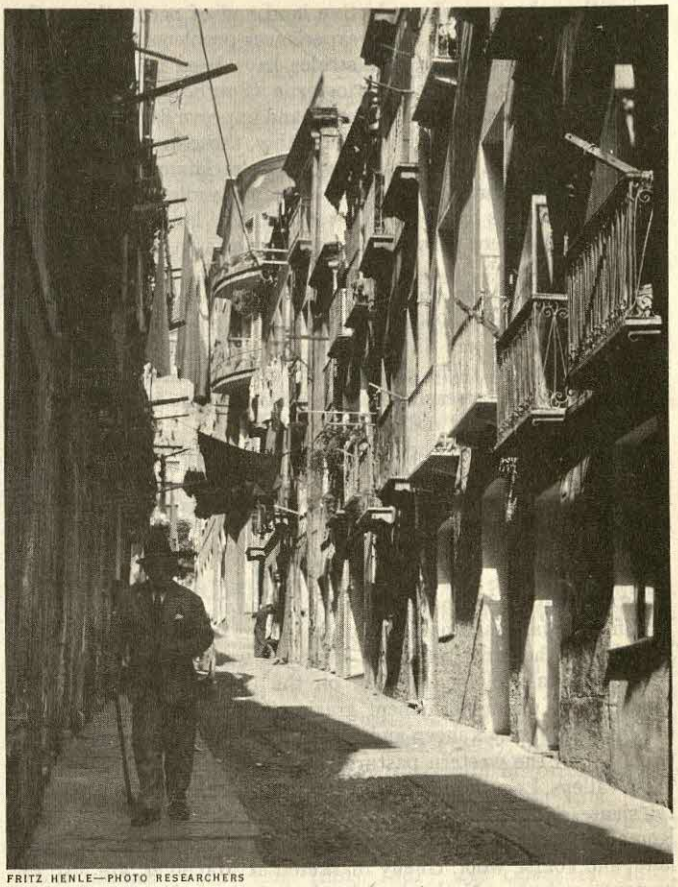
The movement for autonomy revived after the war, and in February 1948 Sardinia finally became a self-governing *regione* of Italy (see *Administration and Social Conditions,* below).

(X.)

POPULATION, ADMINISTRATION, AND SOCIAL CONDITIONS

Population.—According to the 1961 census, Sardinia had a population of 1,372,606, with a density of about 148 per sq.mi. (57 per sq.km.), compared with the general Italian average of 428 (167). The first census taken in 1728 showed a count of only 309,994. It appears that the population declined steadily after Roman times and only regained its estimated Roman total of 500,000 during the 18th century. Its history has been one of foreign exploitation, economic neglect, and the threat of malaria, which was encouraged by the presence of extensive coastal marshes. A campaign launched in 1946 has virtually eliminated the malaria-carrying mosquito (*Anopheles labranchiae*) since 1952.

Sardinia has the greatest concentration of villages of all Italian provinces. In 1951, 93.1% of the population lived in 544 nucleated settlements, 279 of which had over 1,000 inhabitants. Only 6.4% were located on the coast, 54.8% being on inland slopes and hills, a reflection of Sardinia's former insecurity from corsairs and its own tribal rivalries. The west central districts excluding the lower Tirso Valley and the Campidano are the traditional areas of population concentration, but 20th-century population movements have intensified concentration in and around the towns of Cagliari and Sassari (with over 400 per sq.mi.) and in the Campidano (180). In the western zone, population has moved toward the coast, while large tracts of the eastern highlands have less than 65 or even 25 per sq.mi. During the late 19th and 20th centuries there has been some rural depopulation, with a tendency for the lower lands to receive the migrants, though not on the scale that has occurred on the Italian mainland.



FRITZ HENLE—PHOTO RESEARCHERS

VIEW DOWN A NARROW, BALCONY-LINED STREET IN CAGLIARI, CAPITAL OF SARDINIA

According to the 1961 census, 41% of the active male population was employed in agriculture and fishing (28% for Italy) and 42% in industry (39% for Italy).

Administration and Social Conditions.—Sardinia is one of five regions that obtained special forms of self-government by the Italian constitution of 1948 (*see* ITALY: *Administration and Social Conditions*). The isolation of Sardinia during World War II encouraged some measure of self-government after the summer of 1943, when it was occupied by the Allies. In March 1944 a high commissioner was appointed, and regional autonomy was granted in 1946. But the poverty of the island made it undesirable to leave the economic planning entirely in the hands of the Regional Assembly, first elected in May 1949. Administration of the region is carried out by the Assembly (*consiglio regionale*) and its president and Executive Committee (*giunta regionale*). The president of the Assembly, elected from its members, has not the rank of minister in the Council of Italian Ministers as in Sicily but represents the region, promulgates its laws, and has the right to speak in the council on Sardinian affairs. The Sardinian Assembly has less extensive powers than that of Sicily. It cannot legislate on educational affairs, nor can it legislate on all questions concerning agriculture, land reclamation, industry, and commerce. The Italian state retains control of communications, justice, and the armed forces, though the government may delegate to Sardinia the right to safeguard public order.

Sardinia is one of the poorest of the southern regions of Italy,

and with a shortage of productive land and of occupations other than in agriculture, the island experiences problems of unemployment and emigration. Great strides have been made under the auspices of the Cassa del Mezzogiorno (Southern Italy Development Fund) to increase employment and improve living conditions. Projects embarked upon include, notably, those in the Campidano Plain and Arborea to resettle peasants on reclaimed land or amalgamated agricultural holdings. But many landless day labourers and small farmers maintain a low standard of living. The general lack of employment for women has resulted in an effort to develop light industries.

Education follows the Italian national educational pattern. Though in the early 1950s it was estimated that almost a quarter of the population was illiterate, by the 1960s illiteracy had been almost eliminated. The considerable need for adult education is being met by an increasing number of *corsi popolari*. There are universities at Sassari and Cagliari.

Social services as a whole are organized like those on the mainland. In the early 1960s there were 18 general, 13 private, and 7 specialist hospitals. *See* ITALY: *Administration and Social Conditions*.

THE ECONOMY

Agriculture.—Although Sardinia's rural economy has been modified by far-reaching development plans instituted after World War II, by the early 1960s the emphasis was still on pastoralism, which has an agelong tradition on the island. Nearly half the total area is under permanent grazing. Sardinia has about one-quarter of all Italy's sheep and goats. The chief sheep-rearing districts are in the western pastures of Planargia, in the Temo and Tirso valleys, Logudoro, and the mountains of Nuoro, Gennargentu, Iglesiente, and La Nurra. Much ewe's milk cheese of the Pecorino Romano type is exported. Sardinian lamb, in demand on the mainland, and coarse wool, chiefly marketed at Macomer, are also important products. Native breeds of cattle are well adapted to the poorer districts of Sulcis, Trexenta, the Baronie, Gallura, and La Nurra but are poor milk yielders and are used chiefly for draft purposes. Under development plans milk cows have been imported from Switzerland and the Netherlands. Altogether, stock raising provides more than two-fifths of Sardinia's revenue from land utilization.

About one-third of the cultivated land, which covers little more than a quarter of the island's total area and is continuously cropped only in the Campidano, is under cereals, of which hard varieties of wheat are the most important. With primitive methods still predominating, yields are considerably lower than the average for the rest of Italy. Minor cereal crops are barley (for fodder), oats, and maize (corn). The production and yield of rice have been increased, and sugar beet, virtually a new crop since 1948, supplies regional requirements.

Tree crops represent about one-third of the agricultural produce by value. Olives cover the most extensive area, partly in specialized groves, partly in mixed land use. Vineyards, less important than in the 19th century, are chiefly around Cagliari. Citrus fruit, peaches, and almonds have local importance.

Sardinian agriculture has been greatly handicapped by the fact that land tenure is rooted in feudal practices. The prevalence of very small holdings—less than half exceed 3 ha. (7½ ac.)—and of latifundia, mostly in grazing and forest lands, is characteristic; the fragmentation of holdings is excessive, especially in the Campidano. Following legislation by the Italian government in 1950, the Ente per la Trasformazione Fondiaria Agraria per la Sardegna (ETFAS) has done much to promote land reform. Life in the villages, however, has changed little since ancient times: homespun woven on domestic looms, wheat ground by primitive mills and baked into *pillonca*, fields worked with wooden plows, and grazings maintained communally are symbolic of its traditions.

Fishing, never an occupation of the Sardinians, is largely in the hands of immigrants from the Italian mainland. It has been encouraged by subsidies for new boats and the construction of new fishing villages to replace the primitive dwellings still to be found around the coast. Tunny is the chief catch.

Industry.—Minerals, chiefly from Iglesiente, contribute about half the island's industrial revenues from natural resources, and the output of lead and zinc represents about nine-tenths and three-quarters, respectively, of Italy's total production. Silver and cadmium are by-products of lead and zinc extraction, and small quantities of antimony, copper, iron, manganese, molybdenum, nickel, cobalt, and tin are also mined. Inferior coal is mined at Sulcis and anthracite at Seui near Tortoli. The annual production of coal is about 900,000 metric tons. Sea-salt extraction is the second most important source of industrial revenue. Lesser industries are chiefly concerned with the processing of food and other regional products (leather, cork, tobacco, dwarf palm fibre, etc.). There are also plastics and cement factories.

Development.—Financial provisions for economic development are framed with regard to the island's poverty. In addition to the proceeds of local taxation, the region receives rents paid for hydroelectric concessions, while state grants are made for specific public works and land improvement projects. Since the establishment of the Cassa del Mezzogiorno in 1950, numerous irrigation and water supply schemes have been promoted, and a great area of the Nuoro is being improved. The largest single project has been undertaken by the Ente Autonomo del Flumendosa, set up in 1946 to develop the hydrographic resources of the Flumendosa Basin. This has provided irrigation of 125,000 ac. (50,000 ha.) of the Campidano, drinking water for 22 communes with a total population of almost 100,000, a further supply of 10,000,000 cu.m. of water annually to Cagliari, and 125,000,000 kw-hr. of hydroelectric power annually. The Sardinian Recovery Plan inaugurated in 1963 involved the planned investment by the government of 400,000,000,000 lire in a series of economic projects over a period of 13 years.

Communications and Ports.—The road network is not dense, as the population is mostly concentrated in large villages: the chief settlements are linked within a mesh of four main roads running east-west, and another four running north-south. The principal highway runs between Cagliari and Sassari via the eastern edge of the Campidano. Despite the difficulties of relief, Sardinia is well provided for in its railway system. There are 257 mi. (414 km.) of the Italian State system (standard-gauge lines), connecting Cagliari-Iglesias, Oristano-Sassari-Porto Torres, and Olbia-Golfo Aranci. Another 591 mi. (951 km.) of privately owned narrow-gauge lines run chiefly southwest-northeast. The Iglesiente is served by 80 mi. (129 km.) of private mineral lines. Significantly, neither the railways nor the main roads follow the coast.

PHOTO RESEARCHERS (TONI SCHNEIDERS)

SMALL FIELDS AND STONE RUINS SURROUNDING THE VILLAGE OF ORGOSOLO, LOCATED AT THE FOOT OF SOPRAMONTE MOUNTAIN IN EAST CENTRAL SARDINIA

Cagliari, Olbia, and Porto Torres are the chief ports. Cagliari's harbour is artificial, consisting of an old inner harbour and a new one protected by moles. It owes much of its importance to the export of lead, zinc, and salt. It is also a secondary naval base and a fishing and, especially, a passenger port. There are weekly services to Naples, Genoa-Palermo, and Genoa-Tunis. Olbia, the principal passenger port, is linked with Civitavecchia; Porto Torres acts as outport for Sassari and the iron mines of La Nurra District. Trade has been vastly improved by the introduction of new ferry services (*navitraghetto*), especially between Olbia and Civitavecchia, which allow faster transport of goods. La Maddalena in the northeast is a naval base on Maddalena Island. The annual increase in the number of tourists has led to improved communications with the mainland. Olbia's function as the gateway to Sardinia is declining with the increase in air transport. Air services link Cagliari and Rome direct. The airport at Alghero has direct connection with London during the summer months.

SARDIS (SARDES), a ruined city lying about 45 mi. (72 km.) E of Izmir in the Manisa *il* of Turkey, was the capital of the ancient kingdom of Lydia (*q.v.*), the western terminus of the Persian royal road from Susa described by Herodotus, the seat of a *conventus* (a centre for the administration of justice) under the Roman Empire, and the metropolis of the province of Lydia in later Roman and Byzantine times. It was situated in the middle Hermus (Gediz) Valley, at the foot of Mt. Tmolus (Boz Dag), a steep and lofty spur of which formed the citadel. It was about 2½ mi. S of the Hermus. The area was settled in the 3rd millennium B.C., but the earliest reference to Sardis is in Alcman (*c.* 650 B.C.). An older name for Sardis seems to have been Hyde, a name given in the *Iliad* to the city of the Maeonian chiefs. Sardis was the capital of the powerful Lydian kingdom under Gyges (*c.* 687–645 B.C.). It was captured by the Cimmerians in the 7th century, by the Persians in the 6th, by the Athenians in 499 (or 498) B.C., and by Antiochus the Great at the end of the 3rd century. In 133 B.C. the city was bequeathed to Rome with the kingdom of Pergamum by Attalus III Philometor Euergetes. Under the emperor Tiberius, in A.D. 17, it was destroyed by an earthquake, but it was one of the great cities of Asia Minor till the later Byzantine period. As one of the seven churches of Asia, it was addressed by the author of the Book of Revelation. Its importance was due, first to its military strength, secondly to its situation on an important highway leading from the interior to the Aegean coast, and thirdly to its commanding the wide and fertile plain of the Hermus.

In Roman times Sardis lost some of its importance but became the seat of the metropolitan bishop of the province of Lydia formed *c.* A.D. 295. In the 10th century Constantine VII Porphyrogenitus (in his work *De Thematibus*) enumerates it as third, after Ephesus and Smyrna, in the list of cities of the Thracesian *thema.* The Hermus Valley began to suffer from the inroads of the Seljuk Turks about the end of the 11th century; but the successes of the Greek general Eustathius Philocales in 1110 relieved the district of Turkish pressure for the time. The fort on the citadel of Sardis was handed over by treaty to Turkish invaders from the east in 1306. Finally, about 1390, with the termination of the independent Turkish amirates, Sardis was merged in the Ottoman Empire. The latest reference to the city relates its capture by Timur in 1402.

The ruins of Sardis, so far as they are now visible, are Lydian, Roman, and early Byzantine. The great Ionic temple of Artemis on the east bank of the Pactolus River is Hellenistic. The temple and 1,000 Lydian graves were excavated by H. C. Butler and T. L. Shear (1910–14, 1922). A Harvard-Cornell expedition resumed study of the site in 1958. Remains of habitations indicate that the city of Lydian kings extended along the modern highway and into the side valley of the Pactolus.

SARDOU, VICTORIEN (1831–1908), French playwright who, with E. Augier and Dumas, dominated the French stage in the late 19th century. He was born in Paris, Sept. 5, 1831. His *Les Pattes de mouche* (1860; English translation *A Scrap of Paper,* 1861) is a model of the well-made play. He relied on theatrical devices to create an illusion of life and this explains his rapid eclipse, but *Madame Sans-Gêne* (1893), his last success, is still performed although his other successful historical plays—*Patrie!* (1869; Eng. trans. 1915), *Théodora* (1884; Eng. trans. 1885), *Thermidor* (1891; Eng. trans. 1891) and *L'Affaire des poisons* (1907)—and those in which he satirized his contemporaries —*Nos intimes* (1861; Eng. trans. 1862), *Les Ganaches* (1862; Eng. trans. 1893), *Les Vieux Garçons* (1865)—are never played. His initial successes he owed to the actress Virginie Déjazet, and several of his 70 works were written for her; others were written for Sarah Bernhardt. In 1877 he was elected to the Académie Française. He died in Paris, Nov. 8, 1908.

SARGASSO SEA, a relatively still tract in the central North Atlantic ocean strewn with floating seaweed of the genus *Sargassum* (originally named *Sargaço* by the Portuguese). This tract, bounded approximately by 20° and 35° N. and 30° and 70° W., is roughly elliptical and lies inside of a clockwise setting current system of which the Gulf stream forms part of the western rim. The precipitation is low, evaporation is high and winds are light. Its waters are remarkably clear, warm and saline. *Sargassum,* or gulfweed, belongs to the brown algae and bears small but prominent berrylike bladders (*see* ALGAE: *Survey and Classification: Brown Algae*). The pelagic weed drifts with wind and current but apparently maintains itself vegetatively with possibly minor replenishment by coastal plants drifting in from the southwest. The weed supports specialized animals of a type more characteristic of the littoral zone than the open ocean, some of which are found nowhere else. The Sargasso sea was first reported by Columbus who crossed it on his initial "West Indies" voyage; however, Columbus implies in the journal of his first voyage that he had evidence of earlier voyagers through the area and the seaweeds therein, and it is possible that the Carthaginians reached the Sargasso sea as early as 530 B.C. The widely credited story of ships becoming helplessly embedded in the weed has been disproved. The "Michael Sars" oceanographic expedition in 1910 helped delimit the weed area and provided new evidence that the Sargasso sea was the spawning ground of the common eel. (C. A. Bs.)

SARGENT, JOHN SINGER (1856–1925), Anglo-U.S. painter, was born of American parents in Florence, Italy, on Jan. 12, 1856. Sargent's portraits enjoyed the highest possible reputation during his lifetime, but fell into great disfavour after his death. His work has since been re-evaluated and restored to a

position of high esteem. The scintillating bravura of his technique disarmed his contemporaries; his imitators, who saw only the surface aspect of his painting, were sadly lacking his perception, with the unfortunate result that Sargent too was accepted as nothing more than a flashy technician. He had, however, an extraordinary facility for revealing the inner aspects of his sitters' personalities, far exceeding that of any of his followers.

Sargent's father, Fitzwilliam Sargent, a native of Massachusetts, went for his medical training to Philadelphia where he married Mary Newbold Singer. Two years before Sargent's birth his parents went to Europe, a trip which culminated in their permanent establishment abroad.

Sargent showed his special aptitudes from his earliest childhood, which was spent in Nice, Rome, Dresden and other parts of Europe with periodic returns to Florence. He took drawing lessons of a desultory kind, interrupted by the exigencies of schooling and a life of constant travel. His mother, who loved to sketch in water colours, recognized and encouraged his unusual gifts.

Sargent's awakening to the enchantment of visual expression came to him, he once mentioned, at Mürren, Switz., in the summers of 1868 to 1870. His early drawings were painstaking efforts to show every variation in rock forms, or in the verdure that sprang from their crevices. In 1873 he won a prize for drawing at the Florence Accademia. In 1876 he visited the United States for the first time and established his U.S. citizenship.

Sargent's formal art training was received in the Paris studio of Carolus Duran and at the École des Beaux-Arts. His first exhibited work was a portrait of Miss Frances Watts, a neighbour at Nice, at the 1877 Salon.

Sargent himself later declared, perhaps with characteristic modesty, that he was by no means a brilliant pupil, and that he only acquired his amazing technical skill by continued concentrated effort. What he did recognize, with instant appreciation and lifelong acknowledgment, was the scientific precision of the method taught by Duran, who had based his theories on a close study of Frans Hals and Velázquez. Sargent made this technique his own, and it gave him, at the start, the assured mastery of his materials.

His second picture, "En route pour la Pêche" (Corcoran gallery, Washington, D.C.), exhibited in the Salon of 1878, won an honourable mention. The following year he exhibited a portrait of Duran, which he had painted in 1877 at the age of 21, which was instantly acclaimed. Shortly after, he made a pilgrimage to Spain, producing in the Prado gallery various studies which, after his death, were sold at phenomenal prices. On returning from Spain he showed the influence of Velázquez. "El Jaleo" (Fenway court, Boston) was a dramatic rendering of a Spanish café scene. More penetrating in its psychological insight was the "Pailleron Children," son and daughter of Édouard Pailleron, the poet and playwright. In Venice in 1880 he had a studio in the Palazzo Rezzonico and painted the tragically beautiful portrait "Mrs. Charles Gifford Dyer" (Art institute, Chicago) and his Chilean friend Señor Subercaseaux in a gondola. Criticized for "its four corners and a void," the "Daughters of Edward Darley Boit," painted in 1882, was a truly remarkable achievement in asymmetrical balance. Henry James, who praised the picture, said the artist had done "nothing more felicitous."

From the beginning, commissions came to him unsought; he had to knock at no doors. But it was not until the Salon of 1884, when he showed the portrait of Mme Gautreau, that the painter found himself famous—or infamous. Among his friends in Nice was the English essayist and novelist Violet Paget (Vernon Lee) whose brilliantly conceived portrait (Tate gallery, London) Sargent did in 1881. Another of the Nice group was Ben del Castillo, a Cuban-American, through whom Sargent met Virginie Avegno from Louisiana, who had come to Paris, married Pierre Gautreau and become a celebrated figure in French society. He painted a full-length portrait of her (Metropolitan Museum of Art, New York city) in a black evening gown, daringly décolleté, contrasting with what he called her "lavender or blotting-paper colour" skin. When shown at the 1884 Salon criticism by both the press and the Gautreau family led Sargent to remove the picture to his studio where it remained as "Madame X" until 1915. Sargent decided to try his luck in London, spent the summer in England and bought the studio of James A. Whistler in Chelsea.

In England he painted the Vickers, Robert Louis Stevenson and an enchanting children's group, "Carnation, Lily, Lily, Rose," shown at the Royal Academy, London, in 1887 and bought for the Tate gallery.

In 1887 he again visited the United States, primarily to paint Mrs. Henry Marquand at Newport, R.I., and Mrs. Adrian Iselin in New York. While in Boston he painted an exacting portrait of Mrs. Jack Gardner. At the St. Botolph club, Sargent had his first one-man show in the United States. In 1890 he was commissioned to do the frieze of the prophets for the Boston Public library. Extensions of this commission kept him busy with the library murals until 1919. In Dec. 1890 he went to Egypt to gather information about ancient religion as background material for the Boston murals, and while in Cairo he painted the "Egyptian Girl," his only full-length female nude. In 1889 Sargent was made a chevalier of the Legion of Honour, in 1891 an associate of the National Academy, New York, and in 1894 an associate of the Royal Academy of London. In 1897 he became an officer of the Legion of Honour and a full academician in both New York and London. His portrait of the noted Spanish dancer Carmencita, painted in New York in 1890, was acquired for the Luxembourg museum in Paris.

Sargent numbered among his sitters princes and princesses, musicians, actors, teachers, writers, statesmen and diplomats. The great group portraits of the duke of Marlborough and his family (1905), the Ladies Acheson (1902), the daughters of the Hon. Percy Wyndham (1900), the Misses Hunter (1902); a noble series of single portraits, notably those of the duke and duchess of Connaught (1908), the duke (1901) and duchess of Portland (1902), Lord Russell of Killowen (1900) and Francis Penrose, Esq. (1898); and the portraits of innumerable beautiful women, the duchess of Sutherland (1904), the countess of Warwick (1904), Lady Agnew (1893), Lady Ian Hamilton (1896) and Mrs. Hammersley (1893), increased his ever-growing prestige. It became a distinction to be painted by him, and hundreds clamoured for the honour. Universities offered him degrees and he won many medals and awards. Unmoved by this acclamation, which included the

BY COURTESY OF THE TRUSTEES OF THE TATE GALLERY

"CARNATION, LILY, LILY, ROSE." 1887. IN THE TATE GALLERY, LONDON

offer of an English knighthood, he retained the serene simplicity of manner that made him so exceptional and so distinguished a figure.

Sargent was never a popular painter, in the sense of being generally understood. Painting is a language not easily read; its apparent simplicity and directness of appeal are misleading. Pictures as brilliant, uncompromising and authoritative in their presentation of character as Sargent's inevitably awakened much resentment along with admiration. His accomplishments were no less inscrutable for being so frank in expression. They became more tantalizing because they looked so amazingly easy to imitate. Sargent was imitated, but never with distinction. Referred to as a psychologist or a satirist, he was accused of deliberately accentuating the less pleasing qualities in his sitters. "I chronicle," he once said, "I do not judge." Though his outlook on life was essentially indulgent, his sense of humour was irrepressible, and the rectitude of his realism struck at the deep-rooted preference of humans to be seen not as they are but as they should like to be.

Sargent painted what he saw, but he caught, subconsciously perhaps, fugitive betrayals of passing thought: a restless movement, a smile, a glance. This subtle power of definition has been, in all ages, the peculiar gift of great portrait painters. The astonishing variety and scope of his work implies that he was almost indifferent to the form in which he worked. Before the strange, the unexpected, the bizarre, his resource and his freshness were unfailing. No invention was permitted to degenerate into a formula; he never repeated himself. For the extremes of age and youth he had undeniable tenderness; with incredible delicacy he portrayed the flowerlike freshness of the one, and if he did not disguise in the other the hint of decrepitude it was generally illumined by more than a suggestion of wisdom and dignity.

At the very height of his fame, in 1910, Sargent decided to give up portrait painting. He had grown tired of the tyranny of sitters and had begun to lose interest in his work. This decision, so typical of his artistic integrity, he lived up to. Only in exceptional circumstances was he afterward induced to break his rule, and then never for considerations of money. Though he lived on a generous scale, he was never wealthy. Always ready to give a helping hand to a student or to an artist, he was at once too busy and too impatient of all forms of implied superiority to ever want to teach. Deliberately, then, perhaps, he set his face against the scattering of his energies over too wide a field. An omnivorous reader and a passionate musician, an excellent host and a most entertaining guest, he was able to fill all too adequately his rare leisure.

During his first summer of freedom, in a holiday spirit, he began to play with water colour, the medium in which he had done his earliest work. The results may be seen in the brilliance, lightness and certainty of touch of the 80 sketches bought by the Brooklyn museum.

In 1914, at the outset of World War I, he was on holiday in Austria, and he witnessed with horror the disintegration of the Europe he had known. When the opportunity offered he went to the front to record his impressions at first hand. In his war picture "Gassed" (London War museum) may be seen in the background, through the waning light of late afternoon, the ground carpeted with writhing figures; a tragic procession of wounded men, blinded by gas, staggers toward the dressing station.

In 1916, when the Boston library murals were nearly done, he was commissioned to do the rotunda of the Boston Museum of Fine Arts, and in 1922 he painted two murals for the Widener library at Harvard University. As a man of 60 living in a rapidly changing world, Sargent did not have the vision to accomplish the two last tasks in a manner adequate to the times. Thus his mural work which had at first widened his reputation now served to weaken it.

A quieter life in London was better suited to Sargent's temperament than the social exactions of Boston. In London he was to know an honour no living painter had ever experienced: a magnificent series of his portraits, bequeathed to the nation by Asher Wertheimer, were hung in the National gallery. It was later placed in a wing in the Tate gallery along with other works by Sargent—the portraits of Lord Ribblesdale (1902), Coventry Patmore (1895), Octavia Hill (1899), the actress Ellen Terry as Lady Macbeth (1899) and others. Sargent is represented in the principal galleries of the world, but the Metropolitan museum in New York and the Boston Museum of Fine Arts are particularly rich in fine examples.

In surveying Sargent's immense achievement, the most striking characteristic is his extraordinary vitality. His slightest sketch pulsates with life. The beautiful suavity of his style, acquired through the discipline of years, never sacrificed its spontaneity. He shirked no labour, and knew no greater joy in life than this concentration on work provided him. He would paint a head 20 times over in order to establish an appearance of fluency and ease. His insight into character went far beyond ordinary perception, either of artists or of laymen; at its best it was as miraculous as his technical skill. He was entirely lacking in sentimentality; he never painted a beauty or charm that was not in direct relation with his subject. This severity was his strength in contradistinction to much art of the period which perpetuated the worship of purely irrelevant sweetness.

Taken as a whole, his portraits, the subjects drawn from every class of society, in their great number and variety, in the boldness, the wit, the keen incisiveness, and the distinction of their presentation, must come to be considered the epitome of the age he lived in—of its stateliness and splendour, of its elegance and grace, of its pretentiousness and its vulgarity. The human panorama, in its every manifestation, he found endlessly diverting, and delineating it as he did with uncompromising directness, his work, in its unflinching yet happy realism, bears the very stamp of truth.

A tall commanding presence, with a close-cut beard at a time when nine men out of ten were clean-shaven, he made an instant impression upon those who met him. During the last years of his life, with his great size, his dark hair and beard turned silver-white, his florid complexion and an air about him of singular freshness and calm, he had a look as of some serene and beneficent Jove.

Sargent never married. He had been a devoted son and brother, and was survived by his two sisters, Emily Sargent and Mrs. Francis Ormond. He died on April 15, 1925. His body was interred at Brookwood cemetery, Surrey. Memorial services were held at Westminster abbey and a memorial tablet was placed in the crypt of St. Paul's cathedral, London.

SARGODHA, a town, district, and division of West Pakistan. The town, headquarters of the district and of the division, lies in the Chaj, or Jech, doab, 125 mi. (201 km.) WNW of Lahore. Pop. (1961) 83,141. Notable buildings in Sargodha include Jinnah Hall (with its library), a sports stadium, and the mosques. Among the town's educational and cultural institutions are De Montmorency College (affiliated to the University of the Punjab), the municipal college for girls, the Pakistan Air Force public school, and the Sargodha Academy. The town lies on the main road between Lahore and Mianwali, and is also a railway junction. Sargodha is a grain and cash-crop market and an important industrial centre, with textile and hosiery manufacture, cotton ginning, flour and oilseed milling, and chemical and soap factories. Immigrants from Jagadhri (Ambala District, India) established the metal industry in the town after 1947. The town derives its name from the words *sar*, meaning "pond," and Godha, the name of a mendicant who lived by the pond and who was considered sacred by the Hindus. Sargodha was founded in 1903 and developed as the headquarters of the Lower Jhelum Canal colony. It became a municipality in 1914, when the courts and offices of Shahpur district were moved to Sargodha from Shahpur town. However, the district continued to be known officially as Shahpur until 1960.

SARGODHA DISTRICT (area 4,775 sq.mi.; pop. [1961] 1,467,621) is bordered by the Salt Range in the north, the Jhelum flows

through the centre, and the eastern part is irrigated by the Lower Jhelum Canal. West of the Jhelum are undulating sand hills which form part of the Thal Desert. Wheat, grain, cotton, and bajra are the principal crops. Besides Sargodha other important towns are Shahpur (pop. [1961] 6,330) and Bhera (pop. [1961] 17,992).

SARGODHA DIVISION was formed in December 1960 and consists of the districts of Sargodha, Mianwali, Lyallpur, and Jhang. Area 17,095 sq.mi. (44,276 sq.km.). Pop. (1961) 5,976,939.

(K. S. AD.)

SARGON (Akkadian SHARRU-KEN or SHARRUM-KIN) was the name borne by three notable rulers in the ancient Near East:

SARGON of Agade (reigned *c.* 2350–2300 B.C.), a former vizier of a king of Kish, founded the city of Agade (not certainly identified) in north Babylonia and, wresting the hegemony of the city-states from the Sumerian Lugalzaggesi of Erech (Uruk), established the first Semitic dynasty. This implied no racial conquest but merely a climax in the process of Semitic infiltration from the desert. The dynasty of Agade, though it endured for little more than a century, left a permanent imprint on Mesopotamian society, notably in connection with land tenure, for private ownership of land, rare in the Sumerian city-state, from this period became much more common.

Sargon himself gained possession not only of Sumer and Akkad (south and north Babylonia) but claimed control of regions as far distant as the Lebanon and the Amanus range (Alma Dag), while later literary tradition accords him an empire extending to Asia Minor; cylinder seals of the Agade period have been found in Cyprus. International trade flourished, and Sargon boasted that at the quay of his capital city might be found ships from Tilmun (Bahrain), Magan (probably Oman), and Meluhha (either Aden, the Somali coast, or India).

SARGON I of Assyria (fl. *c.* 1850 B.C.) was a ruler of the Old Assyrian period. Little is known in detail of Assyria in his time, but clearly the Assyrian trading colony in Cappadocia, known from the tablets discovered at Kultepe, was then in its heyday. This implies the ability of Sargon I to maintain the security of the trade routes, and the argument has been advanced that the colony in Cappadocia was actually within an area constituting an Assyrian province, a suggestion which derives some support from the existence of a tablet in Cappadocia bearing Sargon's seal.

SARGON II of Assyria (reigned 722–705 B.C.), an able king, was the founder of the last Assyrian dynasty. His greatest achievement lay in holding the pressure of tribal movements north and east of Assyria. As one measure to counter the threat to Assyrian east-west trade routes, he founded a new fortress-capital, Dur Sharrukin (modern Khorsabad), north of the traditional Assyrian capitals. The importance of an event shortly after his accession, the fall of Samaria, has been exaggerated by modern biblical historians.

In 721 B.C., Sargon had to deal with an anti-Assyrian coalition in Syria, organized by the king of Hamath, while in Babylonia Merodach-baladan, paramount chief of the Chaldean tribes in the south, took advantage of the change of ruler to claim the kingship, allying himself with Elam. Assyrian military action failed to displace Merodach-baladan, who remained in control of Babylonia until 710 B.C.

The following years were spent mainly in campaigns to counter Urartian intrigues among the tribes north and northeast of Assyria, and to consolidate Assyrian influence in Manna, south of Lake Urmia. In 714 B.C. Sargon invaded Urartu from the east, compelling Rusa (Rusas, Ursa) I to leave his capital, Tushpa. On its return a flying column from the victorious Assyrian army captured the wealthy mountain city of Musasir.

In the northwest the resurgent power of Mushku (Phrygia), which had already supported a rebellion by Carchemish in 717 B.C., was planning a coalition of neighbouring states, in alliance with Urartu. Prompt action by Sargon in 713 and 712 B.C. drove a wedge between Urartu and Mushku, and the foreign policy of the latter, now isolated and probably already under pressure from Cimmerian hordes, changed in favour of Assyria, so that by 709 B.C. the two powers were in alliance. Further south, there arose in 713 B.C. an anti-Assyrian coalition headed by Ashdod and encouraged by Egypt; this was crushed by prompt Assyrian military action.

Thus by 710 B.C. Sargon was free to turn his attention to Babylonia, where he was able to clear the Babylonian cities of the forces of Merodach-baladan, though the latter remained as paramount chief in the tribal territories of the south.

A new danger arose in the northwest in 707 B.C. with the breakthrough of the Cimmerians, who had already overrun Urartu. Sargon opposed them in Tabal (around Kayseri in Turkey) and deflected them westward. His death in 705 B.C. has generally been assumed, on the basis of an enigmatic letter, to have taken place in action on the northwest frontier, but this view has been disputed. *See* also BABYLONIA AND ASSYRIA: *History*.

(H. W. F. S.)

SARK (French SERCQ), one of the smaller Channel Islands (*q.v.*), lying 7 mi. (11 km.) E of Guernsey, is 3 mi. long and 1½ mi. in extreme breadth; area (including Brecqhou) 2.1 sq.mi. (5 sq.km.). Pop. (1961) 560. Brecqhou (privately owned and with 10 inhabitants in 1951) is separated from Great Sark by a narrow channel of the sea; Great Sark on the north and Little Sark on the south are connected by La Coupée, a 100-yd. (91-m.) isthmus only 6 ft. (2 m.) wide at the top, flanked by precipitous cliffs. Sark forms a plateau about 300 ft. (91 m.) high, rising to 375 ft.; the coast is wholly encircled by cliffs and scenically attractive. Creux Harbour on the east communicates with the interior by two tunnels, dating from 1588 and 1868; a second harbour was opened in 1949 at La Masseline.

Sark and Brecqhou are cut in granite, schist, and gneiss. Mineral veins include silver ore (no longer worked) and amethyst, known as Sark stone in Guernsey. (G. H. D.)

History.—Apart from the legends of St. Magloire (6th century), Sark first appears as part of a gift by William the Conqueror to Mont-Saint-Michel, *c.* 1040. A century later it was in the hands of the De Vernon family, lords of Néhou, who endowed the priory of St. Magloire as a dependency of the abbey of Montebourg. Sark reverted to the king in 1203 by Richard de Vernon's forfeiture. For part of the 13th century an attempt seems to have been made to administer Sark and Alderney together; later Sark was governed by a royal *prévôt* (provost) who presided over a court of six *jurats*. The island suffered severely from the wars of the 14th century and may have been uninhabited for much of the 15th and early 16th centuries. It was captured by the French in 1549, seized by a Flemish corsair and held momentarily in the name of the emperor Charles V, retaken by the French, and was in English hands again by 1558. To prevent it from becoming a nest of pirates, it was colonized by Hélier de Carteret, seigneur of St. Ouen in Jersey, under a patent of Elizabeth I dated Aug. 6, 1565. The colonists, mostly Jerseymen, were settled on a number of farms, subsequently fixed at 40. At first the court was modeled on that of Jersey, with bailiff and *jurats*, but this was changed in 1675 to one composed of seneschal, *prévôt*, greffier, tenants, seigneur, constable, and vingtenier. In 1922 12 deputies were added; but in 1951 the members were reduced to seigneur, seneschal, tenants, and 12 deputies. The De Carterets were seigneurs until 1720 since when the seigneury has changed hands several times. (LE P.)

Government.—The seigneur appoints the seneschal who presides over the Chief Pleas, a body consisting of 40 tenants and 12 deputies, which regulates local affairs by ordinance. The seigneur can, by temporary veto, delay the enactment of ordinances, which can also be annulled by the Royal Court of Guernsey, subject to appeal to the sovereign in Council. Sark is part of the bailiwick of Guernsey. Justice is administered by the court of the seneschal, with rights of appeal to the Royal Court of Guernsey. Police, if required in Sark, are supplied from Guernsey on repayment.

Automobiles are forbidden on the roads of Sark. The canine population is controlled and none but the seigneur (in the 1960s the dame) may keep a female dog.

The Economy.—The island is subdivided into tenements with fixed boundaries, and settlement is scattered. Dairying is practised, but the farmland (about a third of the island) includes substantial tillage. There is a little market gardening. External trade is directed through Guernsey. Sark offers accommodation to visitors, but its capacity is limited and most people come on day trips from Guernsey or on cruises. (G. H. D.)

SARMATIANS, a people who, during the 4th century B.C.–4th century A.D., occupied much of southern European Russia and penetrated into the eastern Balkans and beyond.

Sarmatian studies were in their infancy in the 1960s; but numerous excavations in the U.S.S.R. in recent decades have provided much information. There was good reason to accept the views of Herodotus and other ancient Greek historians that the Sarmatians, or Sauromatians, were an association of tribes. As with the Scythians and the Cimmerians (*qq.v.*) before them, the most vital element in their political group came from central Asia. Its members were of Iranian stock and language; their tongue closely resembled that of the Scythians (Herodotus, book iv, 117). Like the Scythians they were nomadic, excelling in horsemanship and displaying the same skill in warfare. They also had a keen political sense and administrative ability, and followed their conquest of the western Eurasian plain by obtaining full political control over what is now southern European Russia. In consequence their name acquired generic significance; it quickly came to represent a large group of kindred and allied tribes that remained thenceforth attached to the smaller Sarmatian core. The Alani (*q.v.*) and Roxolani were the most important of these secondary tribes (*see* also IAZYGES), yet even when acting independently, all retained their place in the Sarmatian community. All of them accepted the culture and artistic style the Sarmatians had evolved, practising and disseminating them with such vigour that Sarmatian taste was felt even in the Greek cities on the shores of the Black Sea.

History.—It is evident now that the Sarmatians advanced from central Asia to invade and conquer the Scythians and did not, as stated by Diodorus Siculus (book ii, 43), rise against them from within their own territory. It has become possible to divide Sarmatian history into four periods. The first extends from the 6th to the 4th century B.C. and deals with the Sarmatian migration from Asia and penetration to the western foothills of the Urals. Toward the end of this period the Roxolani pushed on toward the Volga River and the Alani settled in the Kuban Valley. For the most part they remained till they were dislodged in the period of the great migration, when some of the latter infiltrated into Ossetia (*q.v.*), surviving there till about the 9th century A.D.

The Sarmatians followed closely in the steps of these tribes and by Herodotus' day they had already made themselves masters of the plain between the Urals and the Don River. This encouraged them to intensify their pressure on the Scythians, and in the 4th century B.C. they crossed the Don and entered Scythia proper. This rapid advance may well have coincided with a decline in Scythian might, resulting from the death of their aged king Ateas in battle against Philip II of Macedonia in 339 B.C.; if so, this would help to account for its speed. This event serves to herald the second (Early Sarmatian) period in Sarmatian history, often called the Prokhorov Period after the important burials of that name with which it is associated. This phase stretched from the 4th to the 2nd century B.C., during which time the Sarmatians partially overcame the Scythians and gradually succeeded them as rulers over most of what later became southern European Russia. The Roxolani had begun by joining with the Sarmatians in attacking the Scythians, advancing upon them from the south. Toward the end of this period, when the Sarmatians had strengthened their hold over the territory of the Royal Scyths, the Roxolani changed their allegiance, joining forces with the Scythians to attack the Greek Black Sea cities.

In the third (Mid-Sarmatian) period, between the 1st century B.C. and the 1st century A.D., the Sarmatians conquered all but the Crimean Scythians, bringing the assaults on the Greek cities to an end. Having consolidated their hold over the captured areas the Sarmatians did not attempt to annex any of these cities; instead, early in Nero's reign they invaded the Roman province of Lower Moesia (Bulgaria). Although the Roman general Plautius Silvanus Aelianus ejected them in A.D. 62–63, the Sarmatians and some Germanic tribes they had joined were thenceforth a menace to the Romans in the west, as were the Alani in the Caucasian area. Vespasian, Trajan, and Marcus Aurelius were forced to adopt such defensive measures as to attempt to transform the vassal Bosporan kingdom into a buffer state (*see* BOSPORUS, KINGDOM OF THE). Hadrian had to build a network of fortresses manned with Roman troops along the borders of Lower Moesia and Cappadocia.

In the last phase of their history, spanning the 2nd to 4th centuries A.D., the Sarmatians and their Germanic allies entered Dacia (Rumania) and began raiding the lower reaches of the Danube, but in the 3rd century the Gothic invasion set a term to their independence. Nevertheless, many Sarmatians retained their position and influence under the Goths; others joined them to sweep into western Europe, fighting at their sides. However, soon after A.D. 370 waves of migrating Huns (*q.v.*) effectively ended the very existence of Sarmatia; the majority of the Sarmatians who remained in southern Russia perished at the hands of these Asian invaders. Some of the survivors were assimilated by their new masters and others by the Slavs of the lower Dnieper, but most fled westward to join their neighbours in harassing the Huns and the remaining Goths. Their descendants continued to do so until the 6th century when they finally disappeared from history.

Social Structure and Way of Life.—Very little was known till the 1960s about the social structure or way of life developed by the Sarmatians. Basically both at first followed closely those rendered familiar by the Scythians, largely as the result of a common central-Asian origin and heritage. Nevertheless, several fundamental differences serve to distinguish the two peoples. Scythians venerated nature deities, while the Sarmatians were fire worshipers who sacrificed horses to their god. Scythian women were relegated to a life of semiseclusion; the Sarmatians treated theirs as equals, during their earlier history expecting them to fight in time of war, and forbidding them to marry till they had killed an enemy in battle. However, after marriage, women were obliged to abandon warfare and to devote themselves to their homes and families. Greek tales about Amazons may have been based on exploits of early Sarmatian women, many of whom were buried with their weapons (*see* AMAZON).

When the Sarmatians penetrated into southeastern Europe they were already accomplished horsemen. They followed a nomadic way of life, devoting themselves to hunting and to pastoral occupations; most of them adhered to this form of existence to the end. There is evidence that some of them practised an elementary form of husbandry, but few settlements of Sarmatian origin have been discovered. In the earlier periods their customs, clothes, and many other possessions resembled those of the Scythians, but their society was matriarchal in character. Gradually, as a prosperous class began to form, the tribe entered a transitional phase during which tribal chieftains tended to replace women as rulers; eventually, kings seem to have predominated.

This may have been stimulated by the formation of a male corps of heavy cavalry, facilitated by the probably Sarmatian invention of a metal stirrup, soon followed by that of the spur. The methods of warfare thus made possible were largely responsible for Sarmatia's military supremacy. The Romans noted and gradually adopted these inventions. During the 3rd century they went so far as to incorporate in some Roman regiments Sarmatian units equipped with their traditional weapons and encouraged to fight in their own manner. From early times onward Sarmatian military accoutrements included conically shaped helmets worn with scale, ring, or plate armour of iron that often protected horses as well as riders. Unlike the Scythians, the Sarmatians did not excel at archery; they relied on long lances or spears and long, sharply pointed swords, all of distinctive shape.

The Sarmatians were excellent craftsmen. Perhaps artistically

less inventive than the Scythians, they were nevertheless equally proficient metalworkers, better potters, and no less adept at curing hides; they were thus able to maintain the important trade in furs, grain (levied from local settlers), honey, fish, and metal that the Scythians had established with the Greek cities on the northern shores of the Black Sea. They also developed commercial contact with the Syr-Darya region, the borderlands of China, and the kingdom of Khorezm (Chorasmia).

Until disrupted by the Huns, Sarmatian culture presented a uniform and all-embracing character, even though it altered with each period in its history. Its evolution is reflected in burials that distinguish each of the four periods. Thus no large mounds are associated with the earliest phase when objects were seldom included in the graves, though the occasional presence of articles points to the beginnings of a class society. Burials of the second period often display considerable wealth; those of the third phase also reflect the growth of a more complex way of life, stemming in part from the Sarmatian subjugation of alien tribes, and assimilation of many of their customs. It also was a result of the flourishing trade the Sarmatians had established. During these periods the truly typical Sarmatian culture evolved and was imposed on the entire region. In the last phase Germanic influence led to the introduction of fibulae (brooches or clasps like safety pins), with resulting changes in costume.

Tombs and Their Contents.—The richest Sarmatian burials have been found in the Kuban area, and on the edges of the great riverbeds of the southern Russian S.F.S.R. and the Ukraine, where many have been subjected to regular seasonal flooding. Hundreds of other graves are to be found throughout the area the Sarmatians once occupied. Many of these were excavated in the second half of the 19th and in the first half of the 20th centuries and sufficient material has become available to permit an overall picture to be outlined.

Except in the Kuban, where they are generally oval in shape, the mounds the Sarmatians constructed are very similar to those of the Scythians; but the tombs beneath them are very different from the elaborate Scythian mortuary chambers. For the most part Sarmatian graves consist of simple square, circular, or oval holes (sometimes pocketed trenches); very occasionally, tombs are found lined with rushes. No coffins were used; the body was usually wrapped in a leather or fur rug and usually laid on the bare earth, though sometimes on a rush mat. In the vicinity of Kerch (*q.v.*) paintings survive on the walls of some graves of late date, some showing Sarmatians wearing cloaks held in place by fibulae; some contain traces of what may be the beginnings of an alphabet.

Diagonal and crouched burials, and cremations, occur side by side; thus although Sarmatian culture prevailed, local habits evidently persisted. In the last phase the influence of the Huns is reflected in the practice of cranial deformation. In the graves of earlier periods Scythian influence often is apparent throughout; horses are associated with most burials, their trappings being generally placed in the graves. In richer burials, such as those of Starobelsk and Yanchokarski, their hooves and skulls were often included, but not, as was customary in Scythian times, the rest of their bodies. Most of the tombs also contained cauldrons of the Scythian type as well as outfits for inhaling hemp, bronze vessels, and mirrors of oriental form in silver alloy. Tiny gold plaques designed as trimmings for clothes are also common but, in contrast to similar gold plaques of Scythian date (which were generally decorated with an animal design), these are usually geometric in character. Among articles of personal adornment fibulae make their first appearance in graves of Sarmatian date; little gold bottles set with jewels are especially characteristic of the period; and various types of glass are numerous. The locally made pottery is of a higher quality than that typical of the Scythian age.

Sarmatian horse trappings differ from those used by the Scythians, as do some of their arms. The iron Sarmatian bits had rings to hold the leather and had fewer animal terminals and decorations than those of Scythian date; hard saddles with a high frontal arch were also new to the Black Sea region. The saddles were often covered with gold leaf studded with bosses and adorned with coloured glass or precious stones; trappings tended to be less ornate than those of the Scythians, although often of silver or silver gilt. The long swords peculiar to the Sarmatians were set into wooden hilts surmounted by a knob of precious stone (*e.g.*, agate or onyx) or in wood laced with gold; the handguards were generally cut from a single large stone. Spears were longer and sharper than the Scythian, but the variety of knives and daggers was equally great.

Metalwork and the Polychrome Style.—Whereas the Scythian was an animal art the Sarmatian, though it retained many animal forms, was primarily geometric and was largely in polychrome (many colours). The Sarmatians apparently delighted in glass inlay, gold-wire granulations, and embossed effects achieved by repoussé (*see* METALWORK, DECORATIVE) or inset stones and jewels; the taste was basically Asian, the designs primarily geometric and floral, though frequently also of an animal character. Jewelers produced diadems, torques, bracelets, rings, fibulae, gold plaques, buckles, buttons, and mounts of various sorts. Hoards that have been found and objects acquired from the more important tombs constitute an important collection of jewelry and fine metalwork. The Pashkov group of burials in the Kuban, excavated during 1929–37 and 1946–49, were among the earliest known in the 1960s. They are associated with a Meteo-Sarmatian tribe and date in the main from the 5th to the 3rd century B.C., though one mound contained jewelry and vessels assigned to the 3rd century A.D. In the earlier instances the men were buried with spears, swords, and arrows; the women were adorned with beads and with bronze bracelets of local manufacture. The Prokhorov burials lie near Sharlyk in Orenburg *oblast,* Russian S.F.S.R., and were excavated by the Russian archaeologist S. I. Rudenko in 1916. The largest belonged to a chieftain who had been buried in an iron chain-mail coat with gold torque and bronze bracelets; a sword and gold-handled knives were placed within easy reach of his hands, and two magnificent silver vessels of Persian workmanship stood close to him. One of these was inscribed in Aramaic with the words "the cup of Atromitra." The richest burial known in the 1960s belonged to the Novocherkassk group and is to be dated to the 2nd century B.C. Discovered in 1864, it produced objects of such value that it seems probable the tomb was for a queen. In addition to a magnificent crown the woman wore a gold necklace and gold bracelets. A small agate bottle mounted in gold and adorned with animal designs, and several gold cups and silver vessels lay beside her. All these were of Sarmatian workmanship, but placed with them was a terra-cotta statuette of

BY COURTESY OF THE HERMITAGE, LENINGRAD

Goldwork from the burial at Novocherkassk, U.S.S.R., 2nd century B.C. (Left) Covered bottle with representations of elks, lions, and monsters; (above) bottle in the form of an animal and ornament with embossed pattern; (below) crown decorated with stylized animals

Eros, of Greek origin, and two Greek-inscribed silver dishes; these testify to the links which the Sarmatians maintained with their Greek neighbours. Another burial in the same region produced a gold vessel, dating from between the 2nd century B.C. and the 1st century A.D., signed in Greek letters with the name of its Sarmatian maker, Tarulla.

Bacon (ed.), *Vanished Civilizations* (1963). (T. T. R.)

SARMIENTO, DOMINGO FAUSTINO (1811–1888), Argentine educator, writer, and statesman, the "schoolmaster president," representative of liberal and anticlerical elements receptive to ideas from abroad, was born in the interior province of San Juan on Feb. 14, 1811. Sarmiento liked to compare his career as a self-made man with that of Abraham Lincoln, whom he greatly admired. Throughout his long public career as provincial legislator, cabinet minister, and governor, diplomatic representative, president, and national senator, Sarmiento's motto was "to govern is to educate." That motto emphasized the role he believed public education must play in creating a nation of industrious and responsible citizens. In his efforts to build a new Argentina, Sarmiento's principal model was the United States, but he used ideas from other countries also, adapting them to his country's needs.

Exiled to Chile for political activities (1840–52), Sarmiento became an important figure in Chilean journalism and politics as a newspaper editor and as an intimate friend and supporter of Manuel Montt (*q.v.*). In 1842, under Montt's sponsorship, Sarmiento became the founding director of the first normal school in South America, the second such school in the Western Hemisphere. In 1845 the Chilean government sent Sarmiento abroad to study educational methods in Europe and the United States. He returned in early 1848 a fervent admirer of Horace Mann's educational ideas and convinced that the United States was the nation Latin America should emulate. Subsequently, Sarmiento participated in Gen. J. J. de Urquiza's overthrow of the dictator Juan Manuel de Rosas (*q.v.*) at Caseros on Feb. 3, 1852, and during the next decade enhanced his reputation as a publicist and educator while also playing an active role in Argentine politics.

For three years (1865–68) Sarmiento represented Argentina in Washington. He spent little time there, however, preferring instead to travel extensively through the United States studying everything that might be useful to his country. In 1868 Sarmiento was elected to the presidency, although he did not return to Argentina until after the election was over. Despite a war with Paraguay, Sarmiento's administration (1868–74) laid the foundations for later national progress by fostering public education, immigration, commerce, agriculture, and the construction of transportation and communication facilities. After 1874, though he continued active in public affairs, education remained his primary interest until his death on Sept. 11, 1888, in Asunción, Parag.

Many pages of the 52 volumes of Sarmiento's published works are devoted to educational themes. His *Facundo* (1845), a sociological interpretation of Argentine dictatorship, has been translated into several languages as one of the masterpieces of Latin-American literature. The celebration of the 50th anniversary of Sarmiento's death (1938) occurred when reactionary indigenous Fascists were launching bitter attacks on Argentine civil liberties and democratic principles. Defenders of those institutions have fostered public interest in Sarmiento's career by publicizing his efforts in support of those institutions and his opposition to dictatorial regimes.

SARNEN, capital town of Obwalden demicanton, Switz., lies at the northern end of the Lake of Sarnen, 13 mi. (21 km.) S of Lucerne by rail. Pop. (1960) 6,554. In its town hall (1729–32) the ancient White Book contains the oldest chronicle of the fight against Habsburg tyranny; the book is also the prime source of the William Tell legend. On the Landenberg, once the site of the Habsburg Castle, open-air elections with voting by show of hands are held annually on the fourth Sunday in April, the ceremony being called the *Landsgemeinde.* Interesting buildings include the Witches Tower (13th century), the Schützenhaus (1752), the Baroque parish Church of St. Peter built in 1739–42 (with a remarkable carved ceiling in the nearby cemetery chapel), the Benedictine monastery (founded 1022), Capuchin monastery (1644), a fine modern hospital (1956), and a college of national repute. Sarnen is an important station on the Lucerne–Brünig electric railway.

SARNIA, county seat of Lambton County, Ontario, Can., on the St. Clair River and Lake Huron. Sarnia is well served by highways and railroads and has transriver communication with Port Huron, Mich., via the St. Clair Railway tunnel, the Bluewater Bridge, and ferry service. The site was visited by French explorers as early as 1627. The first French settlers arrived in 1807, but Malcolm Cameron was the real founder of an English-speaking settlement in 1833. In 1836 it was named (Port) Sarnia, the Roman name for the island of Guernsey, upon the suggestion of Sir John Colborne, lieutenant governor of Upper Canada and formerly lieutenant governor of Guernsey. Oil was discovered in Lambton County in 1858; by 1899 there was a refinery at Sarnia and the city became a petroleum centre. Sarnia has extensive harbour facilities, oil refineries (crude oil is supplied by pipeline from western Canada), extensive petrochemical industries, a salt industry, a grain elevator, and a diversity of small manufacturing industries. Oil products are transmitted to central Ontario by two pipelines. The publicly owned Polymer Corporation, built in 1942, pioneered the manufacture of synthetic rubber in Canada. Pop. (1961) 50,976. (G. FN.)

SARNO, a town of Campania in the province of Salerno, Italy. Pop. (1961) 29,549 (commune). It lies at the foot of Mt. Saretto to the east of the Sarno (ancient Sarnus) River, 14 mi. (23 km.) N of Salerno by rail. Near Sarno in A.D. 552 Teias, leader of the Goths, was killed and his men defeated by Narses, the Byzantine general. Malaria retarded the growth of the town for centuries. In 1460 the battle between the Angevins and Aragonese for the possession of southern Italy took place nearby; the Aragonese were defeated and Ferdinand I fled to Naples. The ruined medieval castle in Sarno belonged to Count Francesco Coppola, who took part in the barons' conspiracy against Ferdinand of Aragon in 1485. Walter of Brienne is buried in the 13th-century church of Sta. Marie della Foce (rebuilt in 1701). There are hot springs near the town and industries include manufacture of preserves, and hemp and cotton mills. (M. T. A. N.)

SARPEDON, in Greek legend, son of Zeus and Laodameia, Lycian prince, and hero of the Trojan War. He fought on the side of the Trojans and was slain by Patroclus. Apollo rescued his body and, by the command of Zeus, handed it over to Sleep and Death, by whom it was conveyed for burial to Lycia, where a sanctuary (Sarpedoneum) was erected in his honour. In later tradition, Sarpedon was the son of Zeus and Europa and the brother of Minos. Having been expelled from Crete by the latter, he and his comrades sailed for Asia, where he finally became king of Lycia.

SARPI, PAOLO (baptized PIETRO) (1552–1623), Venetian state theologian, who led an effective resistance by the Venetian republic against what it regarded as papal encroachment on temporal sovereignty, was born in Venice on Aug. 14, 1552. After the premature death of his father, he came into the care of an uncle and a Servite friar, under whose influence he entered the Servite Order in his 15th year. Sarpi's talents were outstanding and his intellectual curiosity unlimited. In the field of physics and even of anatomy he is credited with important discoveries, but his writings on scientific subjects are lost. In 1570, at Mantua, he caused a sensation by a brilliant defense of more than 100 theses, upon which Duke Gonzaga secured his transfer from Venice to Mantua where the friar often exhibited his skill in debate by defending the most daring propositions. In 1579 he became provincial of his

order, and in 1588 its procurator general in Rome. Three attempts to get him a bishopric proved unsuccessful, in spite of Venice's backing, because his relations with leading Protestants were well known in Rome. Sir Henry Wotton, the English envoy, described him as "a true Protestant in a monk's habit." These disappointments further exacerbated his long-standing antipapal feelings.

In 1606 Sarpi became official theologian to the Venetian republic. In the conflict between Venice and Pope Paul V over papal jurisdiction and ecclesiastical immunity within the republic, Sarpi encouraged resistance. The censures threatened by Rome, he urged, must be ignored; they were invalid, for the pope was exceeding his powers. Fear of Venice's breaking with Rome and the risk of civil war in Italy induced the neighbouring states to intervene, and a compromise was reached on April 21, 1607, chiefly through France's mediation. On Oct. 5, 1607, Sarpi was the object of a murderous attack; there is no evidence of the crime's having been engineered in Rome, and Paul V reprobated it energetically. Though excommunicated in the same year, Sarpi retained his official position and continued to carry on his functions as priest. He died on Jan. 16, 1623, unreconciled, it seems, with the church.

Sarpi's literary remains consist largely of pamphlets written by himself or under his inspiration during the conflict between Venice and Paul V. He is now chiefly remembered for his exceedingly biased *Istoria del concilio tridentino* ("History of the Council of Trent"), published, in English, in London in 1619, under the pseudonym of Pietro Soave Polano, by Marcantonio de Dominis, archbishop of Spalato, a fugitive from the Inquisition. The book created a sensation: it was the first detailed account of a council which Sarpi described as "a large-scale, highly successful deception maneuver" of the papal curia. But the work is important, for its author seems to have had access to documents that were later lost.

BIBLIOGRAPHY.—*Opere,* 6 vol. (1761–65). Best modern edition of the history is by G. Gamborin, 3 vol. (1935). A selection of his letters written 1608–16 was ed. by K. Beurath (1909); his letters to the Protestants were ed. by M. D. Busnelli (1931). *See* also A. Vacant (ed.), *Dictionnaire de théologie catholique,* vol. xiv, col. 1115–21 (1939); H. SARRAUT, ALBERT PIERRE (1872–1962), French Radical statesman, distinguished as a governor general of Indochina and twice premier of France, was born in Bordeaux on July 28, 1872, a member of the important Radical family that owned the newspaper *Dépêche de Toulouse.* Educated at the *lycée* of Carcassonne and the law faculty of Toulouse, he became a barrister and served as a member of the chamber of deputies from 1902 to 1924. He was undersecretary of state under Georges Clemenceau and Aristide Briand (1906–10); and he was minister of education under René Viviani (1914–15) between his two terms as governor general of Indochina (1911–14 and 1916–19). As governor general he applied liberal policies, increasing the proportion of native Indochinese in the civil service, recognizing the use of the local languages and local law and continuing the public works policy of his predecessor, Paul Doumer. He was minister for the colonies from 1920 to 1924. A senator from 1926 to 1940, Sarraut was minister of the interior (1926–28), for the navy (1930–31) and for the colonies again (1932–33). He was premier for the first time from Oct. 26 to Nov. 24, 1933. Having been minister of the interior again in 1934, he was premier again from Jan. 24 to June 4, 1936; his government secured the approval of the chamber of deputies for the Franco-Soviet mutual assistance treaty but failed to deal effectively with the German reoccupation of the Rhineland. From June 1937 to June 1940 he was continuously in office, mostly as minister of the interior.

Sarraut played little part in politics during World War II. He became editor of the *Dépêche de Toulouse* in 1943, after his brother Maurice had been murdered by a pro-Nazi gang. He was arrested by the Gestapo in 1944 and released by the Allies in 1945. Unable to gain a seat in parliament, he became in 1947 a member of the advisory assembly of the French union, of which he was president from 1949 to 1958.

Sarraut died in Paris on Nov. 26, 1962. He had published *La Mise en valeur des colonies françaises* (1923) and *Grandeur et servitude coloniales* (1931).
(P. W. C.)

SARSAPARILLA, an aromatic flavouring agent prepared from the roots of several tropical species of *Smilax,* a genus of the lily family (Liliaceae). The origin of the name is Spanish, *zarza* meaning "bramble" and *parrilla,* "little vine." The plants are native from the southern and western coasts of Mexico to Peru. Chiefly, three species provide the sarsaparillas of commerce: *Smilax aristolochiifolia, S. regeli,* and *S. febrifuga,* known respectively, as Mexican, Honduras, and Ecuadorian sarsaparillas. Other varieties, known commercially as Ecuadorian (or Guayaquil) and Central American (Jamaica or Guatemala), are derived from other species of *Smilax.*

The plants are large, perennial, climbing or trailing vines. Short, thick, underground stems give rise to numerous semiwoody, prickly, angular aboveground stems, which bear large alternate stalked leaves. The tendrils that provide support for the plants spring from the bases of the leaves.

The roots are dried in the sun, then gathered loosely into bundles or bound tightly into cylinders, depending on the place of origin, and exported. Several sterols and a crystalline glycoside, sarsaponin, which yields sarsapogenin on hydrolysis, have been isolated from the root. Sarsapogenin is related to steroids such as progesterone and is used in their synthesis. Sarsaparilla was formerly regarded popularly as a tonic, but in fact is inert and useless; it is now used merely to mask the unpleasant taste of medicines. A liquid extract in which it is combined with wintergreen and other flavouring agents is an ingredient of such carbonated drinks as root beer.

In North America the strongly aromatic roots of the wild sarsaparilla (*Aralia nudicaulis*) and false or bristly sarsaparilla (*A. hispida*) are sometimes used as a substitute for true sarsaparilla.
(V. E.; X.)

SARSFIELD, PATRICK (d. 1693), titular earl of Lucan, Irish patriot and Jacobite soldier, who took part in the Irish resistance (1689–91) to William III, belonged to an Anglo-Norman family long settled in Ireland. His mother Anne was a daughter of Rory O'More, a leader of the Irish rising in 1641. Sarsfield, a Roman Catholic, began his military career as an ensign in George Hamilton's regiment, which was raised in Ireland in 1671 for service under Louis XIV. He continued in the French service in the duke of Monmouth's regiment until 1678.

After the accession of James II in February 1685, Sarsfield was commissioned as a captain in the English Army and fought against Monmouth at Sedgemoor (July 6), where he was wounded. Rapid promotion followed, and in 1686 he was a colonel in the Royal Horse Guards. After the Revolution of 1688 he followed James to France, and in March 1689 accompanied him to Ireland. During the early part of the Jacobite War (*see* IRELAND: *History*) he distinguished himself as a cavalry commander, and was promoted brigadier and then major general. After the Battle of the Boyne (July 1, 1690) he played the chief part in rallying the Irish Army, organized the defense of Limerick, and in August made a spectacular attack on William III's artillery train at Ballyneety, on the road from Clonmel to Limerick. In January 1691 he was created earl of Lucan by James. However, as an opponent of the earl (titular duke) of Tyrconnel, James's lord lieutenant in Ireland, Sarsfield was relegated to the background and at the Battle of Aughrim (July 12, 1691) was given command only of the reserve.

After Tyrconnel's death in August, Sarsfield came to the fore again at the second siege of Limerick, where he negotiated the treaty (Oct. 3, 1691) which ended the war. With most of the Irish Army, Sarsfield went to France in December 1691 to fight for Louis XIV and distinguished himself at Steenkirk (1692). He was mortally wounded at Neerwinden, near Landen, on July 19 (old style; July 29, new style), 1693, and died at Huy, a nearby village, a few days later. Sarsfield remains a favourite hero of Irish national tradition, and his name is widely commemorated in Ireland.

See J. Todhunter, *Life of Patrick Sarsfield* (1895).
(J. G. SI.)

SART, a central Asian name of Indian origin, was first used by Turkic tribesmen to mean "merchant." Later, the Mongols

who ruled the area in the 13th and 14th centuries applied it to Muslims in general but particularly to the Iranian-speaking people of Turkistan (*q.v.*). These had been the chief town dwellers and merchants when the Turkic and Mongol pastoral nomads began to flow into the area. Through the centuries many tribes settled and adopted the way of life of the Iranian-speaking oasis dwellers, while many of the latter took over Turkic speech. Under the Uzbek (*see* UZBEK SOVIET SOCIALIST REPUBLIC: *History*), a confederation of Turko-Mongol tribes who became overlords of Turkistan in the 15th century, the name Sart acquired still another usage. It was applied to Turkic-speaking town dwellers of the oases to distinguish them from the Tadzhik (*q.v.*) who spoke Iranian dialects. In the 19th century Russians took over this usage, as did travelers during the czarist period. (EL. B.)

Thus, the term was once applied only to people of Iranian origin, then to those of Turkic or Iranian origin, and finally only to Turkic peoples. Russian ethnographers gave the term tribal and linguistic significance. After the Russian Revolution it became derogatory and is now obsolete. (G. E. WR.)

See V. V. Barthold, "A Short History of Turkestan," in *Four Studies on the History of Central Asia,* vol. i (1956).

SARTHE, a *département* of northwestern France, formed in 1790 out of the eastern part of Maine (*q.v.*) and neighbouring parts of Anjou (*q.v.*). Area 2,411 sq.mi. Pop. (1962) 443,019. It is bounded north by Orne, east by Eure-et-Loir and Loir-et-Cher, south by Indre-et-Loire and Maine-et-Loire, and west by Mayenne. It includes most of the basin of the Sarthe River, draining with its tributary the Huisne from the Collines de Normandie southwestward to the Loire. The Loir River flows west through the southernmost part of the *département* toward its confluence with the Sarthe above Angers.

Most of the *département* is floored by Cretaceous rocks and is undulating lowland, but in the west the old rocks of the Armorican massif form a hilly margin in the Bocage Manceau. The soil is mainly of poor or moderate quality and there is much fragmentary woodland, but the *département* is predominantly agricultural, concerned with a variety of crops and livestock, among which cattle and poultry are especially important. The vine appears only in the Loir valley in the south, but cider apple orchards are widespread. Mineral resources are quite unimportant and there is little manufacturing, except at Le Mans, the only large town (128,814 in 1962), which under national plans for decentralizing industry has received an important accession of industry in the form of motor-engineering works (Renault). Agricultural tractors, trucks, and other vehicles are made. Near Le Mans is a famous motor-racing circuit.

The *département* is divided into three *arrondissements,* centred upon Le Mans, La Flèche in the valley of the Loir, and Mamers, but apart from Le Mans the towns are merely small market centres. Le Mans, the ancient capital of Maine, is the *préfecture* and centre of the diocese, but the *département* comes under the court of appeal at Angers and under the *académie* at Caen. Le Mans retains many old buildings of great charm, besides its fine Romanesque and Gothic cathedral (11th–13th centuries), and in its townscape epitomizes the historic development of a French provincial city from a Roman foundation. Solesmes (*q.v.*) is noteworthy for its priory (founded 1010), which became a Benedictine monastery in 1830 and later an abbey, and La Ferté-Bernard has an interesting Renaissance church. (AR. E. S.)

SARTHE RIVER, a river of northwestern France, about 177 mi. (285 km.) long, converges with the Loir and Mayenne rivers near Angers to form the Maine tributary of the Loire River. The Sarthe, flowing south, and its tributary, the Huisne, flowing southwest, from the Collines du Perche, join at Le Mans in the centre of the *département* of Sarthe. The river then flows in a winding trench across the Cretaceous rocks on the western margin of the Paris Basin in the ancient province of Maine. Its basin is almost entirely agricultural, and Le Mans is the only considerable town. The river is used for navigation only on a very small scale below Le Mans. (AR. E. S.)

SARTI, GIUSEPPE (1729–1802), Italian opera composer whose career included a long and influential sojourn in Russia, was baptized Dec. 1, 1729, at Faenza. After studying under F. A. Vallotti in Padua and G. Martini in Bologna he became organist at the cathedral of Faenza (1748–50). His first two operas were successfully produced in Faenza and Venice in 1752 and 1753. At the end of 1753 he went as conductor of an Italian opera company to Copenhagen where, in 1755, Frederick V appointed him director of court music and later of the opera. In Copenhagen, where he remained intermittently until 1775, he wrote many instrumental works and operas, including a Danish opera, *Gram og Signe* (1754). He then went to Venice where he became director of the Ospedaletto Conservatory. In 1779 he was appointed *maestro di cappella* at Milan Cathedral, but continued writing operas in both the serious and the comic styles, among them *Giulio Sabino* (Venice, 1781) and *Fra i due litiganti* (Milan, 1782). Among his pupils was Cherubini, who became his assistant.

In 1784 he was invited by Catherine II to St. Petersburg to succeed G. Paisiello as director of court music there. On his way he stopped at Vienna where he met Mozart, who used an aria of Sarti's both as a theme for a set of variations (K. 460) and as a tune played by the band on the stage in *Don Giovanni.* Sarti greatly improved the standard of Italian opera in St. Petersburg and wrote both sacred and operatic works, including a Russian opera, *Nakalnoy upravlenye Olega* ("The Early Reign of Oleg"), for production there. He lived in Russia until 1802, founded a school of singing in the Ukraine, and became director of the conservatory at St. Petersburg, established on the model of the Italian schools. He died in Berlin in July 1802. Although the melodic and harmonic aspects of Sarti's serious operas are not always distinguished, his accompanied recitatives have much character, and his comic operas are remarkable for their ensembles.

See C. Rivalta, *Giuseppe Sarti* (1928). (CS. CH.)

SARTO, ANDREA DEL (1486–1530), one of the most popular Florentine painters of the early 16th century, was born in Florence on July 14, 1486. His father, Agnolo di Francesco, was a tailor (*sarto*), and from this fact the painter derived his name. In 1508 Andrea was enrolled in the guild of the Medici e Speziali. According to G. Vasari, he was trained initially by a goldsmith, was later apprenticed for three years to a painter Gian

ALINARI

"MADONNA OF THE HARPIES" BY ANDREA DEL SARTO. IN THE UFFIZI GALLERY, FLORENCE

Barile, and subsequently worked with Piero di Cosimo, traces of whose influence are found in his earliest authenticated works—five frescoes of scenes from the life of St. Philip Benizzi, executed in the entrance court of the Annunziata in Florence in 1509–10. A sixth of the "Adoration of the Magi" dates from 1511 and a seventh of the "Birth of the Virgin" from 1514. Whereas the earlier of these frescoes are dry and somewhat academic in style, in the latest the scale of the figures is increased and the execution reveals the boldness and beauty of colouring of Andrea's mature work. At this time Andrea was closely associated with the painter Franciabigio, as well as with the sculptor Jacopo Sansovino, who exercised a deep influence on his figurative style. His relation to both artists can be traced in a celebrated cycle of grisaille frescoes of scenes from the life of St. John the Baptist in the Chiostro dello Scalzo, Florence. The Scalzo frescoes were interrupted in 1518 by a visit to France, where Andrea entered the employment of Francis I. The single relic of his activity in France is a painting of "Charity" dated 1518 in the Louvre, Paris. Returning to Florence in 1519, he resumed work in the Scalzo between 1522 and 1526. Tó this period belong his most ambitious frescoes, the "Tribute to Caesar" at Poggia a Cajano (1521), the great "Last Supper" at S. Salvi (about 1526) and the "Madonna del Sacco" in the cloister of the Annunziata (dated 1525). This last fresco, with its bold pyramidal design and delicate handling, is perhaps Andrea's finest work.

With a few exceptions, Andrea's most notable panel paintings are in the Uffizi and Pitti galleries in Florence. They include his best-known work, the "Madonna of the Harpies" (1517), the "Dispute about the Trinity" (1517–18), a magnificent "Lamentation over the Dead Christ" (1524) and three large altarpieces of the Assumption. In these he combines the compositional procedure of the Tuscan High Renaissance with a splendour of colour reminiscent of Venetian painting.

Andrea was also a distinguished portrait painter. His best work in this genre is the introspective "Portrait of a Sculptor" in the National gallery, London. A self-portrait is in the Uffizi gallery. As a draftsman, Andrea favoured the medium of red chalk, which he employed with exceptional directness and accomplishment. A large collection of his drawings is in the Uffizi gallery. Endowed with a less original talent than his great contemporaries Raphael and Leonardo da Vinci, and a more equable temperament than his disciples Rosso and Jacopo da Pontormo, Andrea del Sarto remains a central figure in Florentine High Renaissance art, whose work is marked by monumentality, sincerity and sensibility and by its disregard of external effect. The romantic story of his marriage to Lucrezia del Fede (probably 1517) is recounted by Vasari. Andrea del Sarto died of the plague at Florence on Sept. 29, 1530.

(J. W. P.-H.)

SARTON, GEORGE ALFRED LEON (1884–1956), historian of science, who was instrumental in making his field an independent discipline, was born in Ghent, Belg., on Aug. 31, 1884. As a student at the University of Ghent he abandoned traditional philosophy to study chemistry, celestial mechanics, and mathematics, earning a gold medal in chemistry in 1907. He obtained his doctorate in mathematics in 1911, marrying Eleanor Mabel Elwes of London in the same year. At the invasion of Belgium in 1914 Sarton went to England, and, the following year, to the U.S.; he became a U.S. citizen in 1922. He took with him the scholarly journal *Isis*, which he had founded in 1912 and which he continued to edit for 40 years; in 1936 he founded *Osiris*, a second journal that published lengthier papers on the history and philosophy of science. He was an associate of the Carnegie Institution, Washington, D.C. (1918–48), and professor of the history of science at Harvard University (1940–51). His best-known work is *Introduction to the History of Science*, 3 vol. (1927–47). Other works include *Life of Science* (1960) and *Sarton on the History of Science*, ed. by D. Stimson (1962). He died in Cambridge, Mass., on March 22, 1956.

His daughter, MAY SARTON (1912–), became a distinguished poet and novelist.

See J. F. Fulton, "Scholar of Belgium . . . ," *Isis*, vol. 50 (1959).

(I. B. C.; X.)

SARTRE, JEAN PAUL (1905–), French philosopher, playwright, and novelist, a world-famous figure in contemporary intellectual life who in 1964 refused to accept the Nobel Prize for Literature. Born in Paris on June 21, 1905, and orphaned in infancy, he was brought up by his grandfather, Charles Schweitzer, an uncle of Albert Schweitzer. A graduate of the École Normale Supérieure, where he reacted strongly against Cartesian rationalism, Sartre worked before World War II as a schoolmaster in the French provinces. In 1933–34 he spent a year's leave at the Institut Français in Berlin, studying the work of German philosophers, notably Husserl and Heidegger (*qq.v.*).

He first achieved fame by his early fictional works (*e.g.*, the short stories of *Le Mur*, 1939) and by helping to introduce into France from Germany the theories of phenomenology and existentialism (*qq.v.*). In three early philosophical works, *L'Imagination* (1936; *Imagination*, 1962), *Esquisse d'une théorie des émotions* (1939; *Sketch for a Theory of the Emotions*, 1962), and *L'Imaginaire* (1940; *The Psychology of Imagination*, 1950), Sartre proved his ability to deploy the phenomenological technique with success and originality in the treatment of particular problems. *L'Être et le néant* (1943; *Being and Nothingness*, 1956), his massive attempt to construct a full-scale existentialist theory of Being, earned him his place among the leading philosophers of the first half of the 20th century. By the time it appeared Sartre had already a considerable reputation in France as a novelist. From the existentialist standpoint, fiction or drama was as much a form of philosophical literature as the conventional essay, and in some ways a medium even better able to communicate the experience and meaning of existence.

His first novel—and in the opinion of many critics his best—was *La Nausée* (1938; *Nausea*, 1949), cast in the form of the diary of a writer, Antoine Roquentin, who is disturbed by the sickening, chaotic, viscous quality of the external world, and yearns in vain for a universe which is certain, hard, predictable, and masculine, like the universe of Newtonian physics. Finally he finds salvation in art, in creating imaginary worlds which have the formal perfection that the real world lacks. Sartre evidently shared his hero's sense of alienation from a "viscous" world, but soon lost his faith in the possibility of salvation through art. Instead he moved increasingly closer to the Marxist doctrine of salvation through action. This idea is adumbrated elliptically in his wartime plays *Les Mouches* (1943; *The Flies*, 1946) and *Huis-clos* (1944; *In Camera* [U.S. title, *No Exit*], 1946), and more directly in his postwar plays, notably *Les Mains sales* (1948; *Crime Passionnel* [U.S. title, *Dirty Hands*, in *Three Plays*, trans. by Lionel Abel, 1949; in the acting version, *Red Gloves*], 1949), *Le Diable et le Bon Dieu* (1951; *Lucifer and the Lord*, 1953), *Nekrassov* (1956; Eng. trans. 1956), and *Les Séquestrés d'Altona* (1960; *Loser Wins* [U.S. title, *The Condemned of Altona*], 1960). The recurrent theme of these political dramas is that the man who wants to do good in the world must be willing to "soil his hands."

After *La Nausée*, Sartre wrote only one novel, a four-volume work entitled *Les Chemins de la liberté* ("Paths of Freedom"). This is a sort of tapestry, intended to give a synoptic picture of different peoples' "paths to freedom"; but it was woven in a variety of styles, and was eventually abandoned unfinished. The first volume, *L'Âge de raison* (1945; *The Age of Reason*, 1947), can nevertheless stand as a novel on its own. It has a hero, Mathieu, whose concentrated experiences over a few days lead him from one set of illusions about freedom to another, equally illusory. The second volume, *Le Sursis* (1945; *The Reprieve*, 1947), is based on the "realist" or "documentary" U.S. novel, and is an attempt to convey the inner story of the week of the Munich crisis (September 1938) in France by a montage of different peoples' reactions. In the third volume, *La Mort dans l'âme* (1949; *Iron in the Soul* [U.S. title, *Troubled Sleep*], 1950), Sartre returned to the particular case history of Mathieu, the hero of his first volume, and followed his adventures up to the fall of France in 1940. Having been hitherto an ineffectual character—something of an "antihero"—Mathieu is transformed under the stress of battle into a military hero. Sartre left the fourth volume unfinished, but the two chapters of it which he did complete he pub-

lished in 1949 in his review *Les Temps modernes* with the title *Drôle d'amitié* ("Strange Friendship"); this incident dates from the period of Nazi-Soviet friendship, and describes how a renegade Communist is betrayed by the party hacks. The whole tone of the novel is heavily pessimistic.

L'Être et le néant also contains a notable element of pessimism, and even nihilism, and this earned for its author a notoriety that hindered appreciation of his theories. However, these theories are not always consistent. In *L'Être et le néant* Sartre argues that there is no moral law, that "man is a useless passion," that no one can really respect the freedom of others, and that the basis of all relations between human beings is conflict. On the other hand, in *L'Existentialisme est un humanisme* (1946; *Existentialism and Humanism,* 1948), an exposition and discussion of Sartrean existentialism, he puts forward the view that the pursuit of one's own freedom requires one to promote the freedom of others, and that each man is responsible to all for the values affirmed by his way of life. These "humanistic" notions are elaborated in greater detail in *Question de Méthode* (1960; *The Problem of Method,* 1964) and in a longer work, *Critique de la raison dialectique* (1960), in which he tries to formulate a revitalized Marxist sociology; that is, one which incorporates existentialism, and which is purged of such "19th-century anachronisms" as determinism. In the latter Sartre also argues that conflict between men is simply the result of economic scarcity and of the shortsighted measures their ancestors have taken to deal with scarcity. Conflict is thus seen as being in principle curable. In all his work Sartre puts the strongest emphasis on his belief in indeterminism, or "human freedom." He sees freedom as a heavy burden on mankind, since it brings with it responsibility, guilt, remorse, punishment; but he sees it also as the unique source of human nobility, since it is his freedom alone which "makes man like a God."

After the liberation, Sartre took an active interest in French political movements. In 1945 he founded a monthly periodical, *Les Temps modernes,* as a platform for independent left-wing thought. Several of his works were first published in this review, especially his critical essays (*e.g., Qu'est-ce que la littérature?* [*What Is Literature?*], 1947), many of which have reappeared in the seven volumes of *Situations* (1947–65). Other more extensive essays on philosophy and the arts include *Baudelaire* (1947; trans. 1949) and *Saint Genet, comédien et martyr* (1952; *Saint Genet, Actor and Martyr,* 1963), the latter being a remarkable psychological study of the poet Jean Genet, a homosexual with a police record. In 1949 Sartre helped to found a political party, the Republican Democratic Rally; after its collapse in 1952, he moved closer to the Communists. In 1954 he visited the U.S.S.R.; he traveled widely in the Soviet Union, Scandinavia, Africa, the United States, and Cuba, where he became a champion of the Castro regime.

Sartre resisted what he called "bourgeois marriage," but while still a student he formed with Simone de Beauvoir, the French writer, a union which remained a settled partnership in life. Simone de Beauvoir's published memoirs, notably the second volume, *La Force de l'âge* (1960; *The Prime of Life,* 1962), provide an intimate account of Sartre's life from student years until his middle 50s. Sartre himself published in 1964 (1963 in *Les Temps modernes*) an autobiography of his childhood, *Les Mots* (*The Words,* 1964). This short book is one of outstanding literary distinction, and marks a return, after the diffuse, teutonic, jargon-ridden style of *Critique de la raison dialectique,* to the Cartesian clarity of his early writing. It was a popular book which earned for Sartre the 1964 Nobel Prize for Literature, which, with characteristic intransigeance, he refused to accept.

In *Les Mots,* Sartre analyzes the formation of his mind and temperament as an intellectual. He looked on the early death of his father as in some ways advantageous, since it had given him "undisputed possession" of his mother; on the other hand, his loneliness, and the fact that he was an exceedingly ugly child, had driven him into a fantasy world. This world was in the first place inhabited by imaginary beings that he read about; and then by imaginary beings that he wrote about—for Sartre became an author as soon as he learned how to write at all. He attributed his later obsession with metaphysics to this early experience of fantasy; and he claimed that he owed his deliverance from this metaphysical obsession to Marxism, when it came into his life in middle age.

SARUM USE (USE OF SALISBURY), the most noted of the local variants, or uses, of the Roman liturgical rite obtaining in the pre-Reformation English Church. Salisbury tradition attributed its institution to the Norman bishop of Old Sarum, St. Osmund (1078–99), but the actual originator appears to have been Richard Poore, dean 1197–1215, who produced the consuetudinary (or customary) prescribing the duties of persons at divine service, and the ordinal specifying the liturgical texts to be sung or said, and the ceremonies to be performed, at service throughout the year. When Poore, as bishop (1217–28), moved the see from Old Sarum to Salisbury (New Sarum), the new cathedral inherited the use of the old. A new missal was also compiled, probably under Poore's supervision and with the assistance of the treasurer, Edmund Rich. From time to time during the next century, the old ordinal and service books were amended and amplified. About 1350 the old use was considerably revised, the revision being incorporated in the "new ordinal," which became the foundation of the "new Sarum use." Because of the fullness and explicitness of the ordinal, the Sarum use had from the beginning exercised a wide influence outside the cathedral and diocese of Salisbury; Higden testifies that in his time, the mid-14th century, "almost all England, Wales and Ireland" used the Sarum Ordinal. In 1542 the Canterbury Convocation imposed the Sarum Breviary upon all clerks in the southern province. The Sarum service books were among the sources used by the compilers of the Book of Common Prayer.

Dickinson, *Missale ad usum ecclesiae Sarum* (1861–1883), represents the missal in its latest and most developed state; F. Procter and C. Wordsworth, *Breviarium ad usum Sarum,* 3 vol. (1879–86); C. Wordsworth, *Salisbury Processions and Ceremonies* (1901). (E. C. RA.)

SARZANA, a town and episcopal see of Liguria, Italy, in La Spezia province. Pop. (1961) 16,867 (commune). It lies on the fertile plain of the Magra River, 11 mi. (18 km.) SE of La Spezia by road. Sarzana is mentioned as being a fortress in 963 and as being a town in 1084; it is believed to have been founded by the survivors of the abandoned town of Luni near the site of the Etruscan Luna. The Gothic style cathedral (1355–1474) contains a monument to the mother of Pope Nicholas V (born at Sarzana). In the church of S. Francesco are paintings by the Sarzana-born painter D. Fiasella. The old citadel, built by the Pisans in 1263 and destroyed in 1486, was rebuilt in 1488 by Lorenzo de' Medici; the castle of Sarzanello was built by Castruccio Castracani (d. 1328). The present town is especially important as a centre for early market-garden produce and is on the main Rome-Genoa road and rail routes. (P. RA.)

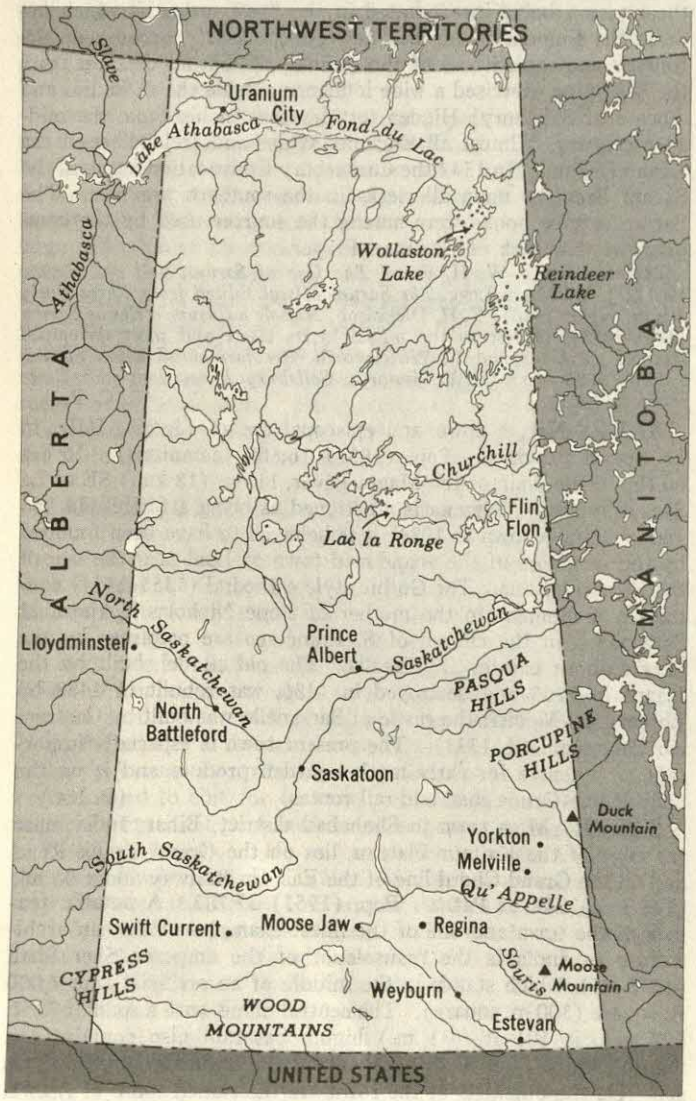
SASARAM, a town in Shahabad district, Bihar, India, near the edge of the Kaimur Plateau, lies on the Grand Trunk Road and on the Grand Chord line of the Eastern Railway about 90 mi. (145 km.) SW of Patna. Pop. (1961) 37,782. A notable feature of the town and one of the finest examples of Pathan architecture in India is the mausoleum of the emperor Sher Shah (1540–45), which stands in the middle of an artificial lake 1,000 ft. square (300 m. square). The central dome, with a span of 72 ft. (22 m.), is 101 ft. (31 m.) high. Sasaram also contains the mausoleum of Sher Shah's father and the unfinished tomb of his son. On the outskirts of the town are the ruined tomb of Alawal Khan, the reputed builder of Sher Shah's and his father's mauso-

leums, and an edict of Asoka inscribed on a rock on the Chandan Pir Shahid Hill. (E. AH.)

SASEBO, a port town in Nagasaki prefecture, Kyushu, Jap. Pop. (1960) 262,484. Provided with a good natural harbour near the mouth of Ōmura Bay, Sasebo was a naval base from 1896 until the end of World War II. It was a small village until the restoration (1868), but expanded rapidly after the wars with China and Russia. The town was partially destroyed in World War II, but because of facilities which years of experience had perfected, Sasebo revived as a commercial and fishing port. (R. B. H.)

SASKATCHEWAN, a prairie province of Canada lying between Manitoba to the east and Alberta to the west and containing part of one of the great grain-producing regions of the world. It has an area of 251,700 sq.mi. (651,900 sq.km.), of which 31,518 sq.mi., mainly in the north, are covered by water. The capital is Regina (*q.v.*).

Physical Geography.—*Geology and Physiography.*—Saskatchewan has purely artificial boundaries cutting across the major geologic and geographic zones of west central Canada (*see* CANADA: *Physical Geography; Geographical Regions*). The northern one-third is a part of the Canadian shield. Precambrian rock is exposed at the surface or underlies shallow glacial drift and sedimentary sands in a terrain which is rugged but not mountainous. Muskegs (swamps), many lakes and small streams are indicative of two immature drainage systems which carry the brackish water to Hudson bay via the Churchill or to the Arctic ocean via the Athabasca and Mackenzie. The southern two-thirds of the province forms part of the great interior continental plains. In Saskatchewan these comprise two distinct levels or prairie steppes. The westernmost, at about 2,500 ft. (762 m.) above sea level, extends to the Missouri *coteau* (cuesta or scarp), a dominant feature which approximately defines the eastern edge of the remnant Tertiary formations. The Cypress hills and Wood mountains rise to 1,000 ft. (305 km.) above this level and comprise the youngest Tertiary beds. The second prairie steppe, at about 1,500 ft., terminates in the Manitoba escarpment, the eastern edge of Cretaceous formations on the prairies. Various series of hills between the two escarpments, including the Moose and Duck mountains and the Porcupine and Pasqua hills, are outriders of the older Tertiary beds. The province was almost entirely glaciated in Pleistocene times and the present surface soils of the plains originated from glacial depositions.



PRINCIPAL PHYSICAL FEATURES AND MAJOR CITIES OF SASKATCHEWAN

The Saskatchewan river (*q.v.*) drains a large part of the southern plains. Its two branches, entering the province from Alberta nearly 200 mi. (322 km.) apart, meet east of Prince Albert and flow toward Lake Winnipeg in Manitoba. A southwestern area drains southward to the Missouri river, and the southeastern corner of the province is drained by the Souris and Qu'Appelle rivers to Lake Winnipeg via the Assiniboine and Red rivers of Manitoba. Most southern Saskatchewan rivers flow through deep, U-shaped valleys which were eroded by glacial melt water in unconsolidated sedimentary beds as the last continental ice sheet retreated.

Climate, Soils and Vegetation.—Saskatchewan has a continental climate with relatively little marine influence, prevailing westerly winds and wide seasonal and daily ranges of temperature. Average monthly temperatures decrease northward, particularly in winter. The average January temperature in the south is 0° F. (−18° C.) while in the extreme northeast it is −20° F. (−29° C.). The isotherm of 65° F. (18° C.) in July runs along the southern border and that of 60° F. (16° C.) through the middle of the province. The low annual precipitation is concentrated fortunately in the growing season. Average precipitation varies from 11 in. (270 mm.) in the southwest to 18 in. (441 mm.) in the northeast part of the agricultural region, with wide local and seasonal fluctuations. Repeated low annual averages of precipitation led to the disastrous prairie drought of the 1930s which was accompanied by dust storms and insect infestations.

As a result of their glacial origin the clay and loam soils of the great plains in Saskatchewan are rich in mineral content. Modification in well-defined zones of vegetative cover, each in turn a characteristic of a particular set of climatic factors, has produced brown soils in the arid southwest, black soils in the prairies (grasslands) proper, degraded black soils in the parklands and gray wooded soils in the northern extremes of the plains area. The grasslands are primary producers of wheat, but the higher levels, particularly the Cypress hills, are wooded and break the monotony of the landscape. Scattered clumps of quaking aspen in the wide belt of parklands eventually thicken and merge into the mixed wood forest at a northwest-southeast line across the province between Prince Albert and Saskatoon. Northward a further transition takes place to dominantly coniferous species. It is the northern part of this mixed wood belt which contains the best of the province's merchantable timber. Still farther northward a wide expanse of potential pulpwood (chiefly black spruce and jack pine) deteriorates into a zone of little commercial value. There poor soil and low temperatures reduce the quality of the tree cover.

Wildlife.—Saskatchewan is rich in wildlife resources. The vast prairies, once the home of great buffalo herds, continue to provide an almost unlimited habitat for deer and antelope, upland birds such as grouse, partridge and pheasant, and waterfowl—ducks, geese, cranes and swans. Deer, elk, moose and bear inhabit the parklands and forests, with caribou in the far north. Of the fur bearers, muskrat, beaver, mink, squirrel, otter and fisher are common. Nearly all Saskatchewan lakes and streams contain fish, many in sufficient abundance to be fished commercially.

History.—Saskatchewan takes its name from the Indian name for the great river of the plains, which is in full Sis-Sis-Katchewan-Sepie, the "Big Angry Water" or "Rapid river." The territory, then unexplored, was granted by Charles II in 1670 to the Hudson's

Bay company for the exploitation of its fur. The first knowledge of this part of the territory came from an expedition of Henry Kelsey of the company (1690–92). Subsequent exploration was accomplished by the La Vérendrye brothers about 1750, and thereafter by Anthony Henday and Samuel Hearne. In 1774 Hearne established the first white habitation to remain a permanent community, at Cumberland House on the lower Saskatchewan river.

Until their merger in 1821 the Hudson's Bay company and the North West company were rivals in the fur trade, particularly in the forested regions of the territory. They set up numerous temporary forts and trading posts, often in direct competition at one location. The consolidated Hudson's Bay company established additional permanent posts, such as Carlton House and Ft. Pitt, by the 1840s. All other settlement was confined to the vicinity of these posts.

The transfer of the territory to Canada in 1869 and railway connection from Winnipeg to St. Paul, Minn., in 1878 prompted immigration and homestead settlement. The dispossession of the resident half-breed population without proper recognition of their rights led to two uprisings, the Riel rebellions, in the Red river valley in Manitoba (1869–70) and in Saskatchewan (1885). The North-West Mounted Police were established in 1873. Organized government of the Northwest Territories south of latitude 60° came in 1875, with Ft. Livingstone the first government seat and Ft. Battleford taking over in 1877. In 1882 Regina was made the territorial seat of government. Completion of the Canadian Pacific railway in 1885 aided farm settlement and a surge of immigrants after 1901 led to the creation of the province of Saskatchewan in 1905, with Regina (*q.v.*) selected to be the capital city.

Rapid growth continued until World War I, the population increasing from 91,279 in 1901 to 492,432 in 1911, and municipalities, towns and cities were established. The University of Saskatchewan at Saskatoon was founded in 1907. There was wide diversity among settlers in nationality, culture and religion. Immigration slackened and practically stopped between World Wars I and II, and the desperate depression years of the 1930s saw some emigration from Saskatchewan and some relocation within the province. Settlers from the "dust bowl" moved northward into the forested regions to resume agricultural and other activities there. The return of wetter seasons and improved crops in the 1940s encouraged reconsolidation and diversification of the provincial economy. In 1955, the jubilee year for Saskatchewan, a recognition program was undertaken to mark many historic sites throughout the province. The 1950s and 1960s saw greatly increased development of the province's mineral resources, especially oil and gas, and in the 1960s, potash.

Politically, through Saskatchewan's first 25 years as a province, the Liberal party remained in control, to be replaced for one five-year term through the worst of the drought and depression years by a Conservative administration. The Liberal party then returned, but the growing unrest and organization of farmer groups and their dissatisfaction with the control over the prairie economy exerted by eastern interests contributed to the election in 1944 of a social democratic (socialist) party entitled the Co-operative Commonwealth federation (C.C.F.), headed provincially by the premier, T. C. Douglas. Reelected in 1948, 1952, 1956 and 1960, Douglas became head of the New Democratic party (formed by C.C.F., organized labour and farmers) and resigned in 1961 to run for the commons. Douglas was succeeded as premier by W. S. Lloyd (C.C.F.). In 1964 the C.C.F. under Lloyd was defeated for the first time in 20 years, by the Liberals led by W. Ross Thatcher.

Population.—Saskatchewan's population, 925,181 in 1961, is concentrated in the southern half of the province. Less than 2% live north of the agricultural region. Settlement took place fairly rapidly in the grasslands and parklands, more slowly in the forest fringe. The main rail line of the Canadian National railway passing through Saskatoon and the park belt, where the risk of drought is less than on the prairies proper, enabled this zone to reach and retain the greatest nonurban density of population in the province. A gradual shift of urban-rural ratios continued after World War II, from 6% urban in 1901 to 21% in 1941 to 43% in 1961, in centres of 1,000 population and over. About 40% of Saskatchewan people were of British origin, 6% French, 17% German, 7% Scandinavian and 9% Ukrainian, with a scattering of over 16 other national groups. About 31,000 Indians lived in Saskatchewan under federal care. The largest religious groups were United Church of Canada (30%) and Roman Catholic (26%), followed by Anglicans (10%) and Lutherans (10%). Over 24 other creeds were represented.

*Saskatchewan: Places of 5,000 or More Population**

Place	Population				
	1961	1956	1951	1941	1921
Total province	925,181	880,665	831,728	895,992	757,510
Estevan	7,728	5,264	3,935	2,774	2,290
Lloydminster	5,667	5,077	3,938	1,624	755

Yorkton	9,995	8,256	7,074	5,577	5,151

*Populations are reported as constituted at date of each census.

Government and Public Finance.—The lieutenant governor, appointed by the federal government, is the titular head in the province; he acts on the advice of the executive council, headed by the premier and comprised of selected members of the provincial legislature. The statutory number of members of the legislature is 55; they are elected for five years unless the assembly is dissolved sooner. There is a nonpolitical civil service. The province is represented at Ottawa by six senators (after 1915) and by members of the house of commons according to population; the 1952 Representation act gave Saskatchewan 17 members.

By 1960 there was elective municipal government in 11 cities, 106 towns, 372 incorporated villages and 296 rural municipalities. There are no counties.

Public revenue in Saskatchewan as in other provinces is drawn from retail sales and income taxes, licences, royalties and crown corporation profits; under a dominion-provincial tax rental agreement the dominion compensates Saskatchewan for income and corporation taxes, formerly levied by the province. Provincial revenue increased from under $12,000,000 in 1921 to over $140,000,000 in the second half of the 20th century. After the economic crisis of the 1930s, stringent provincial controls were imposed on municipal borrowing.

Education.—Throughout Canada the control of education is vested in the provinces. Elementary education in Saskatchewan is public, undenominational, compulsory and free of charge. Private denominational schools are permitted if they conform to the general standard. Both classes of schools are supported by public funds. Enrollment in public day schools totals about 200,000, in private schools about 3,000. Other provincial institutions include a correspondence school, a school for the deaf, two teacher training colleges and a technical institute. Provincial loans and scholarships are available to university, teachers college or nursing school students. The University of Saskatchewan at Saskatoon, with an affiliated college in Regina, offers a wide variety of advanced academic training and extension services, particularly in agriculture.

Health and Welfare.—Universal compulsory prepaid medical insurance established under the Medical Care Insurance act of 1961 went into effect July 1, 1962. It was strenuously opposed by the College of Physicians and Surgeons and the majority of Saskatchewan's 900 doctors withdrew ordinary medical services for about three weeks until a series of agreements was reached. The act was amended to provide safeguards for professional freedom and opportunity both for doctors to practise outside the plan and for voluntary insurance schemes to continue to operate; the principles of universal coverage and administration through a public agency responsible to the government were preserved. The government-sponsored hospital services plan covers more than 95% of the total population. Welfare programs include old-age security supplementary allowances, blind persons' allowances, old-age assistance, mothers' allowances and social aid.

Production.—Until well after World War II, Saskatchewan's economy was primarily agricultural. During the war years the output of nonfarm industry represented just 20% of the value of total commodity production. The growth of the petroleum, mining, manufacturing and construction industries was rapid in the postwar years and by 1958 nonagricultural industries accounted for 65% of gross commodity production.

Agriculture.—Agriculture accounted for 66% of the net value of all production over the ten-year period to 1958 but for less than 50% in the 1960s. Grain crops lead production; the average wheat crop for this period was 277,000,000 bu. or 57% of Canada's total. Long-term average yields for wheat, oats and barley are 15, 29 and 22 bu. per acre, respectively. Other major field crops are flax, rye and forage. Livestock production expanded during the 1950s and 1960s to add stability to the agricultural economy. The value of all livestock on Saskatchewan farms was estimated at $300,000,000. Gross farm income from this source was about 30% of total farm income.

The climate limits production of many orchard and specialty crops, but research, experimentation and assistance programs of provincial and federal departments of agriculture and the provincial university have assisted greatly in improving this and the entire agricultural situation.

Minimum economic farm-unit size varies from several sections per family (a section being 640 ac.) in the arid southwest to between one-half and one section in regions with good soil and moisture conditions. Nearly 38% of Saskatchewan's farms are fully owned by operators. Investment in farm mechanization is exceptionally high. Over 40,000,000 ac. are under cultivation and very little suitable arable land remains uncultivated. Irrigation projects, such as that on the South Saskatchewan river, are planned to provide water for land already in agricultural use. The last free homestead land was taken up in 1930.

Forestry.—The accessible commercial forest zone in Saskatchewan covers 38,000 sq.mi. Despite heavy exploitation early in the 20th century and during World Wars I and II, inventories carried out in the 1950s indicated a very large increment in both saw timber and pulpwood species, totaling 232,000,000 cu.ft. per year, with large volumes ready for cutting. The remote location in relation to major markets retarded postwar development of forest industries, particularly pulp and paper, and the annual market value of production in the 1960s averaged less than $10,000,000, with white spruce the most used species, followed by jack pine and black spruce. After World War II the provincial government implemented conservation and development policies in forest management, organized a parachute forest-fire suppression service and launched an extensive program of forest access road construction.

Fish and Fur.—The most important commercially fished lakes are in the north. They include Athabasca, Reindeer, Wollaston, La Ronge and six others which all support fish-processing and freezing plants serving many lesser lakes as well. These allow better utilization, particularly in summer operations, and a more stable industry. Air transport of produce is necessary in some instances. Major commercial fish species are whitefish, lake trout and pickerel. The provincial catch averages over 10,000,000 lb. annually, with an average market value of $1,600,000. The expanding northern mink-rearing industry consumes 5,600,000 lb.

The wild fur industry remains important to a small section of the province's people as a supplementary source of income, with an annual market value of more than $2,000,000. A provincial government marketing service established after World War II did much to stabilize the industry.

Minerals.—The metals and petroleum industries made great progress after World War II. The value of output grew from only $2,000,000 in 1931 to $36,000,000 in 1949 and to more than $200,000,000 by the 1960s. Base-metal operations started early in the 1930s at Flin Flon on the province's eastern boundary and contributed over $30,000,000 of the total mineral output. From a slow start based on the heavy crude oils of the Lloydminster area, the petroleum industry expanded rapidly through the 1950s to produce more than 55,000,000 bbl. valued at over $100,000,000 by the 1960s.

The uranium industry started production in 1954 and by 1958 reached a milling capacity of 4,500 tons of ore daily, with seven mines operating, all in the Uranium-Beaverlodge area. Production was reduced with the drop in demand after 1959 for uranium for military purposes. Other leading minerals are zinc, coal, sodium sulfate, gold and salt. Late in 1958 Canada's first potash mine started production near Saskatoon at a rated annual capacity of 600,000 tons and the first potash from the Esterhazy field was produced in 1962.

Exploration in the south for petroleum was still very active. Vast areas of the Precambrian north had not been intensively explored in spite of an apparent high potential. A northern development road-construction program was undertaken to facilitate prospecting and exploration. Reserves in the south of industrial minerals, potash and lignite coal appear to be relatively unlimited.

Power.—The major developed source of electric power in Saskatchewan in the early 1960s was the surface lignite coal deposits of the Souris valley, which provide relatively cheap fuel for thermal generation. Most of Saskatchewan (urban and rural) receives electricity services under a provincial government plan implemented by the Saskatchewan Power corporation. This

agency, which controls the province's hydroelectric potentials, undertook studies in 1958 and 1959 of two sites on the Saskatchewan river system with an estimated combined potential of 500,000 h.p.

The hydroelectric potentials of the northern rivers, chiefly the Churchill and the Fond du Lac, had not been completely determined. One Churchill river site of 100,000 h.p. was developed in the early 1930s to serve the Flin Flon mining operations. Total electric energy generated in Saskatchewan amounts to 1,500,000,000 kw.hr. annually.

Manufacturing.—Resources development in Saskatchewan stimulated a growth of secondary industries, and manufacturing made steady advances after World War II. Manufacturing production climbed from $215,000,000 in 1949 to $341,000,000 in 1959. In the 1960s the province had about 1,200 manufacturing operations employing an estimated 14,000 persons.

Postwar development brought the province new industries producing cement, wire and cable, paper products, steel pipe, clay products, building board, transformers, mobile trailer homes and a variety of operations which serve the oil and gas industries. Total capacity of the nine oil refineries in the province was 71,000 bbl. per day, with the two largest in Regina. The province's first steel mill went into production in 1960.

Recreation.—Prior to World War II little attention was paid to the province's recreation resources. After the war, however, major development took place, prompted by local and tourist demands resulting from easier transportation and greater leisure and prosperity. Resident and nonresident angling and hunting licence sales increased from 61,000 to 215,000 in a ten-year period. Many new businesses were established, particularly in the north, to serve the sportsmen's needs. Provincial resources authorities intensified research and improved management techniques in an effort to ensure sustained yields.

The lake and forest scenery of the northern Precambrian landscape and the many lakes still inaccessible to sportsmen other than by float aircraft in the 1960s appeared to ensure broad expansion in the province's tourist industry as northern access improved.

Use of the northerly Prince Albert National park increased greatly for summer family recreation in the 1950s and 1960s. A comparable increase was evident in the use of the developed provincial parks in the Cypress hills, at Moose mountain in the southwest and Duck mountain near Kamsack.

Communications.—The southern populated area is well netted with railways. Main trans-Canada lines serve Regina and Saskatoon east and west, as well as Moose Jaw, Swift Current, North Battleford and Yorkton, with good connections to Minneapolis and Chicago. Although northern Saskatchewan is trackless, the province had over 8,700 of Canada's almost 60,000 mi. of track in the 1960s. In 1960 improved municipal road mileage totaled 95,000, provincial highway mileage about 6,500 with graveled surface and about 1,500 with hard-top surface. The Trans-Canada highway passing through Regina, Moose Jaw and Swift Current was completed in Saskatchewan in 1957.

Air Canada services Regina and Saskatoon regularly east and west. Regular north-south and intercity aircraft routes cover most of the province, including the extreme north. Saskatchewan Government Telephones corporation services all cities and towns and much of rural Saskatchewan. Government-operated two-way radio services all northern points from Prince Albert.

Saskatchewan has no seaports and the rivers are generally not navigable. Lake Athabasca, however, allows lake transport from the railhead in northern Alberta to penetrate to the centre line of northern Saskatchewan.

SASKATCHEWAN RIVER (RAPID RIVER), a river system of Alberta and Saskatchewan provinces, Can. Two large streams, the North and South Saskatchewan, which have their headwaters in the Rocky mountains in Alberta, cross the Saskatchewan boundary 200 mi. apart, unite east of Prince Albert and continue flowing eastward to empty into Lake Winnipeg. Through much of their courses both streams are well contained in deep immature valleys gouged out by escaping glacial melt water. Major tributaries are the Battle, joining the north branch, the Bow, Belly and Red Deer, joining the south branch, and the Carrot and Sturgeon Weir joining the main Saskatchewan. The length of the united Saskatchewan is 369 mi. and the total length to the head of the Bow is 1,205 mi. The Saskatchewan is believed to have been first explored by Henry Kelsey in 1690.

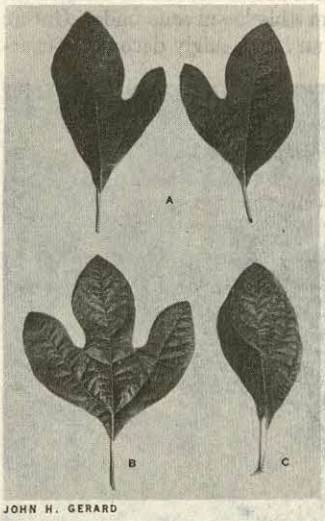
In the fur-trade days the river system served as an important transportation route and numerous forts and trading posts, such as Cumberland House, Carlton House, Ft. Pitt and Ft. Battleford, were located along its banks during the 18th and 19th centuries. It was later plied by steam-driven river boats in the early days of settlement, and in the forested area in Saskatchewan it served for log and lumber transport. It is now navigated only in its lower reaches.

Hydroelectric development on the river began in the late 1950s; *see* SASKATCHEWAN: *Power*. (C. S. BR.)

SASKATOON, a city in the province of Saskatchewan, Can., was founded in 1883 as the proposed capital of a temperance colony and named after a local edible berry (Cree *Missaskatoomina*). Pop. (1961) 95,526. It is situated on the banks of the South Saskatchewan river 150 mi. N.W. of Regina, almost at the centre of the settled area of the province. Both major Canadian railway systems serve the city and major provincial highways converge on it. It is served by Trans-Canada Air Lines and has regular air service with other Saskatchewan cities and the far north. It has daily and periodical newspaper services and television and radio stations; one radio station is French speaking to serve French communities to the north.

Its central position gives Saskatoon wide freight-control and distribution advantages in the province's famous wheat lands. It enjoyed rapid physical expansion and economic development after World War II. It is a major centre for grain storage and flour milling and also for livestock marketing and meat packing. It contains an oil refinery and iron foundries and serves a major potash-mining and refining industry in its vicinity.

It is the seat of the University of Saskatchewan and several affiliated colleges, a university hospital, a school of medicine, a teacher's college and school for the deaf, a National Research council laboratory and the Saskatchewan Research council headquarters. The university school of agriculture and experimental farm make major contributions to provincial agriculture and rural life. (C. S. BR.)



JOHN H. GERARD

SASSAFRAS (S. ALBIDUM) LEAVES. THE THREE FORMS, (A) MITTEN-SHAPED, (B) THREE-LOBED AND (C) ENTIRE, ARE OFTEN ON THE SAME TWIG

SASSAFRAS (*Sassafras albidum*), a North American tree of the laurel family (Lauraceae), called also ague tree, with aromatic bark and foliage. It is native to sandy soils from Maine to Ontario and Iowa and south to Florida and Texas. While usually a small tree, it sometimes attains a height of 80 ft. or more. It has furrowed bark, bright green twigs and entire, mitten-shaped or three-lobed leaves, the three forms often on the same twig. Yellow flowers, in small clusters, are followed by dark blue berries. The root, especially its bark, is used in household medicine and root beer; it yields oil of sassafras, used in perfume.

SASSANIDS (SASANIANS; sometimes SASSANIANS), the ruling dynasty of the neo-Persian Empire founded by Ardashir I *c.* A.D. 224 and destroyed by the Arabs during the years 637–651. The dynasty is named after Sasan, an ancestor of Ardashir I. *See* PERSIAN HISTORY: *Sasanian Empire.*

SASSARI, a town and archiepiscopal see in northwestern Sardinia, Italy, and capital of Sassari province. Pop. (1961) 90,477. It stands about 6 mi. (10 km.) from the sea on the edge of the limestone hills above the plain of the Mannu River. The town is mainly modern, but has an old quarter with narrow, winding streets which was once surrounded by walls. Notable monuments are the cathedral, with a baroque facade; the Romanesque churches Sta. Maria of Bethlehem and Sta. Donata; and the Rosello Fountain (1606), ornamented with statues representing the four seasons. The Sanna National Museum houses archaeological finds from all parts of the island belonging to the prehistoric, Phoenician, and Roman periods, and paintings by local 17th-century artists. The University of Sassari was founded in 1565. The town's industries are mainly concerned with agricultural produce. Rail and road connections link Sassari with Porto Torres, Olbia, and Cagliari. The traditional festival, the Processione dei Candelieri (Aug. 14), is held in honour of Our Lady in fulfillment of a vow made during the plague (1600).

Sassari, then called Tathari, grew in the 12th century as the coastal peoples retreated inland from the raiding barbarians. It was a free town under Pisan rule, but was ceded to Genoa after 1284. It passed under Aragon, but rebelled in 1325. In 1718 it passed with the rest of Sardinia to the House of Savoy. It suffered heavy Allied bombing in World War II.

SASSARI PROVINCE covers all of northern Sardinia, including the islands of Asinara, Maddalena, and Caprera. Area 2,903 sq.mi. (7,519 sq.km.). Pop. (1961) 373,367. It is divided into 75 communes. Agricultural activities include olive and fruit cultivation, collection of cork-bark, stock breeding, and fishing; small quantities of lead and zinc are mined. Other towns in the province include Porto Torres, Olbia, Alghero, and Tempio Pausania.

(M. T. A. N.)

SASSETTA (STEFANO DI GIOVANNI) (d. 1450) was the greatest Sienese painter of the first half of the 15th century. The date and place of his birth are uncertain, but he seems to have been trained in Siena, and the force of the Sienese tradition is evident in the surviving panels of his first commissioned work, an altarpiece for the Arte della Lana in Siena (1423–26). Thereafter he came in contact with the work of the first generation of Florentine Renaissance painters; this is reflected in the monumental altarpiece of the Madonna of the Snow, painted for Siena Cathedral in 1430–32 (Contini-Bonacossi collection, Florence), and in a Crucifix executed for S. Martino at Siena in 1433 (Chigi-Saraceni collection, Siena). From this point on, under Gothic influence, Sassetta's style assumes an increasingly decorative character, manifest initially in a polyptych in S. Domenico at Cortona (probably 1437) and reaching its climax in a cycle of scenes from the legend of St. Anthony the Abbot (Yale University Art Gallery, National Gallery of Art, Washington, and elsewhere). His best-known and most ambitious work was carried out for S. Francesco at Borgo San Sepolcro (1437–44), and was originally a double-sided altarpiece with a Virgin and Child and four Saints (Louvre, Paris, and Berenson collection, Settignano) on the front, and a celebrated panel of St. Francis in Ecstacy (Berenson collection) and eight scenes from the life of the Saint (National Gallery, London, and Musée Condé, Chantilly) on the back. These are perhaps the most eloquent interpretations of the Franciscan legend produced in the 15th century, and mark the peak of Sassetta's career as a narrative artist. Sassetta died in 1450 while engaged on a fresco of the Coronation of the Virgin on the Porta Romana at Siena (completed by Sano di Pietro).

SASTRI, SRINIVASA (VALANGIMAN SANKARANA-RAYANA SRINIVASA SASTRI) (1869–1946), liberal Indian statesman, founder of the Indian Liberal Federation, who served his country well in many important posts at home and abroad, was born of poor Brahman parents at Valangiman, near Kumbakonam, Madras, on Sept. 22, 1869. He became a schoolmaster, but his powers of oratory and his interest in public causes soon brought him national fame. In 1907 he joined the Servants of India Society and succeeded G. K. Gokhale (*q.v.*) as its president in 1915. Already a member of the Madras Legislative Council, he was elected to the central legislature in the following year. He welcomed the Montagu-Chelmsford reforms of the Indian constitution, served on Lord Southborough's franchise committee, and was elected to the new council of state. Finding himself increasingly out of sympathy with the dominant group in the Congress Party, which declined to cooperate in the reforms and preferred methods of civil disobedience, he left the party and founded the Indian Liberal Federation, of which he was president in 1922.

Abroad, he represented India in 1921 at the Imperial Conference in London, at the League of Nations Assembly at Geneva, and at the Washington Conference on the reduction of naval armaments. In 1922 the government of India sent him to Australia, New Zealand, and Canada to help make arrangements to improve the position of Indians domiciled in those countries. In 1926 he went to South Africa for a similar purpose, and in the following year was appointed the first agent general of the government of India in that country. In 1929 he was appointed a member of the Royal Commission on Labour in India. The Indian government also appointed him to report on the conditions of Indian labour in Malaya. During 1930–31 he took an active part in the Round Table Constitutional Conference in London. Finally, his concern for education was given scope with his appointment as vice-chancellor of the Annamalai University (1935–40). He died on April 17, 1946, in the Madras presidency. (KE. A. B.)

SATAN is the English transliteration of a Hebrew word for "adversary" in the Old Testament. With the definite article the Hebrew word denotes "the adversary" par excellence, mainly in the Book of Job where the adversary comes to the heavenly court with the "sons of God" (Job i, 6). His task is to roam (the Hebrew word here has a play on sounds with the word "satan") through the earth (like a contemporaneous Persian official) seeking out acts or persons to be reported adversely (to the king); his function thus is the opposite of that of the "eyes of the Lord," which roam through the earth strengthening all that is good (II Chron. xvi, 9). Satan is cynical about disinterested human goodness and is permitted to test it under God's authority and control and within the limits God sets. (As G. Papini points out, the relations in Job between God and Satan are far closer than is usually imagined; Satan, too, belongs to the spiritual and supernatural world.) (*See* JOB.)

In the New Testament the Greek transliteration Satanas is used and this usually appears as "Satan" in English translations. He is spoken of as the prince of evil spirits, the inveterate enemy of God and of Christ, with his throne among men (Rev. ii, 13), and

takes the guise of an angel of light (II Cor. xi, 14). He can enter a man and act through him (John xiii, 27), almost as the Spirit of God in Old Testament thought could clothe itself in Gideon and rush on Samson; hence a man can be called Satan because of his acts or attitude (Matt. xvi, 23). By his subordinate demons Satan can take possession of men's bodies, afflicting them (II Cor. xii, 7) or making them diseased. (Matt. xii, 26; Luke xi, 18). To him sinners are delivered for the destruction of the flesh that the spirit may be saved (I Cor. v, 5). After the preaching of the 70 disciples, during which devils were subjected to them, Jesus saw Satan fall like lightning from heaven (Luke x, 18). According to the visions in the Book of Revelation, when the risen Christ returns from heaven to reign on earth, Satan will be bound with a great chain for a thousand years, then be released, but almost immediately face final defeat and be cast into eternal punishment (Rev. xx, 2, 7–10). He is identified with the ancient serpent (Rev. xii, 9, xx, 2; *cf.* Gen. iii). His name, Beelzebul, used in the Gospels mainly in reference to demoniac possession, comes from the name of the god of Ekron, Baalzebub (II Kings i). (*See* BEELZEBUL.) He is also identified with the devil (*diabolos*), and this term occurs more frequently in the New Testament than "Satan." In the Koran the proper name Shaitan, "Satan," is used.

In Hebrew thought in the Old Testament there is no suggestion of any dualism, whether temporal, spatial or ethical. God himself forms light and creates darkness, makes weal and creates woe (Isa. xlv, 7). The evil spirit that terrifies men and leads them to murderous action is from the Lord (I Sam. xvi, 14). Hostile heathen powers could be spoken of as fighting against God and his people Israel, but they were the "rod of his anger" (Isa. x, 5), although there is an interesting interchange of God and Satan between two Old Testament writers (II Sam. xxiv, 1; I Chron. xxi, 1). There was thought to be a constant fight between light and darkness, chaos and law, life and death. Myths of which fragments survive in the Old Testament spoke of God's fight against the dragon of chaos, called Rahab or Leviathan (*e.g.*, Job ix, 13; Isa. xxvii, 1) and this fight, which took place at creation, continues constantly. Any philosophy of evil culled from the Bible must find room for evil within the concept of God and within his purpose: his sun and rain, poured out on the good and the evil, make both weeds and wheat grow.

In later Judaism, under Persian influence, a form of dualism developed, finding expression in cosmic speculation and in the idea of successive millenniums; traces can be seen in the Book of Daniel and in Revelation. Two ages or aeons of world history were spoken of as "this age" and "the age to come." In the former, the cosmic power of evil prevails, known variously in apocalyptic writings as Satan, Beliar, Mastema or Azazel, and identified with death and the evil impulse in man; this evil power will be overthrown by the messianic kingdom foretold in the Old Testament, and God will reign on a re-created earth, in paradise or in heaven. The devil and all his hosts were thought of as fallen angels who, like the heathen powers hostile to God, had lapsed through pride and envy into sin and abused their power as God's deputies. But Jewish thought did not depict the fallen angels as the strong energetic element in life, in contrast to the anemic, reasonable forces of good, as Blake accuses Milton of doing.

Persian dualism conceived of the conflict of good and evil as existent from the beginning, outside man, who could take sides and assist one or the other (*see* DUALISM). Later Jewish dualism thought man himself and all nature and creation were affected by sin and the fall of man, and needed a new creation to remove the taint of evil. This was to be achieved not, as in the Old Testament, by a new heart and spirit in man (Jer. xxxi, 33 ff.; Ezek. xviii, 31) but by a dramatic divine intervention to overthrow Satan, whether in human form as the Anti-Christ (*q.v.*) or the beast or false prophet, or as a supernatural being.

Biblical ideas, mediated through the speculation of postbiblical Judaism, were transmitted to the theology of early Christian writers, in which the figure of Satan played a large part in the discussion of the nature of evil, the meaning of salvation and the purpose and efficacy of the atoning work of Christ. Early and medieval church writers discussed at length problems raised by belief in the existence of a spiritual being such as Satan in a universe created and sustained by an all-powerful, all-wise and all-loving God. Under the influence of the 18th-century revolt against belief in the supernatural, liberal Christian theology tends to treat the biblical language about Satan as "picture thinking" not to be taken literally—as a mythological attempt to express the reality and extent of evil in the universe, existing outside and apart from man but profoundly influencing the human sphere. *See* also DEVIL.

SATARA, a town and district in the Poona division of Maharashtra, India. The town, which is the headquarters of the district, lies near the confluence of the Krishna and Venna rivers, 56 mi. (90 km.) S of Poona and 10 mi. (16 km.) SW of Satara Road Station on the Southern Railway, at a height of 2,320 ft. (707 m.) above sea level. Pop. (1961) 44,353. Satara (Hindi "seventeen") is named after the 17 walls, towers, and gates which the fort on the southern side of the town is supposed to have possessed. On the overthrow of the Yadava dynasty in the early 14th century, Satara passed under Muslim rule which was consolidated in the reign of the Bahmani kings. On their decline toward the end of the 15th century the Bijapur kings asserted their authority. Satara subsequently came under Maratha rule and was for a time capital of the Maratha kingdom. (*See* MARATHA; MAHARASHTRA.) In the mid-19th century the town and part of the surrounding area were annexed to British India and formed into Satara District, with Satara town as its headquarters.

SATARA DISTRICT. Area 4,041 sq.mi. (10,466 sq.km.). Pop. (1961) 1,430,105. After Indian independence the boundaries of Satara were enlarged by the inclusion of additional territory and the district was split into two—North Satara and South Satara. In 1960 South Satara was renamed Sangli (*q.v.*) and North Satara became known simply as Satara. The highest point in the district is Mahabaleshwar on the main range of the Western Ghats. The chief river is the Krishna, whose tributaries include the Kudali, Venna, and Urmodi. In some parts the average annual rainfall is more than 200 in. (5,080 mm.). The black, loamy clay soil grows millet, pulses, oilseed, and sugar cane. The main industries are sugar refining, engineering, and glassmaking. Cotton cloth, blankets, and brassware are also manufactured. (M. R. P.)

SATELLITE, in astronomy, a small opaque body revolving around a planet, as the moon around the earth (*see* PLANETS and the articles on individual planets). Man-made space capsules and instrument packages that are propelled into space for scientific and exploratory purposes and which then go into orbit around the earth, another planet, or the sun are also referred to as satellites (*see* SPACE EXPLORATION). In the theory of cubic curves, Arthur Cayley defined the satellite of a given line to be the line joining the three points in which tangents at the intersections of the given (primary) line and curve again meet the curve.

SATIE, ERIK ALFRED LESLIE (1866–1925), French composer whose highly individual style gives him a unique place in modern music, was born at Honfleur on May 17, 1866. He studied at the Paris Conservatoire from 1879 and later worked as a café pianist. About 1890 he became associated with the Rosicrucian movement and wrote several works under its influence, notably the *Messe des pauvres* (1895). In his 40th year, in 1905, he went to study at the Schola Cantorum under V. d'Indy and A. Roussel.

Satie made a deliberate cult of eccentricity by giving his works grotesque titles and sprinkling their pages with comical annotations, but the genuine originality of his compositions won for him the admiration of composers greater than himself, including Debussy (who orchestrated two of the *Gymnopédies* for piano) and Ravel. His *Sarabandes* (1887) and *Gymnopédies* (1888) revealed him as a pioneer in harmony. In his ballets, *Parade* (1916) and *Mercure* and *Relâche* (both 1924), he created a new style of choreographic music. He wrote little for the voice, but his masterpiece, *Socrate* (1918), for four sopranos and chamber

orchestra, on extracts from the *Dialogues* of Plato, showed that he was capable of writing deeply felt music.

Satie died in Paris on July 1, 1925.

See R. H. Myers, *Erik Satie* (1948); "Erik Satie, son Temps et ses Amis," special number of *La Revue musicale,* ed. by R. H. Myers (1952). (R. H. My.)

SATIN, one of the basic weave structures, and a fabric so constructed (*see* Weaving). The fabric has a smooth surface and usually a lustrous face and dull back; it is made in a wide variety of weights for various uses, including dresses, particularly evening wear; linings; bedspreads; and upholstery. Originally a silk fabric, it is now made of yarns of other fibres also.

SATIN SPAR, a name given to certain fibrous minerals which exhibit, especially when cut and polished, a soft satiny or silky lustre, and are therefore sometimes used as gem or ornamental stones. Such fibrous minerals occur usually in the form of veins or bands, having the fibres disposed transversely. The most common kind of satin spar is a white finely fibrous gypsum, used for beads, etc. Other kinds of satin spar consist of calcium carbonate, in the form of either aragonite or calcite (*qq.v.*).

See also Gypsum.

SATIRE, as a literary genre, may be defined as the expression in adequate terms of the sense of amusement or disgust excited by the ridiculous or unseemly, provided that humour is a distinctly recognizable element, and that the utterance is invested with literary form. Without humour, satire is invective; without literary form, it is mere clownish jeering.

The first exercise of satire no doubt consisted in gibing at personal defects. To dignify satire by rendering it the instrument of morality or the associate of poetry was a development implying considerable advance in the literary art. In the accounts that have come down of the writings of Archilochus, the first great master of satire, we seem to trace the elevation of the instrument of private animosity to an element in public life. Simonides of Amorgos and Hipponax were, like Archilochus, distinguished for the bitterness of their attacks on individuals, with which the former combined a strong ethical feeling and the latter a bright active fancy. The loss of their writings, which would have thrown great light on the politics as well as the manners of Greece, is to be lamented. With Hipponax the direct line of Greek satire is interrupted; but two new forms of literary composition, capable of being the vehicles of satire, almost simultaneously appear. Although the original intention of fable does not seem to have been satirical its adaptability to satiric purposes was soon discovered. A far more important step was the elevation of the rude fun of rustic merrymakings to a literary status by the evolution of the drama from the Bacchic festival. The means had now been found of allying the satiric spirit with exalted poetry, and their union was consummated in the comedies of Aristophanes. (*See* also Greek Literature.)

A rude form of satire had early existed in Italy in the Fescennine verses (*q.v.*), the rough and licentious pleasantry of the vintage and harvest. As in Greece, these eventually were developed into a rude drama. Verse, "like to the Fescennine verses in point of style and manner," was added to accompany the mimetic action, and these probably improvised compositions were entitled *Saturae,* a word meaning a hodgepodge, or medley.

The Romans thus originated the name, and, insofar as the Fescennine drama consisted of raillery and ridicule, essentially possessed satire; but it had not yet assumed a literary form. The real inventor of Roman satire is Gaius Lucilius (*c.* 180–*c.* 102 or 101 B.C.). The fragments of Lucilius preserved are scanty, but the verdict of Horace, Cicero, and Quintilian demonstrates that he was a considerable poet. It is needless to dwell on compositions so well known as the *Satires* of Lucilius's successor, Horace, in whose hands this class of composition received a new development, becoming genial, playful, and persuasive. The didactic element preponderates still more in the philosophical satires of Persius (A.D. 34–62). Yet another form of satire, the rhetorical, was carried to the utmost limits of excellence by Juvenal (*c.* 60–after 128), the first example of a great tragic satirist. His slightly older contemporary Martial, improving on earlier Roman models now lost, gave that satirical turn to the epigram (*q.v.*) which it only exceptionally possessed in Greece, but has ever since retained. At about the same time another variety of satire came into vogue, destined to become the most important of any. The Milesian tale, a form of entertainment probably of Eastern origin, grew in the hands of Petronius and Apuleius into the satirical romance, immensely widening the satirist's field and exempting him from the restraints of metre. Petronius' "Banquet of Trimalchio" is the revelation of a new vein, never fully worked till much later. As the novel arose upon the ruins of the epic, so dialogue sprang up upon the wreck of comedy. In Lucian, comedy appears adapted to suit the exigencies of an age in which a living drama had become impossible. With him classical satire expires as a distinct branch of literature. (*See* also Latin Literature: *The Genres: Satire.*)

In the Byzantine Empire, indeed, the link of continuity is unbroken, and such raillery of abuses as is possible under a despotism finds vent in pale copies of Lucian (*see* also Greek Literature: *Byzantine*). The first really important medieval satire, however, is a product of Western Europe, recurring to the primitive form of fable, upon which, nevertheless, it constitutes a decided advance. *Reynard the Fox* (*q.v.; see* also Fable), a genuine expression of the shrewd and homely Teutonic mind, is a landmark in literature. It gave the beast-epic a development of which classical authors had not dreamed. The medieval popular instinct, perhaps deriving a hint from rabbinical literature, fashioned Morolf, the prototype of Sancho Panza, the incarnation of sublunar mother-wit contrasted with the starry wisdom of Solomon; and *Till Eulenspiegel* (*q.v.*) is a kindred Teutonic creation, but later and less significant. *Piers Plowman* (*c.* 1370 onward), by William Langland, the next great work of the class, adapts the apocalyptic machinery of monastic and anchoritic vision to the purposes of satire. The clergy were scourged with their own rod by a poet and a Puritan too earnest to be urbane.

The Renaissance, restoring the knowledge of classical models, enlarged the armoury of the satirist. Partly, perhaps, because Erasmus himself was no poet, the Lucianic dialogue was the form in the ascendant in his age. Erasmus not merely employed it against superstition and ignorance with infinite and irresistible pleasantry, but fired by his example a bolder writer, untrammelled by the dignity of an arbiter in the republic of letters. The ridicule of Ulrich von Hutten (*q.v.*) in his contributions to the *Epistolae obscurorum virorum* (1515–17) is annihilating, and the art of putting the ridicule into the mouth of the victim is perhaps the most deadly shaft in the quiver of sarcasm. It was later used with even more pointed wit though with less exuberance of humour by Pascal. Sir Thomas More cannot be accounted a satirist, but his idea of an imaginary commonwealth (*Utopia; q.v.*) embodied the germ of much subsequent satire.

In the succeeding period politics took the place of literature and religion, producing in France the *Satyre Ménippée* (*see* French Literature: *The 16th Century: Prose*) and elsewhere the satirical romance as represented by the *Argenis* of John Barclay, which may be defined as the adaptation of the style of Petronius to state affairs. In Spain, where no freedom of criticism existed, the satiric spirit took refuge in the picaresque novel (*q.v.*), the prototype of Le Sage and the ancestor of Henry Fielding; Quevedo revived the medieval device of the vision as the vehicle of reproof; and Cervantes' immortal *Don Quixote* might be classed as a satire were it not so much more. Direct imitation of the Roman satirists first appears in English literature in the writings of John Donne, Joseph Hall, and John Marston. The development of the drama at this time probably absorbed talent that would otherwise have been devoted to satire proper. Most of the great dramatists of the 17th century were satirists, more or less, Molière perhaps the most consummate that ever existed; but, with an occasional exception, the range of their work is too wide to admit of their being regarded as satirists. The next great example of unadulterated satire is Samuel Butler's *Hudibras* (1663). Dignified political satire, bordering on invective, was carried to perfection in Dryden's *Absalom and Achitophel.* In France Boileau was long held to have attained the *ne plus ultra* of the Horatian style in

satire and of the mock-heroic, but Alexander Pope was soon to show that further progress was possible in both. The polish, point, and concentration of Pope remain unsurpassed, as do the amenity of Joseph Addison and the daring yet severely logical imagination of Jonathan Swift; while the *History of John Bull* places their friend John Arbuthnot in the first rank of political satirists (*see* also JOHN BULL).

The 18th century was, indeed, the age of satire. Serious poetry had for the time worn itself out; the most original geniuses of the age are decidedly prosaic, and Pope, though a true poet, is less of a poet than Dryden. In process of time imaginative power revived, but meanwhile Fielding and Smollett had fitted the novel (*q.v.*) to be the vehicle of satire and much besides, and the literary stage had been almost wholly engrossed by a colossal satirist, a man who dared the universal application of Shaftesbury's maxim that ridicule is the test of truth. The world had never before seen a satirist on the scale of Voltaire, nor had satire ever played such a part as a factor in impending change. As a master of sarcastic mockery he is unsurpassed; his manner is entirely his own; and he is one of the most intensely national of writers, notwithstanding his vast obligations to English humorists, statesmen, and philosophers.

English humour also played an important part in the literary regeneration of Germany, where G. E. Lessing, imbued with Pope but not mastered by him, showed how powerful an auxiliary satire can be to criticism. Another great German writer, Christoph Wieland, owed little to the English, but adapted Lucian and Petronius to the 18th century with playful if somewhat mannered grace. Goethe and Schiller, Scott and Wordsworth, were by this time at hand, and as Romantic imagination gained ground satire declined. Byron, who in the 18th century would have been the greatest of satirists, was hurried by the spirit of his age into passion and description, bequeathing, however, a splendid proof of the possibility of allying satire with sublimity in his *Vision of Judgment*. Two great satiric figures remain—one representative of his nation, the other most difficult to class. In all the characteristics of his genius Thackeray is thoroughly English; his satire is a thoroughly British article, a little solid, a little wanting in finish, but honest, weighty, and durable. But Heine hardly belongs to any nation or country, time, or place. In him the satiric spirit, long confined to established literary forms, seems to obtain unrestrained freedom.

In no age was the spirit of satire so generally diffused as in the 19th century, but many of its eminent writers, while bordering on the domains of satire, escape the definition satirist. The term cannot be properly applied to Dickens, the keen observer of the oddities of human life; or to George Eliot, the critic of its emptiness when not inspired by a worthy purpose; or to Balzac, the painter of French society; or to Trollope, the mirror of the English middle classes. If *Sartor Resartus* could be regarded as a satire, Carlyle would rank among the first of satirists; but the satire, though obvious, rather accompanies than inspires the work.

The number of minor satirists of merit, on the other hand, is legion. James Russell Lowell's *Biglow Papers* represent perhaps the highest moral level yet attained by satire. W. H. Mallock, in his *New Republic*, made the most of personal mimicry, the lowest form of satire; in *Erewhon* (1872) Samuel Butler held an inverting mirror to the world's face with imperturbable gravity; the humour of George Bernard Shaw had always an essential character of satire—the sharpest social lash. One remarkable feature of the period was the union of caricature with literature.

In the 20th century, although pure satire was developed by Aldous Huxley and George Orwell, the prevailing mood was ironic or sardonic rather than satiric. Evelyn Waugh, who began as a pure satirist, with *Decline and Fall* (1928), later became increasingly depressed at declining standards: the title of the last volume of his war trilogy (*Unconditional Surrender*, 1961), indicates something of the resigned acceptance of moral and spiritual impoverishment that is the negation of the true satirist's art.

(R. G.; X.)

SATNA, a town in Madhya Pradesh, India, and the headquarters of the district of the same name. Pop. (1961) 38,046. It is situated on Vindhyan outcrop at a height of 821 ft. (250 m.) above sea level on the left bank of the Tons River, a tributary of the Ganges. Satna is connected by rail with Allahabad, 104 mi. (167 km.) to the north, and Katni, 61 mi. (98 km.) to the south. Metaled roads radiate from the town toward Rewa, Katni, and Chhatarpur.

SATNA DISTRICT is mostly hilly country. Area 2,823 sq.mi. (7,312 sq.km.); pop. (1961) 694,370. In the north a conspicuous feature of the district is the Panna Hills, which are famous for their diamonds. The Tons River, with its tributary, drains the area in a northeasterly direction. Cultivation is carried on in shallow depressions covered mostly with laterite soil. The chief crops are millets, maize (corn), pulses, oilseeds, and fodder. Most of the population is engaged in agriculture, but a large number work in the stone quarries. Many of the inhabitants of the hilly areas are tribesmen, such as the Gonds. (M. N. K.)

SATPURA RANGE, a line of hills between the Narbada (Narmada) and Tapti rivers in central India. It is the western element of an upland series known collectively as the Satpura Line and including the Mahadeo Hills, Maikal Range, and Chota Nagpur Plateau. Stretching westward from about longitude 85° 5′ E almost to the shores of the Gulf of Cambay, this line is usually regarded as the northern limit of the Deccan Plateau or Peninsular India. Historically it was important as a barrier to the southern advance of the Aryan invaders, and it forms the dividing line between Aryan and Dravidian India. The range proper is about 200 mi. (320 km.) long and reaches heights of about 4,000 ft. (1,200 m.) It is mainly composed of Deccan lavas and is forested. Plateaulike in form, it is bordered by steep scarps on both north and south. The main railway from Bombay to the middle and lower Ganges crosses a low section of the range between Burhanpur and Khandwa. Farther west the main Bombay-Indore road crosses the range. (T. HER.; L. D. S.)

SATRAP, a hellenized rendering of Median *Khshathrapavan*, "protector of the kingdom," the title of provincial governors in the Persian Empire under Achaemenid rule. The division of the empire into provinces was begun by Cyrus the Great (559–530 B.C.) and completed by Darius I (522–486 B.C.), who established 20 satrapies and fixed their annual tribute. Their boundaries varied from time to time and on occasion two or more might be united under a single governor. Each satrapy was divided into districts under subordinate governors, also called satraps. The satraps, appointed by the king, normally were members of the royal family or Persian nobility. They held office indefinitely, often retaining their position through more than one reign; some were hereditary. The satrap was head of the administration of his province and was assisted by a council of Persians, to which provincials were admitted. He controlled

local officials, collected the taxes, and was the supreme judicial authority. He was responsible for internal security and the safety of the roads and raised and maintained his army. He conducted wars with neighbours and engaged in diplomatic relations with foreign states, although major matters of policy were referred to the king. To guard against abuse of powers, Darius instituted a system of controls over the satrap. His secretary, chief financial official, and the commander of the garrison troops stationed in the province were directly responsible to the king, and periodical inspections were carried out by royal officials, especially "the king's eye," who traveled with their own military escort. With the weakening of central authority, however, the satraps often enjoyed practical independence, and after the mid-5th century their rebellions became frequent. The satrapal administration was retained by Alexander the Great and his successors, especially in the Seleucid Empire, but the provinces were smaller than under the Achaemenids. (J. M. M.-R.)

SATU MARE, a town and administrative centre of Satu Mare district in Maramureş *regiunea* of northwestern Rumania, lies near the border of Hungary on the right bank of the Someş River, 80 mi. (129 km.) NNW of Cluj. Pop. (1963) 63,656. Satu Mare was mentioned in the 14th century, and in 1599 Michael the Brave, of Walachia, rallied his army there to reconquer Transylvania (*q.v.*), which was then part of Hungary. In the town are an old palace, a state theatre, and several museums and libraries. It is a commercial centre and has industries that include machine building, metalworking, and the manufacture of textiles (lace, silk, and cotton fabrics). The town is an important railway junction with connections to Hungary and the Ukrainian Soviet Socialist Republic, U.S.S.R.

SATURN (SATURNUS), a Roman god whose cult was so overlaid with Greek features as to obscure his original native character. His name is commonly connected with Latin *satus*, and thus he is a god of sowing or seed. The ancients themselves regarded him as an importation and equated him with the Greek Cronus (*q.v.*), which may well be correct; there is some linguistic evidence (disregarding the connection with *satus*) that he came to Rome through Etruria. Further, he was worshiped in the Greek manner (*i.e.*, with head uncovered and not wrapped in the toga as was the Roman custom).

The remains of his temple at Rome, eight columns of the pronaos, still dominate the west end of the Forum at the foot of the *clivus Capitolinus*. The present remains are of a later rebuilding, but it was the oldest temple whose building is recorded, going back to the beginning of the republic. It served as the treasury (*aerarium Saturni*) of the Roman state. Saturn's cult partner is the obscure goddess Lua, whose name is connected with lues (plague or destruction) and to whom captive arms were sometimes burned. But he was also associated with Ops, the cult partner of Consus, through her identification with Rhea, wife of Cronus.

His great festival, the *Saturnalia,* became the most popular of Roman festivals, and its influence is still felt throughout the western world. Originally on Dec. 17, it was extended first to three and eventually to seven days. The date has been connected with the winter sowing season, which in modern Italy varies from October to January. Remarkably like the Greek Kronia (*see* CRONUS), it was the gayest festival of the year. All work and business were suspended. Slaves were given temporary freedom to say and do what they liked, and certain moral restrictions were eased. The streets were infected with a Mardi Gras madness; a mock king was chosen (*Saturnalicius princeps*); the seasonal greeting *io Saturnalia* was heard everywhere; presents were freely exchanged, principally wax candles and little clay dolls (*sigillaria*). The cult statue of Saturn himself, traditionally bound at the feet with woolen bands, was untied, presumably to come out and join the fun. The influence of the *Saturnalia* upon the celebrations of Christmas and the New Year has been direct. Concerning the gift candles, the ancients had a quaint story that an old prophecy bade the earliest inhabitants of Latium send heads to Hades and *phota* to Saturn; that they interpreted this to mean human sacrifices, but that Hercules advised using lights (*phos* means "light" or "man" according to accent) and not human "heads."

Another tradition regarding Saturn, fostered chiefly by the poets, made him an early Italian king, or perhaps Cronus in flight from Zeus, who established in Italy a new height of civilization (*Saturnia regna*) and a Golden Age (*aurea saecula; cf.* Virgil, *Aeneid,* viii, 319 ff.). Saturday of course was named for Saturn (*Saturni dies*).

(R. B. Ld.)

SATURN is unique as being the only planet shown by telescopes to be encircled by a bright ring system. The Babylonians noted that Saturn moved more slowly against the background of the "fixed" stars than did the other planets visible to the naked eye; therefore, until the discovery of Uranus in 1781, it was thought to be the most remote planet, and it is in fact the sixth major planet in order of distance from the sun, the earth being the third. Saturn's mean distance from the sun is about 886,000,000 mi., and its period of revolution round the sun is nearly 29½ years. Its mean synodic period (interval between successive oppositions) is 378 days. Its least distance from the earth is about 744,000,000 mi., and its greatest about 1,028,000,000 mi. At opposition its light takes about 72 minutes to reach the earth. To the naked eye Saturn, at opposition, always appears as a star brighter than first magnitude; and at a close opposition, with its rings fully opened, it can appear three times as bright as at a distant one with its rings edgewise.

Description of the Globe.—When viewed through a telescope Saturn's globe strongly resembles Jupiter's, but is yellower in colour. It is even more flattened at the poles, its polar and equatorial diameters being respectively about 67,000 mi. and 75,000 mi.; it is less bright near the margin of its disk than at the centre; and its surface shows dusky, cloudlike belts with light zones between them; however, Saturn's belts are usually feeble and ill-defined, compared with those of Jupiter.

The volume of Saturn is about 744 times that of the earth, but its mass is only about 95 times the earth's mass. Therefore, Saturn's mean density is but 13 per cent that of the earth; *i.e.*, about 0.7 times that of water.

Rotation.—The infrequent occurrence of spots on Saturn long delayed determination of the period in which it rotates on its axis. What is observed from the earth is the gaseous envelope of the planet and not its solid core; and the rotation period of this gaseous atmosphere is not uniform but varies according to latitude. In 1794 William Herschel derived a value of 10 hr. 16 min. by noting variations of width and darkness in the planet's southern belts. The accepted period, 10 hr. 14 min., for Saturn's equatorial region is based on the value (10 hr. 14 min. 24 sec.) derived by Asaph Hall from a brilliant white spot which he discovered in 1876, and has been confirmed within about 1 min. by observations of subsequent spots, including those of the brilliant white spot discovered by Will Hay in 1933. Spectrographic observations (1936–37) by J. H. Moore at the Lick Observatory, Calif., confirmed that Saturn's rotation is slower at medium than at low latitudes, and suggested an even slower rate at high latitudes; but in 1960 a conspicuous white spot on the edge of the north polar region discovered by J. H. Botham (Johannesburg, S.Af.) gave a period of 10 hr. 39 min. for latitude +60°, almost the same period as that found in 1903 for spots at latitude +36°. A. Dollfus showed by polarimetric measures that the 1960 spot was at high altitude in Saturn's atmosphere.

Physical Conditions.—In 1923 H. Jeffreys showed on theoretical grounds that Saturn and the other outer planets, previously assumed to be hot and gaseous, are more probably cold and solid. Radiometric measures by W. W. Coblentz and C. O. Lampland verified this, indicating a surface temperature for Saturn of about −150° C (−238° F). This extremely low temperature, with the low mean density, suggested that much of Saturn's apparent globe consisted of a deep atmosphere and that a layer of frozen gases covered the solid surface.

The nature of the atmosphere was revealed in 1932–34 when R. Wildt, V. M. Slipher, and T. Dunham, Jr. proved mathematically

and by laboratory experiment that the dark absorption bands (discovered by A. Secchi 70 years before) in Saturn's spectrum resulted chiefly from methane; weak absorption bands indicated the presence of ammonia. Saturn's atmosphere therefore consists mainly of methane, hydrogen, and helium, most of the ammonia being frozen out at the planet's low temperature.

In 1951–52 W. H. Ramsey showed that the low mean density of Jupiter and Saturn in proportion to their mass could only be accounted for by assuming that they are hydrogen planets, *i.e.*, having abundant hydrogen in their atmosphere and with a solid globe consisting mostly of metallic hydrogen, heavier elements being strongly concentrated in a small central core. Saturn would thus have a hydrogen content of 62–69% by mass.

The Rings.—*Discovery of the Rings.*—A strangeness in Saturn's appearance was noted at once by Galileo when he first observed the planet with his small telescope in 1610; however, his instrument was too weak to reveal the narrower parts of the ring next to the globe, and so he thought that the system was a triple planet consisting of a large body with a small attendant on each side. But the "attendants" had dwindled and disappeared by 1612 (when the rings had turned edgewise to the earth), and Galileo feared that he had been misled by an illusion. They later reappeared and continued to puzzle astronomers for nearly 50 years, for they generally looked like handles ("ansae") attached to the sides of the globe. Curious drawings by P. Gassendi, G. Riccioli, J. Hevel, and others showed how puzzled the observers were and also how near some of them came to solving the mystery.

In 1655 Christiaan Huygens, having discovered Saturn's satellite Titan with its approximately 16-day revolution around the planet, inferred a rotation of Saturn itself in less than 16 days and found the true explanation of its variable appearance. To secure priority for his theory while giving himself more time for observational tests, he published the key sentence of it as an anagram (1656). This sentence, published in 1659 in his *Systema Saturnium* with a full discussion, was: *Annulo cingitur, tenui, plano, nusquam cohaerente, ad eclipticam inclinato* ("It is girdled by a thin, flat ring, nowhere touching, inclined to the ecliptic"). It was the fixed inclination of the ring-plane (about 28° to the ecliptic and about 27° to Saturn's own orbit) that explained the striking changes in the planet's appearance so perplexing to other astronomers, though some at first rejected Huygens' theory.

At two opposite points of Saturn's orbit (near its heliocentric longitudes 172° and 352°, where Saturn is in the constellations Leo and Aquarius, respectively), the earth passes through the planet's ring-plane. When this occurs, the ring becomes exactly edgewise to the earth, and, because of its thinness, disappears from view, even (for a few hours) in powerful telescopes. These edgewise epochs occur at alternate intervals of about $13\frac{3}{4}$ and $15\frac{3}{4}$ years, and at each epoch the earth may pass once or three times through the ring (*e.g.*, 1937, once; 1950, once; 1966, three times; 1979–80, three times; 1995–96, three times). Between one edgewise epoch and the next, the ring appears to open out for some years, thereafter closing gradually again. Fullest opening, at an angle of $26\frac{1}{2}$°, occurs when Saturn is in Taurus-Gemini and in Ophiuchus-Sagittarius, the ring then covering most of one hemisphere of the globe, and, behind the other hemisphere, projecting beyond the polar limb.

Divisions of the Rings.—In 1675 G. D. Cassini made the important telescopic discovery of a black line, now known as "Cassini's division," dividing the ring into two concentric rings. A century later William Herschel proved this to be a gap dividing the ring into two parts: an outer ring (A) and an inner ring (B). Ring A is narrower and less bright than B, the outer part of which is the most brilliant part of the system.

TABLE I.—*Dimensions of Saturn's Ring System*

Ring	Exterior diameter (mi.)	Breadth of ring (mi.)
A	169,300	10,000
B	145,500	16,500
C	112,600	10,000

FROM "ASTRONOMY" BY R. H. BAKER (D. VAN NOSTRAND COMPANY, INC.)

PHASES OF SATURN'S RINGS

The discovery of a third, innermost ring, C, a dusky, semitransparent, continuous ring in both ansae and across the disk, was made in 1850 at Harvard College Observatory by W. C. and G. P. Bond, whose assistant C. W. Tuttle pronounced it a third ring; and independently in England by W. R. Dawes, whose friend W. Lassell named it the "crepe ring." It had probably been seen across the disk, but not in the ansae, and taken to be an atmospheric belt, by Herschel and other earlier astronomers. From the early 19th century many observations have been made in the ansae of various concentric markings rather similar to Cassini's division, but narrower and less dark. Their reality has been much debated. It seems likely that some at least are real markings, but merely ripples, light minima, or edges of shaded areas, and not gaps through the rings.

The breadth of Cassini's division is estimated at 1,750 mi. The total span of the ring system is nearly 170,000 mi. The system is very thin, being probably less than 10 mi. thick. Though casting a strong shadow on the globe, it is at least partly transparent.

When the rings are nearly edgewise to earth and sun, curious lighting and colour effects can be seen. With sun and earth both at low elevation from the ring-plane and on opposite sides of the plane, the dark face of the rings, wide and black across the disk, has appeared on each side against the sky as a faint, ghostly line with two bright condensations on each ansa due to the filtering of sunlight through the crepe ring and the Cassini division.

Nature of the Rings.—In 1785 P. S. Laplace proved that the continued existence of wide, solid rings round Saturn was a physical impossibility. But it took the discovery of the diaphanous crepe ring in 1850 to rouse mathematicians to try to find out the true nature of the rings. Success came in 1857 when J. Clerk Maxwell proved mathematically that the rings must consist of myriads of discrete particles, each orbiting Saturn in accordance with the law of gravitation—a theory suggested (without proof) by G. D. Cassini. In 1895 J. E. Keeler, by photographing the spectrum across the globe and rings and examining the shift of its lines resulting from Saturn's rotation, directly proved Maxwell's hypothesis. He found that the inner edge of ring B was rotating faster than the middle, and the middle of that ring faster than its outer edge, exactly contrary to the way in which a solid ring rotates. It was later found that the rotation period of the outer edge of ring A was more than twice as long as that of the inner edge of ring C. Direct observational proofs of the nonsolidity of the bright rings were obtained with rather small telescopes: in 1917, when M. A. Ainslie and J. Knight independently watched the passage of a seventh-magnitude star behind ring A, and in 1920, when W. Reid and others at Rondebosch, S.Af., made a similar observation of a star behind ring B.

Other studies of the rings have shown: (1) that Cassini's division is due to the attractions on the ring particles by Saturn's inner satellites (especially Mimas, *see* below), and that these attractions could theoretically cause narrower gaps or thinnings to occur at certain other places in the rings; (2) that the greater brightness of parts of the rings is due to greater crowding of the particles and not to differences in the types of particles; (3) that frequent collisions among the particles have probably reduced them to fine dust; (4) that they may be ice crystals; and (5) that they are unlikely to be spherical in shape. In 1958 A. Dollfus deduced, from the polarization of light on ring B, that its particles are probably cigar-shaped or elliptical, each with major axis parallel to its orbit.

TABLE II.—*Saturn's Satellites*

Name	Distance from Saturn's centre (000 mi.)	Synodic period of revolution				Inclination of orbit to Saturn's equatorial plane (degrees)	Eccentricity of orbit	Visual magnitude at mean opposition	Diameter (mi.)	Discoverer and year of discovery	
		days	hr.	min.	sec.						
Janus	95		17	58	30	27.0	0.000	14.0	300	A. Dollfus	1966
Mimas	115		22	37	12	1.5	0.0202	12.1	300	W. Herschel	1789
Enceladus	148	1	08	53	22	0.0	0.0045	11.8	400	W. Herschel	1789

Sources: *British Astronomical Association Handbook*, 1965; A. F. O'D. Alexander, *The Planet Saturn*, 1962.

The Satellites.—Saturn has ten satellites (*see* Table II). J. Herschel chose mythological names for eight of them. W. H. Pickering, who discovered and named Phoebe, announced in 1905 a tenth (Themis) whose existence was never confirmed. However, in 1966 A. Dollfus photographed Saturn while the earth was passing through the plane of the planet's rings. At that time, when the light from the rings was minimized, he discovered in the ring plane the tenth satellite, which he named Janus.

The seven inner satellites (Janus to Titan inclusive) have almost circular orbits nearly in the plane of Saturn's equator. Hyperion's orbit is eccentric with a small but variable inclination; that of Iapetus is highly inclined but almost circular; while Phoebe's is eccentric, very highly inclined, and retrograde.

Titan, the brightest, largest, and most massive of Saturn's satellites, is the only one in the solar system that has been proved to possess an atmosphere. In 1943–44 Kuiper photographed its spectrum, using the 82-in. reflector of McDonald Observatory, Tex., and found striking evidence of methane and a suspected ammonia band. Iapetus has the peculiarity of always appearing about two magnitudes brighter at its western elongation than at its eastern elongation from Saturn. Cassini drew attention to this in 1672, the year after he discovered Iapetus, and suggested that one half of its surface must reflect sunlight better than the other, and that Iapetus, like the earth's moon, must present always the same face to its primary planet. A century later William Herschel, after many observations, endorsed both the peculiarity and Cassini's explanation of it.

Phoebe, extremely remote from Saturn, was the first satellite of any planet to be detected by photography and the first to be discovered from the southern hemisphere (at Arequipa, Peru). Its positions, however, were at first difficult to determine because of the myriads of Milky Way stars showing on successive photographic plates. Transits of satellites across the face of Saturn (except of Titan and its shadow) are difficult to observe, and infrequent, as are eclipses of the satellites.

(A. F. O'D. A.)

SATURNIID MOTH, any of about 800 species of chiefly large, broad-winged moths of the family Saturniidae, commonly called giant silkworm moths. Although they are almost worldwide in distribution, most of the species are found in the tropics, especially in South America and tropical Africa. These night flyers are frequently vividly coloured and often remarkably patterned. Certain Asian kinds, called wild silkworms, spin a commercially valuable silk—a product not so fine, however, as that spun by the common Chinese silkworm (*Bombyx mori*) of another family (*see* SILK).

The Saturniidae includes some of the largest insects; a few tropical specimens have a wingspan of about 9 in., whereas those in North America are smaller, having wingspans up to 6 in. The larvae are large, usually green, caterpillars, most of which have colourful knobs or spines and, in many American sorts, irritant barbs. They are voracious leaf-eaters as caterpillars, but, unlike many other moths, the Saturniidae never feed after they have obtained wings.

Some species have been used for commercial silk from time immemorial and the silkworm which Aristotle cited (his *nekydalos*) as a familiar example of metamorphosis was almost certainly *Saturnia pyri*. Saturniids are used in the modern silk industry only in southeast Asia, and only the tussah silkworm (*Antheraea pernyi*) and the eria, ailanthus or cynthia moth (*Samia cynthia*) have been used long enough to break into cultivated varieties. The North American polyphemus moth (*Antheraea polyphemus*) would be as useful in the silk industry as is the tussah, except for the cost of labour. Being large, handsome and often easy to rear, saturniids are favourites with amateur lepidopterists. They have also served as subjects in studies on hybridization and variation; more recently, the giant cecropia moth (*Hyalophora* or *Platysamia cecropia*) has been used extensively in studies on endocrine control of transformation and hibernation.

Other members of the family include the emperor moth (*Saturnia pavonia*) of temperate Europe and Asia; the yellow (male) or reddish (female) io moth (*Automeris io*), the bright grass-green luna moth (*Actias luna*) and the maroon (female) to blackish (male) promethea moth (*Callosamia promethea*), all found in North America. The genera *Rothschildia* and *Copiopteryx*, common to South America, are among the most beautiful of the saturniids.

(W. T. M. F.)

SATURNINUS, LUCIUS APPULEIUS (d. 100 B.C.), with Gaius Servilius Glaucia, was a political opponent of the Senate at Rome from 104 to 100 B.C., at first on behalf of and with the cooperation of Gaius Marius (*q.v.*). He was quaestor in 104. As tribune in 103 he bid for the support of the proletariat in Rome by a law which reduced the price of the monthly grain ration from 6⅓ *asses* to the uneconomic figure of ⅝ of an *as* per measure. By another bill he assigned grants of land in Africa, amounting to a little over 60 ac. per man, to the soldiers discharged after service in the Jugurthine War. He established the first permanent court to try charges of treason (*quaestio maiestatis*); secured the exile of Gnaeus Mallius Maximus, consul of 105, for his defeat by the Cimbri at Arausio (*see* ARAUSIO, BATTLE OF); and, perhaps wishing to emphasize some resemblance between his own acts and the reforms of the Gracchi, encouraged the claim of L. Equitius to be a son of Tiberius Gracchus.

The conservative censors of 102 (Metellus Numidicus and his cousin Metellus Caprarius) tried unsuccessfully to expel Saturninus and Glaucia from the Senate. The support of the *equites* (*q.v.*) having been secured by the bill of Glaucia as tribune (probably in 101) restoring to them the exclusive right of constituting the juries in the permanent courts, Saturninus was acquitted on a capital charge resulting from his public allegation that senators had taken bribes from envoys of Mithradates VI Eupator, king of Pontus. In 100 Saturninus was tribune again, Marius consul for the sixth time, and Glaucia praetor. The crisis came with Saturninus' proposals for land allotments in Transalpine Gaul for Marius' soldiers discharged after service in the Cimbric War, and for Latin colonies in Sicily and Macedonia-Achaea. The agrarian bill was passed with a stipulation that senators should swear within five days to observe it; Metellus Numidicus refused, and went into exile.

Saturninus was elected tribune again for 99, with L. Equitius, but Marius was now alive to the danger of his extremist policy. The consular elections (for which Glaucia's candidature was disallowed) broke down in disorder, and Gaius Memmius, a candidate,

was murdered. The Senate passed the last decree (*senatus consultum ultimum*), and on Dec. 10, the first day of the new tribunes' office, Saturninus and Glaucia, who, with their gangsters, had seized the capitol, were forced to surrender and were locked in the Senate house, whose roof was then torn off and they were stoned to death. (Among the executioners was Gaius Rabirius, who was tried for treason on this account and defended by Cicero 37 years later.) Saturninus' offensive legislation was rescinded after his death.

Although surviving accounts of Saturninus derive from hostile sources, it is clear that he lacked the integrity and statesmanship of Gaius Gracchus, in whose steps he followed.

Last in *Cambridge Ancient History*, vol. ix, ch. 4 (1932); E. Badian, *Foreign Clientelae* (1958); H. H. Scullard, *From the Gracchi to Nero* (1959). (J. P. V. D. B.)

SATYRS AND SILENI, in Greek mythology, creatures of the wild, part man, part beast, who in classical times were closely associated with Dionysus. Their Italian counterparts were the Fauns (*see* FAUNUS). Satyrs and Sileni are not mentioned in Homer, but they occur in art and literature from the archaic period, at first represented as uncouth men, each with horse's tail and ears and erect phallus. The occurrence of two different names for these creatures has been explained by two rival theories: that Silenus is the East Greek and Satyr the mainland name for the same mythical being, or that the Sileni were part horse and the Satyrs part goat. But it is difficult to make either theory fit all the examples in early art and literature. The type with goat's legs and tail appears to have been developed from the mid-5th century B.C. under the influence of Pan (*q.v.*). Also from the same period the name Silenus was applied to Dionysus' foster father, treated by the youthful Satyrs as representing the older generation. This was part of the gradual absorption of these creatures into the Dionysiac cult. In the Dionysiac festival at Athens the three tragedies were followed by a satyr play (*e.g.*, Euripides' *Cyclops*), in which the chorus was dressed to represent Satyrs (*see* DRAMA: *Greek Drama: Origins*). This play was a parody of the heroic legends, and the chorus of Satyrs was cowardly, lecherous, and wine-bibbing; but Silenus, although bibulous, also appears in legend as a dispenser of homely wisdom. In the story of Midas, Silenus when drunk strays into Midas' rose garden and is kindly treated, being finally restored to Dionysus, who in gratitude grants Midas the magic gift of producing gold at a touch.

In art the Satyrs and Sileni are depicted in company with nymphs or Maenads whom they pursue. Praxiteles represented a new artistic type in which the Satyr is young and handsome, with the smallest vestiges of animal parts but more graceful and fanciful than the classical ideal of manhood. Hellenistic art developed this concept into humorous or forceful representations of half-animal subjects as an escape from the merely human.

SAUD (SA'UD IBN 'ABD AL-'AZIZ IBN 'ABD AL-RAHMAN AL SA'UD) (1902–), son and successor of Ibn Saud (*q.v.*), ruled over Saudi Arabia as King Saud IV from 1953 to 1964. He was born in Kuwait early in 1902. After Ibn Saud had conquered the Hejaz (1925) he made his two eldest living sons, Saud and Faisal, his deputies in Najd and Hejaz respectively. Saud's primary responsibility was for the Bedouin. He was named crown prince in 1933, and he and Faisal led the successful campaign against Yemen in 1934. When Ibn Saud established a Council of Ministers (1953), Saud became its president. In November 1953 he became king, with the support of all his brothers.

King Saud made several journeys abroad—to Europe, the United States, and to nearby Arab countries. He also made periodic tours of Saudi Arabia. At home he expanded his father's program of modernization, with special emphasis on increased medical facilities and education. The first secular university was established at Riyadh (1957), staffed with Egyptian professors, and the first girls' schools were authorized by royal proclamation (1959).

In foreign affairs, King Saud continued his father's policies of friendship with the United States; suspicion of Communism; friendship with all Arabs; and firm opposition to Israel. The Anglo-Saudi dispute over the Buraimi oasis continued, and arbitration at Geneva failed (1955), but diplomatic relations between the two countries, severed in 1956, were resumed in 1963. In 1958, for the primary purpose of restoring the shaken financial stability of Saudi Arabia, the king reorganized and put new life into the Council of Ministers. Faisal, the crown prince and foreign minister, was given full executive powers as president of the council. The king resumed power in December 1960. During 1963 he spent months abroad for medical treatment, and serious dissension developed between him and Faisal. In March 1964 all powers were transferred to Faisal as viceroy of the kingdom; and on Nov. 2 King Saud was deposed, as a result of decisions taken by the supreme Council of the Religious Leaders, senior members of the royal family, and the Council of Ministers. Faisal (*q.v.*) became king, and Saud formally abdicated in January 1965. (C. P. H.)

SAUDI ARABIA (AL MAMLAKAH AL-'ARABIYAH AS-SA'UDIYAH), a kingdom of southwest Asia, ruled by the house of Sa'ud in the 18th century and founded in the 20th century as a modern kingdom by 'Abd al-'Aziz II ibn Sa'ud, occupies most of the Arabian Peninsula. The kingdom is bounded north by Jordan, Iraq, and Kuwait, with two areas of neutral territory west and south of Kuwait; west by the Gulf of Aqaba and the Red Sea; south by Yemen and the Protectorate of South Arabia; southeast by Muscat and Oman; east by Trucial Oman (Trucial States), Qatar, and the Persian Gulf. Its boundaries with Yemen in part and with its southern and eastern neighbours have never been fixed. The total area is 872,722 sq.mi. (2,260,353 sq.km.). The capital is at Riyadh.

PHYSICAL GEOGRAPHY

The ancient Arabian shield of igneous and metamorphic rocks protrudes eastward from Hejaz (Al Hijaz) into Najd (Nejd) as a bulge curving round from the Gulf of Aqaba to a point less than 125 mi. (201 km.) W of Riyadh and then receding toward the southern Red Sea. The shield contains many extinct volcanoes surrounded by lava beds. Sloping eastward are the newer sedimentary areas in which rich oil fields are found. The shield gives symmetry to the landscape, as many escarpments and sand deserts follow its contour.

Saudi Arabia's coastline on the Gulf of Aqaba and the Red Sea is more than 1,100 mi. (1,770 km.) long; its Persian Gulf coastline, though of undetermined length, is somewhat shorter. Neither side has deep natural harbours. Islands and coral reefs in the Red Sea are numerous, particularly in the Farasan Bank, which runs along the Saudi Arabian coast for over 300 mi. (480 km.). In the Persian Gulf the ownership of various islands is in dispute between Saudi Arabia, on the one hand, and Kuwait, Iran, or Abu Dhabi (one of the Trucial States), on the other. A treaty signed in 1958 established a water boundary between Saudi Arabia and Bahrain.

Saudi Arabia's highest mountains are in 'Asir (*q.v.*) where peaks rise to over 9,000 ft. (2,750 m.). The mountains of Al Tubayq dominate the undefined border between Jordan and Saudi Arabia east of Aqaba. Southeast of Jabal Shammar (*q.v.*) province escarpments parallel the bulge of the shield, the most prominent being Jabal Tuwayq, 800 mi. (1,300 km.) long from north to south. The Red Sea coast plains are narrow, whereas plains in the central and eastern regions sometimes stretch over great distances. In the north the Syrian Desert reaches down into Saudi Arabia. The largest sand deserts lie east of the shield: the Great Nafud in the north and the Rub' al Khali (the Empty Quarter) in the south, connected by the Ad Dahna sand belt.

The 'Asir mountains constitute the only area in the kingdom receiving adequate rainfall. Virtually all the rest of the country is desert, apart from scattered oases fed by underground water sources or flash floods. Winters are cool, and spring and fall days are often agreeable, but spells of good weather are interspersed with gusts or storms of swirling dust and sand. The fierce summer heat, tempered by aridity in the higher regions of the

interior, is aggravated along the coasts by high humidity. *See* also ARABIA: *Regional Geography.* (G. S. RE.)

PEOPLE AND POPULATION

In 1963 the population of Saudi Arabia was estimated at 6,600,000. There are no verified figures of the exact population, as no accurate census has been taken. It is estimated that 50% of the population is nomadic, and it is probable that both the town estimates and the estimated proportion of nomads are higher than a census would prove. Recent estimates of the principal cities are: Riyadh (170,000); Mecca (160,000); Jidda (148,000); Medina (72,000); Al Hufuf (Hofuf) (100,000); At Ta'if (54,000); Abha (25,000); Ad Dammam (30,600); Al Qatif (30,000); Buraydah (Buraida) (30,000); Ha'il (30,000); Al Khubar (20,000); 'Unayzah (Anaiza) (25,000); Dhahran (12,000); Ras Tanura (15,000); Al Qunfudhah and Najran (10,000 each).

Arabs, like the people of Europe and America, are of the Caucasian family but there are some of Negroid ancestry because of past importations of Africans. The Saudi Arabs recognize no colour line, and mixed racial strains abound in Saudi Arabia, especially in the Red Sea coastal plain called the Tihamah. But on the interior plateau of Najd, the hue of the Najdis and Bedouin in general is largely the brown Mediterranean type. The colouring of the people in towns varies from white to light brown. The Arab population are predominantly Sunni Muslims who mostly adhere to the Wahhabism (puritanical) interpretation. (*See* ISLAM.) There are no native Christians or Jews, but several thousand Christians (U.S., European, and Arab) are employed in the oil industry. Jews are barred from Saudi Arabia, and non-Muslims are forbidden to enter the sacred cities of Mecca and Medina (*qq.v.*).

The creation of industries and the enormous development of the Arabian American Oil Company (Aramco) have been responsible for the growth of population (since 1945) in the cities of Jidda, Riyadh, Dhahran, Ad Dammam (*qq.v.*), Al Khubar, and Al Qatif, where the increase has been two- to tenfold.

For anthropology, *see* ARABIA: *The People;* ARAB; BEDOUIN. For language, *see* ARABIC LANGUAGE. (K. S. TW.)

HISTORY

For archaeology, exploration, and early history *see* ARABIA. The history of Saudi Arabia begins properly on Sept. 18, 1932, when by royal decree of King 'Abd al-'Aziz II ibn Sa'ud the dual kingdom of Hejaz and Najd (*qq.v.*) with its dependencies, administered since 1927 as two separate units under slightly different systems, was unified under the name of "The Kingdom of Saudi Arabia." The change was far from being purely nominal, though no attempt was made to "liberalize" the supreme authority of the king as the absolute monarch of the new regime. It did, however, represent a substantial change of direction, or attitude, in the domestic and foreign policies of the realm. Until 1926, when Ibn Saud had finally extended his power over the whole of inner Arabia, the country had remained in almost total isolation from the rest of the world because of its poverty, its desert character, and its fanatical religious xenophobia. The only foreign countries with which Ibn Saud was acquainted were Turkey and Great Britain; but the conquest of Hejaz had brought him into contact with other powers, and the new circumstances compelled him to take stock of his position. It was the U.S.S.R. which took the lead in recognizing his new status. Britain and France did the same soon afterward. (*See* also IBN SAUD.)

Preliminary Period, 1926–32.—Ibn Saud, enriched since 1926 by the substantial revenues of the Meccan pilgrimage, had realized from the beginning that the progress and stability of his regime would depend largely on cooperation with the West, particularly in the technical and economic spheres. He had not hesitated to temper the puritan breezes of his native Najd to the latitudinarian exigencies of his new province, and the mildness of his attitude to the non-Muslim stranger within his gates had surprised those who had confidently predicted a sharp turn of the puritan screw on Hejaz, long accustomed to Turkish apparatus and European contacts.

At the same time it had caused some searching of heart among the divines and fanatics of his desert realm, where the Wahhabi brotherhood (known as *al-Ikhwan; see* WAHHABI), though acclimatized to the use of western firearms, tended to challenge the legality of infidel contributions to peaceful progress, such as the automobile, the airplane, the telephone, and radiotelegraphy. Ibn Saud had gradually disarmed the opposition to his projects by tactful persuasion; but there still remained a hard core of irreconcilable elements, the very elements which he himself had created and trained to carry the victorious banners of God through the length and breadth of the land he now ruled. In 1929 Faisal al-Dawish, Sultan ibn Bijad, and other leaders of the *Ikhwan,* accusing him of betraying the cause for which they had fought so stoutly, took the law into their own hands and staged an attack on Iraq, for which Britain still held the mandate from the League of Nations.

The *Ikhwan* raiders were repulsed from the Iraqi border by British forces and then turned their attention to attacking other Saudi tribes. This action rallied the remainder of the population to the king's side and enabled him to defeat the rebels. The civil war, however, dragged on into 1930, when the rebels were rounded up by the British in Kuwaiti territory and their leaders were handed over to the king.

By this means the rebellion was crushed and Ibn Saud had exorcised, though not without reluctance, the devil of his own creation. He was at last free to give his undivided attention to the development of his country and to the problems of foreign policy which beset him on all sides. Above all he was concerned to assert and maintain the complete independence of his country and in it the exclusive supremacy of Islam. Subject to their respect for these fundamental objectives, he was not only ready to cooperate with all nations but prepared to regard with sympathy some of the practices which had taken root in Hejaz and other areas as the result of foreign contacts. The Wahhabi anathema on tobacco was not pressed in Hejaz, and gradually became a dead letter elsewhere. The ban on music was progressively stifled by the radio. The amenities of air travel dispelled the myth of divine displeasure at its indulgence. And so on until the latitudinarian spirit, slowly at first but with ever-increasing momentum, dispersed the inhibitions of the puritan regime.

On the other hand Ibn Saud had rigorously set his face against any foreign intervention whatever in the internal politics of the realm. Britain and other European states had been politely warned against interference in the processes of Islamic law relating to crime, slavery, etc. Requests for permission to construct churches and other public places of worship for non-Islamic communities were courteously rejected.

Foreign Relations, 1932–1953.—From the date of its establishment in September 1932, Saudi Arabia enjoyed full international recognition as an independent state.

In 1934 Ibn Saud was involved in war with Yemen over a boundary dispute. In a six-week campaign the Saudis were generally victorious, advancing as far south as the Yemeni port Al Hudaydah. Hostilities were terminated by the Treaty of At Ta'if and the disputed frontier was demarcated, after which normal relations with Yemen were renewed.

Diplomatic relations with Egypt, severed in 1926 owing to an incident on the Meccan pilgrimage, were not renewed until after the death of King Fuad of Egypt in 1936.

Fixation of the boundaries of the country remained a problem throughout the 1930s. In tribal society, where a considerable proportion of the population is nomadic, sovereignty is traditionally expressed in the form of suzerainty over certain tribes rather than in fixed territorial boundaries. Hence Ibn Saud regarded the demarcation of land frontiers with suspicion. Nevertheless the majority of the frontiers with Iraq and Jordan had been demarcated by 1930. In the south and east no agreement was reached on the exact site of the frontiers with the Trucial sheikhdoms and with Muscat and Oman. As all these states had been in treaty relations with Britain for more than a century, their boundary disputes were destined to create friction between the Saudi Arabians and Britain.

During World War II Ibn Saud declared his neutrality, though his personal bias in favour of the Western Allies was never in doubt. In 1945 he somewhat reluctantly agreed to declare war on Germany, a purely formal action which enabled Saudi Arabia to enter the United Nations as a founder member. Ibn Saud also, after some hesitation, joined the Arab League (*q.v.*), but he did not play a leading part in it. The religious and conservative element in Saudi Arabian life still acted as an obstacle to integration with those Arab states which were actively imitating modern Western life.

Internal Affairs, 1932–53.—Although oil had been discovered in the Hasa Province near the shores of the Persian Gulf before World War II, it was not exploited energetically until after the entry of the United States into the war. Thereafter a considerable number of employees of the oil companies arrived in Saudi Arabia, some to work in the oil fields, some to work at geological surveys, others to engage in negotiations with the government in Jidda or in Riyadh.

The resulting sudden access of wealth was no unmixed blessing. The country's moral standards were adversely affected. Saudi Arabia was itself unable to supply the oil companies with sufficient skilled workers, and as a result a flood of employees entered the country from other Arab states, materially influencing the thought and behaviour of the Saudis. The American way of life imposed itself quickly on a considerable part of the population hitherto noted for its distrust of foreigners, only apparently to increase its xenophobia.

The disturbance of traditional patterns was reflected in the government. Inexperience and the advent of fortune hunters from neighbouring countries encouraged extravagance. The poor became rich overnight, but prices soared and those who were not paid by the oil companies became poorer than ever.

Ibn Saud had virtually been the creator of Saudi Arabia. Brought up in the strict puritanical faith of the Wahhabis, he viewed this flood of wealth and the consequent decline of morality with distaste and bewilderment. He died on Nov. 9, 1953, at the age of 73.

Reign of King Saud ibn 'Abd al-'Aziz.—Ibn Saud was succeeded by his eldest surviving son, Saud, his second son, Faisal, being declared heir apparent. The two brothers were remarkably unalike. Saud was a simple man who had been brought up a strict puritan with many affiliations among the desert tribes. Faisal had lived chiefly in the cities of Hejaz and had often been abroad. Saud thus represented the *ancien régime*. Those advocating modernization supported Faisal, whose influence was later responsible for the abolition of slavery. (*See* also FAISAL; SAUD.)

Meanwhile money continued to pour into the country. There was an enormous increase in the population of the towns, notably of Riyadh and of Jidda. The character of these urban societies was changed beyond all recognition by a large influx of bourgeoisie from neighbouring countries. The foreign ways of immigrant wives were tolerated by the population, but there was as yet no sign of official recognition of the inevitability of female emancipation. In the larger towns, roads, schools, hospitals, palaces, apartment buildings, and airports replaced the old alleyways and mud-built houses.

Ibn Saud had completely dominated the political scene until his death. Afterward, however, there was constant latent rivalry between Saud and Faisal. In March 1958, as a result of pressure, Saud issued a decree transferring all executive powers to Faisal. In December 1960, however, Faisal was obliged to resign and the king himself assumed the office of prime minister. In 1962–63 the pendulum swung back again and Faisal was once more given executive powers. Finally, on Nov. 2, 1964, King Saud was deposed and Faisal was proclaimed king.

Foreign Affairs Under Saud and Faisal.—The frontier between Saudi Arabia and Muscat and Oman had never been demarcated. In the late 1940s this problem assumed importance owing to the possibility of discovery of oil in the area. In 1952 Saudi Arabian tribal forces occupied the oasis of Al Buraymi, which Britain considered as belonging to Muscat and Oman and to Abu Dhabi, with both of which states Britain had treaty relations. Consequently in January 1953 Trucial Oman levies, commanded by British officers, occupied Al Buraymi.

In July 1954 the British and Saudi governments agreed to submit the dispute to an arbitration tribunal. This met in Geneva in September 1955, but the negotiations broke down, and British-officered forces from Muscat and Oman and Abu Dhabi reoccupied the oasis. During the Suez crisis in 1956 Saudi Arabia broke off relations with Britain, and they were not reestablished until 1963. In September 1961, following the Iraqi claim to sovereignty over Kuwait, Saudi Arabia sent troops to that state in response to a request from its ruler.

The United States remained the most influential foreign power in Saudi Arabia, though the Americans made no attempt to interfere in the administration of the country. The second five-year pact which permitted the U.S. Air Force to lease Dhahran base on the Persian Gulf was terminated in 1962. King Faisal paid an official visit to the United States in June 1966.

As a result of the rise to power of Pres. Gamal 'Abd-al-Nasser, Saudi relations with Egypt were often strained. In 1958 Nasser accused King Saud of plotting his assassination. Egyptian propaganda made frequent and sometimes venomous attacks on the Saudi royal family and on the whole system of government.

When Egyptian troops were sent to Yemen (*q.v.*) in 1962, tension between Saudi Arabia and Egypt became even more acute. The Saudis, accused of helping the Yemeni royalists, claimed in turn that Egyptian aircraft had bombed towns in Saudi Arabia. After an agreement had been signed at Jidda by King Faisal and President Nasser in August 1965 providing for an immediate cease-fire in Yemen, some Egyptian troops were withdrawn. At Harad in November, however, Yemeni royalists and republicans failed to agree on peace terms. Further negotiations between Saudi and Egyptian representatives took place in August 1966, but no final settlement was reached and ill feeling persisted.

In December 1965 Great Britain agreed to supply Saudi Arabia with an air-defense system. The U.S., at the same time, agreed to provide Hawk missiles. (H. St. J. B. P.; J. B. Gl.)

In the war which broke out on June 5, 1967, between Israel and the Arab states, Saudi Arabian troops were sent to Jordan to help the Jordanian Army. Saudi Arabia cut off oil supplies to the U.S. and Britain. (X.)

ADMINISTRATION AND SOCIAL CONDITIONS

Government.—The government of Saudi Arabia is patriarchal rather than constitutional. The nearly absolute ruler is bound by the laws of the *shari'a* (*see* ISLAMIC LAW). The ruler is assisted by a Council of Ministers (set up by decree in 1953), drawn equally from the royal family and citizens. The government is assisted by a consultative council and by the *'ulama'*, a council of learned religious men.

The laws of Islam provide the country with civil and penal codes and also regulate religious problems. But the ruler has the power to issue a decree where the religious law is not applicable. The ruler is accessible to his subjects and hears complaints from all classes. Appeals can be made to the *shari'a* or to the Bureau of Complaints. In 1932 it was proposed to provide the whole country with a single constitution, but pending the implementation of this the state has maintained its dual character, with Riyadh as the seat of the government and Mecca as the spiritual centre of Islam. (*See* also HEJAZ; NAJD.)

The organized judiciary is an independent agency in the state, and the public and personal law is derived from the Koran. The qadis (*see* QADI) usually judge according to the predominant Hanbalite version of the *shari'a* law. Punishment is similar to that in the Mosaic code; the penalty for murder is decapitation by the sword. Justice, when not theoretically in conflict with religious law, can also be governed by tribal and customary law (*'urf*).

Administratively Saudi Arabia is divided into provincial areas: Hejaz, Najd, Al Hasa (Eastern Province), Northern Frontiers District, and 'Asir. In 1963 a royal decree for the regulation of provinces was issued. This proposed to decentralize administration and increase local participation by establishing regional

councils (partly appointive and partly elected) to assist the provincial governors, who in turn would be responsible to the minister of the interior.

Living Conditions, Health, and Welfare.—It is sometimes thought that Arabs live only in tents. This is true of the estimated 50% of the Saudi population who are Bedouin. But there are thousands of farmers and landholders who live in two- to five-storied buildings of mud-brick and stone, similar to the dwellings in the towns. After World War II many apartments, government offices, and fine houses of reinforced concrete were constructed.

With the oil economy came the concept of hired labour, and people are now also employed in government services, in various private enterprises, in construction, and in mining. The greatest single industry is the oil operation of Aramco, which employs more than 16,000 persons, most of whom are Saudi Arabs. In 1935 wages paid in this industry were ½ riyal and food per day (1 riyal = 22 cents U.S.). Wages by the mid-1960s had reached a minimum of 8 riyals.

The traditional welfare system based on kinship continues to function throughout the kingdom. A Ministry of Social Welfare and Labour was created in 1963, and increased provision was made for various development projects. Aramco instituted a modern welfare plan which included provision for pension plans, accident compensation, and medical and educational services. Almsgiving, one of the basic tenets of Islam, is common.

The scarcity of water contributes to unsanitary living conditions in many parts of the country. Malnutrition, a major health problem, gives rise to rickets, scurvy, and anemia. There is a high incidence of trachoma, malaria, tuberculosis, and venereal and parasitic infections. The annual influx of pilgrims aggravates public health problems, although the government has established quarantine stations, notably at Jidda. Progress was made after the formation of a Ministry of Health in 1951, and hospitals, some with mobile units, were established in the major population centres. A Ministry of Pilgrimage (established in 1961) is responsible for the care and conditions of pilgrims.

A royal decree of October 1936 made the importation of slaves illegal unless the importers could prove that the slaves were recognized as such in the country of their origin. Slavery was abolished in 1962.

Education.—Elementary education is free to all Saudi Arabs. The modern school system includes elementary, secondary, commercial, and industrial schools, training institutes for teachers, and night schools. By the mid-1960s there were more than 1,000 government educational institutions staffed by over 7,000 instructors and attended by more than 150,000 students. There are many anti-illiteracy centres throughout the kingdom, and in 1959 a royal decree authorized the establishment of government schools for girls. King Saud University at Riyadh (established in 1957) has colleges of arts and sciences, commerce, and pharmacy; the Islamic University was founded at Medina in 1960 and it was proposed to establish King 'Abd al-'Aziz University at Jidda. There is a technological institute at Riyadh and a petroleum institute at Ad Dammam.

Defense.—The armed forces of Saudi Arabia consist of the regular army (estimated at 15,000) and the national guard, known as the White Army (a conglomeration of tribal levies). King 'Abd al-'Aziz Military Academy at Riyadh provides training for officers. The U.S. government conducts training of Saudi Arabs at Dhahran Air Base and maintains a military training mission of the air force. (K. S. Tw.; X.)

THE ECONOMY

The kingdom of Saudi Arabia inherited the simple, tribal economy of Arabia. Many of the people are nomads, engaged in raising camels, sheep, and goats. Agricultural production is localized and poor, but it is being steadily improved and much progress has been made in controlling the periodic locust invasions. Scarcity of rain and water is a perpetual problem; the oases provide a few staple crops; in places dams have been built to trap the seasonal valley floods, and some irrigation is practised. A notable experiment is the royal farm, covering about 3,000 ac., at Al Kharj south of Riyadh. Agricultural development programs in the mid-1960s provided for the construction of several dams (including Wadi Qizan and Abha in the 'Asir province), for drinking water projects, and for the establishment of agricultural centres for technical assistance to farmers. Fishing methods in the Persian Gulf and Red Sea have also been modernized. But it has always been difficult for the country to be self-sustaining in essential foodstuffs, and many necessities of life (such as rice, flour, sugar, tea, and piece goods) must still be imported. Traditional exports, which before the discovery of oil paid for these imports, include skins, hides, wool, dates, horses, camels, and pearls, but the demand for these has decreased. (*See* also ARABIA: *Vegetation, Animal Life,* and *Natural Resources.*)

The Oil Economy.—The discovery of oil changed the entire economic situation of Saudi Arabia. As early as 1923 Ibn Saud granted an oil prospecting concession to a British company, but this concession was never exploited.

In 1933 a large oil concession, to terminate in 1999, was secured by Standard Oil of California, which eventually shared ownership of the operating concern, the Arabian American Oil Company (Aramco), with Texaco, Standard Oil (New Jersey), and Socony Mobil Oil on a 30-30-30-10 basis. Although oil was discovered in 1938, World War II curtailed activities until near its end. Rapid expansion began with the completion in 1945 of the Ras Tanura refinery, the rated capacity of which was later increased to 189,000 bbl. a day. Abqaiq (Buqayq) and Ghawar took their place among the world's largest producing fields, and in the mid-1960s production of crude oil reached a daily average of more than 1,700,000 bbl. In 1950 Aramco's owners put into operation the Trans-Arabian Pipe Line (Tapline), which runs 753 mi. (1,212 km.) from Qaysumah (300 mi. [480 km.] NW of Dhahran) in Saudi Arabia across Jordan and Syria to its Mediterranean terminal at Sidon, Lebanon. The capacity of the line was later increased to 470,000 bbl. a day. Crude oil not refined at Ras Tanura or pumped through Tapline is shipped from Ras Tanura port or piped to Bahrain for refining.

In 1951 Aramco discovered the first offshore field in the Near East at Safaniyah just south of the Saudi Arabia–Kuwait neutral zone. Intensive exploration of the Rub' al Khali began in 1950. Operations in this forbidding desert have led to the development of new techniques, particularly in transportation. Water has been found in a number of deep wells drilled in the heart of the sands. Aramco's second offshore field at Munifah (Manifa) was brought into production in 1964. Other offshore fields are being developed at Al Qatif and Barri (Berri).

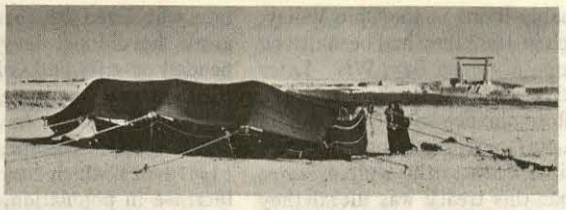
In 1950 Saudi Arabia and Aramco made a new agreement for sharing profits on the basis of the so-called 50/50 principle, this being the first application of this principle in the Near East, where it was later widely adopted. The agreement gave Saudi Arabia a substantially larger return from the venture.

In 1949 Saudi Arabia granted a concession to the Pacific Western Oil Corporation (later the Getty Oil Company) for its interest in the Saudi Arabia–Kuwait neutral zone. Oil was discovered in the zone in 1953, and Saudi Arabia's share of the production reached about 90,000 bbl. a day. Another concession was secured in 1958 by the Arabian Oil Company Ltd. of Tokyo for Saudi Arabia's interest in the neutral zone offshore, with the provision that Saudi Arabia should receive 56% of this company's profits. The first well drilled in the neutral zone offshore in 1960 proved a successful strike.

Since 1955 Saudi Arabia has been surpassed in crude oil production only by Kuwait in the Near East and by the United States, Venezuela, and the Soviet Union. Saudi Arabia's proved reserves were estimated at about 70,000,000,000 bbl., approximately 15% of the world total.

The oil fields also contain enormous quantities of natural gas: proved reserves in Saudi Arabia were estimated at more than 25,000,000,000,000 cu.ft. Aramco has developed the capacity to reinject about 400,000,000 cu.ft. a day to conserve gas for future use and to reinforce the underground pressure needed for oil production. Some gas is liquefied for use locally and for sale abroad.

Mining.—In 1934 the Saudi Arabian Mining Syndicate ob-



(Left) Worshipers at the Great Mosque in Medina; (top) Bedouin tent; (centre) veiled women in the marketplace at Hofuf; (right) date harvester in a palm grove near Medina

BY COURTESY OF (TOP, RIGHT) ARABIAN AMERICAN OIL CO.; PHOTOS, (LEFT) V. K. ANTHONY FROM PHOTO RESEARCHERS; (CENTRE) ARIZONA PHOTOGRAPHIC ASSOCIATES, INC.

tained a concession. After examination of 55 ancient mining sites, work began at one, Mahd adh Dhahab in the Hejaz mountains. Gold and silver worth over $30,000,000 were extracted before the concession was relinquished in 1954 as no longer profitable. In that year the Saudi Arabian government, the United States Geological Survey, and Aramco undertook jointly an elaborate mapping program employing aerial photography to provide the basis for a more systematic survey of mineral resources. Large deposits of iron ore occur in northern Hejaz and Najd, and copper and a silver belt have been found. 'Asir has rock salt; salt and gypsum are exploited commercially and cement is manufactured.

Trade and Finance.—Under the oil economy, trade in the few wares which the country had to offer, other than oil and gas, declined. In 1958 the government formed an Economic Development Committee, and trade agreements were negotiated with various countries. Many imports, such as machinery, motor vehicles, and grain, became increasingly important as the economy grew more complex. The United States, West Germany, and Japan are now the main suppliers. In 1958 a severe check was placed on the import of luxuries in order to strengthen the national currency. In January 1961 a Supreme Planning Board (replacing the Economic Development Committee) was formed to supervise the country's economic development.

The discovery of oil caused a drastic change in Saudi Arabia's finances. Freed from the old dependence on the pilgrim traffic to Mecca and Medina (formerly a main source of national income), customs duties, and taxes on crops and livestock, which together provided a maximum of about 60,000,000 Saudi riyals annually, the government's income by the mid-1960s had risen to over 3,100,000,000 riyals, most of which came directly or indirectly from the oil industry. Oil revenues permitted a favourable balance of trade.

In 1958 the government introduced its first realistic budget, and as a result of the improvement in the financial situation the riyal was stabilized in 1960 at 4.5 riyals to the U.S. dollar and established as the only legal tender. New riyal notes were issued to replace the "pilgrim receipts" then in circulation; the Saudi gold sovereign was withdrawn and exchanged at a fixed rate of riyals.

Transport and Communications.—Difficulties of terrain kept the various regions largely isolated, with the camel as the chief means of transportation, until mechanical transport was introduced in the 20th century. The Hejaz Railway, completed from Syria to Medina in 1908, was damaged during World War I and abandoned in 1924; the rebuilding of this was undertaken in the mid-1960s. After the unification of the kingdom, all areas were linked together by radio. Penetration of the interior by airplane became common after World War II; the principal cities were equipped with airports, and airlines brought the country closer to the rest of the world. In 1951 a railroad, 350 mi. long, was completed to Riyadh from the new port of Ad Dammam on the Persian Gulf just south of the oil-shipping port of Ras Tanura. The government also built a modern port on the Red Sea at Jidda, the gateway to Mecca. Asphalt roads run from Jidda to Mecca (45 mi.) and Medina (280 mi.), and other roads have been planned for a network of first-class arteries, including a trans-peninsular highway. Even where asphalt is not laid, passable motor roads traverse the desert wherever necessary. A road paralleling Tapline leads to the neighbouring states of Jordan and Syria.

SAUERKRAUT, a food product of characteristic flavour, obtained by full fermentation, chiefly lactic, of properly prepared and shredded cabbage in the presence of not less than 2% nor more than 3% salt. It contains, upon the completion of fermentation, not less than 1.5% and usually not more than 2% lactic acid. The characteristic flavour and the lactic acid are produced by a sequence of bacteria which find ideal conditions for growth in the presence of the added salt and the nutrients which it withdraws from the shredded cabbage. Many refer to sauerkraut simply as "kraut." The word "sauerkraut" comes from the German *sauer,* "acid" and *kraut,* "cabbage." Sauerkraut is used as a delicious relish when served raw and as a vegetable when cooked. It is rich in vitamin C (ascorbic acid) and is excellent to add bulk without corresponding fattening properties. The juice is canned and used as an appetizer.

(F. W. FN.)

SAUK or SAC, an Algonkian-speaking Indian tribe closely related to the Fox and Kickapoo Indians, once forming with these

and the Shawnee a single tribe probably living in the Ohio Valley. When first encountered by the French in 1667 they had been driven westward by the Iroquois to the region of Green Bay, Wis. Later they settled along the Mississippi River between Rock Island, Ill., and St. Louis, Mo., and formed a close alliance with the Fox. In 1804 the U.S. commander at St. Louis persuaded some of their minor chiefs to cede most of the tribal lands to the United States and although the Sauk protested that this treaty was illegal they were unable to prevent its enforcement. When a group led by Black Hawk (*q.v.*) refused to leave Illinois it was attacked by the state militia, overtaken while trying to escape across the Mississippi, and massacred. After the Black Hawk War the Sauk were forced to relinquish more territory; later they were moved to Kansas and eventually were settled in Oklahoma.

Sauk culture was of the Prairie type. In summer the tribe lived in bark-house villages along bluffs near river bottoms where women raised corn and other crops. After the harvest the village broke up into family groups which erected winter houses of poles covered with reed mats; in spring the tribe gathered on the Iowa prairies to hunt buffalo. Matrilocal residence was the rule in summer, when kinswomen cooperated in tending crops, but winter and spring brought a shift to patrilocal residence. The kinship system was of Omaha type, and the social organization included patrilineal clans that were crosscut by a nonhereditary dual division with important military and ritual functions. Regulating the inheritance of personal names, the clans also controlled religious ceremonies through ownership of sacred packs on which ritual was based. Some ceremonies, however, were held by secret societies. The Sauk were governed by a tribal council and hereditary chiefs; when war broke out these were temporarily replaced by war chiefs selected for their military ability. Early estimates of their population ranged from 1,500 to 3,000. In the 1960s there were about 1,000 Sauk. *See* also ALGONKIAN TRIBES; CHIEF; FOX INDIANS.

See Alanson Skinner, "Observations on the Ethnography of the Sauk Indians," *Bulletin* of the Public Museum of the City of Milwaukee, v (1923–25); Charles Callender, *Central Algonkian Social Organization*, Anthropological Publications of the Public Museum of the City of Milwaukee (1961). (CH. C.)

SAUL, son of Kish, a Benjamite, became the first king of Israel (reigned *c.* 1020–1000 B.C.) when promonarchist propaganda (*cf.* Judg. 17:6; 18:1; 19:1; 21:25) prevailed over the old theocratic ideal that Yahweh alone must be king (8:23). Samuel's acquiescence was probably forced by the demoralizing defeat of the Hebrews at Aphek (I Sam. 4), which demonstrated the ineffectiveness of the Israelite amphictyony (*i.e.*, federation or league) against the unified, better-armed Philistines. The inconsistency in Samuel's attitude toward unification under a king is to be explained in part by the method of composition of the author of the books of Samuel. He incorporated the traditions available without attempting to harmonize varying details (*see* SAMUEL, BOOKS OF). Because the interest of the sources utilized in I Sam. 9–31 is focused on Samuel and David rather than on Saul, less than due credit may have been given to the first king. Moreover, the author's interpretation of Samuel's judgment on the monarchy (8:6–18; 10:17–24) anticipates the sad experience which both the northern and the southern Hebrew states had with their kings. Once convinced that the kingship was Yahweh's will, Samuel took the initiative; he anointed Saul secretly (according to the "royalist" tradition, 9:1–10:16), before presenting him to the people at Mizpah, where the sacred lot also singled out the son of Kish (10:17–27).

Saul's prowess was soon proved. When the Transjordanian Ammonites threatened to wipe out the Israelites of Jabesh-gilead (11), "the spirit of God came mightily upon Saul," as upon the charismatic heroes of the period of Judges; he rallied the tribes and promptly crushed the enemy. Saul's kingship was, in fact, transitional between the saviour-judge who was looked upon as a special channel of divine power, and the royal office developed by David and Solomon. Excavations at Gibeah (Tell el-Ful, about 3 mi. N of Jerusalem) unearthed a 170- by 115-ft. stone structure, the simple, rough palace fortress of Saul, which attests the warrior who had to defend his people rather than the oriental potentate who lived off them. Although he had a small permanent army, he did not levy taxes or introduce conscription; he depended on gifts and volunteers.

Saul's real challenge was the Philistines. By the victory of Michmash (13–14) he cleared Israelite territory of enemy garrisons. More important, he ended the Philistines' monopoly of iron (13:19–22) which had kept Israel in an inferior position. The increase in population, improvement in building techniques, and higher standard of living for which archaeology finds evidence in this period are doubtless due to the strength, cohesion, and enthusiasm which Saul gave the Hebrew nation.

His career, unfortunately, was blighted by his preoccupation with the growing influence of the politically more astute David and by his break with Samuel. The biblical authors depict this break as the result of conflict between the two powers, civil and religious, due to a sharp divergence between the king's and the prophet's conceptions of the theocratic character of the kingdom. According to 13:8 ff., Saul waited the week appointed for Samuel's arrival, and even then, it was only after his soldiers began to desert that he offered the sacrifices preliminary to battle. Was it not normal for kings to be chief priests? His failure to follow the current interpretation of the *herem* ("ban") after the defeat of the Amalekites (15) is a disobedience easier to pinpoint, even if his conduct strikes a modern reader as more sensible and humane than Samuel's, who insisted upon total destruction of captives and cattle. Possibly in retaliation for Samuel's prophetic word that Yahweh had repudiated him (13:13–14; 15:23–26), Saul reinstated the priestly family of Eli, appointing Eli's great-grandson, Ahimelech, priest at the royal sanctuary of Nob (21:1; 22:11 ff.; *cf.* 14:3, where Ahijah is probably an alternative name for Ahimelech). Fits of extreme melancholy seized the King, for "the Spirit of the Lord departed from Saul, and an evil spirit from the Lord tormented him" (16:14). Gradually he suspected everyone of plotting against him (20:30; 22:7 ff.). His brutal massacre of Ahimelech's family, suspected of being in league with David, gives an insight into his view of church-state relations that must be remembered when his conflict with Samuel is appraised.

Saul's mental derangement no doubt explains in part the military debacle that cost him his life and almost undid his earlier accomplishments. When Saul realized how desperate his situation was, he turned for help to the one man whom, more than anyone else, he might have blamed for his unhappiness. But Samuel was dead. The King must speak to him nevertheless; he insisted upon the services of a witch, or medium, at Endor, but the subsequent encounter with the ghost of Samuel—whatever be our judgment of the identity of the "ghost"—only confirmed his worst fears (28). The incident dramatically preluded the defeat at Gilboa, in which three of Saul's sons were slain, and the King himself, grievously wounded, took his own life (31). The elegy preserved from the Book of Jashar in II Sam. 1:19–27, pays eloquent tribute to his personal bravery and magnetic leadership. *See* also DAVID; SAMUEL. (E. F. ST.)

SAULT SAINTE MARIE, a city in Ontario, Can., and a port of entry, is on the north bank of St. Marys River, the outlet from Lake Superior into Lake Huron, opposite the U.S. city of the same name. Pop. (1961) 43,088. Known to the French explorers from the time of Étienne Brulé, it was named Sault de Gaston early in the 17th century. The name was changed to Sault Ste. Marie ("Rapids of Saint Mary") in 1669 when a permanent mission was established by the French. The North West company established a trading post in 1783 and built a small lock to handle canoes and small boats for trading purposes, this being completed in 1797–98. The lock was destroyed by U.S. troops in the War of 1812 and rebuilt as a historical site late in the 19th century.

The growth of Sault Ste. Marie has been intimately associated with the rapids, and the locks and canal around them. The present Canadian lock was built for military purposes in the late 19th century after use of U.S. locks was denied to Canadian troops sent to suppress the Riel rebellion of 1870. It was later widened to its present size: 16.8 ft. deep, 59 ft. wide and 900 ft. long. The canal itself is 1.38 mi. long.

In the second half of the 20th century the locks and canal

handled about 3,000,000 tons of shipping annually, considerably less than the U.S. system paralleling it. Cheap transportation led to the development of heavy industry. In the 1960s the Algoma steel plant, for example, had an annual capacity of more than 1,000,000 tons. Of the gainfully employed inhabitants of the city, more than half were engaged in manufacturing, and of those four-fifths were in iron and steel.

In addition, the "Soo" is a retail and wholesale centre and a notable tourist headquarters. (F. A. Ck.)

SAULT SAINTE MARIE, a city of Michigan, U.S., the seat of Chippewa County and a port of entry, is located at the northeast end of the upper peninsula of Michigan on the south shore of the St. Marys River, the connecting waterway between Lake Superior and the lower Great Lakes. A canal and four parallel locks provide a navigable channel for shipping past the rapids which mark a 20-ft. drop in elevation. It is connected with Sault Sainte Marie, Ont., by a vehicular and a railroad bridge. It is a dairy, hay, and small grain area and is the oldest settlement in Michigan. From 1917 it has had a commission-manager form of government. Its strategic location, both economically and geographically, makes the Sault, or "Soo," a centre of government activity: the St. Mary's Falls Canal (popularly called Soo Locks) is operated and maintained by the U.S. Army Corps of Engineers; the U.S. Air Force maintains the Kincheloe Air Force Base 18 mi. S of the Sault and a radar base at the city limits; customs and immigration offices are at Sault Ste. Marie; and the U.S. Coast Guard has a base from which it maintains and controls navigation in the area. From 1948 the Sault branch of Michigan College of Mining and Technology has occupied buildings formerly used by historic Fort Brady, built in 1822 shortly after the United States took possession of the area. It is the centre of a summer and winter resort area. The manufacture of carbide and wood products provide the main industry.

The flags of three nations have flown at Sault Ste. Marie since the first white man, explorer Étienne Brulé, visited the area some time between 1615 and 1622. Jesuit missionaries are credited with naming the rapids and river Ste. Marie and are said to have introduced Christianity there. The site was a favoured residence and stopping place for Ojibwa Indians because of the great catches of whitefish that could be taken from the rapids. In 1668 Father Jacques Marquette founded a mission at Sault Ste. Marie and thereby established the first permanent white settlement in Michigan. The French took official possession of the interior of North America in a ceremony at the Sault in 1671. British occupation began in 1762. By the Treaty of Paris (1783) Great Britain ceded land east of the Mississippi to the United States; however, it was not until 1820 that the U.S. flag was raised at the Sault by Lewis Cass, governor of Michigan territory. Writings by Henry Rowe Schoolcraft (*q.v.*), first Indian agent in Sault Ste. Marie, provided source material for Longfellow's poem *Song of Hiawatha.*

Sault Ste. Marie was incorporated as a village in 1879 and as a city in 1887. The original canal and state lock was opened in 1855.

The navigation season is limited to eight months because of severe winter conditions. Handling this lake traffic are the Poe, Davis, Sabin and MacArthur locks on the Michigan side of the St. Mary's River, and one lock on the Canadian shore. Construction of a new lock, 1,000 ft. long, on the site of the Poe Lock was begun in 1961 as a part of the St. Lawrence Seaway program of development on the Great Lakes. For comparative population figures *see* table in Michigan: *Population.* (G. A. Os.)

SAUMAREZ, JAMES SAUMAREZ, Baron de (1757–1836), English admiral who fought in many naval battles during the French Revolutionary and Napoleonic wars, was born at St. Peter Port, Guernsey, on March 11, 1757. Entering the navy as a midshipman at the age of 13, he was promoted to lieutenant for his bravery at the attack on Charleston (June 1776) during the War of the American Revolution and commander for his services against the Dutch off the Dogger Bank (Aug. 5, 1781). In command of the "Russell" (74 guns) he contributed to Adm. George Rodney's victory over the French fleet under the comte de Grasse at the Battle of the Saints, off Dominica (April 12, 1782). Soon after the outbreak of the war with revolutionary France, he captured (Oct. 20, 1793) "La Réunion," a large French frigate, and was knighted in November 1793. He took part in Adm. Lord Bridport's action against the French fleet near Lorient (June 22, 1795), distinguished himself in the battle off Cape St. Vincent (Feb. 14, 1797), and was present at the blockade of Cadiz (February 1797–April 1798). At the Battle of the Nile (Aug. 1, 1798) he was Nelson's second-in-command. He received the command of the "Caesar" (84 guns) in February 1799 and during the winters of 1799 and 1800 kept watch on the French fleet off Brest. On July 12, 1801, he routed a superior combined force of French and Spanish ships at Algeciras. He commanded the Baltic Fleet with great distinction from 1809 to 1814 when he was promoted to admiral. Raised to the peerage in 1831, he died in Guernsey on Oct. 9, 1836.

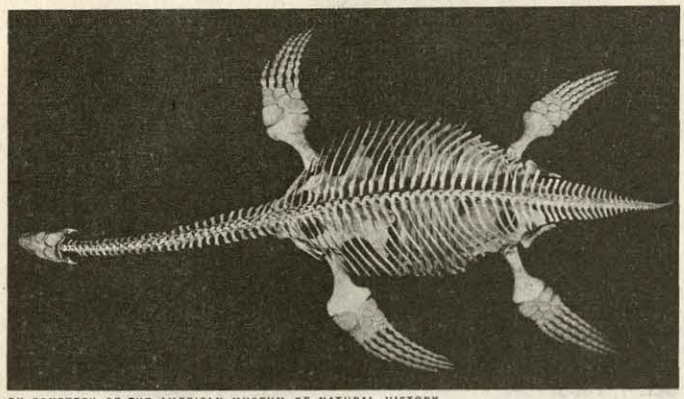
See Sir John Ross, *Memoirs . . . of . . . Saumarez,* 2 vol. (1838); O. Warner, *The Sea and the Sword* (1965). (O. M. W. W.)

SAUMUR, a town of western France, and centre of an *arrondissement* in the *département* of Maine-et-Loire, lies on the Loire River, 41 mi. (66 km.) WSW of Tours by road or rail. Pop. (1962) 20,466. Situated between the Loire and its left-bank tributary, the Thouet, above their confluence, the town stands on rising ground dominated by the château of the dukes of Anjou. It also occupies the Île Millochau in the Loire, to whose right bank (site of the railway station) it has more recently spread. The main Rouen-Bordeaux road crosses it in a straight line on the axis of the two bridges on the Loire and the bridge on the Thouet. The château was reconstructed in the late 14th century by Louis I, duke of Anjou, on the site of earlier strongholds. The surrounding ramparts were built in the late 16th century by the governor Philippe de Mornay (*q.v.*), who made Saumur the centre of French Protestantism and founded there a Protestant academy (closed at the revocation of the Edict of Nantes in 1685). The château now houses a rich museum of decorative arts, and the probably unique Musée du Cheval (horse museum). Other prominent buildings on the left bank of the Loire are the 19th-century theatre, the 16th-century town hall, the 12th-century Church of Saint-Pierre (17th-century facade), and the 17th-century Church of Notre-Dame des Ardilliers, adjacent to which is the almshouse (formerly the convent of the 17th-century Oratory), partly built into the rock. The Romanesque and Gothic Church of Notre-Dame de Nantilly contains a notable collection of 15th–17th century tapestries. The horticultural gardens, on the site of a former monastery, include a museum of viticulture. The Cavalry School, built in 1768, has become the practical training school for the armoured forces, but French equestrian traditions are maintained by its famous "Black Cadre." On the island the 15th-century "House of the Queen of Sicily" holds memories of Yolande of Aragon, mother of King René.

Saumur is on the roads from Orléans to Nantes and from Le Mans to Niort, and is connected by rail via Montreuil-Bellay with Poitiers and Niort. It is famous for its dry white, red, and rosé wines, as well as its sparkling wines made by the Champagne method. Since the 17th century it has produced religious articles (medallions and rosaries); carnival masks and metal closures for wine and liqueur bottles are also made, and locally produced spring fruit and vegetables are preserved. Mushrooms are cultivated in old tufa workings.

There are prehistoric caves along the Loire and the Thouet near Saumur, and at Bagneux, a southwestern suburb, is one of the largest known dolmens. In the 9th century Saumur's stronghold was a refuge for the surrounding district (whence perhaps its name, from *Salvus Murus*). Taken by Fulk Nerra, count of Anjou, in 1025, it finally passed to the French crown on the death of René (1480). After the revocation of the Edict of Nantes its population was halved. In 1793 it was occupied by the Vendéans. During World War II it was heavily damaged when the Cavalry School cadets withstood the German advance for three days in June 1940. (M. Ja.)

SAUROPTERYGIAN, any of the extinct reptiles of the order Sauropterygia, remarkably well-adapted to an aquatic life, and including the nothosaurs, plesiosaurs, and often placodonts.



BY COURTESY OF THE AMERICAN MUSEUM OF NATURAL HISTORY

SKELETON OF A PLESIOSAUR, VIEWED FROM ABOVE

The largest of these Mesozoic creatures were certain plesiosaurs that attained a length of 40 ft. The characteristics of the Sauropterygia are associated with a mode of swimming accomplished by "rowing" motions of powerful limbs, contrasting with the more fishlike mode of progression in ichthyosaurs and mosasaurs.

Most primitive of sauropterygians are the Triassic nothosaurs. In these small reptiles the body was long and slender; the limbs were basically comparable to those in normal terrestrial reptiles, suggesting some degree of ability to progress on land. Best known from the marine Middle Triassic of Europe, nothosaurs are structurally antecedent to plesiosaurs.

Plesiosaurs appear at the end of the Triassic, and remain prominent until the Late Cretaceous; specimens are most common in the Jurassic strata of England and Germany and the Upper Cretaceous of the United States. The tail was short; the trunk broad and stoutly built, with the ventral parts of shoulder and pelvic girdles greatly expanded for the attachment of powerful limb muscles. The limbs were transformed into compactly built oar-like paddles; the number of toe-joints was greatly increased. The long jaws were armed with pointed teeth appropriate for seizing fish.

Two main trends are discernible in plesiosaur evolution. In one line, of which *Pliosaurus* of the Jurassic is typical, the neck was short but the skull large and long; a giant of the group was *Kronosaurus* of the Lower Cretaceous of Australia, with a skull some nine feet long. In a second line of plesiosaurs the head was small but the neck greatly elongated; in *Elasmosaurus* of the Upper Cretaceous the neck had as many as 76 vertebrae and constituted nearly two-thirds of the animal's entire length.

Often considered as a suborder of the Sauropterygia are the placodonts of the Middle Triassic. The body was structurally similar to that of nothosaurs but more compactly built. In *Placodus* and other typical forms there were broad flat tooth plates for crushing the mollusks on which they fed. Many placodonts developed dermal armour; *Henodus* had a shell comparable to that of a turtle. *See* also PALEONTOLOGY. (A. S. RR.)

SAUSAGE AND READY-PREPARED MEATS. Sausages and ready-prepared meats are many and various and are usually associated in their production. Their chief ingredient is comminuted (very finely chopped) or minced meat. With the exception of fresh sausages, they undergo some form of curing or preserving; hence a principal feature is their keeping quality, although this is variable. Fresh sausages should be eaten within a few days.

SAUSAGE

Sausage (Lat. *salsus,* "salted," hence preserved) is one of the oldest forms of processed food. Meat or mixtures of various meats, blood, offal, and other ingredients stuffed into gut or other suitable materials were known in remote antiquity. They are alluded to in Homer's *Odyssey* and in later Greek literature. The ancient Romans prepared one type from fresh pork and white pine nuts, chopped finely with cumin seed, bay leaves, and black pepper.

In the Middle Ages sausage-making became a local culinary art, and many types of sausage derive their names from the places where they were made; *e.g.,* frankfurter (Frankfurt am Main, Ger.), bologna (Bologna, It.), romano (Rome), genoa salami (Genoa, It.), berliner (Berlin), goteborg (Göteborg, Swed.), lyons (Lyons, Fr.), d'arles (Arles, Fr.), cracow (Cracow, Pol.).

Sausage basically is very finely chopped meat, although somewhat similar preparations have been produced from fish and even vegetables. Preparation consists of the mincing, cutting, or pulverizing of lean meat, fat, and in certain cases edible offal, of the admixture of spices, curing salts, or other ingredients, and then of the filling of the mixture into a casing. In some countries, Great Britain for example, appreciable quantities of cereal binder (such as bread, rusk, ground rice, cornflour [cornstarch], and farina) may be incorporated with the comminuted meat, while in other countries the inclusion of such binders is prohibited (see *Commercial Production* below).

Casings may be natural or synthetic. Natural casings are pig, sheep, or ox gut, the bladder, and the lining of the esophagus (weasand); and a development is a casing prepared from reconstituted collagen, which can be produced to a standard dimension. In the United States the use of synthetic casings far exceeds that of natural casings. In some districts sausages are filled into fabric bags treated with paraffin wax to restrict the loss of moisture.

After filling, sausages may be smoked, cooked, or air-dried, or treated with a combination of these processes, to make them keep.

Types of Sausage.—Fresh sausages are made from fresh meat, chiefly pork and beef, sometimes with the addition of veal or mutton. The stock seasoning used includes salt, white pepper, nutmeg, mustard, mace, ginger, cayenne, cloves, pimento, and coriander. The sausages are fried, grilled, or in some cases heated in water, before consumption. The following are representative examples of sausage: beef; pork; chipolata (a small sausage, beef or pork); skinless (beef or pork); Bockwurst (German, veal and pork); Bratwurst (German, pork and veal); tomato pork; Swedish flask korv (pork and potato); thuringer (pork, veal, and sometimes beef).

Cooked sausages may consist of fresh uncured meat or cured meats and the various seasonings. A frankfurter, for example, may consist of pork, bull meat, ox cheek, veal, cooked tripe, cereal, and ice water, with white pepper, ginger, coriander, and mace as seasoning. They are cooked after being filled into casings, and some types may be smoked. Prepared ready for consumption, they usually need no further cooking, although in a few cases they may be heated before consumption. Such sausages include bologna; frankfurter and Vienna ("hot dogs"); polonies; blood sausage; tongue and blood; liver; pork luncheon; beef luncheon; hog puddings; ham and tongue; saveloys; Scotch white puddings; haggis. (Haggis has been included as a cooked sausage since it is filled into a casing. It is a pudding made from the heart, lungs, and liver of a sheep or other animal, finely minced with suet and oatmeal, seasoned with salt, pepper, onion, etc., and boiled in the animal's everted stomach. Though regarded since the mid-18th century as a distinctively Scottish dish, it was long popular in England. Formerly considered a rustic dish, it is today served with some ceremony on Scottish national anniversaries.)

Dry sausages are made by comminuting fresh meat and other ingredients, including a curing agent (basically salt and saltpetre with, in some cases, sugar) and allowing the meat to cure for a short period before being filled into casings. With some types the curing may take place in the casings. The sausage may then be smoked or cooked in the smokehouse at a high temperature before drying in air (cooked salami, cervelat, kosher salami), or may be dried without smoking. The unsmoked dried sausages include Italian, Hungarian, and German salamis and a variety of the lesser-known sausages of European origin. Garlic is sometimes an ingredient of dry sausages. The following are representative examples of these types of sausage: cappicola (though considered a sausage it consists of seasoned pork meat, unchopped, stuffed into beef bungs); cervelat; chorizos; d'arles; goteborg; holsteiner; landjaeger; lyons; mortadella (filled into beef bladders); pepperoni; and many varieties of salami.

Commercial Production.—In developed countries sausages

are now produced by factories distributing branded goods rather than by the local butcher. This has resulted in much standardization and the disappearance of some regional varieties of sausage.

A development in the United States and to a lesser degree in Great Britain has been the production of "skinless" sausages; in the U.S. their consumption soon exceeded that of the traditional cased forms. The ingredients are first filled into cellulose casings, which are tied off automatically into links. Then the sausages are immersed in hot and afterward iced water, so that a small amount of soluble protein forms a thin film immediately below the cellulose casing. On removal of the casing this layer surrounding each individual prevents the sausages from sticking together when subsequently wrapped in a transparent film in packs of standard weight. The light heating also provides a relatively firm outer layer, which obviates damage during packing.

Legal standards for sausage vary in different countries. Thus it is prohibited in Germany to use any binding material of a cereal or other nature. In the United States, the addition of up to 3.5% of cereal, starch, or dried milk is permitted if declared. The use of soya flour is prohibited, owing to the difficulty of differentiating between protein of meat origin and that from soya. In Britain sausages may contain considerable amounts of cereal binder, and during World War II the statutory minimum quantities were 65% meat in fresh pork sausages and 50% meat in fresh beef sausages. Although wartime regulations were rescinded in 1953, many courts tend to uphold prosecutions for adulteration on the basis of these figures. Regulations differ confusingly between countries concerning the use of artificial colouring agents, added preservatives, and chemical emulsifying substances, such as the extensively used phosphate derivatives. In Great Britain, certain colours from a permitted list may be used; sulfur dioxide may be added as a preservative in quantities not exceeding 450 parts per 1,000,000, subject to appropriate labeling; and the use of phosphates is not legally restricted.

Sausage Consumption.—In the United States, the main demand is for frankfurters and Vienna-type sausages (sold in huge quantities as "hot dogs"), followed by the bologna type of sausage.

Of the European countries, Italy probably produces the greatest bulk of sausages; the largest producing area is that surrounding Bologna, though many varieties are produced in and around Florence. Germany makes the greatest variety and production is widespread, notably in Frankfurt and Hamburg. In Spain greatest production is in Catalonia, Vich making sausages prepared exclusively from lean pork and a small quantity of bacon. Large quantities of sausage are prepared and consumed in Poland and Hungary, and Switzerland and the Scandinavian countries have their distinctive types. The warmer countries bordering the Mediterranean tend to use a heavier cure and more spices for their dry sausages than those of northern Europe, where preservation is less difficult.

In Great Britain fresh pork and fresh beef sausages form the vast majority of the trade, although there are local preferences. In Scotland beef sausages tend to predominate in terms of volume, but not so in England. Cumberland and Lincoln prefer a coarse-cut fresh sausage, while in the midlands and the south the demand is for a fine texture. Interest in the continental type of dry sausage has been increasing.

READY-PREPARED MEATS

Ham.—Canned ham forms a major item among ready-prepared meats. Before about 1930, practically all the U.S. processers precooked cured hams before canning, while in Europe the only cooking that the ham received was during heat-processing within the sealed can. The latter procedure has been adopted universally. To retain juiciness and palatability, the processing temperature is relatively low, the internal temperature seldom exceeding 160° F (71° C). As this does not protect the canned ham against all conditions of storage, it should be stored under refrigeration. For export to tropical countries higher processing temperatures are employed.

Luncheon Meat.—This is a popular canned product, usually consisting of chopped pork, sometimes with the addition of small amounts of chopped beef. The chopped meat is mixed with salt, nitrate, nitrite, and sugar, and a small quantity of water is added to facilitate distribution of the cure and mixing. The spicing employed is generally light, as the cured pork flavour should predominate. In those countries where regulations permit, small quantities of cereal, dried milk, or protein additives may be included. The mixing of the chopped meats is usually carried out under vacuum in order to exclude air, which might otherwise be trapped in the product. The smaller-sized domestic cans, which are subjected to shelf display at atmospheric temperatures, are heated to achieve a commercial sterility. The larger cans (3 to 6 lb., 1.36 to 2.72 kg.) are not heat-processed to the same degree and should therefore be stored under refrigeration.

Corned Beef.—The production of corned beef is a specialized operation, generally restricted to the larger meat plants and frequently prepared in combination with the manufacture of meat extracts. Corned-beef hash is popular in the United States and consists of chopped corned beef, diced potatoes, onions, and flavouring materials. The ingredients are heated in a cooking kettle prior to filling, hot, into the cans. Thermal exhaust of the air usually precedes the sealing of the can (*see* CANNING, COMMERCIAL). Most meat products lend themselves to canning and the more popular include ox, pig, and sheep's tongues, stews, sausages, particularly frankfurters, pork and beans, and even meat pies. Chile Con Carne consists of a meat mold prepared from coarsely cut beef and a high percentage of beef suet; the essential flavouring includes chili pepper, garlic, and onion. Gravy is mixed with cereal, soya bean flour, or milk to obtain the correct texture.

Jellied products contain parts of the carcass possessing a high proportion of connective tissues (collagen), such as the rind and head of hogs and calves' feet. Lean meat and fat may be added, a typical example being English brawn, which was traditionally prepared from a brawner. The U.S. souse and headcheese are somewhat similar products, one variety of the latter using blood, in which the meat is cooked, and consequently termed blood headcheese. Scrapple, of which there are many forms, incorporates about 10% of cereal, usually corn meal and possibly rye flour or soya flour.

Hamburger.—As its name implies, this product originated in Hamburg, but it now enjoys a huge market in the United States and elsewhere; almost one-third of the total beef consumption in Australia is sold in this form. Traditionally, hamburger should be prepared from beef, with or without added fat, chopped to a medium-coarse consistency, no moisture, spices, or cereal being added. In many countries the inclusion of moisture, cereals, flavouring, and in some cases onion, is common practice. In the United States hamburger has been popularized as an all-beef product, and pork has been considered an inappropriate ingredient partly because, as hamburger may be given only a superficial heating prior to consumption, it is potentially dangerous mixed with pork.

Meat loaves consist basically of finely comminuted meats with the addition of cereal or milk powder, a small quantity of water, and spices. The chopped meat is packed into pans and baked in a moderate oven, although some types may be cooked in water. The galantine, German *rouladen,* and continental mosaics are also cooked in water or water vapour, the mosaics being prepared to exhibit elaborate patterns on cutting.

Pâtés.—In Europe various types of pâté are produced, generally of pigs' or calves' liver and pig meat containing a high proportion of fat, reduced to a smooth paste and suitably seasoned. In France, Belgium, Switzerland, and the Netherlands, veal is often used to provide a more subtle flavour. Probably the most famous type is *pâté de foie gras* consisting of goose liver. The geese are specially fed for a period of six weeks on a diet of maize and poppy oil which induces fatty infiltration of the liver. On killing at the end of this period the liver may weigh 2 lb. (.9 kg.), instead of the normal weight of about 4 oz. (113.4 g.). Strasbourg, Fr., is a noted area for the production of this type of pâté.

Meat and Paste Products.—Meat pies consist of a meat or in some cases a meat and vegetable filling enclosed in a paste casing,

usually with a paste top. They may vary in size from about 3 oz. to the large 6-lb. (2.72 kg.) oblong pie, often containing a layer of hard-boiled eggs. Their food value lies in the presence of protein, fat, and carbohydrate. Meat pie production lends itself to mechanization, the baking being carried out in automatically controlled, traveling-type ovens, and mass production has largely replaced the traditional "hand-raised" pie.

Similar products are sausage rolls and Cornish pasties, the latter consisting of meat, potatoes, and other vegetables enfolded in a layer of paste before cooking; stuffed boar's head; the Italian deboned and stuffed pigs' feet; bath chaps (the lower jaw of the pig, cured, smoked, and cooked); and haslet (chopped pork meat, covered with the caul—omentum fat—of the pig, and then baked).

SAUSSURE, FERDINAND DE (1857–1913), Swiss linguist, one of the most influential of modern times, who attained his eminent position not through published works but through the school of linguistics he founded and the excellence of his disciples, was born on Nov. 26, 1857, at Geneva, the scion of a family of scientists and writers. He studied at the universities of Geneva, Leipzig, and Berlin, and obtained a doctorate at Leipzig in 1880. From 1881 to 1891 he was instructor at the École des Hautes Études in Paris; from 1901 to 1913 he was professor of Indo-European linguistics and Sanskrit and from 1907 to 1913 also professor of general linguistics at the University of Geneva.

The only book from Saussure's pen was written when he was 21 years old: *Mémoire sur le système primitif des voyelles dans les langues indo-européennes* (1878). But his most important work, *Cours de linguistique générale* (2nd ed., 1922), is a collection of lectures published posthumously by his students. Saussure's principal tenet was that language is, and must be dealt with as, a social phenomenon, a structured system of signs that can be viewed descriptively (synchronically) and historically (diachronically). The systematic structure (*langue*) is realized and becomes manifest in actual speech events (*parole*)—a dichotomy that has proved extremely useful and fruitful. His own Geneva school, the French and the Prague schools of linguistics, and particularly the structuralists everywhere, owe much to Saussure. He died on Feb. 22, 1913, at Geneva. *See* also LINGUISTICS: *History of Linguistic Studies: Descriptive and Structural Linguistics.*

(E. PM.)

SAUSSURE, HORACE BÉNÉDICT DE (1740–1799), Swiss physicist, early Alpine explorer, first-known experimental petrologist, and developer of what was probably the first electrometer, was born at Geneva on Feb. 17, 1740. From 1762 to 1786 he taught at the Academy of Geneva. His early devotion to botanical studies led him to undertake numerous journeys in the Alps, and from 1773 onward he devoted much of his time to the study of that area. An interest in meteorology led him to develop the hair hygrometer, an instrument for measuring atmospheric humidity. Descriptions of seven of his Alpine journeys were published in *Voyages dans les Alpes* (1779–96). De Saussure was elected a fellow of the Royal Society and in 1772 founded at Geneva the Society for the Advancement of the Arts. He died in Geneva on Jan. 22, 1799.

See W. Noyce, *Scholar Mountaineers* (1950).

SAUVEUR, ALBERT (1863–1939), U.S. metallurgist and teacher, who prior to 1900 developed methods of improving the quality of steel through studies of the crystal structure of metals. He pioneered the technique of photomicrographs in the late 1800s to further his studies of metal microstructures. Sauveur's work in the heat treatment of metal is still a scientific landmark. Born in Louvain, Belg., June 21, 1863, of French parentage, Sauveur received his early education in Europe, and graduated from the Massachusetts Institute of Technology, Cambridge, in 1889. After a period of work as a chemist and metallurgist, he left industry in 1899 for Harvard university as an instructor. In 1905 he became a professor of metallurgy, and in 1924 he was appointed the Gordon McKay professor of mining and metallurgy at the university. From 1898 to 1903 Sauveur was editor of *Metallographist,* and in the period 1903–06 he served as editor of *Iron and Steel Magazine.* He received many medals and honorary degrees from U.S. and European societies and universities. The Legion of Honour of France and the French Academy both elected him an officer. A national award established in 1934 by the American Society for Metals bears his name. Sauveur served the French and U.S. governments in World War I as a metals consultant, and in 1925 he was a U.S. delegate to the Pan-American Scientific Congress in Lima, Peru. He died in Boston, Mass., Jan. 26, 1939. (R. T. B.)

SAVA (SABAS), **SAINT** (*c.* 1174–1236), first archbishop of the independent Serbian Church, was the third and youngest son of Stephen Nemanya, the Grand Zhupan of Serbia. According to biographers, Rastko (his name in the world) left his father's court at the age of 18 and went secretly to Mt. Athos, where, resisting all Stephen's importunities, he became the monk Sava. In 1196 his father abdicated and himself embraced the religious life as the monk Simeon, joining his son two years later on Mt. Athos. Father and son together founded the monastery of Chilandari (Khilandar), where Sava lived while he remained on the holy mountain and which became the great centre of Serbian theological learning. In 1208 at the request of his brother Stephen the First Crowned, Sava brought the remains of their father back to Serbia, where they were interred at Studenitsa, of which Sava then became archimandrite.

As a statesman Sava had to cope with the quarrels of his elder brothers, with the Bogomil heresy (*see* BOGOMILS), and with the low level of culture in Serbia at that time. He did much to strengthen political and ecclesiastical unity. He visited the emperor and the patriarch of Constantinople who, after the Fourth Crusade (1204), were in exile at Nicaea, and by their appointment returned to Serbia in 1219 as the first archbishop of an independent Serbian church (*see* SERBIAN ORTHODOX CHURCH). His policy ensured the permanent adherence of the Serbian Church to Constantinople instead of Rome. He established eight bishoprics which he filled with men whom he had trained at Chilandari. He worked for the spread of education, and his account of his father's last years was the first original (not translated) piece of Serbian literature. Before his second pilgrimage to Palestine (1233) he retired from the Serbian archbishopric, nominating Arsenius as his successor. On the way back he died at Trnovo (Turnovo, in modern Bulgaria) in 1236. His feast day is Jan. 14.

See E. E. Golubinsky, *Kratkiy ocherk istorii pravoslavnykh tserkvey bolgarskoy, serbskoy i rumynskoy* (1871); J. Matl, "Der heilige Sava als Begründer der serbischen Nationalkirche," *Kyrios,* 2: 23–37 (1937).

(RE. M. F.)

SAVA (SAVE), a river of Yugoslavia and an affluent of the Danube. It rises in the Triglav group of the Julian Alps from two sources, the Sava Bohinjka and the Sava Dolinka, which join at Radovljica, at a height of 1,350 ft. (411 m.) above sea level. It then flows eastward through Slovenia, just south of Ljubljana, through Croatia touching Zagreb and, passing through part of Bosnia, joins the Danube at Belgrade. The most important tributaries of the Sava are the Kupa, Una, Vrbas, Bosna, Drina, and Kolubara. The longest river entirely in Yugoslavia, the Sava has a length of 584 mi. (940 km.), the area of its basin being 37,000 sq.mi. (95,800 sq.km.). It is navigable for small river steamers from Sisak to its mouth, a distance of 362 mi. (V. DE.)

SAVAGE, RICHARD (*c.* 1697–1743), English poet and satirist, and the subject of one of the best short biographies in English, Dr. Johnson's *Life,* was by his own account in the preface to *Miscellaneous Poems* (1728) the illegitimate son of Anne, countess of Macclesfield, and Richard Savage, 4th Earl Rivers. His exact date of birth is uncertain (in Johnson's *Life,* and in the anonymous *Life of Mr Richard Savage,* 1727, it is given as Jan. 10, 1698), unless Savage is to be certainly identified with the illegitimate son by Earl Rivers born to the countess on Jan. 16, 1697, at Fox Court, Holborn, who on Jan. 18 was christened Richard

Smith, and six months later vanished from all authentic record. The supposition that Savage was born in 1697 is perhaps supported by other evidence (*see* C. Tracy's biography in *Bibliography,* below). The countess of Macclesfield was divorced in 1698 and became Mrs. Brett by a second marriage in 1700. In Nov. 1715 a young man taken into custody for treasonable, *i.e.,* Jacobite, doggerel identified himself as "Mr. Savage, natural son to the late Earl Rivers," and continued so to describe himself for the rest of his life. Mrs. Brett at no time countenanced his pretensions, and in the absence of proof most modern students have followed her example.

In addition to his claim to be the son of a nobleman Savage pressed another, to be a man of letters. In 1717 he published *The Convocation,* a poem about the religious dispute known as the Bangorian Controversy (*q.v.*); and in 1718 had *Love in a Veil* (publ. 1719), a comedy taken from the Spanish of Calderón, produced at Drury Lane, where in 1723 a neoclassical tragedy, *Sir Thomas Overbury* (publ. 1724), was also produced. *Miscellaneous Poems* appeared in 1726 and again in 1728, this time with the preface against Mrs. Brett which Savage had originally suppressed, probably under pressure from her friends. In 1727 Savage had been tried for the murder of one James Sinclair in a tavern scuffle, but was saved from execution mainly by the intervention of Mrs. Brett's nephew John Brownlow, Viscount Tyrconnel. He marked his escape with the publication of *The Bastard* (1728), a stinging attack in verse on Mrs. Brett, and it was probably to safeguard the family's good name that Tyrconnel in 1728 took Savage into his own home and paid him a pension of £200 a year.

The poet's acquaintance included people prominent in society as well as men of letters such as James Thomson, Edward Young, and Pope. His most considerable poem, *The Wanderer,* a discursive work with passages of natural description revealing the influence of Thomson's *The Seasons,* appeared in 1729, as did his prose satire on Grub Street, *An Author to be Let;* and by 1732 he had engaged the charitable attention of Queen Caroline. But he was unstable, his charm alternated with arrogance, and he was an inveterate sponger. In 1735 he quarreled finally with Tyrconnel, failed to find patron or sinecure, and after the queen's death, in 1737, found himself destitute. In 1737–38 he met Samuel Johnson (*q.v.*), then newly arrived in London, and to Johnson's perceptive and compassionate *Account of the Life of Mr Richard Savage* (1744), rather than to his own writings, he owes his continuing fame. His friends, Pope prominent among them, eventually provided money to convey him out of London, and after a year spent in Wales he died miserably in a debtor's prison in Bristol on Aug. 1, 1743.

BIBLIOGRAPHY.—The best edition of the *Poetical Works* is by C. Tracy (1962). Of several contemporary accounts of Savage, the best-known is the anonymous *Life of Mr Richard Savage* (1727). The first effective research into his claims was that by W. Moy Thomas in *Notes and Queries,* Second Series, vol. VI (1858). S. V. Makower's *Richard Savage: a Mystery in Biography* (1909) has been superseded by C. Tracy, *The Artificial Bastard* (1953). (G. Jo.)

SAVANNAH, the leading seaport in Georgia, U.S., is situated at the mouth of the Savannah river on an elevation of 42 ft. (13 m.), 18 mi. (28 km.) W. of the Atlantic coast; it is 260 mi. (420 km.) S.E. of Atlanta and 140 mi. (225 km.) S. of Columbia, S.C. The city was laid out by James Oglethorpe according to plans drawn in England, with rectilinear streets crossing at right angles, the plat being symmetrical with numerous squares reserved for public parks. These parks, studded with semitropical trees and flowers and surrounded with Georgian colonial and Greek revival buildings, give the city an atmosphere of tranquility and grace. It exceeds all Georgia cities in historical interest and it is a leading tourist and recreation centre. It is also a city of commercial and industrial importance. Pop. (1960) city 149,245; standard metropolitan statistical area (Chatham county) 188,299. (For comparative population figures for the city *see* table in GEORGIA: *Population.*)

History.—The original Georgia settlement in 1733, Savannah was the seat of colonial government and remained the capital of the commonwealth until 1786, although sharing this distinction with Augusta after 1778 (*see* also GEORGIA: *History*). Among the early residents were the brothers John and Charles Wesley, who came in 1736, John as a representative of the Society for the Propagation of the Gospel, Charles as secretary to Oglethorpe. Charles Wesley stayed only a few months; John Wesley remained until 1738. The evangelist George Whitefield visited the settlement for the first time in 1738 and several times thereafter; he founded in Savannah the Bethesda orphanage.

As early as 1744 there was established at Savannah an exporting and importing firm engaging in coastwise traffic and by 1750 the port was clearing vessels directly to Europe. Lumber products, sago powder, rice, indigo, beef, pork, animal skins, tar and turpentine were its early exports. In 1769 Savannah merchants condemned the British acts of trade and adopted nonimportation agreements but its revolutionary sentiment was comparatively moderate. During the American Revolution the town remained only briefly in rebel hands, being occupied by loyalist forces from 1778 to near the end of the conflict. After the war Gen. Nathanael Greene, who is buried in the city, settled on an estate, 14 mi. N. of Savannah, granted him by the state of Georgia. It was while visiting the Greene family there in 1793 that Eli Whitney invented the cotton gin. There was a devastating fire in the city in 1796, and in 1820 another fire coupled with a yellow-fever epidemic destroyed considerable life and property. Cholera swept the city in 1834 and hit the slave population severely.

In the meantime the importance of the port was increasing, partly as a result of improved transportation in the hinterland. The town's early means of contact with other communities was provided by rivers and coastal waters, but by the end of the 18th century a network of roads connected it with points in the back country. The "Savannah," the first steamboat to cross the Atlantic, sailed from Savannah for Liverpool in 1819. Commercial rivalry with Charleston and Augusta caused Savannah citizens to promote a railroad, known as the Central of Georgia, which was completed to Macon in 1843. By 1860 the Atlantic and Gulf railroad connected Savannah with points in southern Georgia. The city's commerce suffered during the Civil War as a result of the Union blockade but the city was not captured until late in 1864, when it became the objective of Gen. W. T. Sherman's march to the sea. The city was occupied by Federal troops on Dec. 21, 1864.

After the Civil War Savannah recovered fairly rapidly in spite of a yellow-fever epidemic in 1876. It remained the largest urban centre in Georgia until it was surpassed by Atlanta in 1880. Savannah's history in the 20th century is largely its increasing industrialization and its increasing importance as a maritime centre. It has a council-manager form of government, in effect since 1954.

Population Characteristics.—Both the city of Savannah and its metropolitan area increased in population during the middle part of the 20th century, the rate of increase between 1950 and 1960 being 24.7% in the city and 24.3% in the metropolitan area. The population of the city in 1960 was 62.9% native-born white, 1.4% foreign-born white and 35.7% nonwhite. Although the percentage of foreign-born residents is low, in the past it has been the highest in Georgia. In 1870, for example, the foreign-born comprised 24.2% of the white population. Among the foreign-born the Irish have predominated.

Commerce, Industry and Transportation.—In the latter part of the 20th century manufacturing was the leading occupation but wholesale and retail trade ranked a close second, with public utilities, including transportation and communication, being third. Professional and related services ranked next. Less than 1% of the people of the county were engaged in farming.

The city is served by railroads and state and federal highway systems, with bridges spanning the Savannah river and other water barriers in the vicinity. It has two airports and about 1,500 vessels enter the port of Savannah annually. Piers, docks, wharves and storage warehouses are located along the west side of the Savannah river. Savannah is the leading manufacturing port city between Baltimore and New Orleans, its industry including over 250 manufacturing firms, the principal operations being pulp and

paper, sugar refining, packaging, shipbuilding and repair, building materials (including felt, asphalt and roofing), fertilizers, castings and chemicals. The Hunter air force base, a permanent installation of the strategic air command, is located near the city, and within 40 mi. are two other military installations, the marine corps recruit depot at Parris Island, S.C., and Ft. Stewart, a U.S. army armour and artillery firing centre.

Education and Cultural Activities.—Savannah was the earliest centre of artistic and cultural interest in Georgia. In 1801 a library society was established there, followed shortly by a theatre which brought to the community the outstanding productions of the times. The Telfair Academy of Arts and Sciences, a museum of permanent collections of all phases of art, was founded in the city in 1875. The community has several public libraries, a symphony orchestra, a little theatre, an annual camellia show and other similar attractions. Located in the heart of the city are Armstrong Junior college and the Savannah State college, both units of the university system of Georgia (*see* GEORGIA: *Education*). A Savannah woman, Juliette Gordon Low (1860–1927), is considered the founder of the Girl Scout movement in the U.S.; a number of places of interest in this connection are marked in the city. (Js. C. B.)

SAVANNAH RIVER, rising in northwest South Carolina, U.S., is formed 8 mi. NW of Hartwell, Ga., by the confluence of the Tugaloo and Seneca rivers and serves as a natural boundary between Georgia and South Carolina. Its course is southeastward past Augusta and Savannah, Ga., to the Atlantic, a distance of 314 mi. (505 km.). North of Augusta the Savannah is fed by the Broad and Little rivers and south of Augusta by Brier Creek. It is navigable for barge traffic from its mouth on the Atlantic to Augusta, 212 mi. (341 km.) upstream. The river is used extensively for hydroelectric power. The Hartwell dam and reservoir near Augusta provides upstream impoundment of the Savannah for hydroelectric, flood control and navigation purposes. There are three other dams near Augusta; the largest of these, Clark Hill dam, is 200 ft. (61 m.) high and 5,660 ft. (1,725 m.) long. The U.S. Atomic Energy Commission's Savannah River plant is in Aiken and Barnwell counties in South Carolina, across the river from Augusta. Clark Hill provides power for the Atomic Energy plant and the river serves as a coolant for plant processes. Savannah, 17 mi. (27 km.) upstream from the mouth of the river, was the centre for James Edward Oglethorpe's initial Georgia colony. Deepdraft navigation by ocean vessels extends 5 mi. upstream beyond the city. At Savannah are one of the world's largest naval stores markets, large state-owned docks operated by the Georgia ports authority and a large refinery for processing sugar imported from the Caribbean. Near Savannah is a large pulp-paper plant with a capacity of 1,900 tons of paper products daily. Many of the former rice and cotton plantations along the lower Savannah are large producers of pulp wood. (M. C. P.)

SAVARA (SORA, SAWARA, SAORA), a Munda-speaking tribe of eastern India, are distributed mainly in Orissa, Madhya Pradesh, Andhra Pradesh, and Bihar, with a total population of about 400,000 in the 1960s. Of these more than 325,000 were in Orissa, especially in the Ganjam (*q.v.*) and Koraput districts.

Most Savara, living in the plains areas, have become Hinduized and generally speak Oriya (*see* ORIYA LANGUAGE). Their traditional form of Munda dialect is preserved in the hilly tracts of Koraput, Ganjam, and Vizagapatam (*see* MUNDA LANGUAGES; MUNDA PEOPLES.).

They practise shifting cultivation and settled, terraced plow agriculture. Paddy rice is the main crop; they also grow millet in the slash-and-burn fields. The Savara sell jungle products to itinerant Hindu traders or at weekly markets where they buy or barter for tobacco, yarn, and pots. Cash is used principally to purchase sacrificial animals for magico-religious ceremonies. The Savara have many specialists of both sexes for their elaborate rituals.

Those Savara who live in the hill country are divided into subtribes mainly on the basis of occupation: the Jati Savara, the main cultivator group (*see* JAT); the Arsi, weavers of tribal cloth; the Muli, workers in iron; the Kindal, basket makers; and the Kumbi, potters. The Savara social unit is the exogamous extended family, including both males and females descended from a common male ancestor. There is a tendency to distinguish an aristocracy of chiefs and priests.

SAVARY, ANNE JEAN MARIE RENÉ, DUC DE ROVIGO (1774–1833), French general and administrator who rose in Napoleon's service, was born at Marcq (Ardennes) on April 26, 1774. He joined the army in 1790, fought in the Rhine campaigns, and went to Egypt (1798) as aide-de-camp to Gen. Louis Desaix de Veygoux. After Desaix's death (June 1800) he became aide-de-camp to Bonaparte and was appointed chief of the First Consul's *gendarmerie d'élite* (1801), general of brigade (1803), and general of division (1805). In 1804 he threw all his energies into the investigation of the Cadoudal-Pichegru royalist conspiracy and commanded the troops at Vincennes when the duc d'Enghien was executed (*see* NAPOLEON I: *The Consulate*).

Both before and after the Battle of Austerlitz (December 1805) Savary was sent by Napoleon to discuss an armistice with Alexander I of Russia. He took a notable part in the rout of the Prussians after Jena (1806) and while in temporary command of the 5th Corps defeated the Russians at Ostroleka in Poland (February 1807). After the Treaty of Tilsit (July 1807) Savary spent five months as ambassador at St. Petersburg. In 1808 he was sent to Spain, where he skilfully exploited the differences between Charles IV and his son Ferdinand VII, in whose favour Charles had recently abdicated. He persuaded both to submit to Napoleon's arbitration and by false promises induced Ferdinand to meet Napoleon at Bayonne, a step which cost him his crown and his freedom for six years (*see* SPAIN: *History*). Created duc de Rovigo in May 1808, Savary replaced Fouché in June 1810 as minister of police, an office in which he showed more zeal than ability. Among the last to abandon Napoleon in April 1814, Savary was also one of the first to welcome his return in March 1815. He was then created a peer of France and first inspector general of constabulary. After the Battle of Waterloo (June 1815) he accompanied Napoleon to Rochefort and Plymouth but was not allowed to go with him to St. Helena. Imprisoned for seven months in Malta, he escaped (April 1816) and lived first at Smyrna (Izmir), and then at Graz in Austria. He returned to France in 1819, and a sentence of death passed on him in December 1816 was reversed and he regained his civil rights. After the Revolution of July 1830 he was commander of the army in Algeria in 1832, but illness forced him to give up his command (March 1833). He died in Paris on June 2, 1833. His *Mémoires* (eight volumes) were published in 1828 in both French and English; a French edition by D. Lacroix appeared in 1901.

See B. Melchior-Bonnet, *Savary, duc de Rovigo* (1962). (C. E. Du.)

SAVATE, literally, "old shoe," the old French sport of fighting by kicking, whose chief practitioners were from among the lower orders of Parisians. *Savate* had died out by about 1850, its more skilful gambits being married with those of English bare-knuckle pugilism to produce *la boxe française.* The name *savate* continued to be used to describe any form of fighting in which the use of the feet was permitted. Two classic blows were a back heel aimed at the stomach and a double mule kick in the face delivered from a handstand position.

The pioneer of *la boxe française,* or modern *savate,* was Charles Lecour, who opened a school in Paris. The sport had a considerable vogue and public exhibitions were staged. The authorities frowned on these and the police intervened. The sport declined in the 20th century and tended to be thought of as confined to the wealthy. In 1927, demonstrations of it were staged at the Ring, Blackfriars, in London; but they excited more curiosity than admiration, especially since one of the exponents was a woman.

In Thailand, boxing with the feet is more popular than boxing

with the fists. The sport is taught to local boys at monasteries, and competitions are held regularly. (N. D. McW.)

SAVERNAKE FOREST, a large beech wood covering 4,500 ac. (1,820 ha.) on the chalk downs just south of the market town of Marlborough, in Wiltshire, Eng. A Saxon charter dated 934 calls it Safernoc, and from the Conquest until 1550 it was a royal hunting ground extending over 20 sq.mi. (52 sq.km.). In 1083 the hereditary office of warden was granted to the family of Esturmy, and their lineal descendant, the marquess of Ailesbury, now holds the freehold.

In 1939 the woods were leased to the Forestry Commission, and during World War II they sheltered American forces before the Normandy invasion. Large fellings were made for timber at that time, but the clearings have since been replanted with beech.

The finest scenic feature is the Grand Beech Avenue which runs for 3 mi. SE from the London-Bath Road to Tottenham House. (H. L. En.)

SAVIGNY, FRIEDRICH KARL VON (1779–1861), German legal scholar, one of the originators of the influential historical school of jurisprudence, was born in Frankfurt am Main on Feb. 21, 1779. In Savigny's classic words, law "is first developed by custom and popular faith, next by judicial decisions—everywhere, therefore, by internal silently operating powers, not by the arbitrary will of a law-giver." Savigny became a doctor of law at the University of Marburg in 1800 and was one of the first members of the German nobility to teach in a university. He subsequently taught criminal law, Roman law and its history and property and contract law at Marburg and Landshut but spent most of his academic career (1810–42) at the University of Berlin. In 1803 his book on possession, *Das Recht des Besitzes,* was published. Soon thereafter he turned to the historical and jurisprudential interests that dominated the remainder of his career.

The immediate occasion that led him in that direction was the publication of a book, *Civilistische Abhandlungen,* in 1814, by Anton Thibaut, a professor at Heidelberg, who demanded immediate codification of German law. Thibaut's book reflected the rise of German nationalism after the Napoleonic wars and a reaction against Roman and other foreign law. Savigny vigorously opposed codification in a monograph, *Vom Beruf unserer Zeit für Gesetzgebung und Rechtswissenschaft* (1814), which gave much impetus to the emerging historical theory of law. Historical jurisprudence viewed law as a slow, almost imperceptible growth, like language.

This jurisprudential perspective was a phase of the romantic movement, which had begun in the latter part of the 18th century, and it took the form in Germany of a movement back to the simplest tribal origins of the German people, to their folk songs and tales and to their distinctive ethos, their *Volksgeist* ("national spirit"). The movement found expression in the philosophy of Johann Gottfried von Herder, the fairy tales of the Grimm brothers and Barthold Niebuhr's Roman history. The national spirit was the ultimate datum to be explored in its various manifestations. From this point of view law is not something that can be made but originates in the unique spirit of the people and is expressed spontaneously in custom and, much later, in the formal decisions of the judges. Accordingly, legislation and codes can, at most, give only verbal expression to existing law the actuality and meaning of which can be discovered by careful historical investigations. Thus, historical jurisprudence opposed not only codification but also natural-law philosophy as illusory and fictitious. Instead of assuming that familiar law was "universal," as Savigny charged was done in natural-law philosophy, historical jurisprudence insisted on thorough research into legal origins and transformations.

While the philosophy of historical jurisprudence was in the 20th century perverted by the Nazis in their glorification of the German *Volk,* it is certain that Savigny would have thoroughly disapproved of racist interpretations. He was a pioneering legal scientist who made lasting contributions to jurisprudence, especially in revealing the continuity of present legal institutions with past ones; in laying the foundations of legal sociology; and in articulating the methods of historical research. These contributions greatly influenced all the social disciplines. (*See* also Jurisprudence.)

In 1815, shortly after the appearance of his epochal book, Savigny, Karl Friedrich Eichhorn and Johann Friedrich Ludwig Göschen founded the *Zeitschrift für geschichtliche Rechtswissenschaft* as the organ of the new historical school. In 1815 also, the first volume of his six-volume treatise on medieval Roman law, *Geschichte des römischen Rechts im Mittelalter,* appeared, the last of which was published in 1831.

Savigny then devoted himself to an elaborate treatise on modern Roman law, *System des heutigen römischen Rechts* (8 vol., 1840–49), which contains his theory of private international law and his further study on possession and error. In March 1842 he was appointed high chancellor of Prussia by Frederick William IV and, after carrying out several important reforms especially in regard to bills of exchange and divorce, he resigned in 1848. In 1850 appeared his collected minor works, *Vermischte Schriften,* in 5 volumes, and in 1851–53 he published a book in 2 volumes on contracts (*Das Obligationenrecht*), a supplement to his work on modern Roman law.

Savigny died in Berlin on Oct. 25, 1861.

SAVIGNY, ABBEY OF, in Normandy, was for a time the head of one of the reformed Benedictine orders of the early 12th century. It owed its foundation to Vitalis, a secular clerk who spent about 17 years as a hermit in the wild regions of Craon and the forest of Savigny. With the aid of a grant of land from Raoul of Fougères he founded a monastery in 1112 for the group of disciples who had joined him there. Savigny from the first had much in common with Cîteaux (*q.v.*), including an emphasis on agricultural work and the admission of lay brethren; annual general chapters for the daughter houses were added by Geoffrey, the second abbot. In 1147 Abbot Serlo, an admirer of St. Bernard, secured the fusion of Savigny and more than 30 French and English dependencies with the order of Cîteaux. The abbey was secularized in 1790, and only fragmentary ruins remain.

C. Auvry, *Histoire de la Congrégation de Savigny,* 3 vol. (1896–98). (M. M. Ch.)

SAVILE, SIR HENRY (1549–1622), English classical scholar, mathematician, and patron of learning, was born at Bradley, near Halifax, on Nov. 30, 1549, of a prosperous Yorkshire family. He matriculated at Brasenose (1561) and was elected a fellow of Merton College, Oxford (1565). He lectured on Ptolemy's *Almagest* and after a continental tour collecting manuscripts became Queen Elizabeth I's tutor and, in 1585, warden of Merton. Gifted, handsome, and on good terms with the earl of Essex, he persuaded the queen in 1596 to appoint him provost of Eton although he was a layman. Both his colleges benefited from his autocratic rule, for it was coupled with a determination to have genuinely learned men as fellows and scholars. His friendship with the rebellious Essex earned him a brief imprisonment in 1601 and a knighthood in 1604 when James I had come to the throne. He helped to prepare the Authorized (King James) Version of the Bible, the Acts, Revelation, and a part of the Gospels falling to his share. He died on Feb. 19, 1622, at Eton with his reputation undimmed. Savile was a pioneer in many branches of scholarship. His translations from Tacitus' histories (1591) were accompanied by one of the earliest English treatises on Roman antiquities. His eight-volume Chrysostom (1610–13) remains the best edition of Chrysostom's works. He published some neglected medieval historians, as well as the 14th-century philosopher, Thomas Bradwardine (1618), whose thought his mathematical interests helped him to appreciate. But his greatest service to learning was probably the foundation in 1619 of the two Savilian professorships of mathematics and of astronomy at Oxford, for they had the effect of bringing at a critical moment the official study of these subjects into line with the latest advances in knowledge.

See J. E. Sandys, *History of Classical Scholarship,* vol. 2 (1908); M. H. Curtis, *Oxford and Cambridge in Transition 1558–1642* (1959). (R. R. Bo.)

SAVING, NATIONAL. Saving means the setting aside for future use of part of current income—the excess over the amount currently consumed or paid in taxes. Saving may thus be performed by anybody having an income—by an individual, a family, or by a business firm. Because of disagreement as to the sense in which a government body has an income, there is some difference of opinion among economists as to whether or not it is appropriate to say that governments (as distinct from the citizens and businesses under their jurisdiction) carry on saving. But whether or not the government is said to save, the nation may be said to save the sum of the amounts saved by the individuals and business firms (plus government bodies if they are considered to have savings) which it includes. Since there are always some individuals and businesses whose current expenses and taxes outrun their incomes, and whose savings are therefore negative, national saving must be thought of as a net total with negative savings subtracted.

Forms of Saving.—Saving is often spoken of loosely as if it were synonymous with the piling up of idle cash. This interpretation is misleading. While it is true by definition that savings are not spent on the consumption of the saver, it does not follow that they are not spent at all. They may be spent directly by the saver or indirectly by business firms he helps to finance; they may be spent on the purchase of new items added to the community's stock of wealth, such as new houses or machinery. They may be spent indirectly on the consumption of some other person who borrows or sells property to finance his negative savings. They may help to finance a government deficit, thus supporting whatever spending the government is carrying on, whether for armaments, highways, food to feed the hungry, or routine government expenses.

Part of current saving—sometimes a small part, sometimes a large part—appears in the form of increase in savings deposits and other cash assets held by the individuals or business firms doing the saving. The remainder is represented in their accounts by additions to their holdings of physical property, acquisition of government or private securities, or reduction of the debts they owe to others.

Saving and Investment.—Under the generally accepted use of terms, it will always be found at the end of any accounting period that if the revenues and expenditures of government are equal (the budget balanced) and if all government expenditures are on current account, national saving for the period amounts to just as much as investment in new buildings, equipment, etc. This is a matter of definition. Saving means the excess of national income over consumption and taxes. Investment is taken to mean the excess of net national product (which is the same thing as national income) over the parts of the product made up of consumption goods and services and items bought by government expenditures.

Since economic progress depends largely on the increase of wealth through investment, it follows also that economic progress is linked with the achievement of national saving. Some increase in production might be possible without any net national saving, through increasing the labour force, finding new ways to use existing equipment and labour, and replacing old equipment and buildings as they wear out (*see* DEPRECIATION) with more modern types. But to make full use both of the growing labour force and of new methods of production requires a net increase of plant and equipment; besides this there is always a backlog of opportunities to increase production, with preexisting methods and labour force, for which more equipment would have been required.

The need of investment and saving to increase production is of course most acute in countries where modern technology has not yet been put into operation and in devastated areas where houses, workshops, and transportation equipment have been destroyed.

The meaning of the much-misunderstood doctrine of "abstinence" may be stated as follows: if there is to be an increase of productive wealth, somewhere in the economic system somebody must abstain from consuming his entire income. It does not necessarily follow that those who abstain from consuming are suffering. On the contrary, insofar as saving is left to individuals, it is performed chiefly by persons with high incomes who both save heavily and consume considerably more than the average. But for the community as a whole it is impossible both to consume the whole of current income and to build up productive wealth.

It should be observed that these propositions do not prove that economic progress either will or will not be served by an increased inclination to thrift on the part of individuals and business firms. Progress depends on the achievement of substantial investment and therefore of substantial saving. But as John Maynard Keynes pointed out, decisions to save and decisions to invest are taken by different persons operating under different incentives. A decision by one individual to save more, unaccompanied by a decision by him or anybody else to invest more, cannot be guaranteed to increase the volume of saving and investment actually realized; in fact, many economists argue that the effect would be to decrease that volume. This point will be examined further below.

Effect of Government on Saving-Investment Relation.—If the government's revenues and expenditures are unequal, the relation of saving to investment just described is modified. In a period of depression, for example, the tax base shrinks and revenue declines, while the addition of relief programs to government responsibility increases expenditure. Government is therefore obliged to finance its expenditures in part either by borrowing, by paying out cash on hand, or by issuing money. Some savers, consequently, either use their savings to buy government securities, or hold more cash, or have larger balances with banks and other credit institutions while the latter have more cash and government securities. The same is true when a government deficit is incurred for war purposes.

In these circumstances it is no longer true that the net total saved by individuals and businesses is equal to the net total invested by individuals and businesses in new productive wealth. Private savings exceed private investment by the amount of the deficit. Whether national saving is said to exceed national investment is a matter of language. The part of government expenditure used to pay for productive wealth such as hydroelectric dams, roads, needed buildings, and recreation facilities can reasonably be described as investment. Any excess of the deficit over such government investment can be described as negative saving by government, reducing the net total of national saving. This way of using language has the advantage of stressing the fact that when government saving is positive (*i.e.*, when government has an excess of revenue over current expenses, the excess serving to reduce government's net debt and to finance government investment) there can be an increase of the nation's productive wealth in the absence of private saving. It has the drawback, however, of inviting dispute as to the scope and measurement of government activity to be classified as investment (particularly in time of war) and leaving statistical measurements of national saving with a much wider range of possible error than measurements of private saving.

Ways of Estimating Saving.—For an individual there are two ways to measure his saving for a given accounting period. One is to estimate his income and subtract his current expenditure, the difference being his saving. The alternative is to examine his balance sheet (his property and his debts) at the beginning and end of the period and measure the increase in net worth, which reflects his saving. While different figures are taken out of the individual's accounts under these two procedures, the two methods are logically equivalent. In either case it is necessary to make sure that we do not include in income (or in the increase of net worth) any items which reflect merely changes in price levels at which pieces of property are valued, or items reflecting events not regarded as linked with income—broadly speaking, to exclude capital gains and losses (whether realized or "paper") from income. For example, losses due to property destruction by enemy action in wartime, or gains due to a rise of prices on the stock market, would be excluded in income determination. If income is measured by the rules generally adopted by national income statisticians, the result is to exclude not merely the effects of price changes but some actual physical changes—chiefly losses—in

wealth. The net total of saving estimated in this way tends to exceed the value of additions to the nation's stock of wealth to the extent that war damage, uninsured fire losses and similar events fail to appear in the income account. On the other hand, it tends to fall short to the extent that new wealth is found (for example through mineral discoveries) or that wealth becomes more useful through new techniques (for example, through the development of dry farming techniques which made previously worthless land take on value).

In standard national accounting practice, the economy's saving is generally estimated by subtracting an estimated flow of consumption outlays from an estimated flow of income. But even when both income and outlay are both well estimated this method is vulnerable to minor errors in the two figures used in the subtraction: an error of 1% in estimated income, for example, can yield an error of 10% in the residual figure of estimated saving. Hence these figures must be controlled by other methods. In the United States, estimates of assets and liabilities for individuals, corporations, and government bodies are made currently by the Securities Exchange Commission and are used to frame alternative estimates of saving, which agree fairly well with those obtained from estimates of income and consumption. In his monumental *Study of Savings in the United States* (1955–56), Raymond W. Goldsmith relied primarily on estimates of assets and liabilities, with corrections for changes in price levels.

War Saving.—Savings under war conditions follow different patterns than in peace. Individuals and businesses set aside a larger proportion of their incomes, so that net private savings grow enormously. On the other hand, private investment is restricted because war needs divert labour and materials from making buildings and equipment for private use. Public construction and acquisition of equipment by government expands, but most of the resulting facilities are either used up in the war or are inconvertible to civilian uses thereafter. The consequence is a great growth in the paper wealth of individuals and business firms (corresponding to the growth of the government's debt) with little or no growth in actual productive wealth.

Not much precise information is available about saving during World War I. Interwar studies reveal that individuals and business firms saved in 1919 a much larger proportion of income than in any year in the 1920s, and that saving in 1920, though declining, was still high. For World War II, comparatively reliable studies made at the time show that the proportion of income saved rose well above peacetime levels during 1941 and continued to rise thereafter. At the peak of war activity, individuals were saving nearly one-third of their disposable incomes (*i.e.*, income payments less personal taxes), and corporations well over one-half of theirs.

The total wartime accumulation by individuals amounted to far more than the income of any single year of the interwar period, and the great bulk took the form of additional currency, bank deposits, government securities, and claims upon life insurance companies.

It is probable that the saving of the richer groups of the population made up a much smaller proportion of the war saving than of peacetime saving, but the difference must not be exaggerated. About half of the wartime accumulation of individuals and corporations was accounted for by the growth in their holdings of government bonds—more than two-thirds in denominations of $500 and upward—which were not to any great extent small savings. The proportion of the growth in bank deposits, currency and insurance claims representing large savers was probably still higher.

Motives for Saving.—Saving is a very complex phenomenon. Different savers save for different reasons, and a given saver for a mixture of reasons. At any given moment, furthermore, many individuals find themselves spending less or more than their incomes simply because their incomes are more or less than was expected when commitments to spend were made. This is true especially for farmers and self-employed business and professional men whose incomes are subject to unexpected fluctuations.

Insofar as saving goes back to decisions to save, the main motives seem to be the following: (1) provision for a future period when income is expected to be less or the need for expenditure greater than at present—for example, provision for retirement, education or vacations; (2) provision against unpredictable decline in income or growth in need—for example, against sickness in the family or loss of earning power by the breadwinner; (3) acquisition of higher income, either by improving the equipment, etc., of a business, or by being housed better or at less expense, or by obtaining interest, dividends, rent or other property income; (4) gain in social status through acquiring property; or (5) direct subjective satisfaction from accumulation ("miser's" instinct). Pulling against these motives, of course, is the desirability of current consumption, and the desirability of having more leisure at the expense of potential income.

This hypothesis about the motives for saving explains the U.S. record fairly well. High-income individuals have greater incentives to save than low-income individuals, for example, because the former: (1) are a group many of whose members are enjoying temporary increase of income and must expect a drop later on; (2) have better opportunities to place savings where they will yield income; (3) are more able to gain power and social approbation by saving; and (4) are less hard-pressed to maintain what they regard as necessary standards of consumption and of leisure. Rural people are more inclined to save than urban people of like income because: (1) their incomes are more uncertain; (2) their opportunities to gain income from saving are better and the fruits of their savings, in buildings, livestock, equipment, etc., are more visible and thus more conducive to improved social standing and direct enjoyment; and (3) their standards of consumption and of leisure are less exacting. War saving is higher than peacetime saving because: (1) incomes are regarded as abnormally high and are above previous levels; (2) ordinary outlets for negative saving (retirement of elderly people, education, prolonged vacations and medical treatments) are reduced; (3) incomes are less secure; (4) social pressures to save are intensified; and (5) normal standards of consumption and leisure are suspended. The fact that the rising trend of real per capita income has not brought a rising trend in the proportion saved is explained by: (1) progressive urbanization; (2) rising standards of consumption and leisure; (3) the trend away from private houses and away from direct ownership by individuals of tangible business property (which reduces both opportunities to gain income and opportunities to gain social status and direct satisfaction by increase of property); (4) the downward drift in interest rates; and (5) increased importance of some sources of negative savings (in particular the increased stress upon higher education and the increased proportion in the population of elderly people who tend to live on past saving).

SAVINGS AND LOAN ASSOCIATION, a cooperative savings institution of the type originally established to make loans to members for the purchase of homes. Such associations are also known in the United States as building and loan associations, co-operative banks, homestead societies, building societies and savings associations. The identifying labels that promise to become most common are savings and loan associations in the United States and building societies in Great Britain.

UNITED STATES

The modern savings and loan association in the United States resembles a bank, but is differently constituted. The savers purchase shares of stock and are thus owners of the association, not depositors. They receive dividends on their shares in proportion to the profits of the organization. The association is pledged to repurchase the shares bought by savers, after reasonable notice; it invests most of its funds in long-term mortgages. These features have characterized U.S. associations since their origin and have made them highly successful in home mortgage financing. By the middle 1960s savings and loan associations held 44% of the

mortgage debt on nonfarm homes in the United States.

Origins and Development.—Savings and credit institutions for noncommercial groups developed in the United States in the first half of the 19th century. The savings and loan associations were, at first, informally organized groups of neighbours or of men in the same industry who pooled their savings to purchase homes. Though there were many plans for saving and borrowing, a common pattern was followed. Each member was committed to make regular payments to a fund. A member could borrow from the fund to purchase a home. His share and his home were the collateral for the loan. The borrowing member would continue his regular payments to the fund and also make interest payments. Both savers and borrowers were penalized by fines and forfeitures if they did not maintain regular payments. The association was not a permanent institution but was created for the period necessary to enable each of the members in turn to purchase homes. By the end of the 19th century these small neighbourly associations were replaced by permanent institutions which had members who were not saving to purchase homes and borrowers who were not members of the association before making their loans.

Savers and Owners.—Associations in the United States may be chartered by the federal or state governments. All federally chartered associations are mutually owned; every saving member is an owner and can vote for the selection of the management. State chartered associations may be mutual or stock associations. If they are stock associations, the savers receive investment certificates which do not carry the right to vote or to claim the residual profits of the association. In all cases the savers are not depositors; as noted above, they do not stand in the same relation to the association as does a saver in a bank. The depositor in the bank is a creditor of the bank; the saver in an association has an ownership right or investment. In practice, since the associations must offer convenient service in order to compete for savings with other institutions, withdrawal requests are usually honoured promptly.

The formal difference of ownership shares as against deposits is of importance. The associations can be less liquid than banks; *i.e.*, more of the assets of the associations can go into long-term investments since they are not required to meet every unexpected demand by depositors for their funds. Therefore associations allocate a larger percentage of their assets to mortgages. Compared to other institutions the associations write mortgages for longer periods and their loans are for a larger percentage of the appraised value of the property. Since mortgages of this type are more risky, the associations' interest rate is usually higher than that charged by banks.

There are many patterns of savings in use. Originally the associations were characterized by forced savings schemes. Individuals were expected to make regular payments to accumulate sufficient funds for the ownership of a stated number of shares. If they did not maintain the payments for the shares the savers might be forced to pay a fine, lose part of their dividends or lose a bonus dividend. Forced savings are no longer popular and the usual form of savings is as flexible as that offered by a savings bank.

Amortized Loans.—The loan repayment provisions of the early associations were the prototype of the amortization plans used in repayment of mortgages in the 20th century. It was the pioneering work of the savings and loan associations that provided the experience for the federal government's policies in the 1930s for the reform of mortgage financing. The association plan, referred to as the direct reduction loan plan, required the home buyer to make a fixed payment each month; part of this payment was applied to the principal and part to interest, the former increasing each month as the latter decreased.

The associations generally prefer conventional mortgages to those insured by the Federal Housing Administration (FHA) or guaranteed by the Veterans Administration (VA) because these mortgages earn a higher interest rate. A higher interest rate gives the associations a higher profit and enables them to pay a higher dividend rate to savers. A higher interest rate is necessary in order to compensate savers for the slightly greater risk of investment in an association.

Local Nature.—The early associations in the United States were small and local, and most of them still are. The federally chartered associations must make most of their loans on property within a 50-mi. radius of the home office. More frequently the associations restrict themselves to a city or a neighbourhood within a city, though they may solicit savings from investors in a much wider area. Area restrictions serve to limit the size of the associations but their growth since 1950 has been rapid. The more than 6,200 associations in existence in 1960 represented only a 17% increase over the total number in existence in the year 1900, but during this 60-year period the assets of the associations had increased 100-fold. The assets of the average association increased from approximately $100,000 in 1900 to more than $10,000,000 in 1960. Some associations in the early 1960s had assets exceeding $100,000,000. These associations were no longer small groups of neighbours or fellow workers joined together to provide homes for themselves but had become big business enterprises that extended credit to nonmembers and sought funds from investors over a wide area. Their size and diffusion of ownership meant that government controls were necessary to avoid abuses.

Public Policies.—Most state regulations are based on a detailed regulatory code adopted by the legislature which severely restrains the associations' freedom of action. In addition all associations which are members of the Federal Home Loan Bank System are subject to examination according to the detailed regulatory code adopted by the Federal Home Loan Bank Board. The major purposes of the regulations are to make certain that an association is complying with its governing charter and that its investments are sound. By 1960 the great majority of all associations were members of the Federal Home Loan Bank System. Members of the system may receive loans from the Federal Home Loan Bank Board.

The Federal Savings and Loan Insurance Corporation was established in 1934 to insure savings up to $5,000. In 1952 the ceiling was extended to $10,000. (*See* also HOUSING: *Housing in the United States.*) Savings and loan associations are represented nationally by the U.S. Savings and Loan League with headquarters in Chicago, Ill. (J. Ms.)

GREAT BRITAIN

Building societies in Great Britain perform essentially the same functions as savings and loan associations in the United States. They accept money from the public, pay interest on it, allow it to be withdrawn and, in brief, provide a convenient investment service. They also lend money on the security of a mortgage of freehold or leasehold property. Although the earliest building societies undertook the construction of houses, this function was abandoned about the middle of the 19th century and consequently the name building society has become a misnomer. The term is, however, compulsory by law and although various alternatives have been suggested, none has met with universal acceptance.

History and Development.—In the latter half of the 18th century in Great Britain the artisans of the new machine age were emerging as a social group and, in order to give themselves some measure of self-protection against the misfortunes of life, many of them made regular contributions to sick and burial clubs and friendly societies. It was a similar motive—security—which led to the formation of building societies, and according to S. J. Price, who undertook extensive research on this subject, the earliest society of which any record has been found was established in Birmingham in or before 1775.

The early societies were all "terminating"; that is to say, they were intended to have a limited life. Each member agreed to pay a fixed sum at regular intervals from the establishment of the society until it was disbanded. From this steady income the society bought a piece of land and built houses one after another until each of the subscribers had been housed. When the cost of the land and all the houses had been met, the society was dissolved.

As time went on societies began to borrow money from people who did not themselves want to buy a house and this accretion of funds enabled the borrowing members to purchase a house with

less delay. As a result of this development there was no longer any need to bring each society to an end when all its original members had received an advance, so that gradually the "terminating" societies were replaced by "permanent" societies.

Building societies were first certified under the Friendly Societies Acts of 1829 and 1834. Their rapid rise led, in 1836, to a special act which extended the friendly society regulations to them in so far as they were applicable, binding all members of a society by the rules, which were certified by specially appointed officers who gave security. Provision was made for control by a committee of management. The society's property was vested in trustees empowered to bring and defend actions and to settle disputes by arbitration. Exemptions were given from stamp duty and the usury laws. By 1850 over 2,000 societies were registered in the United Kingdom.

In 1870 a royal commission was appointed to inquire into the working of friendly societies and building societies. As a result, an act was passed in 1874 and this remained the basis of later practice. Under this act the societies became corporate bodies possessing full legal powers corresponding to those of a limited company. The liability of an investing member was limited to the amount actually paid or in arrears on his shares and that of a borrowing member to the amount still payable under the terms of his mortgage.

The assets of the movement in 1890 have been estimated at £51,000,000 and from then until 1918 there was a steady but unspectacular growth to £68,000,000. Between 1919 and 1939 and again after 1945 there was an immense expansion of activity so that by the middle 1960s the total assets were approximately £4,000,000,000.

Organization and Control.—Apart from statutory control, building societies are governed by their own rules. Management is vested in a small body, usually consisting of between 5 and 12 persons and termed the board of directors. The directors are elected by the members in general meeting. The chief official is usually called either the general manager or the secretary.

The rules deal with such matters as the rights of members, the duties and powers of directors and officers, the holding of meetings of members and the method of voting. They also regulate the society's borrowing powers, the way in which shares are to be issued, how withdrawals are to be paid and upon what conditions advances may be granted and repaid.

Building societies are under the supervision of the chief registrar of friendly societies, who is, by virtue of office, also registrar of building societies. This official has a number of powers and duties derived from the Building Societies Acts. He registers new societies, approves their names, examines their rules and receives from each society an annual report which is open for inspection by the public. The report consists of a list of names of the directors and officers, together with the society's accounts in great detail. A new society may not advertise for funds until the registrar gives it permission to do so. If the registrar considers it expedient he may, with the consent of the Treasury, control and prohibit advertising and even prevent a society from accepting new investments from the public. Each year the registrar prepares a report on building societies which is submitted to Parliament. The movement is nationally represented by the Building Societies Association (founded in 1869).

Investment.—Building societies issue shares although they do not have a fixed share capital and do not offer shares for sale or purchase on the stock exchange. In a leading building society case, Lord Dunedin referred to the "so-called shares" of a building society and added that, though the word was the same, there was nothing more than a faint analogy between them and the shares of a joint-stock company. Building society shares are commonly called "paid-up shares" and the denominations vary from one society to another.

Some societies operate savings accounts under which the saver undertakes to pay a weekly or monthly amount over a period of time until he has accumulated the amount of a fully paid share, and societies often offer a higher rate of interest to encourage this type of regular saving.

There is no legal limit to the total amount of shares that a society may issue or to the number of shares that can be held by one person. In practice, however, nearly all societies impose a limit of £5,000 on the holding of any one member—husband and wife being regarded as one for this purpose. This limitation is due to special income tax arrangements with the Board of Inland Revenue by which the income tax due on interest received from a building society is paid by the society. The arrangements do not cover surtax, which is paid by the investor on the gross equivalent (at the standard rate) and not on the amount of interest actually received. The tax paid by a society on behalf of investors who are individuals is computed at a special "composite" rate. This rate is fixed by reference to the proportionate amounts invested in building societies by (1) persons liable to tax at the standard rate; (2) persons liable at a reduced rate; and (3) persons not liable to pay any income tax. In general, interest on shares held by a limited company or other corporate body is liable to tax at the standard rate, as is interest on a holding of more than £5,000 by a private person.

Interest on shares is paid every half year or year either by warrant or by addition to the shareholder's account with the society. Some societies calculate interest by the day and some by the month. The length of notice required and the conditions on which withdrawals are to be paid are governed by the rules of the society. In practice most societies pay withdrawals at a month's notice, waiving even that period if the amount is small or the money is urgently required.

The Building Societies Acts enable a society to include in its rules the power to borrow money either from an individual or from a corporate body. Such loans are known as deposits. The depositor is a creditor of the society and therefore entitled to priority of repayment over all the shareholders and his rate of interest is normally lower. The income tax arrangements for deposits are the same as for shares. A depositor is not a member and therefore has no voting rights. The Act of 1874 limits the amount a society may take on deposit to two-thirds of the amount due on mortgages. By law, deposits cannot be accepted on terms of less than one month's notice for withdrawal, although in practice if the depositor requires his money urgently such notice is often waived by the society. In general, the larger the amount of the deposit, the longer is the notice required.

Mortgages.—Building societies can lend money only on the security of a first mortgage of freehold or leasehold property. In consideration of the advance which the society makes, the borrower charges his property to the society as security until the loan has been repaid. This is effected by means of a mortgage deed, on which stamp duty is payable according to the amount of the loan. The borrower becomes a member of the society and subject to its rules. In general, societies lend their funds mainly on the security of private dwelling houses purchased for owner occupation. Some societies occasionally make loans on blocks of flats, commercial or industrial premises and farms, but the total value of such loans in any year is strictly regulated by the Building Societies Act, 1960. Many societies make loans on shops which have living accommodation.

Within the framework of the society's general lending policy the amount of the loan will be related to the value of the property, its suitability as security, the standing and reliability of the borrower and the value of any authorized additional security. The deeds of the property are retained by the society until the mortgage has been repaid.

The rate of interest charged on a mortgage loan is determined by various factors, which include the general level of interest rates, the rates paid by the society to investors, the composite rate of income tax and the level of management expenses. Interest is paid to the society without the deduction of tax, but a borrower obtains an allowance against his liability to income tax in respect of the interest paid.

The bulk of repayments are monthly, by a fixed sum from which the interest for the month is appropriated and the balance applied in reduction of the outstanding principal. Most societies calculate interest on an annual basis.

If a borrower should default in his repayments, the society can sue him on his personal covenant either for the principal debt outstanding or for the amount of subscriptions in arrears. Alternatively, the society can proceed against the property by taking possession, by appointing a receiver of the rents or by selling it.

When the mortgage debt has been fully repaid, the society will endorse the mortgage deed with a statutory vacating receipt. This receipt, which is sealed by the society, acknowledges payment of all money due under the deed. The mortgage deed together with the title deeds are then returned to the mortgagor.

Under the House Purchase and Housing Act, 1959, the registrar of building societies was empowered to "designate" certain societies, meaning that investments with them are trustee investments.

Economic and Social Aspects.—The building society movement in the range of its membership and the magnitude of its financial resources touches the life of the country at many points. From 1919 onward building societies in Great Britain attracted large sums, mainly from the smaller investors, because they offered security, a reasonable rate of interest, prompt withdrawal facilities and freedom from income tax deduction. Despite the unemployment of the interwar years, wage earners in general were better off than in 1914. Many workers had a margin of income which gave them an opportunity to save and the "small savings" institutions, including building societies, benefited. During the years of full employment and comprehensive social insurance which succeeded World War II, the margin for saving increased even further, as did the share of that saving which went to building societies.

The other major function of building societies is the promotion of home ownership. After World War I the nation became aware of an acute housing shortage and the government gave direct encouragement to building. Between 1919 and March 1940 some 4,000,000 houses were built in England and Wales and of these about 2,500,000 were built by private enterprise without subsidy of any kind. The existence of the building societies' mortgage service made this private enterprise building possible.

Home ownership also expanded after World War II, although under the Labour government, which came into power in 1945, greater encouragement was given to building by local authorities of houses to rent than to private enterprise building. It was not until 1951 when the Conservatives took office that legislation was introduced to increase the proportion of private building allowed and to permit council houses to be sold. This gave a great impetus to building societies, and the number of borrowers increased from 1,579,000 in 1951 to nearly 2,425,000 ten years later. The steady growth in the number of investors and borrowers was accompanied by a gradual reduction in the number of societies, due mainly to the difficulty of the smaller societies in attracting sufficient funds from the public and in maintaining the necessary administrative machinery.

Development Abroad.—The building society idea has spread far and wide. There are societies in many countries of the Commonwealth, most of them closely following British practice. They are also to be found in most countries of Europe and in parts of Central and South America.

SAVINGS BANK. A savings bank is one of the many institutional arrangements that society makes to bring together lenders and borrowers of funds. Although it is customarily looked upon as an agency utilized by individuals who wish to accumulate funds for future spending, the savings bank is also a lending institution and could not exist in its present form were it not. It performs an important economic function in its dual capacity of borrower from individuals who wish to consume less than their income and of lender to others who wish to spend more. It serves to direct the flow of money income so that some of the economic resources of a society are turned from the production of goods for current consumption to add to its total stock of capital, or its wealth.

There are also other institutions that perform a similar economic function. The most important are the savings departments of commercial banks; building and loan, or savings and loan, associations; insurance companies; investment trusts; and a number of minor (in terms of magnitude of deposits) savings institutions, such as credit unions and similar cooperative credit organizations, industrial savings plans, and school savings programs. *See* BANKING; CREDIT UNION; DEPOSIT INSURANCE; SAVINGS AND LOAN ASSOCIATION.

HISTORICAL BACKGROUND

Savings banking is the product of two historical forces, one of which operated uniquely to create it alone and the other to create all savings institutions. The development of a liberal economic order, based upon specialization and exchange, presupposed an effective supply of money, in the creation of which all credit institutions participated. Such an order (dating from about 1550) carried with it certain ethical presuppositions concerning the nature of man, among which was the notion that he was capable of looking after himself amid the uncertainties of a market system. Savings banking, then, in addition to being one of the many credit institutions that an exchange economy finds indispensable is also a product of the effort to secure the individual against the caprices of capitalism. Not long in coming was recognition of the fact that if individuals were to be considered self-reliant they must have institutions enabling them to provide for such uncertainties as they might encounter.

In 1610, a Frenchman, Hugues de Lestre, published a treatise in which he urged the establishment of savings institutions for the poor so that their lot might be bettered and the rich might escape the necessity of almsgiving. Seventy-seven years after, the irrepressible Daniel Defoe, finding himself in a debtor's prison, wrote a tract on the wonders that could be wrought by the practice of thrift. To this end, he proposed that the government establish a pension office. If each person in the realm—rich and poor, of all ages—were to pay each year four shillings into a common fund managed by the state, they could "forever banish beggary and poverty out of the kingdom." Such a happy state could be purchased for the price of "two pots of beer a month." While the French and English continued to write about savings banks, elsewhere in Europe banks were developing out of the municipal pawnshops, the most famous of which was the Monte de Pietà that for centuries operated in the Italian city states as a savings and loan agency. The eventual product of this development was the municipal savings bank. Almost concurrent was the development of private savings banks in Germany, the first of which began in Hamburg in 1778.

The first savings bank in Britain was founded in 1810 by the Rev. Henry Duncan, pastor of an impoverished flock in Dumfriesshire, Scot. Duncan, who had been a student of the classical economist, Dugald Stewart, established the Savings and Friendly Society, the members of which were divided into three classes: ordinary members, who made regular deposits; extraordinary members, who contributed to a surplus fund out of which premiums were paid to encourage frequent deposits; and honorary members. The bank was not operated for profit, and its officers devoted their time to it as a philanthropic service. Penalties were imposed upon those who did not deposit regularly, and ordinary members who wished to withdraw their savings had first to obtain the permission of the court of directors of the society. Duncan's bank was the forerunner of the trustee savings banks in the United Kingdom and of the mutual savings banks in the United States. Its success was soon indisputable, and by 1827 the plan had spread over Scotland, England, and Ireland. They soon became subject to governmental regulation, and in 1863 the Trustee Savings Bank Act was passed. In 1861 the Post Office Savings Bank System

was inaugurated, and the trustee banks declined in relative importance.

The origin of savings banking in the United States was quite similar to that in Britain, for the first banks were nonprofit institutions founded for charitable purposes. The original bank was the Provident Institution for Savings, of Boston, which received its charter in December 1816. One month earlier, the Philadelphia Saving Fund Society began business but was not incorporated until 1819. The Bank for Savings of New York was incorporated in 1819 by the Society for the Prevention of Pauperism. The founders' roll of American savings banks includes a number of men of some historical importance, such as Condy Raguet, Thomas Eddy, James Savage, and Clement and Alexander Biddle. Out of these early organizations developed the mutual savings banks of America, which are still largely confined to their place of origin in the North and Middle Atlantic states. Their growth was slow until the decade preceding the Civil War when the number of banks increased from 108 to 300, the number of depositors from 250,000 to 700,000, and total balances from $50,000,000 to $150,000,000. By 1875 this latter figure had risen to $900,000,000 and by 1913 to almost $5,000,000,000—even though the period between the close of the Civil War and the turn of the century was one of falling prices.

The success of mutual banks resulted in the creation of additional savings institutions, but the mutual structure was not copied by the new banks, which began in the middle and far western states. These were organizations operated for profit and managed in the interest of the shareholders. Stock savings banks were established, and commercial banks began to accept savings deposits toward the end of the 19th century. Prior to 1913, however, the national banks (*see* BANKING) did not distinguish between savings, or time, deposits and demand deposits, because there was no legal basis for such a distinction in the National Bank Act under which they operated. Their acceptance of savings deposits brought them into competition with the mutual, stock, and state banks.

When the Federal Reserve System was established in 1913, a distinction was made between kinds of deposits, and a lower reserve requirement was fixed for time deposits—those which could be withdrawn only after prior notice has been given.

The proliferation of savings plans late in the 19th century brought demands for a savings system under the control and operation of the post office, and in 1911 the Postal Savings System was started. It was discontinued by Congress in 1966.

In the entire history of savings banks, the period after World War I was the most eventful. Like other banks they reeled under two near-fatal blows. The first of these was the monetary disorder that fell upon almost every nation in the 1920s. The effect was to shake the confidence of the people in the value of money and to evoke a flight from currency to the hoarding of goods. In such circumstances, it is suicidal for an individual to abstain from current consumption in order to accumulate claims against future income, for the claims which the bank hands over to him may be worthless. That this was well realized in Germany—where inflation drove the mark down to $\frac{1}{1,000,000,000}$ of its original value—is evident in the decline of savings bank deposits from 19,700,000,000 gold marks in 1913 to 4,600,000,000 gold marks in 1927. Inflation or the fear of inflation—whichever verges upon the probable in a world of budgetary disorder—will produce a flight from the currency and the disorganization of banking.

The second catastrophe was the great depression of 1929. Depression, or deflation, produces a movement away from the holding of stocks of goods to the hoarding of money, and as the movement gains momentum these hoards are withdrawn from the banks and held privately. Concurrent with the heavy withdrawal of deposits after 1929 was a substantial decline in the value of bank assets, making it impossible for many banks to meet their obligations to depositors. The failure of thousands of banks created suspicions about the soundness of others until they, too, failed. The crisis reached its climax in the United States when all banks were closed by presidential decree in the spring of 1933 and later reopened under new conditions. The effect of the depression, particularly in the United States, was to disturb profoundly the confidence of the people in the banking system and to disclose the inadequacy of conventional standards of bank management. It demonstrated that even the most scrupulous practices in maintaining required reserves and holding only prescribed investments did not render a bank capable of meeting all of its obligations when all depositors demanded payment and when earning assets were shrinking in value.

In the course of about 130 years both the purpose and practice of savings banking have changed drastically, and in these changes are reflected the changing character of individual saving habits. The banks are no longer benevolent institutions created by the wealthier members of the community for the succor of their less fortunate fellow citizens. They are avowed profit-making enterprises, as in the case of commercial banks engaging in the savings deposit business, or cooperative agencies, or public institutions operated by local or national governments. In the eastern United States, where mutual savings banks still flourish, their early overtones of philanthropy and paternalism have passed away. Savings bank practices have also changed. Originally the funds received from depositors were invested in government securities, which were long in maturing, comparatively safe, and bore a low rate of interest. Today savings deposits are invested as well in the securities of private enterprises, and, in the case of commercial banks in the Federal Reserve and of most state banks, they may be loaned out for short periods to businessmen.

Since the beginning of the 20th century savings banks have encountered mounting competition from other outlets for individual savings, such as insurance companies, postal savings banks, investment trusts, cooperative agencies, and, greatest of all, from governments seeking to borrow from individuals. It should also be noted that changes in the savings habits of individuals have lessened the permanence of their deposits. Studies made of the decade from 1930 to 1940 disclose that in the United States the majority of deposits were made, not as security against misfortune and old age, but for future spending anticipated with a considerable degree of certainty, with the consequence that the rate of turnover of deposits is antithetical to what were once conceived to be proper savings practices. In one important American bank—believed to be representative—three-fourths of all savings deposits were withdrawn before they were five years old.

All of these changes are symptomatic of the changing character of individual savings. The causes that once compelled an individual to lay aside funds for a rainy day have either disappeared or have found a different expression. The uncertainty that once haunted members of Western industrial society has become less terrible as governments have assumed the responsibility of looking after the jobless, the aged, and the infirm—a development that is signalized by social security legislation and the socializing of charity. Moreover, those individuals who are able to invest against misfortune have alternative methods of doing it, such as purchasing insurance policies or the securities of enterprises or governments. Savings deposits are still useful for accumulating funds for large expenditures—as for education and travel—but even for this purpose they are not as essential as they once were. The development of mass credit institutions—installment selling, small loan agencies, and the like—has diminished the necessity of saving to spend. Finally, the very notion of thrift has lost much of its enticement, because the contemporary man discounts the future at an inordinately high rate. He is a victim of what Adam Smith called "the passion for present enjoyment," and is refractory to the very instinct which Smith believed would redeem him—the desire to save which "comes with us from the womb, and never leaves us till we go into the grave." Not only does thrift no longer keep its high place among the cardinal virtues but is often looked upon as a pernicious practice by many of those very people who were once among its archadvocates: the economists.

SAVINGS INSTITUTIONS IN THE UNITED STATES

Savings institutions in the United States are of three principal kinds: commercial banks in their savings deposit departments;

mutual savings banks; and the postal savings system. In addition, savings and loan associations and credit unions receive the savings of the public in savings accounts.

Savings Accounts Trends.—During the 1920s, total savings accounts rose from $17,300,000,000 to $34,600,000,000, an increase of over $1,700,000,000 per year. About two-thirds of this increase was in time deposits at commercial banks and savings deposits in mutual savings banks. During the 1930s, because of sharp declines during the depression years, total accumulations in savings accounts fell off $2,700,000,000. The sharpest drop relatively was in savings capital of savings and loan associations, followed by the decline in time deposits at commercial banks. Time deposits in mutual savings banks showed a steady rise during these years except in 1932 and 1933, and postal savings rose sharply during the depression years. During the 1940s, total holdings of savings accounts much more than doubled, reaching $73,100,000,000 in 1950. Particularly large savings were accumulated during the World War II period and the first three postwar years. The average annual increase in total savings accounts in this decade was $4,100,000,000 per year. In the five years 1951 through 1955 there was a further marked increase in total holdings of savings accounts to an aggregate at the end of 1955 of $110,800,000,000. The average accumulation of funds in savings accounts during these five years was $7,500,000,000 per year.

In the early 1950s, time deposits in commercial banks and time deposits in mutual savings banks lagged behind savings accounts in savings and loan associations in terms of rate of increase. In dollars, the increase in savings capital at all savings and loan associations from 1950 to 1955 almost equaled the increase in savings accounts at the other four sets of institutions. In percentage terms, time deposits in commercial banks rose almost 33%, and time deposits at all mutual savings banks rose over 40%. During the same span of time total savings accounts at all savings and loan associations rose about 130%. Thus, during this period savings balances in savings and loan associations showed phenomenal gains, while the increases in savings deposits in commercial banks and mutual savings banks were more moderate.

Commercial Banks.—Time deposits in commercial banks, most of which are savings deposits, comprise a significant portion of the total deposits of these institutions. During World War II, time deposits declined from about one-fourth of total deposits in all commercial banks to about one-fifth. In the postwar period, however, they rose faster than other deposits and soon returned to their pre-World War II relationship to total deposits. By 1965, time deposits, other than interbank deposits, in all commercial banks amounted to more than $137,000,000,000. Wide differences exist among individual commercial banks in the relative importance of time and savings deposits in their deposit structure.

No member bank of the Federal Reserve System or insured nonmember bank may pay interest on any deposit that is payable on demand. Furthermore, the legal minimum and maximum reserve requirements for member banks against time deposits are between 3% and 6%, much less than the ranges of reserve requirements for member banks against demand deposits. Accordingly, in regulations of the board of governors of the Federal Reserve System, the terms "time deposits" and "savings deposits" are strictly defined. Savings deposits are evidenced by a passbook, and may be accepted only from individuals or nonprofit organizations, with the legal possibility of requiring notice of withdrawal. Furthermore, the Board of Governors of the Federal Reserve System, under provisions of the Federal Reserve Act, establishes maximum rates that may be paid by member banks on time deposits. The rate payable by a member bank may not in any event exceed the maximum rate payable by state banks and trust companies on like deposits under the laws of the states in which the member bank is located. The same maximum rates of payment were established for insured nonmember banks by the Federal Deposit Insurance Corporation (FDIC), effective Feb. 1, 1936.

Mutual Savings Banks.—Mutual savings banks concentrate on savings deposits and generally accept no commercial or checking accounts. Such banks have no capital stock and are purely mutual organizations. With no shareholders, the mutual savings banks are governed by boards of trustees, most of them self-perpetuating bodies, made up of outstanding business and professional men. Mutual savings banks operate exclusively under state law and state charter and are supervised and examined by the state banking departments in their respective states. Most mutual savings banks are quite old institutions, and many have celebrated their 100th anniversaries.

All the net income of these financial institutions, after operating expenses, is paid to the depositors as dividends or is allocated to reserves for future losses. Mutual savings banks pay "dividends" or "interest-dividends" to their depositors, but these payments have come to be viewed simply as interest. By 1965 total deposits in mutual savings banks amounted to more than $50,000,000,000. The average size of accounts was $2,108 and the number of accounts was 22,120,000.

Several states place a limit on the maximum amount that any one person or organization may have on deposit in any one savings bank. The laws pertaining to mutual savings banks provide that depositors may be required to give notice (typically 60 or 90 days) as stated in the savings account passbook before withdrawals are paid. In fact, however, savings banks ordinarily meet withdrawals without requiring notice.

The mutual savings banks have a long history of conservative operation, with emphasis placed on safety and availability of savings entrusted to them, rather than on earning a high rate of dividend. In particular, the savings banks went into the great depression with substantial reserves and strong liquidity positions. "Runs" on mutual savings banks by their depositors were not as drastic as those in commercial banks. As a result, in spite of losses on some investments and mortgages, the savings banks went through the depression without a single failure or liquidation. No mutual savings bank had to go "on notice" or delay the meeting of withdrawal requests, except when all banks were closed during the bank holiday.

Mutual savings banks are in operation under state charters in all of the New England states and in New York, New Jersey, Maryland, Delaware, Pennsylvania, Ohio, Indiana, Wisconsin, Minnesota, Washington, Oregon, and Alaska. They also operate in the Virgin Islands.

The investment powers of mutual savings banks are closely prescribed by state laws and by rules and regulations of state supervisory authorities. Investments in securities, for instance, are usually confined to a "legal list" of authorized securities from which the savings banks determine their bond portfolio. Some states limit real estate mortgage investments to 60% to 75% of savings bank deposits.

After World War II the legal investment provisions of various states were changed to enable the mutual savings banks to broaden their investments and so to increase earnings. Particularly important in this respect was the enactment of legislation which permitted mutual savings banks to purchase Federal Housing Authority (FHA)-insured and Veterans Administration (VA)-guaranteed mortgages without reference to the location of the residential property against which such loans had been made. New York passed such legislation for FHA-insured mortgages in 1948 and for VA-guaranteed mortgages in 1951. These laws provided substantially enlarged outlets for investment in mortgages, particularly by the large metropolitan savings banks, and gave rise to much greater marketability of FHA-insured and VA-guaranteed mortgage loans over the nation. In 1953 a New York law also permitted a savings bank to borrow funds for purposes other than paying depositors up to 5% of its assets. This measure was adopted to help savings banks meet varying mortgage commitments without having to sell securities. During the postwar period, the majority of mutual savings banks states legalized the purchase of some type of equity securities having an adequate earnings and dividend record and within certain restrictions in relation to surplus and assets. In certain states mutual savings banks were permitted to invest in large-scale housing developments.

Postal Savings System.—The postal savings system was authorized by Congress in 1910. It was established partly as an

aftermath to the panic of 1907 and partly to attract deposits from those who lacked confidence in usual banking institutions and from the many immigrants in those times who frequently sent their savings to institutions in Europe. Over the years, both before and after its founding, the postal savings system met opposition from banking circles as an unwarranted duplication of private facilities.

The U.S. government is solemnly pledged to the payment of postal savings deposits. Accounts may be opened and deposits made by any competent person over 10 years of age. Deposits with the postal savings system are evidenced by certificates issued in denominations from $1 through $500. No depositor may have to his credit more than $2,500, exclusive of accumulated interest. The depositor may at any time withdraw all or any part of his deposits, with any interest payable thereon, from the post office where the deposits were made.

Postal savings deposits earn interest at the rate of 2% a year, a rate that has been in effect ever since the establishment of the postal savings system. Until recent years, only simple interest was paid. Interest has been compounded annually, however, on deposits represented by postal savings certificates issued on or after Sept. 1, 1954. The assets of the postal savings system are invested mainly in U.S. government obligations, although funds may also be redeposited in local banks at a required rate of 2½%.

Until 1930, growth of the postal savings system was limited, partly because the banks paid much higher rates than 2%, and total postal savings due depositors amounted to only $169,000,000 at the end of 1929. With the bank failures during the early 1930s, however, people withdrew savings from commercial banks and put them in postal savings deposits. By the end of 1933 the postal savings system had grown to $1,229,000,000, eight times its size before the great depression.

Then followed several years of little change in postal savings, and amounts due depositors totalled $1,315,000,000 at the end of 1939. During World War II, as a part of the general upsurge in savings at that time, and continuing in the early postwar period, the postal savings system experienced another period of rapid growth, reaching a high point of $3,523,000,000 late in 1947. Postal savings then declined, in part under the impact of vigorous competition from savings and loan associations and banks. The total amount due depositors by the postal savings system in 1965 was only $400,000,000.

Economic Significance.—The gathering together of savings of the public and the investment of these funds by the savings banks and savings institutions is a service to the U.S. economy of the greatest importance. In the capital markets the annual increase in savings accounts is the largest single component of the supply of funds. Likewise, home mortgages, in which much of "over-the-counter" savings are invested, comprise the largest single component, by far, of the demand for funds. Such savings and investment are essential to the progress and growth of the nation.

Accordingly, in the two decades after World War II there was renewed attention to the economic importance of savings, and particularly to savings deposits and savings accounts. There was also intensified competition among financial institutions for the favour of the public and the opportunity to be entrusted with savings. Nowhere was competition stiffer than among commercial banks, mutual savings banks, and savings and loan associations. Competition took several forms. Fundamental, of course, is the seeking of what is deemed fair treatment of net earnings under the federal income tax law. Rivalry was keen in new and attractive office quarters, in range of services offered, in advertising, and public relations. Competition was sharp in rate of interest or dividend. At the same time, "over-the-counter" savings were under pressure from alternative forms of saving, such as social security and pension funds and the attractiveness of common stocks. Attitudes toward savings were challenged by inflation, by less cyclical instability in the economy after World War II, and by government welfare programs. (J. K. L.)

SAVINGS BANKS IN EUROPE

United Kingdom.—After the first savings bank in Britain was established at Ruthwell, Dumfriesshire, Scot., in 1810, the movement soon spread throughout Scotland and England, with the result that in 1817 the first law governing these institutions was passed, the first act of its type ever to be adopted by any country. By 1859 there were 635 savings banks holding deposits amounting to £39,000,000. In the mid-1960s there were 79 separate savings banks with more than 1,350 offices, 9,000,000 depositors, and funds amounting to £2,100,000,000.

These banks, known as trustee savings banks, are not conducted for private profit; their sole concern is to offer the most convenient and remunerative method of saving compatible with sound administration and security. They combine the security offered by close connection with the state with the freedom that comes from independent management. The banks are under the direction of bodies of trustees and managers who do not receive any payment for their services. The banks are subject to government supervision and are also inspected on behalf of the Trustee Savings Banks Inspection Committee. The funds of the ordinary departments of the banks are invested with the National Debt Commissioners, and the funds of the special investment departments (where a higher rate of interest is paid) are, with the commissioners' approval, invested in government securities and with the municipal authorities.

The British Post Office Savings Bank, founded by W. E. Gladstone in 1861 as a department of the General Post Office, has been a model for similar banks in other countries; it works under government guarantee. (*See* POSTAL SERVICES.) The rate of interest in the Post Office Savings Bank is similar to that paid in the ordinary departments of the trustee savings banks, and in both institutions the limit of deposit is £5,000. In the special investment departments of trustee savings banks the limit of deposit is £3,000.

The post office and the trustee savings banks, together with the National Savings Committee of England and Wales (formed as the War Savings Committee in 1916 to help finance World War I by the sale of savings certificates) and its counterparts in Scotland and Northern Ireland, form the National Savings Movement, which promotes the sale of national savings certificates, national development bonds, and premium savings bonds, and encourages deposits in savings banks. In addition to the sale of national savings securities, the savings banks purchase government stocks and bonds for their depositors. The total amount of national savings in the mid-1960s was about £8,250,000,000.

Scotland has a few savings banks free of government supervision; England has only the Birmingham Municipal Bank, controlled by the city council under the Birmingham Corporation Act, 1919. The joint stock banks also accept savings deposits; other large savings institutions are the building and cooperative societies.

Interest up to £15 on deposits in the post office savings banks and in the ordinary departments of trustee savings banks is free of income tax for each individual.

France.—The first French savings bank was that of Paris, the Caisse d'Épargne de Paris, instituted in 1818. Soon thereafter other savings banks were established at Bordeaux, Metz, Marseilles, and Nantes, and by the mid-1960s there were 580 savings banks with more than 4,000 offices, 16,500,000 depositors and funds amounting to Fr. 26,400,000,000.

The French savings banks, like the British trustee savings banks, are controlled by a board of management. The funds of the banks are deposited with the Caisse des Dépôts et Consignations, a government institution, which invests them in government securities or in securities guaranteed by the government, in debentures issued by chambers of commerce, with the Crédit Foncier de France, or in French and foreign securities authorized by the minister of finance.

In addition to the savings banks there is the Caisse Nationale d'Épargne Postale, which is well established throughout France and is the equivalent of the Post Office Savings Bank in Britain, with deposits in the mid-1960s exceeding Fr. 16,800,000,000.

Federal Republic of Germany.—The first German savings banks (*Sparkassen*) were founded in Hamburg in 1778, in Oldenburg in 1786, and in Kiel in 1796. The latter two banks still exist.

The German savings banks are mostly municipal savings banks. They are common welfare institutions juridically independent, incorporated under the provisions of public law and enjoying the guarantee of the municipalities. The legal regulations concerning savings banks are voted separately by each *Land*. One of the characteristics of the German savings banks is that normal savings activities, the short-term current account and transfer deposits (*Giro*) are handled simultaneously.

In 1947, after World War II, the German savings banks founded the General League of the Savings Banks and Clearing House Association to promote the interests of its members, of member regional associations, and of clearing houses through advice, assistance, and the exchange of experience.

In the mid-1960s there were about 870 separate savings banks in the federal republic, with 11,000 branches and agencies and a total of 51,800,000,000 DM. of savings deposited.

U.S.S.R.—The new savings banks in the U.S.S.R. began early in 1923. The principal aim of these banks, which are state organizations, is to collect the people's available resources by means of deposits or of subscriptions to state loans and to direct these resources to funds necessary for the national economy. The general management of the savings banks and of state credit, which is a section of the ministry of finance, invests the funds of the savings banks, controls their functioning, and issues instructions relating to the technique of their operations.

The foundation capital of the savings banks, supplied by the government, was 10,000,000 rubles. The reserve funds are made up from sums deducted from profits; another part of the net profit goes to the treasury and the remainder to the fund for the improvement of the material condition of the personnel.

In the early 1960s the total deposits in these savings banks exceeded 100,000,000,000 rubles; the interest paid amounted to 3% on deposits withdrawable at six months' notice and 2% on other deposits.

Other avenues through which Soviet families may invest their money include state loans, collective deposits with the cooperative banks (*Vsekobanki*), municipal banks (*Tsekombanki*), and rural banks (*Selkhozbanki*), and payments to mutual-help associations and to social insurance.

Italy.—The first Italian savings banks were established in Padua, Rovigo, Udine, and Venice in 1822, in Milan in 1823, in Verona in 1826, and in Turin in 1827. In the early 1960s there were 80 savings banks and 10 pawn banks that accepted savings deposits and deposits on current account. The funds were mainly invested in government securities, loans to local authorities, mortgage loans, overdrafts, and other short-term credits and discounts. There were about 2,500 branches, and deposits (mainly savings deposits) totaled 3,000,000,000,000 lire. The Italian Savings Banks Association was founded in 1912; there is also a central bank, whose shares are owned by the savings banks.

The Italian Post Office Savings Bank was founded in 1876. In addition to the savings and postal check business, this bank arranges the purchase of government bonds on behalf of the depositors. In the mid-1960s total savings deposits (including postal savings certificates) amounted to about 2,200,000,000,000 lire.

Netherlands.—The earliest local savings banks in the Netherlands were established through the initiative of a philanthropic society, the Society for the Promotion of Common Welfare, founded in 1783. The first bank was opened in the small town of Workum, Friesland, in 1817. In the mid-1960s there were about 260 local savings banks with 400 branches, each bank being administered by a board of trustees. The local savings banks owed their 3,700,000 depositors 4,120,000,000 guldens.

The Netherlands Savings Bank Association, established in 1907, protects the common interests of all local savings banks and endeavours to expand the services offered to depositors. There is a central auditing department, a central publicity office, and a cooperative investment fund, founded in 1958. The fund accepts deposits from the affiliated savings banks at one week's and three months' notice, investing them in easily realizable assets such as call money, treasury bonds, and short term municipal loans.

The Post Office Savings Bank was inaugurated in 1881. Its funds are mainly invested in government stock, treasury bonds, and loans to local authorities. In the mid-1960s deposits with the Post Office Savings Bank amounted to about 2,900,000,000 guldens.

SAVINKOV, BORIS VIKTOROVICH (1879–1925), Russian revolutionary, a redoubtable enemy of both the imperial and the Soviet regimes, was born in Kharkov. He joined the Socialist-Revolutionary Party in 1903, and as a leading member of its "fighting organization" he participated in several terroristic acts, including the assassination in 1904 of V. K. Plehve (*q.v.*). When World War I broke out he took a patriotic stand; he enlisted in the French Army and, after returning to Russia in 1917, became a military commissar and subsequently deputy minister of war. He sought to combat defeatism and to strengthen the provisional government by concentrating power in a triumvirate consisting of the prime minister A. F. Kerenski, Gen. L. G. Kornilov and himself. But his partners fell out, and he was obliged to resign.

After the Bolshevik Revolution, Savinkov established a clandestine military organization which in July 1918 brought about abortive risings in several Russian towns. Subsequently he moved to Paris and solicited Allied intervention against Soviet Russia. In January 1920 he was invited to Warsaw by Jozef Pilsudski. There he organized a Russian volunteer corps to fight with the Polish Army. After the signature of the Polish-Soviet Peace Treaty of Riga (1921), however, he returned to Paris disillusioned. Soviet agents penetrated his organization and, it appears, tricked him into returning to the U.S.S.R. Arrested in Minsk on Aug. 18, 1924, he was tried a week later. His death sentence (Aug. 29, 1924) was commuted to imprisonment, but in May 1925 he was stated to have committed suicide at the Lubianka prison in Moscow.

See R. Gul, *Boris Savinkov,* 2 vol. (1930). (J. L. H. K.)

SAVOIE, a *département* of southeastern France, formed in 1860 from the southern parts of the former duchy of Savoy, namely Haute-Savoie, Tarentaise, and Maurienne, which were ceded to the emperor Napoleon III by the kingdom of Sardinia. It lies along the Italian frontier between the *départements* of Haute-Savoie to the north and Hautes-Alpes to the south, and is bounded west by the *départements* of Isère and Ain. Area 2,389 sq.mi. (6,187.5 sq.km.). Pop. (1962) 266,678.

The *département* extends across the longitudinal belts of the northern French Alps. In the west are the limestone ranges of the Préalpes in the Bauges and Grande Chartreuse massifs on either side of the Chambéry-Lac du Bourget Gap. There follows the Combe de Savoie, the great longitudinal valley that separates the Préalpes from the crystalline core of the Alps. East of the latter the *département* includes the high intra-Alpine valleys of the upper basins of the Isère and the Arc, extending to the frontier, which follows the main watershed. The mountains everywhere show the strong imprint of the Quaternary glaciation, and the high valleys are a succession of basins and gorges, where the rivers cross rocky constrictions. Surrounding the Tarentaise (the upper valley of the Isère) and the Maurienne (the upper valley of the Arc) the highest peaks exceed 12,000 ft. (3,700 m.) and include the Grande Casse, Mont Pourri, Pointe de Charbonel, and Aiguille dè la Grande Sassière. The Tarentaise leads to the Petit Saint-Bernard Pass into Italy, the Maurienne to the Mont Cenis Pass and tunnels. Near the valley heads the Col de l'Iseran (9,085 ft. [2,769 m.]) provides an interconnection, followed by a motor road. The north-south route of the high French Alps is continued south from the Maurienne by the road that climbs past Valloire toward the Col du Galibier.

The wet Préalpes are heavily clothed with forests. The shel-

tered intra-Alpine valleys are relatively dry and, although the period of snow cover is long, farming and settlement extend to high altitudes, especially on sun-facing slopes (*adrets*). Above, fine forests cover the mountain slopes up to a tree line that reaches as high as 7,000 ft. (2,000 m), with extensive meadows still higher. The forests are an important resource, and in the rural buildings there is prodigal use of timber, great overhanging eaves and balconies being characteristic features. Below the forest, the farmland is devoted to hay and other fodder crops. The isolation that imposed a self-sufficient economy has been broken down by the development of modern communications; hence the cultivation of cereals and fruit crops, including the vine, has contracted, and these crops are mainly confined to the low-lying areas of the Combe de Savoie and the Chambéry Gap. The high Alpine valleys are concerned almost exclusively with pastoral farming, the elaborately staged cultivation and grazing zones having given way to specialized cattle farming, providing dairy products and young animals for export to the lowlands. Cheese production is well organized, and big herds on the summer pastures are looked after by only a few specialized workers.

Some anthracite is worked in the Maurienne and in the Tarentaise, where there is also a silver-lead mine at La Plagne. The abundant waterpower resources have been vigorously developed, and there are numerous electricity-generating stations. Most of the power is transmitted for use outside the Alps, but there are some local electrometallurgical and electrochemical works, notably at Ugines and along the railway approaching Modane. The chief concentration of industry is in the Chambéry Gap. Besides silk manufacture and engineering, the timber and limestone of the Préalpes provide the bases of important paper and cement industries. Lacking the benefits of manufacturing industry, the Alpine valleys that remain rural suffered severe depopulation from the mid-19th to the mid-20th century. The tourist industry has become important and widespread but has not counteracted depopulation, except in a few localities. Aix-les-Bains, on Lac du Bourget, is an important spa resort.

Chambéry (*q.v.*) is the largest town and the *préfecture* of the *département*, which comes under its court of appeal, archiepiscopal jurisdiction, and, for administration of education, its *académie;* but the diocese of Chambéry is only one of three that share the *département*. The upper basins of the Isère and the Arc constitute the separate bishoprics of Moûtiers-Tarentaise and Saint-Jean-de-Maurienne respectively. The *département* consists of three *arrondissements*, centred upon Chambéry, Albertville, and Saint-Jean-de-Maurienne. For the history of the district *see* SAVOY, HOUSE OF. (AR. E. S.)

SAVONA, a city, seaport, and episcopal see of Liguria, northwestern Italy, and capital of Savona Province, lies 27 mi. (43 km.) WSW of Genoa by rail. Pop. (1961) 72,916. Most of the town is modern, with rectilinear streets laid out in the late-19th-century style. In the old quarter are examples of medieval, Renaissance, and Baroque architecture. The late Renaissance cathedral (1589–1602) has a 12th-century font and choir stalls, and a pulpit of the 15th century. The Sistine Chapel was built by Pope Sixtus IV; the Della Rovere Palace, built by Cardinal Giuliano Della Rovere (Pope Julius II), now houses public offices. The Chiabrera Theatre was built in 1853 in honour of the poet Gabriello Chiabrera (born in Savona 1552).

Savona is a major Italian port and an outlet for the Piedmont region and part of central Europe. Coal and fuels are the main imports; coal is distributed to the industrial centres of Bormida Valley by an extensive telpherage system. An oil pipeline runs to Trecate and Novara. Savona is one of the main centres of the Italian iron industry; it also has shipbuilding, mechanical and electrical engineering, sulfur and glass works, tanneries, and food processing. Linked by rail with Turin, it is also on the main rail and road route from Genoa to the French border.

Savona is recorded as allied with Carthage against Rome in 205 B.C. It reappears in A.D. 568–569, when the Ligurians were fighting the barbarians. Rothari, king of Lombardy, destroyed it in 641. It was capital of Marca Aleramica (950–1191) and later, as an autonomous commune, formed an alliance with Genoa, but rivalry between the cities arose and in 1528 the Genoese destroyed Savona's port and built a fortress there in 1542–43. In 1805 Savona was annexed to the Napoleonic Empire; it was joined to the Kingdom of Sardinia in 1815, and entered the Kingdom of Italy in 1861. The city was heavily bombed in World War II.

SAVONA PROVINCE, created in 1927, stretches along the western coast of Liguria from Cogoleto to Cervo. Area 596 sq.mi. (1,544 sq.km.). Pop. (1961) 270,544. Much of the mountain zone, over 4,000 ft. (1,200 m.) in places, is wooded, especially with chestnut. Most of the coastal area is under cultivation. Early market-garden produce is exported to northern and central Europe. Industrial and commercial centres besides Savona include Vado Ligure, Cairo Montenotte, Cengio, Ferrania, Albisola Marina, Varazze, Pietra Ligure, and Finale Ligure. The coastal fringe forms part of the popular Riviera di Ponente; resorts include Alassio, Albisola Marina, Celle Ligure, and Finale Ligure. There is an airport at Villanova d'Albenga. (G. B. N. B.)

SAVONAROLA, GIROLAMO (1452–1498), Italian reformer and martyr, was born at Ferrara on Sept. 21, 1452, the son of Niccolò Savonarola and of Elena Bonaccorsi. He was educated by his paternal grandfather, Michele, a celebrated doctor and a man of rigid moral and religious principles. From this elderly scholar, whose own education was of the 14th century, Savonarola may perhaps have received certain medieval influences. In his early poetry and other adolescent writings the main characteristics of the future reformer are seen. Even at that early date, as he wrote in a letter to his father, he "could not suffer the blind wickedness of the peoples of Italy." He found unbearable the humanistic paganism which corrupted manners, art, poetry and religion itself. He saw as the cause of this spreading corruption a clergy vicious even in the highest levels of the church hierarchy.

MANSELL—ALINARI

POSTHUMOUS PORTRAIT OF GIROLAMO SAVONAROLA AS ST. PETER MARTYR, BY HIS DISCIPLE FRA BARTOLOMMEO (1472–1517)

On April 24, 1475, he left his father's house and his medical studies, which he had embarked on after taking a degree in the liberal arts, to enter the Dominican order at Bologna. Returning to Ferrara four years later he taught scripture in the Convento degli Angeli. Scripture together with the works of Thomas Aquinas had always been his great passion. In 1482 Savonarola was sent to Florence to take up the post of lecturer in the convent of San Marco, where he gained a great reputation for his learning and asceticism. As a preacher he was unsuccessful until a sudden revelation inspired him to begin his prophetic sermons. At San Gimignano in Lent 1485 and 1486 he put forward his famous propositions: the church needed reforming: it would be scourged and then renewed.

The following year (1487) he left Florence to become master of studies in the *studium generale* of Bologna. Then, after the year of his appointment was up, he was sent to preach in various cities until Lorenzo de' Medici used his influence to have him sent back to Florence, thus opening the doors to the bitterest enemy of Medici rule. Having returned to the city of his destiny (1490), Savonarola preached boldly against the tyrannical abuses of the government. Too late Lorenzo tried to dam the dangerous eloquence with threats and flattery, but his own life was drawing to a close, while popular enthusiasm for Savonarola's preaching constantly increased. Soon afterward Savonarola gave his blessing to the dying Lorenzo. The legend that he refused Lorenzo absolution is disproved by documentary evidence.

Medici rule did not long survive Lorenzo and was overthrown by the invasion of Charles VIII (1494). Two years before, Savonarola had predicted his coming and his easy victory. These

authenticated prophecies, the part he had played in negotiations with the king and in moderating the hatred of the factions after the change of government, enormously increased his authority. Once the Medici had been driven out, Florence had no other master than Savonarola's terrible voice. He introduced a democratic government, the best the city ever had. He has been accused, but unjustly, of interfering in politics. He was not ambitious or an intriguer. He wanted to found his city of God in Florence, heart of Italy, as a well-organized Christian republic which might initiate the reform of Italy and of the church. This was the object of all his actions. The results he obtained were amazing: the splendid but corrupt Renaissance capital thus miraculously transformed seemed to a contemporary a foretaste of paradise.

Savonarola's triumph was too great and too sudden not to give rise to jealousy and suspicion. A Florentine party was formed in opposition to him called the *Arrabbiati.* These internal enemies formed an alliance with powerful foreign forces, foremost of which were the duke of Milan and the pope, who had joined in the Holy League against the king of France and saw in Savonarola the main obstacle to Florence's joining them. It was then, after a firm rejection of the League by Florence, that the pope sent to Savonarola the brief of July 21, 1495, in which he praised the miraculous fruits of Savonarola's work and called him to Rome to pronounce his prophecies from his own lips. As that pope was the corrupt Alexander VI the trap was too obvious. Savonarola asked to be allowed to put off his journey, offering illness as his excuse.

The pope appeared to be satisfied, but on Sept. 8, under pressure from his political friends and Savonarola's enemies, he sent him a second brief in which praises now turned into vituperation. He ordered him to go to Bologna under pain of excommunication. Savonarola replied to this strange document with respectful firmness pointing out no fewer than 18 mistakes in it. The brief was replaced by another of Oct. 16, in which he was forbidden to preach. As the pope himself frankly confessed, it was the League which insisted. After a few months, as Lent 1496 drew near, Alexander VI, while refusing the Florentine ambassadors a formal revocation of the ban, conceded this verbally. Thus Savonarola was able to give his sermons on Amos, which are among his finest and most forceful, and in which he attacked the Roman court with renewed vigour. He also appeared to refer to the pope's scandalous private life, and the latter took offense at this. A college of theologians found nothing to criticize in what the friar had said, so that after Lent he was able to begin, without further remonstrances from Rome, the sermons on Micah.

At that time, as Savonarola's authority grew, the pope tried to win him over by offering him a cardinal's hat. He replied: "A red hat? I want a hat of blood." Then Alexander VI, pressed by the League and *Arrabbiati,* mounted a fresh attack. In a brief of Nov. 7, 1496, he incorporated the Congregation of San Marco, of which Savonarola was vicar, with another in which he would have lost all his authority. If he obeyed, his reforms would be lost. If he disobeyed, he would be excommunicated. Savonarola, however, while protesting vigorously, did not disobey, because no one came forward to put the brief into force. He therefore went on unperturbed in Advent 1496 and Lent 1497 with his series of sermons on Ezekiel. During the carnival season that year his authority received a symbolic tribute in the "burning of the vanities," when personal ornaments, lewd pictures, cards and gaming tables were burned. Destruction of books and works of art was negligible. Events in Italy now turned against Savonarola, however, and even in Florence his power was lessened by unfavourable political and economic developments. A government of *Arrabbiati* forced him to stop preaching and incited sacrilegious riots against him on Ascension day. The *Arrabbiati* obtained from the Roman court, against payment, the desired bull of excommunication against their enemy. In effect the excommunication, besides being surreptitious, was full of such obvious errors of form and substance as to render it null and void, and the pope himself had to disown it. However, the Florentine government sought in vain to obtain its formal withdrawal: wider political issues were involved. Absorbed in study and prayer, Savonarola was silent. Only when Rome proposed an unworthy deal, which made withdrawal of the censure dependent on Florence's entry into the League, did he again go into the pulpit (Lent 1498) to give those sermons on Exodus which marked his own departure from the pulpit and from life. He was soon silenced by the interdict with which the city was threatened. He had no other way out but an appeal to a church council, and he began a move in this direction but then burned the letters to the princes which he had already written, in order not to cause dissension within the church. Once this road was closed the only remaining one led to martyrdom.

The imprudence of the most impassioned of his followers, Fra Domenico da Pescia, brought events to a head. Fra Domenico took at his word a Franciscan who had challenged to ordeal by fire anyone who maintained the invalidity of Savonarola's excommunication. The *signoria* and the whole population of the most civilized city in Italy greedily encouraged that barbarous experiment, as it alone seemed to promise a solution of an insuperable problem. Only Savonarola was dissatisfied. The decree, which assigned to the ordeal Fra Domenico himself and a Franciscan, declared the loser whichever might withdraw or even vacillate. In fact the Franciscan failed to appear and so the ordeal did not take place. Savonarola, victorious by the terms of the decree, was blamed for not having achieved a miracle.

The following day the rabble led by the *Arrabbiati* rioted, marched to San Marco and overcame the defenders. Savonarola was taken like a common criminal together with Fra Domenico and another follower. After examination by a commission of his worst enemies and after savage torture, it was yet necessary to falsify the record of the inquiry if he were to be charged with any crimes. But his fate was settled. The papal commissioners came from Rome "with the verdict in their bosom," as one of them said. After the ecclesiastical trial, which was even more perfunctory, he was handed over to the secular arm, with his two companions, to be hanged and burned. The account of his last hours is like a page from the lives of the Church Fathers. Before mounting the scaffold he piously received the pope's absolution and plenary indulgence.

In fact Savonarola's quarrel was with the corruption of the clergy of whom Alexander VI was merely the most scandalous example, not with the Roman pontiff for whom he always professed obedience and respect. He was a reformer, but Catholic and Thomist to the marrow; his faith is borne out in his many works, the greatest of which is the *Triumphus crucis,* a clear exposition of Christian apologetics. His *Compendium revelationum,* an account of visions and prophecies that came true, went through many editions in several countries. Of his sermons, some exist in a version taken down verbatim.

After Savonarola's death a cult was dedicated to him which had a long history. Saints canonized by the church, such as Philip Neri and Catherine dei Ricci, venerated him as a saint; an office was said for him, and miracles he had performed were recorded. He was portrayed in paintings and medals with the title of *Beatus.* In the *Acta sanctorum* he was included among the *praetermissi.* When the 500th anniversary of his birth came round in 1952, there was again talk of his canonization.

BIBLIOGRAPHY.—Ten vol. of the Italian national edition (1953–) of Savonarola's works had appeared by 1964. Partial editions were published by P. Villari, *Scelta di prediche e scritti* (1898), and by R. Palmarocchi, *Prediche italiane ai Fiorentini,* 3 vol. (1930–35). His letters were edited and published by R. Ridolfi in 1933. *See* also R. Ridolfi (ed.), *Cronologia e bibliografia delle prediche* (1933); L. Giovannozzi, *Contributo alla bibliografia di G. Savonarola* (1953); M. Ferrara, *Bibliografia savonaroliana* (1958).

Biographies: P. Villari, *La storia di fra Girolamo Savonarola,* 2 vol. (1887), new ed. (1927), Eng. trans. (1889); J. Schnitzer, *Savonarola,* 2 vol. (1931), original German ed. (1924); R. Ridolfi, *Vita di G. Savonarola,* 2 vol. (1952), Eng. trans. (1959).

(R. RI.)

SAVOY, HOUSE OF, one of the great historic dynasties of Europe. From its medieval seat astride the western Alps, where the modern map shows France, Italy, and Switzerland converging, it spread its dominion, gradually and through numerous vicissitudes, farther and farther over Piedmont; in the 15th century it was raised from comital to ducal rank, as a principality of the Holy Roman Empire; in the 18th century it attained royal status, first with the Kingdom of Sicily, then with that of Sardinia;

and in the 19th century it merged Sardinia-Piedmont into the new Kingdom of Italy, which it retained till the establishment of the Italian Republic in 1946.

Origin.—The earliest recorded form of the name Savoy is Sapaudia or Sabaudia, which in the 4th century A.D. may have meant all the territory from Lake Neuchâtel to the middle Isère River. By the 9th century, however, the form Saboia appears, designating the so-called Savoy proper; *i.e.*, the country round Chambéry, in the modern French *département* of Savoie (*q.v.*). From this restricted connotation the name Savoy (French Savoie, Italian Savoia) was loosely extended to include adjacent areas—not only the Maurienne and Tarentaise regions now belonging to the same *département,* but also the Genevois, Faucigny, and Chablais regions, which together constitute the *département* of Haute-Savoie (*q.v.*).

Savoy in the 10th century was part of the last Kingdom of Burgundy (*q.v.*), which lay between France on the one hand and the German and Italian kingdoms on the other, the two latter kingdoms being united under the Holy Roman emperors from 962. This Burgundy was claimed in 1032 by the German king Conrad II, and one of its magnates who supported this claim was Humbert the Whitehanded (d. probably 1047 or 1048, perhaps *c.* 1050), founder of the House of Savoy. Humbert's provenance has been the subject of much speculation: a 15th-century theory named a Saxon called Berold as his ancestor, a 16th-century one the Saxon hero Widukind; some later scholars tried to connect him with the Burgundian kings, other with the Italian king Berengar of Ivrea, others again with a supposed son of the emperor Louis III the Blind. In the 1890s, however, G. de Manteyer advanced a far more likely theory, based on the location of the first certain possessions of the family: it seems that Humbert's ancestors came from Champagne or from French Burgundy in the 10th century and first established themselves in Viennois, the northern part of the future Dauphiné (*q.v.*). By Humbert's time, in any case, the family held the countship of Savoy proper (in their hands before 976); that of Belley, in Bugey, north of the Rhône, between Savoy and Bresse; that of Sermorens, in Grésivaudan, south of Viennois; and that of Aosta, on the Italian side of the Alps. Chambéry, however, the chief place in Savoy proper, was held by a separate line of viscounts.

The Counts, to 1391.—Humbert added the countship of Maurienne to his possessions; and his fourth son Odo, whose elder brothers (Amadeus I and two churchmen, Aimon and Burchard) predeceased him, gathered the whole Humbertine inheritance into his hands. Moreover, Odo's marriage to the heiress Adelaide, daughter of the margrave Olderico Manfredi, led to his investiture with the March or Mark of Turin by the emperor Henry III. By the end of the 11th century his successors had acquired Chablais (then including part of what is now Swiss Valais), Tarentaise (linking the Valle d'Aosta with Savoy and Maurienne), and the Valle di Susa (continuing southward from Maurienne). The Mont Cenis, Little St. Bernard, and Great St. Bernard passes were controlled by them.

From Odo's death (*c.* 1059), Adelaide of Turin held the mass of territory together for her sons Peter I (d. 1078) and Amadeus II (d. 1080); but both she and Peter's daughter Agnes, whose husband, Frederick of Montbéliard, had been invested with Turin, died in 1091. From the time of Amadeus II's son Humbert II (d. 1103) the Savoyard power in Italy underwent a setback, as the emperors proceeded to break up the March of Turin. Humbert II's son Amadeus III (d. on crusade 1148) was finally unsuccessful in his attempts to recover Turin; but he reduced the viscounts of Chambéry to vassalage and arranged some important marriages for his family on the French side of the Alps, including that of his sister Adelaide to King Louis VI. His son Humbert III (d. 1189), after being alternatively threatened and caressed by the emperor Frederick I (*q.v.*), finally took the side of Milan (*see* Lombard League) and of Pope Alexander III against Frederick, who put him under the ban of the empire but could not break his resistance in his mountain strongholds. Humbert's son and successor Thomas I (d. 1233) was soon reconciled with the empire.

Amadeus IV (d. 1253), Thomas I's eldest son, succeeded to the countship of Savoy; but while two of his brothers were making their fortunes in England (Peter as lord of Richmond, Boniface as archbishop of Canterbury), another of them, Thomas II (d. 1259), built up a position for himself in Piedmont. By a pact of 1235 the dynastic lands north of the Alps, with the passes, the Valle d'Aosta, and the Valle di Susa, were reserved to Amadeus, while the rest of the Italian domains, from Avigliana southward, were assigned to Thomas. To these Thomas added not only Rivoli and other places but also Turin itself, which in 1251 accepted incorporation with his territories in order to offset the commercial rivalry of Asti. Asti, Alessandria, and Montferrat (*q.v.*) opposed this new consolidation in Piedmont; and the defeat of Thomas II's forces by those of Asti in 1255 prompted the people of Turin to revolt against him. Taken prisoner, forced to renounce his rights, and handed over to Asti, Thomas regained his freedom only a short time before his death. His son Thomas III (d. 1282), however, captured William VII of Montferrat in 1280 and then obtained recognition of his own claims and the surrender of Turin.

In Savoy, meanwhile, Amadeus IV's son Boniface (d. 1263) had been succeeded by his uncles Peter (the lord of Richmond, now Peter II of Savoy; d. 1268), and Philip I (d. 1285). Peter brought Vaud, the county north of Chablais, under his control and married the heiress of Faucigny, the country between Chablais and Tarentaise, so that his domains extended from the Alps to Lake Neuchâtel in a solid bloc dented only by Genevois, west of Faucigny, which remained under the counts of Geneva. On Peter's death, however, Faucigny was inherited by his only daughter, Beatrix, who was married to Guigues VII, dauphin of Viennois (*see* Dauphiné). Savoy and Dauphiné thereupon embarked on a long contest for Faucigny.

The dynasty's collective inheritance was partitioned again when Philip I died childless (1285). Thomas III's brother, Amadeus V the Great (d. 1323), became count of Savoy, with the lands which Amadeus IV had had; his brother Louis (d. 1302) received Vaud; and Thomas III's son Philip (d. 1334) kept the Piedmontese lands, from Rivoli southward, but acknowledged Amadeus V as his feudal overlord. This Philip assumed the nominal style of prince of Achaea (Italian Acaia) by right of his marriage (1301) to Isabella of Villehardouin, heiress of that Frankish principality in Greece; but neither he nor his descendants, who continued to bear the title, could make it effective.

Amadeus V, who had received Bresse, west of Bugey, as the dowry of his first wife, Sibylle de Bâgé, obtained complete possession of Chambéry in 1288 and made it the capital of his dominions. He also fought a war against Genevois to defend his appointment (1285) as lay representative of the bishop of Geneva; and three wars against Dauphiné, as Faucigny was still in dispute. To preclude any more partitions, he introduced the Salic law of succession and the law of primogeniture. He also kept a close watch on Piedmont, insisting on his feudal suzerainty. Moreover, he and Philip of Achaea, in 1306 and again in 1313, agreed to hold jointly any new acquisitions that might be made by exploiting the rivalries of the three states that bordered Philip's territory, east, south, and southwest, namely Montferrat, the countship of Cuneo (held from 1259 by the Capetian House of Anjou), and the marquisate of Saluzzo; and this agreement took effect when Ivrea was annexed 1313. The emperor Henry VII recognized Amadeus as a prince of the Holy Roman Empire (1313), as well as enfiefing him, ineffectively, with Asti; but the disorders of the emperor Louis IV's reign induced Amadeus latterly to coordinate his external policy with that of France.

Amadeus V's sons Edward (d. 1329) and Aimon (d. 1343) and the regents for Aimon's son Amadeus VI conducted themselves practically as vassals of France; but when Amadeus VI (1334–83) came of age in 1348, the relationship soon changed. Known as the Green Count (because of the colour which he first wore at a tournament in 1353 and then adopted for his general use), Amadeus VI was strong-willed and clear-sighted alike in domestic and in foreign affairs. In 1350, seeing that he could not oppose the power of the Visconti (*q.v.*) in Milan, he married his sister Blanche to Galeazzo Visconti; in 1355 he obtained the long-desired Faucigny by ceding the ancient Savoyard rights in Dauphiné to the French; and in

1359 he bought Vaud back from the last heiress of his great-uncle Louis, whose male line had died out in 1339. Ruthlessly exploiting the quarrels and mistakes of the princes of Achaea, he brought their Piedmontese lands practically under his control. Abroad, he won prestige through his successful expedition of 1366–67, during which he took Gallipoli from the Turks and rescued the Byzantine emperor John V Palaeologus (his first cousin) from the Bulgars; and in 1381 he mediated the Peace of Turin between Venice and Genoa, at the end of the War of Chioggia. Finally, he obtained the cession of all Angevin rights in Piedmont (including Cuneo) by allying himself with Louis I of Anjou-Provence, claimant to the Neapolitan crown, against Charles III of Naples; but he died during the consequent campaign.

Amadeus VII (1360–91), the Red Count, succeeding his father in 1383, won a Mediterranean port for Savoy by annexing Nice and its hinterland in 1388, with the connivance of the local House of Grimaldi, which severed that territory's dependence on the countship of Provence. His premature death gave rise to a miasma of suspicion which persisted throughout the minority of his son.

The Dukes of Savoy, to 1675.—Amadeus VIII (1383–1451), was proclaimed of age to rule in 1393 and began to do so in 1400. Since the male line of counts of Geneva had died out, he purchased all rights to Genevois from their legatees and from the bishopric of Geneva (1401–05), thus acquiring Annecy. Insisting on Savoy's dependence on the empire, in order to counteract the designs of France and of Ducal Burgundy alike, he obtained the title of duke from the German king Sigismund in 1416. With regard to Italy, he reduced Thomas III of Saluzzo to vassalage (1413); incorporated all the lands of the Achaea line when its male line died out (1418); and pursued a course of opportunism toward Montferrat and toward the Visconti, obtaining Vercelli from the latter (1427). He created new institutions to transform his widespread dominions into a centralized state and tried to unify the legal system by his Statutes of 1430.

In 1434 Amadeus VIII withdrew to a hermitage at Ripaille, near Thonon, retaining his ducal title and his supreme authority but entrusting the detail of government to his son Louis. In 1439, however, the Council of Basel (*q.v.*) rather paradoxically elected Amadeus to the papacy, and he was its pope, as Felix V, till his resignation in 1449. Though he formally abdicated his duchy to Louis in 1440, he still concerned himself with its foreign affairs, as Louis proved incompetent. When the bishopric of Geneva fell vacant (1444), he retained it for himself.

On Amadeus VIII's death (1451) a period of decline began. Duke Louis (d. 1465) had a frivolous wife and corrupt ministers; and both he and his eldest son, Amadeus IX (1435–72), as well as the latter's young son Philibert I (1465–82), had to face disorders from which the malcontent Philip the Landless (1443–97) a younger son of Louis, sought to promote his own interests. After a brief recovery under Charles I (1468–90; Philibert's brother) there was more trouble during the regency for his infant successor Charles John Amadeus (1489–96; sometimes reckoned as Charles II), which saw the invasion of Italy by Charles VIII of France. Philip the Landless became duke himself at last, as Philip II, in 1496, but died next year; and the successive reigns of his sons, the half brothers Philibert II (1480–1504) and Charles III (1486–1553; Charles II if Charles John Amadeus is not so reckoned), were overshadowed by the Italian campaigns of the French kings Louis XII and Francis I. In the developing struggle between France and the Habsburg Empire, Savoy inclined to the latter's side: Philibert II had married an aunt of the emperor Charles V (*see* MARGARET of Austria); and Charles III in 1521 married the emperor's niece, Beatrice of Portugal. On the other hand Philibert II's sister Louise was the mother of Francis I of France; and a younger brother of Charles III received a French duchy in 1528 and became the ancestor of a line of ducs de Nemours (*q.v.*). The emperor granted Asti and Ceva to Beatrice of Portugal, so that they passed to the House of Savoy on her death (1538); but he disappointed Charles III by assigning vacant Montferrat, not to him, but to the Mantuan House of Gonzaga (1536).

Charles III sustained serious losses on his northeastern frontier. From the time of Amadeus V and, more intensively, from that of Amadeus VIII, the House of Savoy had been tightening its hold over the bishopric of Geneva, which from the middle of the 14th century was virtually a Savoyard monopoly. In 1526, however, the citizens of Geneva, in reaction against these encroachments, allied themselves with the Swiss city-states of Bern and Fribourg; and in the early 1530s their rebellion against the bishop, Pierre de La Baume, which was followed by revolt against Catholicism in the name of the Reformed Church, led to the complete elimination of Savoyard influence. The bishop took refuge in Annecy, but Charles was unable to prevent the Swiss from overrunning Vaud and Chablais.

At war with Charles V, Francis I of France sent troops to occupy both Chambéry and Turin in 1536. When Charles III died, in 1553, at Vercelli, his lands north of the Alps had been lost, and Piedmont was little more than a battleground between the Spanish Habsburgs of Milan and the French invaders. To his son and successor Emmanuel Philibert (*q.v.*; 1528–80) fell the task of reconstruction. The Franco-Spanish Peace of Cateau-Cambrésis (1559) restored the duchy, but only when the peacemakers' hesitations had been overcome by the duke's marrying a French princess on the one hand and by his concluding a secret pact with Spain on the other; and he had to submit to the occupation of Asti and Vercelli by the Spaniards, and of Turin, Chieri, Pinerolo, Chivasso, and Villanova d'Asti by the French. This occupation was not wholly terminated till 1575, but Turin was restored to the duke in 1563, whereupon he made it the capital of his duchy. To conciliate the Swiss, he left the question of Geneva open and renounced his claims to Vaud; but he recovered the greater part of Chablais. He sheltered refugees from Guglielmo Gonzaga's despotism in Montferrat; he acquired the countship of Tenda in the 1570s, thus facilitating communications between Cuneo and Nice; and he purchased Oneglia from the Genoese House of Doria (1576). As the French rejected his offer of Bresse in exchange for Saluzzo (which they had taken in 1548), he took advantage of local rivalries in Saluzzo and was on the point of dominating the situation there when he died (1580). Meanwhile he had enforced honest administration within his duchy, organized a peasant militia, built a small fleet (which took part in the Battle of Lepanto), and withstood ecclesiastical attempts to interfere excessively in public affairs.

After years of warfare against the French, the ambitious Charles Emmanuel I (*q.v.*; 1562–1630), duke in succession to his father from 1580, obtained the formal cession of Saluzzo by the Treaty of Lyons (1601), in exchange for Bresse, Bugey, and Valromey. His efforts to subdue Geneva, however, came to nothing with the failure of his surprise attack in 1602. Thenceforward he concentrated his intentions on Italy. The Treaty of Bruzolo (or Brosolo; 1610), whereby Henry IV of France was to abet the duke's conquest of Lombardy from the Spaniards, was made abortive when Henry was murdered; but Charles Emmanuel tenaciously pursued his designs on Montferrat (*q.v.*), fighting a single-handed war against Spain for it from 1613 to 1618 and resuming the struggle, with Spanish support, on the outbreak of the War of the Mantuan Succession (1628). The French were again occupying Savoy when he died. His son Victor Amadeus I (1587–1637), duke from 1630, recovered Savoy and obtained one-third of Montferrat under the Treaty of Cherasco (1631), but had to yield the Piedmontese fortress of Pinerolo to the French, who were to hold a threat of domination over Savoy for the next 65 years.

When Victor Amadeus I died, open hostilities between France and Spain had already broken out (*see* THIRTY YEARS' WAR). His widow Christine de France, known as Madame Royale, a sister of the French king Louis XIII, became regent, first for the short-lived Francis Hyacinth (d. 1638), then for her other son, Charles Emmanuel II (1634–75); but the latter's uncles, the princes Maurice (1593–1657; a cardinal from 1607 till 1642) and Thomas of Carignano (1596–1656), challenged her authority, and civil war ensued between Madamisti and Principisti from 1639 to 1642. Charles Emmanuel in fact let Christine govern long after he came of age, and French pressure on the duchy was relaxed only after the Franco-Spanish Peace of the Pyrenees (1659). A war against

Genoa (1672–73) ended in humiliation for Savoy. In France a line of comtes de Soissons (*q.v.*), to which the famous Prince Eugene (*q.v.*) belonged, was descended from the youngest son of Prince Thomas of Carignano.

Victor Amadeus II.—Charles Emmanuel II's widow, Marie Jeanne Baptiste de Savoie-Nemours (*see* NEMOURS, DUCS DE), regent from 1675 to 1684, was wholly subservient to Louis XIV of France; but her son Victor Amadeus II (*q.v.;* 1666–1732) reversed this policy in 1690, when France wanted to occupy Turin (*see* GRAND ALLIANCE, WAR OF THE). Defeated in battles against the French, he triumphed in diplomacy, obtaining not only the dismantling of Casale (1695; *see* MONTFERRAT), but also the retrocession of Pinerolo (Treaty of Vigevano, 1696). The Treaty of Rijswijk (1697) confirmed his success. In the War of the Spanish Succession (*q.v.*), his opportunism won even greater prizes. The Peace of Utrecht, in 1713, added Montferrat, Valenza, Alessandria, Lomellina, Valsesia, and some smaller areas in Italy to Piedmont; fixed the Franco-Piedmontese frontier north of Nice by making it run along the watershed of the Alps; and furthermore assigned the Kingdom of Sicily to Victor Amadeus. By the Treaty of London, however, in 1718, it was decided that he should cede Sicily to the Austrian Habsburgs in exchange for the Kingdom of Sardinia, which Austria effectively got for him from Spain in 1720. Well-advised by excellent ministers, he carried out a thoroughgoing reform of the internal administration of his dominions before abdicating in 1730.

The Kings of Sardinia.—While the royal dignity of the House of Savoy was founded on Sardinia, that remote island was in itself not a very valuable asset; and while the kings of Sardinia continued to be numbered in the same series as the dukes of Savoy, their lands north of the Alps had long ceased to offer those prospects of aggrandizement which they had held out in the Middle Ages, when France had been in a state of feudal disruption and the Swiss Confederation had not come into being. Piedmont was the real seat of power, the nucleus from which further expansion, eastward and southward into divided Italy, seemed ever possible.

To break Austria's predominance in Italy, Charles Emmanuel III (1701–73), who succeeded his father in 1730, joined the Bourbon powers, France and Spain, in the War of the Polish Succession (*q.v.*), and his victory at Guastalla (1734) made him master of Austrian Lombardy. Though the Treaty of Vienna (1738) deprived him of much of his conquest, he retained Novara and Tortona, with their dependencies extended eastward to the Ticino River. In the War of the Austrian Succession (*q.v.*), on the other hand, he took Austria's side; and after his victory at L'Assietta (1747) the Treaty of Aix-la-Chapelle, in 1748, gave him Vigevano (so that his eastern frontier ran from Lake Maggiore down the Ticino River to the Po), the Alto Novarese (adjacent to Lake Maggiore), and also the former dependencies of Pavia on the right bank of the Po (including Voghera and a tongue of land stretching to the Trebbia).

The French Revolutionary and the Napoleonic Wars (*qq.v.*) were catastrophic for the House of Savoy. Victor Amadeus III (1726–96), king of Sardinia from 1773 in succession to his father, had some successes against the French in 1792, 1794, and 1795; but Napoleon Bonaparte's campaign of 1796 forced him to accept the Armistice of Cherasco and the Treaty of Paris, whereby he ceded Savoy and Nice and granted free passage across Piedmont to the French. His timid and ascetic son, Charles Emmanuel IV (1751–1819), king from 1796 to 1802, accepted a French garrison in Turin but was soon pressed to abdicate (1798). Retiring to Sardinia, he revoked his abdication (1799), but later again renounced everything but his royal title (1802). He died a Jesuit in Rome.

Victor Emmanuel I (1759–1824) made some unavailing claims to his brother's full succession before having to settle in Sardinia in 1806. On Napoleon's first downfall he returned to the Italian mainland. Piedmont, Nice, and the greater part of Savoy were restored to his kingdom by the Congress of Vienna in 1814, with the former territory of the Genoese Republic in addition; and the rest of Savoy, which had been left to France, was assigned to him in 1815, after Napoleon's Hundred Days.

Victor Emmanuel I abdicated in 1821, when a revolutionary *coup* in Turin confronted him with the aspirations of his subjects for constitutional freedom in the spirit of the Italian national Risorgimento (*see* ITALY: *History*). His brother Charles Felix (1765–1831), who succeeded him, died childless; and the crown then passed to a distant cousin, Charles Albert (*q.v.*), of the sixth generation from Prince Thomas of Carignano (the brother of Victor Amadeus I). Charles Albert, who had been rather sympathetic to the revolution of 1821, identified Sardinia-Piedmont with the anti-Austrian cause in the war of 1848–49 (*see* ITALIAN INDEPENDENCE, WARS OF) and had to abdicate in consequence.

The Kings of Italy.—Though Charles Albert had failed, his son and successor Victor Emmanuel II (*q.v.*), the only Italian sovereign to maintain constitutionalism during the absolutist reaction, still stood as the main practical hope of Italian patriots. While the solution of the Italian problem on the European level was mainly the achievement of the statesman Cavour (*q.v.*), Victor Emmanuel's personal action was of great importance in matters of extreme delicacy, such as his government's relationship with the radical revolutionaries Mazzini and Garibaldi. In the event, at the cost of two wars and the surrender to France of ancestral Savoy and of Nice, Victor Emmanuel II was proclaimed king of Italy in March 1861; and before his death (1878), the new kingdom was enlarged through two more wars (1866 and 1870). During the lifetime of Victor Emmanuel II his second son, the duke of Aosta, was king of Spain, as Amadeo I (*q.v.*), from 1870 to 1873.

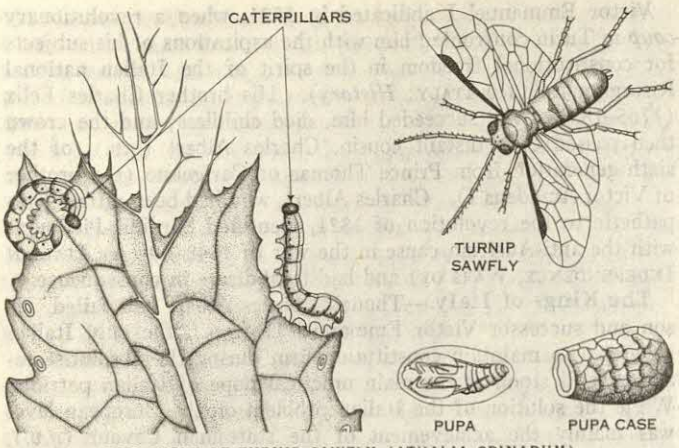
On Victor Emmanuel's death the Italian kingdom passed to his eldest son, Humbert I (*q.v.*), who left it in turn to his son Victor Emmanuel III (*q.v.*). After World War I the frontiers of the latter's kingdom were further expanded. Moreover, the Fascist regime augmented his titles with that of emperor of Ethiopia in 1936 and with that of king of Albania in 1939. The same regime, in 1941 during World War II, set up the duke of Spoleto, Aimone (1900–48; a grandson of Amadeo of Spain), as king of Croatia under the name of Tomislav II. By the end of World War II, however, Ethiopia, Albania, and Croatia were lost; and Victor Emmanuel's abdication of his Italian crown in 1946 failed to save the monarchy for his son Humbert II (Umberto), as Italy became a republic.

Humbert II had a son Victor Emmanuel, prince of Naples, born in 1937, to continue representation of the direct royal line of Italy. The male line of Aosta branch, of which the explorer Luigi Amedeo, duke of Abruzzi (1873–1933) had been a distinguished member, was continued by Aimone's son Amedeo (Amadeus), born in 1943. There survived also the extensive Genoa branch, descended from a younger brother of Victor Emmanuel II (titular dukes of Genoa, of Pistoia, of Bergamo, and of Ancona).

SAWAI MADHOPUR, a town in Rajasthan, India, and the administrative headquarters of the district of the same name, lies about 75 mi. (120 km.) SE of Jaipur city on the Western Railway. Pop. (1961) 20,952. Sawai Madhopur, which is walled, takes its name from Madho Singh, maharaja of Jaipur from 1751 to 1768, who laid out the town somewhat on the plan of Jaipur city. The town is famous for its copper and brass vessels, and there is also a brisk trade in lacquered wooden articles, round playing cards, and the scent extracted from *khas* grass.

SAWAI MADHOPUR DISTRICT has a total area of 4,070 sq.mi. (10,541 sq.km.) and a population (1961) of 943,574. The annual rainfall is about 25 in. (635 mm.). More than 1,000,000 ac. (400,000 ha.) are under cultivation, and the chief crops include wheat, maize (corn), rice, barley, gram, and sugarcane. (S. M. T. R.)

SAWFLY, not a true fly but a wasp relative in which the lower or anterior blades of the ovipositor are toothed and sawlike. Sawflies belong to several families of the suborder Symphyta (Chalastogastra). They are characterized by the broad base to the abdomen, where it joins the thorax, and by the wing veins being less reduced than in other members of the order. Their larvae are usually caterpillars and in most cases may be distinguished from those of moths and butterflies by having six or more pairs of abdominal feet and only a single pair of simple eyes or ocelli. When disturbed, they roll themselves in a spiral



LIFE CYCLE OF TURNIP SAWFLY (ATHALIA SPINARUM)

fashion and some species discharge a thin fluid from glands above the spiracles. The females lay their eggs in incisions in plants, cut by the sawlike blades of the ovipositor. The larvae are vegetable feeders. Species of several genera, notably *Pontania,* form galls on willows. The cause of the gall is stated to be a secretion injected along with the egg, and it has been suggested that it contains an enzyme that acts upon the plant so as to induce gall formation.

Reproduction in sawflies is of considerable interest: in many species males are unknown and parthenogenesis (*q.v.*) is the rule. In the gooseberry sawfly the unfertilized eggs give rise only to males, whereas the fertilized eggs produce individuals of both sexes, females predominating.

The true sawflies belong to the large family Tenthredinidae, the larvae of many of which are injurious to plants. Among these are the currant worm, or gooseberry sawfly (*Nematus ribesii*), and the pear slug (*Caliroa limacina*). These two species and also the larch sawfly (*Lygaeonematus erichsonii*) were accidentally imported from Europe into North America, where they likewise became destructive. Other harmful species in Europe are the turnip sawfly (*Athalia spinarum*) and the pine sawfly (*Diprion pini*).

The small families Cephidae and Siricidae have larvae that are borers. The Cephidae, or stem sawflies, make burrows, usually in stems; the best-known species is *Cephus pygmaeus,* which attacks wheat. It is destructive in North America, where *Janus integer,* the stem girdler of the currant, is also troublesome. The Siricidae, which bore into solid timber, are known as wood wasps or horntails. *Sirex gigas* is the most familiar European wood wasp and is not uncommon in Great Britain. (A. D. I.; X.)

SAWHAJ (SOHAG), a town and *muhafaza* (governorate) of Upper Egypt (United Arab Republic). The town, capital of the governorate, stands on the west bank of a large loop of the Nile 190 mi. (306 km.) NNW of Aswan on the main Cairo railway. Pop. (1962 est.) 65,000. Nearby are two important Christian monuments, the White and Red monasteries. There is cotton ginning and textile weaving, and limestone is quarried across the river at Al 'Isawiyah Sharq ('Isawiya).

SAWHAJ *muhafaza,* formerly Jirja (Girga) Province, comprises the stretch of the fertile Nile Valley between the *muhafazat* of Asyut in the north and Qina in the south. Pop. (1960) 1,578,858. Area 595 sq.mi. (1,540 sq.km.). The Nile there flows in a flat-bottomed trough, 12–14 mi. wide, called the Nile Ravine and cut in almost horizontally bedded limestone. The valley is hemmed in by precipitous limestone walls rising to nearly 1,000 ft. (305 m.). Throughout the area the Nile flows close to the eastern side of the valley; nearly all the arable land lies west of the river. There are two notable sites of antiquities, that of Abydos (*q.v.*), the pilgrim centre of the Osirian creed near Jirja town, and Bayt Khallaf, the site of a mastaba probably of King Zoser (3rd dynasty), near Sawhaj.

Sawhaj is one of Egypt's most densely peopled *muhafazat* (2,654 persons per square mile). Agriculture is the principal activity, employing 75% of the occupied population (the heaviest proportion in all Egypt), but more than half of the farmland is under basin irrigation whereby only one crop can be grown annually, and there is much poverty. The principal crops are cotton (on land with perennial irrigation), millet, wheat, sugarcane, onions, peanuts, and melons. The perennially irrigated land is watered from the Jirjawiyah and Sawhajiyah canals, fed from the Naj' Hammadi Barrage to the south. The basin lands are inundated by Nile floodwater in August, drained after about 50 days, and seeds are then sown. There are stone quarries at Jabal al Haridi and Al 'Isawiyah Sharq, east of Akhmim. Industries are restricted to the processing of agricultural produce: milling, cotton ginning, and the weaving of cotton, wool, and silk, especially at Akhmim. The principal towns are Sawhaj, Tahta, Akhmim, and Jirja.

(A. B. M.)

SAWMILL, a mill in which logs are cut into rough-squared sections or into planks and boards for sale or further treatment. The word is often applied to a mill equipped with planing, molding, tenoning, and other machines for finishing processes. The biggest mills are usually situated where timber can be brought by river or rail, and the design of the mill is in some degree affected by the mode of transportation. More space is necessary for storage in the rail-borne system. Waterborne logs float into the mill and are dragged out in turn by a winch. An overhead crane serves the stock yard in the rail system, and carries the logs to the machines.

The cutting is performed on various kinds of big machines, a preliminary operation often being that of crosscutting to obtain convenient lengths. Cutting up into the various thicknesses is done by either reciprocating saws or band saws (known also as circular saws), the log being held on a table which feeds it past the saw. The log frame is a machine with a set of vertically reciprocating blades, suitably spaced apart; it divides a log into boards at one pass of the table. The number of blades may be few, not exceeding four in some cases for cutting thick pieces, or as many as fifty for thin boards. Resawing machines are those for further dealing with material partly broken up, such as flitches and deals. The great quantity of sawdust and chips from the machines is neatly disposed of by pneumatic ducts ending in the boiler house. *See* also LUMBERING: *Sawmill Operations;* WOODWORKING MACHINERY.

SAWS AND SAWING MACHINES: *see* HAND TOOLS, HISTORY OF; MACHINE TOOLS; WOODWORKING MACHINERY.

SAX, ANTOINE JOSEPH, known as ADOLPHE (1814–1894), maker of musical instruments and inventor of the saxophone (*q.v.*), was born at Dinant, Belgium, on Nov. 6, 1814. He was the son of CHARLES JOSEPH SAX (1791–1865), a maker of wind instruments, especially brass instruments, who also made pianos, harps, and guitars. Adolphe Sax studied the flute and clarinet at the Brussels Conservatoire and in 1842 went to Paris. There he exhibited the saxophone, a single-reed instrument made of metal, with a conical bore, overblowing at the octave, which was the result of his efforts to improve the tone of the bass clarinet. It was patented in 1846. With his father he evolved the saxhorn (*q.v.;* patented in 1845), an improvement on the bugle horn; the saxo-tromba, producing a tone between that of the bugle and the trumpet; and the saxtuba. Sax discovered that it is the proportions given to a column of air vibrating in a sonorous tube, and these alone, that determine the character of the timbre produced. In 1857 Sax was appointed instructor of the saxophone at the Paris Conservatoire. In the latter part of his life Sax improved several instruments and invented others without, however, establishing a basis for their commercial exploitation. In his 80th year he was living in abject poverty; Chabrier, Massenet, and Saint-Saëns were obliged to petition the minister of fine arts to come to his aid. He died in Paris on Feb. 7, 1894.

BIBLIOGRAPHY.—O. Comettant, *Histoire d'un inventeur au 19e siècle* (1860); Paul Gilson, *Les Géniales Inventions d'Adolphe Sax* (1939); A. Remy, *La Vie tourmentée d'Adolphe Sax* (1939); L. Kochnitzky, *Adolphe Sax and his Saxophone* (1949).

SAXE, (HERMANN) MAURICE, COMTE DE (1696–1750), one of the most brilliant commanders in the history of the French Army. He was born on Oct. 28, 1696, at Goslar in cen-

tral Germany, the natural son of the elector Frederick Augustus I of Saxony (later also king of Poland as Augustus II) and Maria Aurora von Königsmark (*q.v.*). His father sent him to serve in Flanders under Prince Eugene of Savoy in 1709–10, granted him the title of count of Saxony (Graf von Sachsen; Fr., comte de Saxe) in 1711, and arranged his marriage (later annulled) to the heiress Johanna Victoria von Löben in 1714. In 1719 his father bought for him a German regiment in the French service, and with it Saxe first attracted attention by his new methods of training, especially in musketry.

In December 1725 Saxe arrived in Warsaw on a visit to his father. The future of Courland (*q.v.*) was then under discussion, and in May 1726 Saxe rode off to Mitau (Jelgava) where he quickly endeared himself to the dowager duchess, Anna Ivanovna (later empress of Russia), and was elected duke of Courland. He might have married Anna, but neither Poland nor Russia would consent to his enterprise; and in 1727 he was expelled by the Russians.

Back in France, Saxe in 1732 wrote *Mes Rêveries* (not published until 1756–57), a remarkable treatise on almost every aspect of war and military life, with many original ideas. When the War of the Polish Succession broke out, he took part in Marshal Berwick's campaign on the Rhine. Marshal de Noailles (Adrien Maurice) procured for him the rank of lieutenant general in 1734.

In the War of the Austrian Succession (*q.v.*) Saxe won fame by suggesting and personally executing the capture of Prague (Nov. 26, 1741). In July 1743 Noailles, left in control by the failure of the other marshals, gave him command of an army in Alsace; but after protests by other generals the French king, Louis XV, transferred Saxe to Dunkerque in January 1744, to command an expedition against England on behalf of the Young Pretender, Charles Edward. When Saxe embarked a storm shattered his squadron and the project was dropped.

On March 26, 1744, Saxe was made a marshal of France. He was given command of a corps in Flanders to cover Louis XV's own army in the usual sieges; but when Louis and Noailles removed part of the army to the German front, Saxe was outnumbered in Flanders by the Allied forces (British, Austrian, and Dutch). Yet he established his camp near Courtrai so skilfully that the Allies could attempt nothing.

When Louis XV and Noailles joined Saxe in 1745 for the siege of Tournai and a battle was expected, they insisted that he alone should give the orders. The result was the Battle of Fontenoy (May 11, 1745), in which the French, by hard and costly fighting, with some element of chance, won a great victory over the Allies under William Augustus, duke of Cumberland. The consequent surprise of Gand (Ghent) (July 11) and, still more, the capture of Brussels (Feb. 20, 1746), which also secured Antwerp, were operations of high skill. Saxe then marched south, took Mons and Namur, and, on Oct. 11, 1746, defeated Prince Charles of Lorraine at Raucoux (properly Rocourt, near Liège), in a long struggle of infantry.

On Jan. 10, 1747, Saxe was appointed marshal-general of France, a dignity held only by Turenne and Villars before him. All France's military effort was centred on him, and he wielded almost sovereign power over the Netherlands from his headquarters in Brussels. Many Frenchmen believed that he and his Danish protégé, Ulrich Löwendal, were prolonging the war for their own profit. Saxe's last great battle was that of Lauffeld (July 2, 1747), in which the Allies, defending the approaches to Maastricht, lost 10,000 men. Maastricht itself, however, did not fall to the French till May 1748.

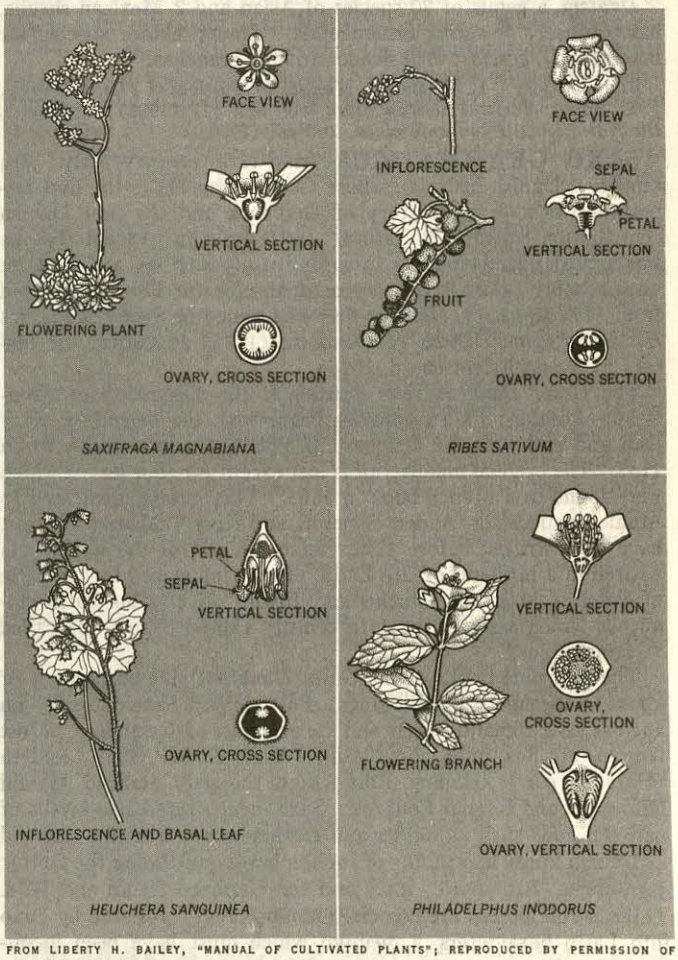
After the Peace of Aix-la-Chapelle, Saxe lived mostly at his château of Chambord, with his Negro bodyguard and his German regiment encamped in the park. When he died there on Nov. 30, 1750, it was rumoured that the prince de Conti (Louis François de Bourbon) had killed him in a duel. Saxe had been insatiably promiscuous in his amours. The most devoted of his mistresses was the actress Adrienne Lecouvreur (*q.v.*). By Marie Rinteau he had a daughter from whom George Sand (*q.v.*) was descended.

See J. L. A. Colin, *Les Campagnes du comte Maurice de Saxe,* 3 vol. (1901–06); J. M. White, *Marshal of France* (1962). (I. D. E.; X.)

SAXHORN, a family of brass wind instruments patented by Adolphe Sax in Paris in 1845, provided military bands with a homogeneous series of valved brass in place of the miscellany of valved instruments, largely of German invention, that had come into use since 1825. Saxhorns, from sopranino to contrabass, had a wide bugle-like bore, while the saxo-trombas, a parallel but short-lived family, were rather narrower in bore. The deeper saxhorns became and remain regular brass-band instruments in France, the U.S., and Britain, where they are known not as saxhorns but simply as: alto in E♭ (in Britain "tenor horn"); tenor in B♭ ("baritone"); the wider-bore baritone in B♭ ("euphonium," *q.v.*); and bass in E♭ and contrabass in BB♭. *See* also TUBA. (A. C. BA.)

SAXIFRAGACEAE, the saxifrage family of the order Rosales, embraces about 80 genera and 1,200 species of dicotyledonous plants of cosmopolitan distribution with concentration in the north temperate zone and subarctic regions. There are more than 40 genera in the western hemisphere, found from Alaska to Cape Horn. The plants are annual or perennial herbs, shrubs, or small trees. The leaves are simple or compound, alternate or opposite, without stipules, often in basal rosettes. Flowers are arranged in clusters, bisexual, rarely unisexual, with regular or bilateral symmetry. The calyx is made up of four to five sepals, usually united and prolonged to a floral tube with a glandular disc; corolla, of four to five separate petals, is common; there may be five to ten or many stamens, and one pistil, mostly two carpellate, with parietal or axile placentation; styles and stigmas are mostly separate; fruit is a many-seeded capsule or a juicy berry.

Saxifraga, or rock-breaker (garden saxifrage), is the largest genus, comprising more than 300 species, of which about 15 are British. They are crevice-loving herbs, of arctic and alpine habitats, usually with tufted leaves from crowns of rhizomes anchored by roots in mossy fissures or wet meadows. Many are prized ornamentals in rock gardens, including *S. umbrosa* (London pride),



FROM LIBERTY H. BAILEY, "MANUAL OF CULTIVATED PLANTS"; REPRODUCED BY PERMISSION OF THE MACMILLAN CO.

SOME SPECIAL CHARACTERISTICS OF THE FAMILY SAXIFRAGACEAE

with crimson-dotted petals, and *S. rosacea* (rose saxifrage), with scarlet petals. *S. sarmentosa* (strawberry geranium) is a popular house plant, with attractive panicles of irregular flowers, propagating by a profusion of runners with terminal rosettes of leaves.

Chrysosplenium (golden saxifrage), including 85 species of delicate creeping herbs found in springheads and creek beds, has four-parted flowers, the eight golden anthers compensating for the lack of petals.

Parnassia (grass-of-Parnassus) includes 40–45 species with circumpolar distribution; *P. palustris*, of shores and wet meadows, has showy white flowers.

Heuchera (alumroot), with 30 species, is exclusively a North American genus. The plants are characterized by a naked flowering stem with rosette leaves from thick rhizomes which contain astringent principle. *H. sanguinea* (coral-bells) is a rock garden favourite because of its graceful panicle of showy flowers. Any species, indeed, is suitable for rock gardens.

Astilbe, a genus of about 20 Asian and 2 American species, are ornamental herbs with twice or thrice compound leaves, small numerous flowers in terminal clusters, and fruits often follicular from distinct carpels. *A. japonica* is preferred in gardens.

The genus *Ribes* (currant and gooseberry, *qq.v.*) includes 140 species of smooth or prickly shrubs, widely distributed. *R. sativum* (garden currant) and *R. grossularia* (or *Grossularia reclinata;* the English gooseberry) bear edible berries. Among ornamentals are *R. odoratum* (clove currant) and *R. sanguineum* (cherry currant). All species of *Ribes* are valuable shrubs in providing shelter and food for wild life, but they also are the alternate host for the fungus that causes blister rust in white pine.

Philadelphus (or mock orange) is a genus consisting of about 70 species, several Asian, 1 European and the remainder American. *P. coronarius* and its many forms are widely cultivated for their attractive clusters of showy-white fragrant flowers.

Deutzia, a genus of 70 species of Asian and 2 Mexican shrubs, has profusely flowering ornamentals. Among choice species for borders is *D. gracilis*, with slender arching branches.

SAXO GRAMMATICUS (mid-12th century–early 13th century), Danish historian whose *Gesta Danorum* is the first important work on the history of Denmark and the first Danish contribution to world literature. Little is known except that he was a Sealander belonging to a family of warriors, and that he was probably a clerk in the service of Absalon (archbishop of Lund from 1178 to 1201). Saxo is first mentioned in Svend Aggesen's *Historia Regum Danicæ compendiosa* (1185) as writing the history of Svend Estridsen (d. 1076).

The *Gesta Danorum* was written at the suggestion of Archbishop Absalon: its 16 volumes begin with the legendary King Dan and end with the conquest of Pomerania by Canute VI in 1185. The original manuscript is lost except for four leaves which were found in a French book in 1863. The preface, dedicated to Absalon's successor, Anders Sunesen, and King Valdemar II, must have been written before 1222. Like the rest of the work, it is written in a brilliant, ornate Latin, clearly influenced by the style of Valerius Maximus, Curtius and Justin. It was his Latin eloquence which early in the 14th century caused Saxo to be called "Grammaticus."

The first nine books of the *Gesta Danorum* give an account of about 60 legendary Danish kings. For this part Saxo depended on ancient lays, romantic sagas and the accounts of Icelanders. Most famous are his tales about Uffe (Anglo-Saxon, Offa), Amleth (Hamlet [*q.v.*]), Hading, Rolf Krake, the giant Starkad, Harald Hildetand and Ragnar Lodbrok. Saxo incorporated also myths of national gods such as Balder and Hother whom tradition claimed as Danish kings, and myths of foreign heroes, including the Gothic Jarmunrik (Ermanaric; *q.v.*) and the Germans Hedin and Hild. Three heroic poems are especially noteworthy, translated by Saxo into Latin hexameters, a medium which must have been incongruously alien to the concentrated, pithy style of the originals, the oldest known Danish poetry. They are *Bjarkemaalet*, a battle hymn designed to arouse warlike feelings; *Ingjaldskvadet*, a poem stressing the corruptive danger of luxury upon the old Viking spirit; and *Hagbard and Signe*, a tragedy of love and family feuds.

The last seven books comprise Saxo's account of the historical period, but he only achieves independent authority when writing of events close to his own time (from book 14 onward). Archbishop Absalon and his family, and oral accounts by Danish warriors, seem to have been Saxo's main sources for this period. His work is noteworthy for its sense of patriotic purpose based on a belief in the unifying influence of the monarchy. By presenting a 2,000-year-long panorama of Danish history, he aimed to show his country's antiquity and traditions. Saxo's work became a source of inspiration to many of the 19th-century Danish romantic poets.

Bibliography.—Saxo's *Gesta Danorum* was first published by Christiern Pedersen (Paris, 1514), modern ed. by J. Olrik and H. Ræder (1931). Since 1575 it has been translated into Danish five times; Eng. trans. by Oliver Elton, *The First Nine Books of the Danish History of Saxo Grammaticus* (1894). *See* also A. Olrik, *Kilderne til Saxos oldhistorie*, i–ii (1892–94) and *Danske oldkvad i Saxos historie* (1898); C. Weibull, *Saxo* (1915); K. Malone, *The Literary History of Hamlet* (1923); S. Larsen, *Saxo Grammaticus, hans Værk og Person* (1925); Ellen Jørgensen, *Historieforskning og Historieskrivning i Danmark indtil Aar 1800* (1933). (E. L. Bf.)

SAXON DUCHIES, ERNESTINE, a collective name for the various states, in the Thuringian area of central Germany, which were ruled by members of the Ernestine line of the House of Wettin between 1485 and 1918. From 1826 there were four of them: (1) the Grand Duchy of Saxe-Weimar-Eisenach, in all 1,394 sq.mi. (3,610 sq.km.), comprising three major blocks of territory, northern (around Weimar), southeastern (around Neustadt an der Orla), and western (around Eisenach), with ten smaller exclaves; (2) the Duchy of Saxe-Meiningen-Hildburghausen, 953 sq.mi. (2,468 sq.km.), a crescent of territory extending from Salzungen in the west, southeastward to Meiningen and Hildburghausen, and then northeastward to Saalfeld, with nine exclaves; (3) the Duchy of Saxe-Altenburg, 511 sq.mi. (1,324 sq.km.), two major blocks of territory, one (round Altenburg) in the east on the Pleisse River, the other (including Eisenberg, Roda, and Kahla) between the Weimar and Neustadt parts of the Grand Duchy, with one small exclave; and (4) the Duchy of Saxe-Coburg-Gotha, 763 sq.mi. (1,977 sq.km.), two major blocks, one (Coburg) in the extreme south of the area, the other (Gotha) east of the Eisenach part of the Grand Duchy, with six exclaves. The discontinuity of the Ernestine lands was further enhanced by the existence of quite distinct territories in the same area: an exclave of Hesse-Kassel (part of Prussian Hesse-Nassau from 1866), an extension and numerous exclaves of Prussian Saxony, exclaves of Schwarzburg-Sondershausen, and the main territory of Schwarzburg-Rudolstadt in the central zone; the Unterland of Reuss (*q.v.*) between the two parts of Saxe-Altenburg; and the Oberland of Reuss in the southeast.

The House of Wettin (*q.v.*) accumulated possessions in Thuringia from the middle decades of the 13th century onward. It received the Pleissnerland, round Altenburg, from the Holy Roman emperor Frederick II in 1243; won the landgraviate of Thuringia, with control over the Eisenach and Gotha areas, in 1264, after the war of 1256–63; obtained Neustadt by marriage to the heiress of Arnshaugk in 1300; acquired Coburg and Hildburghausen from the House of Henneberg, and Weimar from that of Orlamünde, between 1347 and 1374; and purchased Saalfeld from Schwarzburg in 1389 and Weida from the House of the *Vögte* (imperial advocates) in 1410–27. The accession of the Wettins to the electorate of Saxony (*q.v.*) in 1423 gave rise to the use of the prefix Saxe- (Ger. Sachsen-) for their dynastic ramifications in Thuringia.

In 1485, at the partition of the Wettin lands under the Treaty of Leipzig between the sons of the elector Frederick II of Saxony, the elder son, Ernest (1441–86), received the Saxon electorate, Altenburg, and most of the Thuringian lands, while the younger son, Albert, received Meissen, Dresden, Leipzig, and a strip of lands in northern Thuringia. In 1547 Ernest's grandson John Frederick I (*q.v.*), taken prisoner at the Battle of Mühlberg, had to renounce not only electoral Saxony but also a great part of his Thuringian territory to his Albertine cousin Maurice. The Ernes-

tines, however, kept Weimar (with Jena, where John Frederick I founded the university), Gotha, Eisenach, Saalfeld, Weida, and Coburg (the last held as a separate duchy by John Frederick I's half brother John Ernest from 1541 to 1553, when it reverted to John Frederick's sons); and in 1554, by the Treaty of Naumburg, they recovered Altenburg, Eisenberg, and other places from the Albertines. From 1567 Weida, Neustadt, and some other places were ceded to the Albertines as a consequence of the defeat of John Frederick II and his protégé Wilhelm von Grumbach (*qq.v.*); but the extinction of the House of Henneberg in 1583 eventually brought Meiningen to the Ernestines, though the final division of the Henneberg inheritance between Ernestines and Albertines was not agreed till 1660.

The Ernestines continually distributed their lands between themselves. Saxe-Weimar-Gotha and Saxe-Coburg, with respective dependencies, were separated in 1566, but realigned as Saxe-Coburg-Gotha and Saxe-Weimar in 1572. Then Saxe-Coburg-Gotha was split between Coburg and the first Eisenach branch from 1596 to 1633; and Saxe-Weimar was split between Weimar and Altenburg branches from 1603. The first Eisenach branch inherited the Coburg lands in 1633, but died out in 1638, whereupon its succession was divided between Weimar and Altenburg. In 1640 the Weimar branch was yet again split, between Weimar, Eisenach, and Gotha branches. Weimar and Gotha partitioned the Eisenach branch's lands when it died out in 1644 and the Altenburg branch's when it too died out in 1672.

Saxe-Weimar proceeded to a final division in 1672, between Weimar, Eisenach, and Jena branches, but Saxe-Jena died out in 1690 and Saxe-Eisenach in 1741. As the Weimar branch had at last adopted the rule of primogeniture in 1724, the integrity of Saxe-Weimar-Eisenach was thereafter maintained. For its most notable ruler *see* CHARLES AUGUSTUS (Karl August).

Meanwhile Saxe-Gotha had been split between seven branches in 1680–81. Of these, Saxe-Coburg died out in 1699, Saxe-Eisenberg in 1707, Saxe-Römhild (named after a part of the Henneberg inheritance) in 1710. There remained Saxe-Meiningen (called Saxe-Coburg-Meiningen from 1699), Saxe-Hildburghausen, Saxe-Gotha-Altenburg, and Saxe-Saalfeld (called Saxe-Coburg-Saalfeld from 1735). The extinction of the Gotha-Altenburg branch in 1825 led to a definitive redistribution of territory in 1826: Frederick of Saxe-Hildburghausen ceded his original territory to Bernard of Saxe-Meiningen and became duke of Saxe-Altenburg instead; and Ernest of Saxe-Coburg-Saalfeld ceded Saalfeld to Saxe-Meiningen likewise and became duke of Saxe-Coburg-Gotha.

The Ernestine duchies had entered the Confederation of the Rhine in 1807 and the German Confederation, as sovereign states, in 1815. The Congress of Vienna moreover raised Saxe-Weimar-Eisenach to the rank of a grand duchy, restored Weida and Neustadt to it, and also awarded it some new territory. Constitutions were granted to the Grand Duchy in 1816, to Saxe-Coburg-Saalfeld in 1821, to Saxe-Meiningen-Hildburghausen in 1829, to Saxe-Altenburg in 1831. Saxe-Altenburg underwent violent disturbances at the revolution of 1848. Saxe-Coburg-Gotha during the first half of Duke Ernest II's reign (1844–93) was a centre of liberal German nationalism (*see* also WETTIN for the accession of members of the House of Saxe-Coburg-Gotha to four kingdoms). During the Seven Weeks' War (1866) Saxe-Meiningen-Hildburghausen took the Austrian side, the other Ernestine states the Prussian. All four states subsequently joined the North German Confederation (1866) and the German Empire (1871). At the German revolution of 1918 all the Ernestine rulers abdicated, and in 1920 their former lands were merged in the new Thuringia (*q.v.*), with the exception of Coburg, which joined Bavaria.

SAXONS, a Germanic people said by Ptolemy (*Guide to Geography, c.* A.D. 150) to have lived on the "neck of the Cimbric Peninsula," *i.e.*, in Schleswig, and to have extended thence along the Baltic coast. They also occupied three islands north of the Elbe estuary. The period of decay of the Roman power in the West was marked by vigorous piracy in the North Sea by the Saxons, and they made settlements on the French coast, but these seem not to have been permanent. Because of their infestation, the coasts of Britain and Gaul adjacent to the English Channel were known as *litora Saxonica* at the beginning of the 5th century. Great expansion over land was taking place at the same time, and the Saxons reached the Rhine, absorbing many ancient tribes on the way. Their last conquest was that of the Boructuari shortly before 700. This expansion was, however, inland in North Germany. The coastal stretch from the Elbe to the Scheldt rivers was held by the Frisians, on whom, archaeological evidence indicates, the Saxons had great influence.

The expansion of the Saxons brought collision with the Franks. Saxons and Franks together destroyed Thuringia in 531, but the two nations had frequent clashes. In 772 Charlemagne decided on a campaign of conquest and conversion. With interruptions, the Saxon wars lasted 32 years, and ended with the incorporation of the Saxons into the Frankish empire. Although they had not developed a strongly centralized government, their national resistance was concentrated round the Westphalian chief Widukind.

Bede (*Historia ecclesiastica*) describes the Germanic invaders of Britain as Angles, Saxons, and Jutes. He says that the East, West, and South Saxons are descended from the Saxons, the East Angles, Middle Angles, Mercians, and Northumbrians from the Angles, the people of Kent, Wight, and parts of Hampshire from the Jutes. Bede is supported by (1) many of the names of the Old English nations, (2) the dialects of Old English, which, while their phonological differences mostly developed in England, yet show that Saxon and Anglian have a marked distinction in vocabulary, and (3) the peculiar social structure of Kent (*see* JUTES). Yet the memory of the Jutes quickly died out, and Bede himself is not always careful to distinguish Angles and Saxons (*see* ANGLES). Furthermore, all the invaders of Britain were closely related, and spoke dialects similar to each other and to the Frisian language. The dialects of the continental Saxons, on the other hand, underwent considerable approximation to High German, and their affinity to those of the English and the Frisians is only to be traced in sporadic spellings in texts now extant, of which none are older than the 9th century. When Procopius (*Gothic Wars, c.* 550) alleges that the inhabitants of Britain are Britons, Angles, and Frisians, he is no doubt confusing Frisians and Saxons, owing to their close relationship and to the extensive Saxon settlements among the Frisians.

For details of the Saxon conquest of southern England *see* ENGLISH HISTORY; *see* also references under "Saxons" in the Index.

SAXONY (Ger. SACHSEN), the name of important territories in German history. It has been applied successively: (1) before A.D. 1180, to an extensive region including Holstein but lying mainly west and southwest of the estuary and lower course of the Elbe River; (2) between 1180 and 1423, to two much smaller and widely separated areas, one on the right bank of the lower Elbe southeast of Holstein, the other on the middle Elbe; and (3) between 1423 and 1952, to a large area with its principal axis even farther up the Elbe and including, in the widest sense, all the country from Thuringia to Lusatia. The name of the first Saxony was officially recalled, in 1946, for the German *Land* Lower Saxony (*q.v.*), or Niedersachsen, that is, Saxony lower down the Elbe; but the new *Land* was not coextensive with the old territory of the Saxons.

The French form of the name, SAXE, is used in English as the normal form for a prefix to designate subdivisions of Saxony or of the ruling dynasty's lands: thus Saxe-Lauenburg and Saxe-Wittenberg for the two Saxonies of the period 1180–1423; and Saxe-Weimar, Saxe-Coburg, etc., for the subdivisions of Saxon, or rather Wettin, Thuringia (*see* SAXON DUCHIES, ERNESTINE).

THE STEMLAND

The Ancient Saxons.—The Saxons (*q.v.*), a Germanic people, are mentioned by the Greek geographer Ptolemy, of the 2nd cen-

LEFT, SAXONY PRIOR TO A.D. 1180, RIGHT, A.D. 1180–1423

tury A.D., as inhabiting the neck of land between the Elbe estuary and the Baltic Sea; *i.e.*, the later Schleswig-Holstein. In the following centuries they spread westward and southwestward. While the westward migration, by sea to Britain, is irrelevant to this article, the southwestward movement is fundamental to it.

In the 1st–2nd centuries A.D. the country between the lower Rhine and the lower Elbe was occupied by various Germanic peoples. Between *c.* 200 and *c.* 700, as a product of the Germanic Völkerwanderung or Great Migration (*see* EUROPE: *History*) a great tribal union under the name of the Saxons was gradually imposed, by conquests or by confederations, on all this country except the coastal zone. In the coastal zone the Frisians (*q.v.*) withstood Saxon pressure and even, from *c.* 600, began slowly to supplant the Saxons in country taken over by the latter.

The tribal union of the Saxons was the origin of the so-called stem land or stem duchy of Saxony (Ger. *Stamm*, "people" or "nation"). It was distinct, moreover, from other products of the Völkerwanderung insofar as it was built, ethnically, on purely Germanic stock. The people adhered tenaciously to their ancient customs and, in particular, to their paganism. The central object of cult was an Irminsul or "Pillar of the World," a tall wooden column erected on a mountain and supposed to support the universe (there were several such columns). The country was divided into three great provinces: Angria or Angraria (Ger. *Engern*) in the centre along the Weser, with Marklo (probably near the modern Lohe, north of Nienburg) as the yearly meeting place of the national assembly; Eastphalia (Ger. *Ostfalen*) to the east, apparently including Nordalbingia (Holstein); and Westphalia (*q.v.*) to the west.

The Frankish Conquest.—In the 530s the Saxons had cooperated with the Franks (*q.v.*) against the Thuringians on their southeastern border, where the Saxon frontier was pushed forward to the Saale River. Subsequently, however, Franks and Saxons collided. The Frankish campaigns against the Frisians threatened Westphalia; and the Franks sponsored the unwelcome enterprises of Christian missionaries. Hostilities were intensified on the rise of the Carolingians (*q.v.*) to power in France. Finally Charlemagne (*q.v.*) embarked on a long series of wars against the Saxons. His first campaign (772) culminated in the capture of Eresburg (the modern Obermarsberg), where he destroyed a great Irminsul. The Saxon leader Widukind was the hero of the resistance in the next phase of warfare, from 775, but he submitted to Charlemagne and was baptized in 785. Even so, Charlemagne's subjection of Saxony was not completed till 804.

The incorporation of Saxony into Charlemagne's empire was accompanied by the foundation of numerous bishoprics: Bremen and Verden in the north; Osnabrück and Minden in the central area; Paderborn in the south; Halberstadt in the extreme southeast; and Münster in the west. To these the emperor Louis I added Hildesheim and Hamburg, as well as the great abbey of Corvey.

Charlemagne's eastern frontier was not altogether secured by the annexation of Saxony. By the middle of the 7th century the Slavs (*q.v.*), who for 200 years had been displacing the Germans in central Europe, were moving into Saxony. Against them, therefore, the Frankish emperors set up lines of fortification: the Limes Saxonicus from the Elbe in the vicinity of Lauenburg to the Baltic near Kiel, to protect Nordalbingia; and the Limes Sorabicus from Bardowiek in Eastphalia southward across Thuringia.

The Duchy of the Liudolfings.—The emperor Louis I's sons partitioned the Frankish Empire (843). Saxony was included in the East Frankish Kingdom, under Louis the German (*see* GERMANY: *History*). During this king's reign Liudolf, one of his local officers or counts, won recognition as duke or military leader of the East Saxons, largely because of his success in defending Nordalbingia. On Liudolf's death (866), his son Bruno maintained his position in Saxony till he was killed in battle against the Danes (880), whereupon his brother Otto took his place. By this time the decline of the Carolingian dynasty was giving rise to consolidated duchies throughout Germany—not only Saxony, but also Franconia, Swabia, and Bavaria. By defense of the frontier against the Hungarians, Duke Otto had extended his influence over Thuringia before the accession of the German king Conrad I (911), the first non-Carolingian sovereign. Thenceforward the hereditary ducal rank of the Liudolfings was incontestable. It should here be emphasized that, while in the past century feudalism (*q.v.*) had been developing steadily in the German kingdom, so that many lands were held as fiefs dependent on a higher suzerain (king, duke, or bishop), in Saxony allodial land, that is, land held in absolute ownership, remained comparatively widespread.

Otto died in 912. His son Henry I (*q.v.*), elected German king in 919, began that penetration of Slav lands to which the Saxons were to devote their maximum of effort for generations to come, thus earning most of the credit for the Germanization of Europe east of the Elbe. This work was continued by Henry's successors, the Holy Roman emperors Otto I, Otto II, and Otto

III (*qq.v.*), who with Henry constitute the direct line of German kings of the Saxon or Liudolfing dynasty. In Otto I's reign Gero (*q.v.*) conquered a vast area between the Elbe-Saale line and the Oder. On this area the Saxon Nordmark (Northern March) and the Saxon Ostmark (Eastern March to the south of the Northern), as well as the four smaller marches of Aschersleben (*see* ASCANIAN DYNASTIES), Merseburg, Zeitz, and Meissen (*q.v.*) were constituted after Gero's death in 965. The archbishopric of Magdeburg was founded in 968 for the evangelization of the Slavs.

The Billung Dukes and the Revolt against Henry IV.—The emperor Otto I in 961 transferred his Saxon ducal title to Hermann Billung, a member of the indigenous Saxon nobility (*see* BILLUNG), to whom he had already delegated much of his local authority. Whereas the Saxon dynasty of German kings came to an end in 1024 with Otto III's second cousin, Henry II (*q.v.*), the Saxon duchy remained in the hands of the Billungs for four generations after Hermann (d. 973). These dukes energetically continued the struggle against the Slavs. Hermann's son Bernard I (d. 1011) obtained guarantees of the special privileges and customs of the Saxons from Henry II on the latter's accession in 1002, and Bernard II (d. 1059) obtained similar guarantees from Conrad II, the first German king of the Salian dynasty, in 1024. Both Bernard II and his son Ordulf (d. 1072) resisted the aggrandizement of Archbishop Adalbert (*q.v.*) of Bremen under Conrad's successors Henry III and Henry IV.

King Henry III established his principal seat for the government of Germany in the ancient royal palace at Goslar, in Easphalia. Alarm grew when Henry IV tried on the one hand to bring the Saxon customs into line with the law for the rest of Germany and on the other to reassert control over those parts of the royal domain in Saxony which had come irregularly into other hands during his minority. He began to build a chain of castles, including the great Harzburg near Goslar, across eastern Saxony, with Swabian *ministeriales* (*q.v.;* that is, unfree officers entirely dependent on the king) in command of them.

Besides the Billungs, one of the greatest of the landowning nobles in Saxony was Otto (*q.v.*) of Nordheim. In 1070 this Otto was charged with treason, and his Saxon lands were declared forfeit; but the Saxon duke Ordulf's son, Magnus, and other nobles took his side and rebelled against Henry IV. Both Otto and Magnus, however, were captured in 1071. Though Otto was soon released, Magnus was still detained in the Harzburg when he succeeded to the Saxon dukedom on Ordulf's death (1072). Henry was clearly resolved to break the power of the Billungs.

Henry's arrival at Goslar in summer 1073, to muster forces for an expedition against the Poles, at a time when he was in dispute with the papacy, gave an opportunity for a coup by the malcontents of eastern Saxony. A widespread revolt was organized, in which the Billungs and the margraves of the frontier zones, with Otto of Nordheim again, were joined by the bishops of Magdeburg, Halberstadt, and Merseburg, and also by the Thuringians. Henry was driven from Saxony, the royal castles were attacked, and Magnus was set free. In February 1074, at Gerstungen on the Werra River, the king had to consent to the demolition of the castles and to reaffirm the autonomy of the Saxons.

The other German princes envied the Saxon success and began to rally to Henry after his first reconciliation with the papacy a few weeks later. When the Saxon peasants, demolishing the Harzburg, razed its church as well as its fortifications, their sacrilege became a pretext for concerted measures by king and *Reich* against Saxony. On June 9, 1075, at the head of a massive army of mounted knights, Henry won a great victory over the Saxon infantry under Otto of Nordheim at Homburg an der Unstrut (near Langensalza). In the following autumn he reduced all Saxony to submission. The Saxon leaders were taken into custody.

Subsequent events destroyed the effect of Henry's victory. After his excommunication by Pope Gregory VII (1076), the captive Saxons were released to make common cause with the Swabian rebels against the king. But whereas the affairs of 1070–75 had been essentially concerned with Saxony, the Saxon participation in the later troubles is best considered as an aspect of the general upheaval throughout Germany (*see* GERMANY: *History*).

Lothair and the Welfs.—Magnus Billung died in 1106, leaving no son. His elder daughter, Wulfhild (d. 1126) was married to the Welf duke of Bavaria, Henry IX the Black; and her sister Eilika (d. 1142) was married to Otto of Ballenstedt, ancestor of the Ascanians (*q.v.*). Welfs and Ascanians therefore shared the allodial inheritance of the Billungs, but neither succeeded to the dukedom of Saxony, which the German king Henry V bestowed instead on Lothair of Supplinburg (*see* LOTHAIR II or III, German king). This Lothair, whose patrimonial lands lay around Helmstedt, had married Richenza (d. 1141), who was to be the

SAXONY AT MID-17TH CENTURY

ultimate heiress not only of the Brunonian family's land (around Brunswick) but also of the possessions of her paternal grandfather, the great Otto of Nordheim. Lothair soon turned against Henry V, whose forces he defeated in battle at Welfesholz in 1115. In 1125, he was himself elected king in succession to Henry.

On King Lothair's death (1137) his son-in-law, Henry (*q.v.*) the Proud, who was moreover the son of the Billung Wulfhild, could claim the succession to the Supplinburg, Nordheim, and Brunonian lands. Henry, however, was also already duke of Bavaria; and the German king Conrad III, of the House of Hohenstaufen, refused to invest him with Saxony, on the ground that no one could hold two duchies at once. Conrad in 1138 therefore assigned the Saxon duchy to the Ascanian Albert the Bear, son of the other Billung heiress Eilika (*see* ALBERT I, margrave of Brandenburg). Contesting this decision, Henry the Proud lost Bavaria but prevailed over Albert in Saxony; and his son Henry (*q.v.*) the Lion succeeded to his claims there in 1139. Finally, in 1142, peace was made at Frankfurt, Henry being recognized as duke of Saxony.

Henry the Lion in 1154 induced Conrad III's nephew and successor the German king Frederick I Barbarossa, to invest him with Bavaria as well. There followed two decades of cooperation between Welf and Hohenstaufen, during which Henry advanced the Saxon frontiers northward and eastward. His excessive power exasperated the neighbouring German princes and eventually led to a breach between him and Frederick, who in 1180 outlawed him. Henry was ultimately allowed to keep much of his allodial land, which became the nucleus of the duchy of Brunswick, but his fiefs within the ancient duchy were redistributed: the southwest, as the duchy of Westphalia, was allotted to the archbishopric of Cologne; and other local magnates, bishops or counts, partitioned the remainder. The Ascanian Bernard of Anhalt, a younger son of Albert the Bear, received the title duke of Saxony.

For the later history of secular states in Saxon country outside the Ascanian sphere *see* BRUNSWICK; HANOVER; HOLSTEIN; LIPPE; OLDENBURG; WESTPHALIA. For the 20th century *see* LOWER SAXONY.

THE ASCANIAN DUCHIES AND THE ELECTORATE

The principal territory assigned with the ducal title to Bernard of Anhalt was on the lower Elbe northeast of Lüneburg. There he built a stronghold at Lauenburg (*q.v.*). At the same time he received the Hadeln land, between the Elbe and Weser estuaries. Bernard however had also considerable possessions in Anhalt (*q.v.*) on the lower Saale and on the right bank of the middle Elbe, namely Wittenberg and its hinterland, which tapered northward to the borders of the Brandenburg Mark beyond Belzig. When Lauenburg fell to the Danes (1203) Wittenberg was left as Bernard's major possession, and the name Saxony came to be applied to it.

After Bernard's death (1212), Anhalt passed to his elder son Henry, the duchy of Saxony to his younger son Albert I. Albert recovered Lauenburg; and before the end of his reign the duke of Saxony was in 1257 recognized as having an inalienable right to participate in the election of a German king (*see* ELECTORS). On Albert's death (1260), however, his sons partitioned the ducal lands: the elder, John I (d. 1285) took Lauenburg and Hadeln; the younger, Albert II (d. 1298) took Wittenberg. As both retained the ducal title, the Saxon electorate was disputed between Saxe-Lauenburg and Saxe-Wittenberg.

Saxe-Lauenburg and Saxe-Wittenberg.—Though Saxe-Lauenburg was the senior line, its possessions were scattered about the lower Elbe and hemmed in by more powerful principalities. Furthermore John I's descendants frequently subjected their inheritance to joint rule by brothers or cousins, or to division. Consequently Saxe-Lauenburg's claims to the electorate were overruled in favour of Saxe-Wittenberg, to which the countship of Brehna, extending some distance eastward and westward from Torgau, was attached from the 1290s. Albert II's son Rudolf I of Saxe-Wittenberg (d. 1356) consistently exercised the electoral right; and by the Golden Bull of the emperor Charles IV in 1356 the electorate was definitively attached to Saxe-Wittenberg. Rudolf I's son Rudolf II (d. 1370) was succeeded by his half brother Wenceslas (d. 1388), the latter by his elder son Rudolf III (d. 1419).

Rudolf III's brother Albert III died in 1422, the last of the Ascanians of Saxe-Wittenberg. The vacant duchy and the electorate were thereupon claimed by Eric V of Saxe-Lauenburg, whose father Eric IV (d. 1412) had reunited the possessions of his great-grandfather John I. At the same time the Hohenzollern margrave of Brandenburg put forward counterclaims. The German king Sigismund ignored both pretensions and, in 1423, gave the electoral duchy to Frederick the Warlike, margrave of Meissen.

Sigismund's act constitutes another epoch in Saxon history. Before describing its effects, Saxe-Lauenburg must be dismissed from the narrative. The Ascanians of Saxe-Lauenburg continued to claim the electorate till the time of Magnus I (d. 1543), whose pretension was overruled by the Holy Roman emperor Charles V in 1530. Magnus tried to exploit the Reformation in order to annex episcopal principalities; but both he and his successors were quite unable to prevail against stronger competitors. When the line died out with Julius Francis in 1689, a dispute over the succession ensued, till the land was finally secured by Brunswick-Lüneburg. *See* further LAUENBURG.

THE WETTIN ELECTORATE

The House of Wettin (*q.v.*), to which Frederick the Warlike belonged, had held the margraviate of Meissen (*q.v.*) from the 12th century and had extended its rule not only eastward into Lusatia (*q.v.*), which was mainly in the hands of the Bohemian crown, but also westward, over the Osterland (that is, the country round Leipzig), far into Thuringia (*q.v.*). The southeastern border of the Wettin territories ran along the minerally rich mountain range of the Erzgebirge, by which they were separated from Bohemia; and the Wettins were also disputing control of the Vogtland (between the Erzgebirge and Thuringia) with the Bohemians. When the margrave became elector of Saxony as Frederick I (*q.v.*) in 1423, his ancestral possessions were united with those of Saxe-Wittenberg. Just as the name Saxony had traveled with the duchy from the Elbe estuary upstream to Wittenberg after 1180, so after 1423 did it travel with the electorate still farther upstream, to cover the whole power block of the Wettin dynasty. Thus Meissen and Dresden on the Elbe, together with Leipzig nearer to the centre of the Wettin dominions, came to be regarded as constituting the axis of Saxony; and it is with Saxony in this sense, which obtained till the middle of the 20th century, that the rest of this article is concerned.

After Frederick I's death (1428) his successor, Frederick II, had to face invasions of Saxony by the Hussites (*q.v.*) of Bohemia. Of more ominous significance for Saxony, however, was the quarrel between Frederick II and his younger brother William over the partition of the Wettin inheritance, which resulted in William's detaching the landgraviate of Thuringia for himself (1445). If the Wettins had earlier established a firm rule of primogeniture, Saxony might have assumed the role which Brandenburg-Prussia was later to play in eastern Germany. Instead, they long continued to sap their strength by dividing their possessions. Constitutionally the most positive development of the reign was the meeting, at Leipzig in 1438, of the first collective Diet of the Estates (*see* ESTATES-GENERAL) of all Saxony, at which counts, knights, and towns were represented, but not the clergy.

On Frederick II's death (1464), his sons Ernest (1441–86) and Albert the Courageous (1443–1500) succeeded jointly to his lands. They acquired Plauen, the key point in the Vogtland, and also the distant Silesian principality of Sagan in Silesia. In 1482, however, when their uncle William died childless, so that Thuringia reverted to them, Albert demanded a partition of the collective inheritance. This was effected, in 1485, by the Treaty of Leipzig: Ernest retained Electoral Saxony (Saxe-Wittenberg) and numerous lands in Thuringia, the two units being linked by a corridor between Meissen and the Osterland; Albert, with the title of duke, took the margraviate of Meissen (with Dresden as his capital), the Osterland, and a northern slice of Thuringia. Cer-

tain rights, notably in Lusatia and in Silesia, as well as protectorates over various ecclesiastical lands, were still held in common between the brothers. The intricacy of the partition may have been designed to conserve a prospect of dynastic reunion, but the separation between Ernestine and Albertine lines persisted into the 20th century, with unfortunate consequences.

The Ernestines and the Reformation.—Frederick III (*q.v.*) the Wise, elector in succession to his father from 1486 to 1525, made Wittenberg a centre of humanism and, in 1502, founded the great university there. His later role as the foremost protector of Martin Luther (*q.v.;* and *see* GERMANY: *History*), made Saxony the cradle of the Reformation, and he himself accepted Lutheranism in 1524. By that time the revolt of the German peasants had spread across the Albertine lands into the Ernestine.

Frederick III's brother, John (*q.v.*) the Steadfast, adopted a more active policy for Lutheranism. He established the Saxon Church, under the control of the elector. His alliance of 1526 with Philip (*q.v.*) of Hesse and his signature of the Protest of 1529 were followed by the formation of the League of Schmalkalden (*q.v.*) for the defense of the Protestant princes in Germany against the threat of aggression by the emperor Charles V. As the emperor's dynasty, the House of Habsburg (*q.v.*), had acquired the crown of Bohemia and its dependencies (1526), relations with the Habsburgs were to be of crucial importance to Saxony.

John Frederick I (*q.v.*) succeeded John in 1532. His reign saw the downfall of the Ernestine electorate. In 1542 he took unilateral action in an ecclesiastical matter which should have been decided in consultation with the Albertine duke Maurice (*q.v.*), thus provoking the latter into threats of war. A reconciliation was patched up; but in 1546, when the emperor finally launched his campaign against the League of Schmalkalden, the ambitious and versatile Maurice seized the occasion of aggrandizing himself at the Ernestines' expense and took up arms against John Frederick. The latter, defeated and captured by the emperor, had to sign the Capitulation of Wittenberg (May 1547), renouncing the electorate, the electoral territory, the Ernestine tract between Meissen and the Osterland, and some of his Thuringian land. All this went to Maurice.

The Capitulation left some Ernestine lands in Thuringia to John Frederick's children, while he himself was kept a prisoner. Released in 1552, when Maurice was in rebellion against the emperor (*see* below), John Frederick I tried to recover the electorate. A few days before his death, however, in 1554, he concluded the Treaty of Naumburg with Maurice's successor Augustus I, whom he recognized as elector in return for the retrocession of Altenburg and some adjacent places. Though his son John Frederick II (*q.v.*) later made some disastrous attempts to win the electorate back, the complex history of the Ernestine territories is henceforward best considered apart from that of the electorate (*see* SAXON DUCHIES, ERNESTINE).

The Albertine Dukes.—Duke Albert the Courageous, instigator of the partition of 1485, left a will prescribing the rule of primogeniture for his descendants. He was therefore succeeded, in 1500, by his eldest son, George the Rich or the Bearded (1471–1539). Whereas Albert had been much occupied abroad (in the service of the Habsburg dynasty), George devoted himself to his own lands: he divided them administratively into "circles" (*Kreise*), reorganized the judicial system, laid the foundation of a central government and developed the economy—to the great advantage of the ducal treasury—by exploiting his mineral resources (tin, silver, and coal). Contrary to his Ernestine cousin, moreover, he adopted a strongly anti-Lutheran attitude from 1519 onward. To his chagrin, his sons predeceased him, so that he was succeeded by his Lutheran brother Henry (d. 1541), who had already made his court at Freiberg a centre for the new doctrine.

Henry's son Maurice began his reign as duke of Saxony with important reforms. The church was taken over by the state, and the ancient ecclesiastical lands were confiscated (1543). Much of the revenue from the confiscation was applied to educational purposes: the University of Leipzig was completely reorganized; and the three so-called *Fürstenschulen,* or Princes' Schools, were founded at Meissen, at Pforta, and at Merseburg (this one was later transplanted to Grimma) to give six-year courses, free of charge, to pupils nominated by the municipalities, by the nobles, or by the ruler.

The First Albertine Electors, to 1694.—On the acquisition of the electorate and of the greater part of the Ernestine lands in 1547 (*see* above), Maurice reorganized the system of "circles," which he made dependent on his own central council, so as to enhance his authority over the Estates. Though he had to cede the Vogtland to a local dynast under Habsburg protection (1547) and distant Sagan to Habsburg Bohemia (1549), and also to allow the restoration of Catholicism in the bishoprics of Meissen, Merseburg, and Naumburg, he had built up a great state stretching from the Werra Valley in the west over the Saale and Elbe basins to the Lusatian frontiers in the east. But he owed this to the emperor Charles V, and he could not be sure that the emperor's benevolence to a Protestant would continue. Consequently, though his conduct in 1547 had gravely compromised his relationship with the militant Protestants, he sought a *rapprochement* with them, joined their conspiracy with the French in 1551, and rebelled against Charles in 1552. (*See* again MAURICE; GERMANY: *History.*)

Under Maurice's brother Augustus I (*q.v.*), elector from 1553 to 1586, Saxony reached new levels of prosperity. The religious Peace of Augsburg (*q.v.*), in 1555, inaugurated an era in which Albertine Saxony, the leading Lutheran state, could cooperate with the Catholic Habsburgs for the maintenance of order in Germany, as Protestant militancy passed to the Calvinists. The concessions made to the Ernestines at Naumburg (*see* above) were soon offset by the absorption of ecclesiastical lands (Meissen, Merseburg, and Naumburg), by the acquisition of Weida and the Neustadt area of southeastern Thuringia in 1567, by the recovery of the Vogtland in 1569, and by a large share of the countship of Henneberg, enclaved within the Ernestine zone, in 1583. Internally the elector contrived to weaken the Estates, sponsored a major codification of the laws (1572), and made himself a pioneer of cameralism, which in practice meant the direction of the national economy by an absolute ruler for the benefit of all classes in the light of Christian thought. The development of Leipzig as a great centre of the arts was a feature of the reign, and lace making was promoted as an industry.

Augustus I's son Christian I, elector from 1586 to 1591, tried to unite Lutherans and Calvinists in a common front against the Habsburgs, but his League of Torgau fell to pieces on his death. His son Christian II reverted to cooperation with Austria.

The long reign of John George I (*q.v.*), from 1611 to 1656, saw the diminution of Saxony's prestige, notwithstanding territorial expansion, during the Thirty Years' War (*q.v.*). For the first decade of the war the elector supported the emperor Ferdinand II, on the understanding that he would receive Lusatia as his reward; but Ferdinand's Edict of Restitution (1629), which demanded the surrender of church property secularized since 1552, together with a particular quarrel over the administration of the bishopric of Magdeburg, which the Saxon electors had long coveted, drove John George, after long prevarication, into alliance with the Swedish king Gustavus II Adolphus (1631). Swedes and Saxons won a great victory at Breitenfeld; but in 1632 Gustavus was killed at Lützen, and in 1635 the elector deserted his Swedish alliance to conclude the Peace of Prague with Ferdinand. The treaty secured Lusatia for Saxony and confirmed one of the elector's younger sons, Augustus, as administrator of Magdeburg, but was followed by a Saxon declaration of war against the Swedes, against whose subsequent ravages the country could scarcely defend itself. At the general Peace of Westphalia, in 1648, John George was recognized as head of the Corpus Evangelicorum, that is, the body which was to represent Protestant interests in the *Reich;* but he had to agree that on the death of his son Augustus the administration of Magdeburg should pass to the Hohenzollerns of Brandenburg (*q.v.*). This precluded any further expansion of Albertine Saxony northward down the Elbe and marked the beginning of Brandenburg's extrusion of Saxony from leadership in eastern Germany. Finally, John George saw fit to create separate

duchies for three of his younger sons: Saxe-Weissenfels for Augustus (line extinct 1746), Saxe-Merseburg for Christian (line extinct 1738), Saxe-Zeitz for Maurice (line extinct 1718).

John George I's eldest son, John George II (d. 1680) concluded alliances with Louis XIV of France, the great opponent of the Habsburgs. His son John George III (d. 1691), on the other hand, raised a considerable army to support the Habsburgs against the Turks in 1683 and against the French in the War of the Grand Alliance. John George IV, elector from 1691, died in 1694, leaving Saxony to his brother Frederick Augustus I.

The 18th Century: Saxony and Poland.—Frederick Augustus I inaugurated the expensive and ultimately fruitless connection of Saxony with Poland, of which he was elected king, as Augustus II (*q.v.*) in 1697. To win election, he had to become a Catholic, renouncing the Lutheranism to which his Saxon subjects were firmly attached and, with it, the headship of the Corpus Evangelicorum, which was passed to the Saxon Privy Council (*geheime Rat*); and to raise money for his Polish ambitions he had to pawn Saxon rights over numerous outlying territories. In 1700, in coalition with Denmark and Russia, he began, for the sake of Poland's interests, the great Northern War (*q.v.*) against Sweden. The first phase of the war culminated in a Swedish invasion of Saxony, whereupon the elector signed the Peace of Altranstädt (1706), renouncing Poland and allowing the Swedes to winter in his country; but on the collapse of the Swedish invasion of Russia (1709) he reentered the war, and finally Poland was won back. Despite opposition from the Estates (for which rules of procedure were formulated in 1728), he ruled the electorate firmly; and his institution of a Privy Cabinet (*geheime Kabinett*) enabled him to conduct policy over the head of the Privy Council. He also founded the porcelain industry of Meissen (1710).

Frederick Augustus II succeeded to Saxony in 1733 and was elected king of Poland, as Augustus III (*q.v.*) later in the year. The ensuing War of the Polish Succession (*q.v.*) ended in his favour. Saxony and Poland, however, remained without any territorial link, since Silesia, then a Habsburg possession, lay between them. Desire to obtain such a link was a principal motive in the policy of Frederick Augustus II's minister Heinrich Brühl (*q.v.*), but he was not successful. When Frederick II the Great of Prussia invaded Silesia at the start of the War of the Austrian Succession (*q.v.*), Saxony took no immediate action, but in 1741 the elector entered the war against Austria. Frederick the Great's Treaty of Breslau with Austria (1742), which gave Silesia to Prussia, ignored Saxony's interests; and Saxony's conversion to alliance with Austria for the remainder of the war proved fruitless.

The Seven Years' War (*q.v.*) opened with a Prussian invasion of Saxony to forestall an Austrian attempt to recover Silesia. Dresden was occupied without resistance; the Saxon Army, capitulating at Pirna, was absorbed into the Prussian forces; and for the duration of the war Saxony was devastated by foreigners. The Peace of Hubertusburg restored the elector in 1763, but within a few months he, his son and momentary successor Frederick Christian, and the energetic Brühl were all dead.

Frederick Christian's son was only a boy when he became elector, as Frederick Augustus III, in 1763 (*see* FREDERICK AUGUSTUS I, king of Saxony). He came of age to rule in 1768. Free from involvement with Poland, he pursued the economic rehabilitation of Saxony, whose trade began to compete keenly and successfully with Prussia's. In foreign affairs, however, he took Prussia's side against Austria in the militarily cheap War of the Bavarian Succession (*q.v.*); and the monetary compensation awarded to Saxony under the Peace of Teschen was largely devoted to redeeming rights pawned since Frederick Augustus I's time. He also joined the Fürstenbund or League of Princes organized by Prussia in 1785 to deter Austria from renewed designs on Bavaria.

On the outbreak of the French Revolutionary Wars (*q.v.*) in 1792, the elector joined the Austro-Prussian coalition. Even after Prussia's defection (1795), he fought on against the French till 1796. Ten years later, he rejoined Prussia in war against Napoleonic France (*see* NAPOLEONIC WARS). Defeat led to a momentous change of policy: after the Franco-Saxon Peace of Posen (Dec. 11, 1806), Saxony was to be one of Napoleon's most loyal allies.

THE KINGDOM OF SAXONY

On the Peace of Posen the elector of Saxony took the title of king, as Frederick Augustus I; and in 1807 the kingdom was admitted to the Confederation of the Rhine (*see* GERMANY: *History*). While some western areas had to be ceded to the Kingdom of Westphalia, Saxony got Cottbus, hitherto a Prussian enclave in Lusatia. Moreover the Duchy of Warsaw, carved out of Prussian Poland, was assigned to Frederick Augustus, who in 1809 also received Austrian Poland, though Prussia retained Silesia.

Saxony's good fortune lasted only so long as Napoleon's. The retreat of the French from Russia in the winter of 1812–13 (*see* again NAPOLEONIC WARS) was followed by a Russo-Prussian invasion of Saxony. Having tried to conciliate Austria, Frederick Augustus brought Saxony back to the French side after Napoleon's victory at Lützen (May 1813); and the defeat of Napoleon at Leipzig in October, during which much of the Saxon Army went over to his enemies, was followed by a Russian occupation of Saxony.

The fate of Saxony was one of the major issues before the Congress of Vienna (*q.v.*). Prussia wanted to annex Saxony; and Russia, to get Prussian support on the question of Poland, in September 1814 transferred to Prussia the task of occupying Saxony. Austria, however, insisted that if Prussia was to have Saxony, then Poland must be independent; and when Russia and Prussia persisted in their Polish program, Austria, Great Britain, and France made a secret alliance to withstand their arbitrary domination of central Europe. The final result was that Frederick Augustus was restored to a grievously diminished Kingdom of Saxony (May 1815): he had to cede the old Electoral Circle (Wittenberg), Torgau, northern Thuringia (with all his former possessions farther north), and most of Lusatia to Prussia, which divided the Lusatian areas between the provinces of Brandenburg and Silesia and merged the rest with older Hohenzollern possessions on the Elbe to form a new Province of Saxony (Provinz Sachsen); and the Weida-Neustadt area was transferred to the Ernestine Grand Duchy of Saxe-Weimar. The Kingdom of Saxony was thus reduced to less than half the size of the Albertine state before the Revolutionary Wars. It became a member state of the new German Confederation.

For the rest of his reign King Frederick Augustus I adhered to the conservative policy of the Restoration as laid down for Germany by Austria. On his death in 1827, he was succeeded by his aged brother Antony (Anton; 1755–1836), who had to face the wave of revolution that swept over Germany in 1830. When riots started in Dresden and in Leipzig (September 1830), the king was forced to accept Frederick Augustus, son of his brother Maximilian, as co-ruler; and on Sept. 4, 1831, a constitution was promulgated. This established a bicameral diet: the First, or Upper, Chamber, consisted of the ancient aristocracy of the Estates, with the difference that counts, knights, and municipal delegates sat no longer separately, but together; the Second, or Lower Chamber, comprised 20 representatives of the knights (over and above their majority in the First Chamber), 25 of the urban bourgeoisie, 25 members elected by the peasantry, and 5 members elected by workers in commerce or industry. While this attempt to compromise between conservatism and the liberal aspirations of the middle classes satisfied neither element, a responsible ministry took the place of the Privy Cabinet, and the peasant serfs were emancipated. In 1834 Saxony joined the Prussian-dominated *Zollverein* or German Customs Union.

On Antony's death his co-ruler became king as Frederick Augustus II (1836). Industrial and commercial prosperity, founded on mining and on the various manufactures of Leipzig, Dresden, Meissen, Chemnitz, Zwickau, and Bautzen, was exemplified by the opening of the Dresden-Leipzig railway (1839), but political discontent was exacerbated by Liberal demands for the publicity of judicial proceedings and for a free press. The government's intolerant attitude toward the rationalistic movement of the "Ger-

man Catholics" (*Deutschkatholiker*), who held their ecclesiastical council in Leipzig in 1845, provoked further criticism.

The revolutionary events of 1848 (*see* GERMANY: *History*) precipitated a crisis. A Liberal ministry took office in March, the First Chamber was opened to representatives elected by the higher taxpayers, and suffrage for the Second Chamber was made universal, while freedom of the press, publicity of judicial proceedings, and, for some cases, trial by jury were introduced. Elections returned a majority of leftwing progressives to the Saxon Diet, which promptly demanded the king's acceptance of the German constitution proposed by the National Assembly at Frankfurt. The king, having formed a ministry in February 1849, withheld acceptance and dissolved the Diet; and insurrection broke out in Dresden (May). The king fled to Königstein, and the insurgents set up a provisional government, under the inspiration of the Russian extremist M. A. Bakunin (*q.v.*). A week later, Prussian troops, despite fierce resistance, restored Frederick Augustus.

With Prussia and Hanover, Saxony concluded the *Dreikönigsbündnis*, or Three Kings' League (May 1849), for the elaboration of a German federation under Prussian leadership. Saxony and Hanover, however, withdrew from Prussia's "Erfurt Union" when the other two German kingdoms, Bavaria and Württemberg, declined to join it. After forming the *Vierkönigsbündnis* with Hanover, Bavaria and Württemberg, Frederick Augustus finally supported Austria's policy for reviving the old German Confederation, which meant the collapse of Prussia's schemes (1850). When the First Chamber opposed him and refused to consider an urgent loan, he dissolved the Diet and restored the constitution of 1831.

F. F. von Beust (*q.v.*) had been the chief sponsor of Saxony's reorientation toward Austria. He remained in office when Frederick Augustus II's brother John (1801–73) succeeded to the throne in 1854. He allowed some liberalization, including an extension of the franchise (1861). As the Austro-Prussian conflict grew more acute the "Trias" policy of consolidating the lesser German states into a third block came to nothing; and in the Seven Weeks' War (*q.v.*) of 1866 Saxony took Austria's side. After Prussia's victory Beust resigned.

Saxony had to pay a war indemnity to Prussia and to enter the North German Confederation (*see* GERMANY: *History*). The Army became part of the Confederation's forces, under Prussian control. A law of 1868 removed the constitutional distinction of the Estates and extended the franchise still farther.

After the Franco-German War of 1870, in which the crown prince Albert (*q.v.;* 1828–1902) played a distinguished role, the Kingdom of Saxony in 1871 became a member state of Prussia's new German Empire. Albert succeeded his father as king in 1873. Economically the country prospered, but the most sensational feature of the new reign was the progress of the Social Democrats. Having won 5 seats in the Second Chamber in 1885, they won 14 in 1895, whereupon the older parties, in consternation, in 1896, revised the law, to introduce indirect suffrage, the voters being divided among three classes according to the amounts paid in direct taxation (*Dreiklassenwahlrecht*). This system grossly favoured the rural as against the urban or industrial population and eliminated the Social Democrats from the Saxon diet of 1901; but in 1903, during the short reign of Albert's brother George (1832–1904; king from 1902) the Social Democrats won 22 of Saxony's 23 seats in the *Reichstag* or Diet of the German Empire, for which universal suffrage obtained. Within "the Red Kingdom," as Saxony was now called, some reform of the franchise was evidently required; and under George's son Frederick Augustus III (1865–1932; king from 1904 to 1918) a complex system with plural voting was introduced. At the polls of 1909, the Social Democrats won 25 seats.

THE FREE STATE AND THE LAND

Saxon industries and manpower made a heavy contribution to Germany's effort in World War I. Defeat precipitated revolution, which broke out on Nov. 2, 1918. The king abdicated, and a government of Social Democrats took office. Communist guerrilla activity, led by Max Hölz, largely in reaction to right-wing coups elsewhere in Germany, had to be suppressed by the armed forces of the *Reich*. On Nov. 1, 1920, Saxony adopted a republican constitution as a Free State of the *Reich* under the Weimar regime.

Erich Zeigner, Social Democratic prime minister of Saxony, in 1923, formed a coalition government with the Communists, whose intention of promoting a proletarian revolution throughout Germany was made clear by the inflammatory speeches of his finance minister, Paul Böttcher, and by the organization of paramilitary "hundreds." Conflict ensued between the Saxon government and the *Reich* government's forces in Saxony; and finally, on Oct. 29, the German chancellor Gustav Stresemann sent more forces into Saxony to depose Zeigner. Moderate Social Democrats then governed the country, usually in coalition with other democratic parties, till 1929. In 1933 the Nazis came to power.

After World War II Saxony fell to the Soviet-occupied zone of Germany (1945) and so was organized as a *Land* of the German Democratic Republic. In 1952, when the *Länder* were dissolved, Saxony was divided between the *Bezirke* or districts of Leipzig, Karl-Marx-Stadt (the former Chemnitz), Dresden, and Cottbus.

The formerly Prussian Province of Saxony was merged with Anhalt in 1945 to form a *Land* Saxony-Anhalt (Sachsen-Anhalt), which in turn was dissolved in 1952 between the *Bezirke* of Magdeburg, Halle, Leipzig, and Cottbus.

See R. Kötzschke and H. Kretzschmar, *Sächsische Geschichte,* 2 vol. (1935).

SAXOPHONE, a family of reed wind instruments patented by Adolphe Sax in Paris in 1846. A saxophone has a conical brass tube with about 24 openings controlled by padded key-mechanisms. A single-reed mouthpiece akin to that of the clarinet is placed over the narrow end. The instrument overblows at the octave, by means of two octave-key vents operated by a thumb key. The normal compass is written from B♭ below the treble stave to F three lines above the stave—sounding, however, differently with each member of the family. The B♭ soprano saxophone, sounding a tone lower than written pitch, is built straight like a clarinet. The other members of the family have the lower end upturned and the upper end made as a detachable "crook." They are the E♭ alto, sounding a sixth lower than written; the B♭ tenor, with undulating crook, sounding a ninth lower; the E♭ baritone, with looped crook, an octave below the alto; and the rarer B♭ bass, similar in shape to the baritone but larger, an octave below the tenor. Little-used sizes include the "C melody" saxophone, a tenor in C for playing from vocal music without transposition. Originally the whole family of saxophones was pitched in C and F alternately.

BY COURTESY OF H. & A. SELMER, INC.
CONTEMPORARY ALTO SAXOPHONE

Sax left no historical account of his invention, which was intended for military bands and which he may have discovered through experiments with reed mouthpieces on brass instruments such as ophicleides. He quickly procured its official adoption by the French Army, and saxophones from alto to baritone are regularly included in bands constituted on French models. In the U.S. they have been used in bands from P. S. Gilmore's time. In British military bands, only an alto and a tenor are obligatory. The saxophone was a popular solo instrument in the U.S. about the time of World War I and was then adopted by dance bands, in which the standard team remains two altos and a tenor. Larger bands use more than four saxophones and include the baritone.

The use of saxophones in dance bands brought mechanical improvements, as well as changes in mouthpiece design to produce brighter, more penetrating sounds.

As a serious concert instrument the saxophone was cultivated by virtuosi, notably Sigurd Rascher in the U.S., and Marcel Mule, founder both of the Paris Saxophone Quartet (soprano, alto, tenor, baritone) and of the class at the Paris Conservatoire. Debussy, Glazunov, and Ibert are among earlier composers who wrote solo works for saxophone, all for the alto instrument. From Bizet's *L'Arlésienne* (1872) until the 1920s orchestral works using the saxophone were few. Later it was occasionally used by numerous composers. Webern and others sparingly used it in small combinations. The saxophone is infrequently used not because of prejudice against a popular, nonclassical instrument but because of the scarcity of players acquainted with the concert style.

(A. C. Ba.)

SAY, JEAN BAPTISTE (1767–1832), French economist best known for his law of markets, which remained a central tenet of orthodox economics until the great depression of the 1930s, was born at Lyons on Jan. 5, 1767.

Say's law postulates that supply creates its own demand; hence there can be no general deficiency of effective demand to cause economic depression and unemployment. Actual depression Say attributed to temporarily misdirected production, which must automatically right itself because the overproducers of particular products will suffer losses; they must either redirect their production to conform with consumers' preferences or be forced out of business by continuing losses. An obvious implication of Say's law is that the capitalist system is self-adjusting and there is therefore no need for government intervention in economic affairs.

Say was perhaps the first important economist to distinguish clearly between entrepreneur and capitalist and to assign to the former the creative role of combining the other factors of production—labour, land, and capital. His career as a businessman as well as a professor of economics contributed to his insight into entrepreneurial activity. He died in Paris on Nov. 15, 1832.

Say's principal work is *Traité d'économie politique* (1st ed., 1803; 6th ed., 1846).

See E. Teilhac, *L'Oeuvre économique de Jean Baptiste Say* (1927); Leo Rogin, *The Meaning and Validity of Economic Theory*, ch. 6 (1956). (D. Dd.)

SAY, THOMAS (1787–1834), U.S. Quaker naturalist, often termed "the father of descriptive entomology in America," was born at Philadelphia, Pa., on June 27, 1787. He was an original member of the Philadelphia Academy of Natural Sciences, founded in 1812; and after various activities, including two expeditions to the Rocky Mountains, he became curator of the American Philosophical Society in 1821 and was professor of natural history at the University of Pennsylvania from 1822 to 1828. During this period he took part in other expeditions, and joined the experimental ideal community at the village of New Harmony, Ind., where he spent the remainder of his life, dying there on Oct. 10, 1834.

His work was almost entirely taxonomic and his writings for the most part purely descriptive. His entomological papers in various journals were collected by J. L. Le Conte and published in two volumes: *The Complete Writings of Thomas Say on the Entomology of North America* (1859). His works on conchology were collected by W. G. Binney and published in 1858 as *The Complete Writings of Thomas Say on the Conchology of the United States*, with 75 plates, many of them drawn by his wife. His paleontological writings were reprinted in 1896 by G. D. Harris in *Bulletin of American Paleontology*, vol. 1, no. v.

(Ed. He.)

SAYAN MOUNTAINS (Sayany) in southern Siberia, U.S.S.R., consist of a number of ranges from 90 to 120 mi. (145 to 193 km.) wide. Peaks vary from 1,700 ft. (518 m.) in the north and 3,000 ft. (914 m.) in the south to 8,000–10,000 ft. (2,400–3,000 m.) in the centre; the elevation does not fall below 1,700 ft. (518 m.) except in the Minusinsk and other river basins. Two systems are distinguished: the Western Sayan (Sayanski Khrebet) and the Eastern Sayan. The Western Sayan in Krasnoyarsk *kray* and Tuva Autonomous Soviet Socialist Republic stretch from the Maly (Little) Abakan River for more than 400 mi. (644 km.) to the northeast to the headwaters of the Kazyr and Uda. The highest peak is Karagosh (9,613 ft. [2,930 m.]). The Eastern Sayan in the Irkutsk *oblast* stretch from the western bank of the Yenisei River, southwest of Krasnoyarsk, for more than 620 mi. (998 km.) in a southeasterly direction to the Tunkin depression, which separates them from the Transbaikal (Zabaikalye) ranges. The mountains as far east as the Zun-Murin Valley are sometimes included in this system. Small glaciers are found in the highest parts; Munku-Sardyk (11,457 ft.) is the highest peak.

The north-flowing Yenisei and its numerous tributaries intersect both systems. The rocks are a complex of Precambrian and Caledonian Age. In the Western Sayan gold, iron quartzites, asbestos, magnetites, and copper are found and coal is mined in the Minusinsk and Tuva basins; in the Eastern Sayan are iron quartzites, asbestos, graphite, nephrite, and mica. Vegetation consists of forests of pine and larch, with some birch, aspen, and alder, giving way to cedar and fir on the higher slopes, where lichens and mosses clothe many of the scattered boulders.

(R. E. F. S.)

SAYAT-NOVA (pseudonym of Aruthin Sayadian) (1712–1795), Armenian troubadour, famous for his love songs, was born at Tiflis. He worked first as a weaver and later (1750–65) became the court minstrel of Irakli II of Georgia. In 1770 he entered a monastery in Haghbat, and he was martyred in 1795 by the Persian invaders of Georgia.

Most of his extant songs are in Azeri Turkish, the rest in Armenian and Georgian. (C. J. F. D.)

SAYCE, ARCHIBALD HENRY (1845–1933), British philologist, whose services to Babylonian and Assyrian scholarship cannot be overestimated, was born at Shirehampton on Sept. 25, 1845. He was educated at Bath, and at Queen's College, Oxford, becoming a fellow in 1869. In 1870 he was ordained. From 1891 to 1919 he was professor of Assyriology at Oxford. He was a member of the Old Testament Revision Company (1874–84); deputy professor of comparative philology in Oxford (1876–90); Hibbert lecturer (1887); Gifford lecturer (1900–02). Sayce died on Feb. 4, 1933, at Bath.

Among his more important works are: *Assyrian Grammar* (1872); *Principles of Comparative Philology* (1874); *Introduction to the Science of Language* (1879); *Early History of the Hebrews* (1897); *Israel and the Surrounding Nations* (1898); *Babylonians and Assyrians* (1900); and *Archaeology of the Cuneiform Inscriptions* (1907). He also contributed important articles to *Encyclopædia Britannica* and published his *Reminiscences* in 1923.

SAYE AND SELE, WILLIAM FIENNES, 1st Viscount (1582–1662), a leading opponent of James I and Charles I in the House of Lords and a supporter of Parliament in the English Civil War, was born at Broughton Castle, near Banbury, Oxfordshire, on May 28, 1582, the only son of Richard Fiennes, 7th baron Saye and Sele. Educated at New College, Oxford, he succeeded as 8th baron in 1613. He opposed the policy of James I in Parliament and in 1622 was imprisoned for six months for objecting to the imposition of a benevolence by the king. Created a viscount in 1624 through the friendship of George Villiers, 1st duke of Buckingham, he nevertheless continued his opposition to the crown in the early parliaments of Charles I. From 1630 Saye became actively engaged in colonization schemes. He was a member of the company formed to colonize Providence Island (now Providencia) in the Caribbean Sea, and in 1635 was responsible with Robert Greville, Baron Brooke, for the establishment of a settlement on the Connecticut River which was named Saybrook after them. A thorough aristocrat, his ideas for the government of colonies in New England included the establishment of a hereditary aristocracy.

Saye reluctantly accompanied Charles I against the Scots in the first Bishops' War in 1639 but together with Brooke he refused to take the oath binding peers to fight for the king. In 1642 Parliament appointed him a member of the committee of safety and lord lieutenant of Oxfordshire, Cheshire, and Gloucestershire, and

after the outbreak of the Civil War in August, Saye raised a regiment for the parliamentary forces. He was mainly responsible for the passage through the House of Lords of the Self-Denying Ordinance (April 1645) which discharged members of Parliament from holding civil or military commands. A supporter of the army in its struggle with Parliament in 1647, he soon became anxious for Parliament to reach an agreement with the king and was one of the parliamentary commissioners who negotiated with Charles at Newport, Isle of Wight (April–November 1648). After the king's execution (Jan. 30, 1649) Saye retired from public life. He took his seat in the Convention Parliament in April 1660, and in June, after the restoration of Charles II, was appointed a privy councilor. He died at Broughton Castle on April 14, 1662.

SAYERS, TOM (1826–1865), English middleweight boxing champion, was born on May 25, 1826, at Brighton. In 1849 he left bricklaying to become a fighter. Despite his size (height 5 ft. 8½ in.; weight 155 lb.), the "Little Wonder" often fought much bigger opponents, yet he lost only one bout during the ten years he fought —that to Nat Langham on Oct. 18, 1853, in 61 rounds.

In 1860, in the first international heavyweight title match in boxing history, he fought America's great champion John C. Heenan. Although he was outweighed by 40 lb. and was nine years older, Sayers was made the 2 to 1 betting favourite over Heenan. The fight lasted 2 hr. 20 min. (42 rounds) and was declared a draw after Sayers injured his right arm (*see* BOXING). Sayers then retired from the ring, and the British raised £3,000 (about $15,000) by public subscription for him. He died on Nov. 8, 1865. (J. D. McC.)

SAYYID AHMAD KHAN, SIR (1817–1898), distinguished Indian Muslim scholar and educator, founder of Aligarh Muslim University, was born in Delhi on Oct. 17, 1817. After his father's death in 1836, against the wishes of his family, he entered the civil service. During the Indian Mutiny (1857–58) he was instrumental in saving the lives of many Europeans by sending them, at great risk to himself, into safety at Meerut. The government awarded him a pension and he was appointed a companion of the Star of India (being made knight commander in 1888). In 1869 he founded a college at Ghazipur in which western methods of instruction were adopted and the teaching was carried on in English. In spite of the opposition of the more conservative Muslims, he was so successful that in 1875 he opened the Muslim Anglo-Oriental College at Aligarh, which developed into Aligarh Muslim University, chartered 1920 (*see* ALIGARH). Although he retired from public life in the following year, he accepted membership of the legislative council of India (1878–82). Until his death at Aligarh on March 2, 1898, the rest of Sir Sayyid's life was occupied by literary research and the advancement of his college.

See G. F. I. Graham, *The Life and Work of Sir Syed Ahmed Khan* (1909); J. M. S. Baljon, Jr., *The Reforms and Religious Ideas of Sir Sayyid Ahmad Khan* (1949). (S. J. C.)

SAZONOV, SERGEI DMITRIEVICH (1861–1927), Russian diplomat and statesman, foreign minister during the four years that preceded World War I as well as during the first two years of that war, was born in the province of Ryazan on Aug. 10 (new style; July 29, old style), 1861, the son of a large landowner. He began his career in the foreign ministry in 1883 and served subsequently in London, Washington, and the Vatican. In May 1909 he became deputy foreign minister under A. P. Izvolski (*q.v.*), whom he replaced on Oct. 11 (N.S.; Sept. 28, O.S.), 1910.

Sazonov's career was marked by few major diplomatic successes. Handicapped by the internal condition of Russia, which demanded a period of peace and tranquillity for political reform, Sazonov concentrated principally on the protection of Russian interests in the Balkans, the Turkish Straits, and northern Persia. The policy of cooperation with France and Great Britain, based on the Franco-Russian alliance of 1893 and the Russo-British treaty of 1907, was continued. Sazonov worked in complete subordination to the emperor, Nicholas II.

Sazonov's first steps as foreign minister were directed toward easing relations with Germany. In a meeting at Potsdam on Nov. 4–5, 1910, Nicholas and the German emperor William II reached a tentative agreement on Russia's aims in Persia and on Germany's ambitions in connection with the Baghdad Railway (*q.v.*). Russia's relations with Great Britain deteriorated sharply when Russian troops entered northern Persia in November 1911 to suppress a liberal movement.

In the Near East, Sazonov continued to seek a revision of the Straits agreements (*see* STRAITS QUESTION), but the major Russian effort in this area was the sponsorship of the Balkan League, composed of Serbia, Bulgaria, Greece, and Montenegro. Although Russia wished the alliance to function chiefly as a bulwark against Austro-Hungarian penetration of the peninsula, the Balkan states soon freed themselves of Russian control and, in October 1912, went to war against Turkey (*see* BALKAN WARS). A second Balkan war began on June 29, 1913. This war, in which Serbia, Greece, Rumania, and Turkey fought Bulgaria, resulted in the shattering of the Balkan League, and the alliance of Bulgaria with the Central Powers in World War I. Continued Russian concern with the Straits question was shown in 1913 in the strong opposition offered to the Turkish appointment of the German general Otto Liman von Sanders. As a result of Russian protests, which were supported by Great Britain and France, the general was forced to give up the command of the Turkish troops in Constantinople.

After the assassination of the Austrian archduke Francis Ferdinand at Sarajevo on June 28, 1914, the Russian government made it clear that it would not allow Serbia to be annihilated. When the Austrian ultimatum to Serbia was delivered on July 23, almost a month later, Sazonov played a direct and major role in the events which led to the entry of Russia into the war. Urged on by Russian military leaders, who believed that a partial mobilization against Austria-Hungary alone would be a military disaster, and with the promise of French aid, Sazonov pressed the emperor to agree to complete mobilization. This was ordered on July 30. On Aug. 1 Germany declared war on Russia.

After the outbreak of war Sazonov's main preoccupation as foreign minister was with the definition and defense of Russian war aims. With the entry of Turkey into the war in November 1914, the problem of the Straits assumed immediate urgency. In March 1915 Sazonov demanded Russian annexation of Constantinople and the Straits area, and was able to secure recognition of these claims by Great Britain and France. When the Polish question arose during the war (*see* POLAND: *History*), he took the position that an autonomous Poland in free union with Russia should be created on the restoration of peace. This proposal was so unpopular in Russian official circles that it brought about his dismissal (Aug. 5 [N.S.; July 23, O.S.], 1916). He was succeeded by Boris Stürmer, a friend of Rasputin (*q.v.*).

Shortly before the March 1917 revolution Sazonov was appointed ambassador to London. Dismissed from this post in May, he moved to Paris where he acted as foreign minister for the counterrevolutionary government of Adm. A. V. Kolchak. His *Vospominaniya* was published in 1927 (Eng. trans. *Fateful Years*, 1928). He died in Nice on Dec. 23, 1927. (B. J.)

SBEITLA, a village 19 mi. ENE of Kasserine, Tunisia, the site of the ancient Roman city of Sufetula. Sufetula probably originated as a fort during the campaigns against the rebel Tacfarinas (A.D. 17–24) and was a centre of Roman influence as the nomads became sedentary. It perhaps became a *municipium* under Vespasian (69–79) and was made a *colonia* by Marcus Aurelius (161–180) or Commodus (180–192). There, as elsewhere in the interior of Tunisia, Roman engineering skill applied to the conservation and use of the limited water supplies produced an agricultural prosperity, based primarily on olivegrowing, not reached again until modern times. There are impressive Roman remains, especially those surrounding the forum. There is a triumphal arch of Antoninus Pius opposite to which, and forming one side of the forum, are three temples. Slighter remains survive of a theatre, amphitheatre, and Christian churches. Sufetula was destroyed by the Arabs *c.* A.D. 646 after their victory over the Byzantines. (B. H. WA.)

SCABIES: *see* SKIN, DISEASES OF.

SCABIOSA, a genus of about 80 species of Eurasian annual or perennial herbs belonging to the teasel family (Dipsacaceae),

and commonly grown in gardens for ornament under the names of scabious, mourning bride, or pincushion flower. In medieval times preparations of the plant were used medicinally, primarily to allay itching, hence the derivation of the generic name from the Latin *scabiosus,* meaning itchy, mangy, or scabby.

The annual sweet scabious (*S. atropurpurea*) and its variants and the perennial pincushion flower (*S. caucasica*) are the commonest sorts, available in blue, purple, brown, pink, cream, etc. Other perennial species frequently grown are *S. graminifolia* with grasslike silvery leaves and lavender-blue flowers; *S. ochroleuca* with yellowish-white flowers; *S. columbaria* with lilac flowers; and *S. fischeri* with bluish-purple flowers. Most scabiosas grow to heights of 1½ to 3 ft., have toothed or lobed leaves, and produce almost globular to conical showy flower heads, usually 1 to 3 in. across. They are excellent as cut flowers.

Scabiosas are easily grown in ordinary garden soil in a sunny location. Seed may be planted in midspring; if pinched back when small the resulting bushy plants will produce blooms all summer if old flower heads are removed. The perennials, after two or three years' growth, may be increased by root division in early spring.

The garden plant known as shepherd's- or sheep's-bit scabious is *Jasione perennis,* a member of the bellflower family.

(G. H. M. L.)

SCAEVOLA, the name of a famous family of ancient Rome, the most important members of which are described below.

GAIUS MUCIUS SCAEVOLA, a legendary hero, who volunteered to assassinate the Etruscan king Lars Porsena when he was besieging Rome. He reached Porsena's tent but killed his attendant by mistake. Before the royal tribunal Mucius declared that he was one of 300 noble youths who had sworn to take the king's life. Threatened with death or torture, Mucius thrust his right hand into the fire blazing on an altar and held it there until it was consumed. Porsena, deeply impressed and dreading a further attempt upon his life, ordered Mucius to be freed, made peace with the Romans, and withdrew his forces. Mucius was rewarded with a grant of land beyond the Tiber, known thereafter as the *Mucia Prata,* and received the name of Scaevola ("lefthanded"). The story is presumably an attempt to explain the name Scaevola. Alternatively the word may mean an amulet worn by children. The Mucius of the legend is described as a patrician; the following were undoubtedly plebeians.

PUBLIUS MUCIUS SCAEVOLA (d. before 115 B.C.), Roman orator and jurist, was consul in 133 during the time of the Gracchan disturbances. He was not opposed to moderate reforms, advised Tiberius Gracchus on his land law, and refused to use violence against him. After the murder of Gracchus, however, he expressed his approval of the act. He was an opponent of Scipio Aemilianus, for which he was attacked by the satirist Lucilius. In 130 he succeeded his brother Crassus Mucianus as *pontifex maximus.* During his tenure of office he published a digest in 80 books of the official annals kept by the *pontifex maximus* since early times; the publication of these *annales maximi* was a landmark in Roman historiography (*see* ANNALISTS). Cicero frequently mentions him as a lawyer of repute, and he is cited several times in the collection of Roman legal extracts called the *Digest* (A.D. 533). He was also a famous player at ball and the game called *duodecim scripta.*

QUINTUS MUCIUS SCAEVOLA (d. 82 B.C.), son of the above, usually called PONTIFEX to distinguish him from his cousin (below), was consul in 95 with L. Licinius Crassus the orator. He and his colleague brought forward the *Lex Licinia Mucia* which removed from the citizen-roll Latin and Italian allies who had been illegally acting as citizens, and thus hastened the Social War ("war of the allies"). After his consulship Scaevola was governor of the province of Asia, and dealt severely with the tax farmers. His provincial edict became a model for later governors, and the Greeks of Asia established an annual festival in his honour, called the Mucia. He was subsequently (*c.* 89) appointed *pontifex maximus,* and in accordance with custom dispensed free legal advice, which was extensively sought. He regulated the priestly colleges and insisted on observance of the traditional ritual, though he himself believed that religion was only for the uneducated. He escaped attempted murder in 86 and stayed in Rome under Cinna's government, but was killed in 82.

Scaevola was the founder of the scientific study of Roman law and the author of a systematic treatise on *ius civile,* in 18 books, frequently quoted and followed by subsequent writers. It was a compilation of legislative enactments, judicial precedents, and authorities, from older collections, partly also from oral tradition. A small handbook called *Horoi* (*Definitions*) is the oldest work from which any excerpts are made in the *Digest,* and the first example of a special kind of judicial literature (*libri definitionum* or *regularum*). It consisted of short rules of law and explanations of legal terms and phrases. A number of speeches by Scaevola, praised by Cicero for their elegance of diction, were in existence in ancient times.

QUINTUS MUCIUS SCAEVOLA (d. 88 B.C.), cousin of the above, from whom he is distinguished by the appellation of AUGUR. He was instructed in law by his father and in philosophy by the Stoic Panaetius of Rhodes. He married the daughter of Gaius Laelius and became the father-in-law of L. Crassus (consul 95 B.C.). In 120 he was governor of Asia. Accused of extortion on his return, he defended himself successfully. In 117 he was consul. He was a great authority on law, and at an advanced age he gave instruction to Cicero and Atticus. He had a high appreciation of Marius (*see* MARIUS, GAIUS) and refused to vote for Sulla's motion declaring him a public enemy. Scaevola is one of the interlocutors in Cicero's *De oratore, De amicitia,* and *De republica.*

See articles by F. Münzer and B. Kübler in Pauly-Wissowa, *Real-Encyclopädie der classischen Altertumswissenschaft,* xvi, 416–424 (no. 10), 425–428 (no. 17), 437–446 (no. 22) and 430–436 (no. 21) (1933). For the legendary Scaevola, *see* R. M. Ogilvie, *A Commentary on Livy,* Books 1–5, pp. 262 ff. (1965). For Scaevola Pontifex, *see* also E. Badian, *Studies in Greek and Roman History* (1964); F. Schulz, *History of Roman Legal Science,* pp. 94 ff. (1946). (H. H. Sd.)

SCAFELL (pronounced and sometimes written SCAWFELL), a mountain of Cumberland, Eng., in the Lake district (*q.v.*). The name is specially applied to the southern point (3,162 ft. in height) of a certain range or mass, but Scafell pike, separated from Scafell by the steep narrow ridge of Mickledore, is the highest point in England (3,210 ft.). The ridge continues northeast to Great End (2,984 ft.), which falls abruptly to a flat terrace on which lies Sprinkling tarn. The range thus defined may be termed the Scafell mass. Northwest from the pike the lesser height of Lingmell (2,649 ft.) is thrown out, and the steep flank of the range sweeps down to the head of Wastdale. On the east an even steeper wall, with splendid crags, falls to Eskdale. Above Mickledore ridge Scafell rises nearly sheer, with bold clefts.

SCAFFOLD, an elevated platform of temporary nature used to support materials and workmen in the construction or repair of a structure or machine. The term also denotes a platform used for the execution of criminals. The surface of the scaffold consists of one or more planks of convenient size and length. The method of support is varied to suit the immediate need and its form determines the type of scaffolding. Temporary built-up

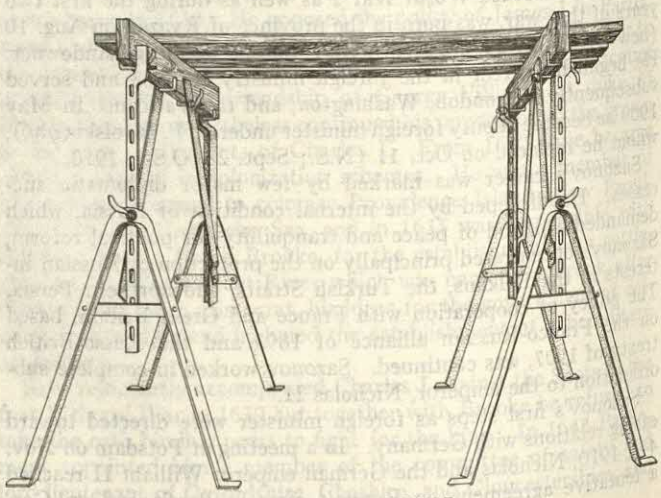

FIG. 1.—STEEL TRESTLE

seats for an athletic contest are sometimes referred to as scaffolds but should be called temporary bleachers.

Timber Scaffolding.—In this type of scaffold the support for

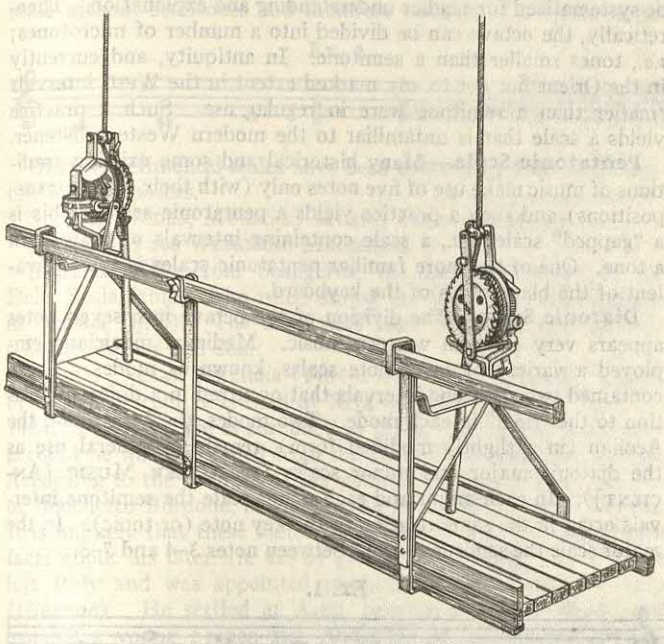

FIG. 2.—SWINGING SCAFFOLDING

the planks is provided by a timber frame fabricated and erected at the site. The frame may consist of vertical posts, horizontal longitudinal members called ledgers, transverse members supported by the ledgers, and longitudinal and transverse cross bracing. The planks rest on the transverse members.

The posts are generally arranged in pairs with one post close to the wall and the other about 4 or 5 ft. out from the wall. Pairs of posts are placed along the wall at intervals of from 8 to 12 ft. The pairs are fastened together by ledgers running parallel to the wall and by braces. Transverse members may be cantilevered across the ledgers or may be supported by a ledger and the wall. The posts are 2 × 4s for light loads and short spans or 4 × 4s where heavier frames are needed. The posts are usually supported on a sill resting on the ground.

As with all scaffolding, the timber must be thoroughly braced and should also be tied to the wall by suitable lashings. If a scaffold is carried up on the inside of the wall as well as on the outside, the two should be tied together through window openings to provide greater stability. The vertical spacing of the ledgers is determined by the size of lift or working space desired. The members are fastened together by nails or lashings as custom dictates.

Trestle Supports.—This type is used to carry the staging where little or no adjustment of height needs to be made for each use and where the scaffolding needs to be spread over a large area, as when plastering the ceiling of a house. The trestles may be of special design or may simply be wooden sawhorses of the type used by carpenters. Some specially designed trestles may be adjusted to provide for working heights of from 7 to 18 ft. One type of adjustable trestle is shown in fig. 1.

Putlog Trestles.—This type consists of one A-frame and adjustable vertical support similar to a single-end support of the trestle shown in fig. 1. A horizontal member, the putlog, is supported at one end by the A-frame and at the other end by the wall. Planks span across the putlogs.

Common Trestle.—This type consists of two ladders so hinged that they form an inverted V when opened; they fold together for ease in transporting or storing. Two such units provide the end supports for simple or extension planks. The rungs in the ladders are spaced so that adjustments of plank heights may be made about every ten inches. The side rails of one leg of the inverted V may vary in length from 6 to 10 ft.

Extension Trestles.—The basic support unit for this type comprises two ladders similar to those of the common trestle and a third section of ladder in a vertical position and supported by the two inclined ladders forming an inverted Y. These support units may be procured in different heights and each height is adjustable. Two of the inverted Y's may support a plank for the working area or that plank may support one end of several planks to provide a wider working platform.

Scaffold Brackets.—Scaffolding is supported in frame (lumber) construction by brackets attached to the wall. A horizontal member 3 to 3½ ft. long has one end fastened to the wall by nails and the outer end supported by a V-frame at about 45° and nailed to the timber frame. In some cases the horizontal member is so formed that it may be hooked around one of the wall studs (the vertical members in standard frame construction). The horizontal member may be manufactured with a screw end which is placed through a hole in the sheathing and fastened by a wing nut.

The diagonal support is similar in the three types. Special corner brackets are provided to turn the scaffold planks around a corner. The wall brackets fold for handling and storage.

Adjustable Roofing Brackets.—These generally consist of a rectangular frame with one member extending beyond the rectangle so it may be held by one or more nails. Attached to the frame are two members which provide an essentially horizontal

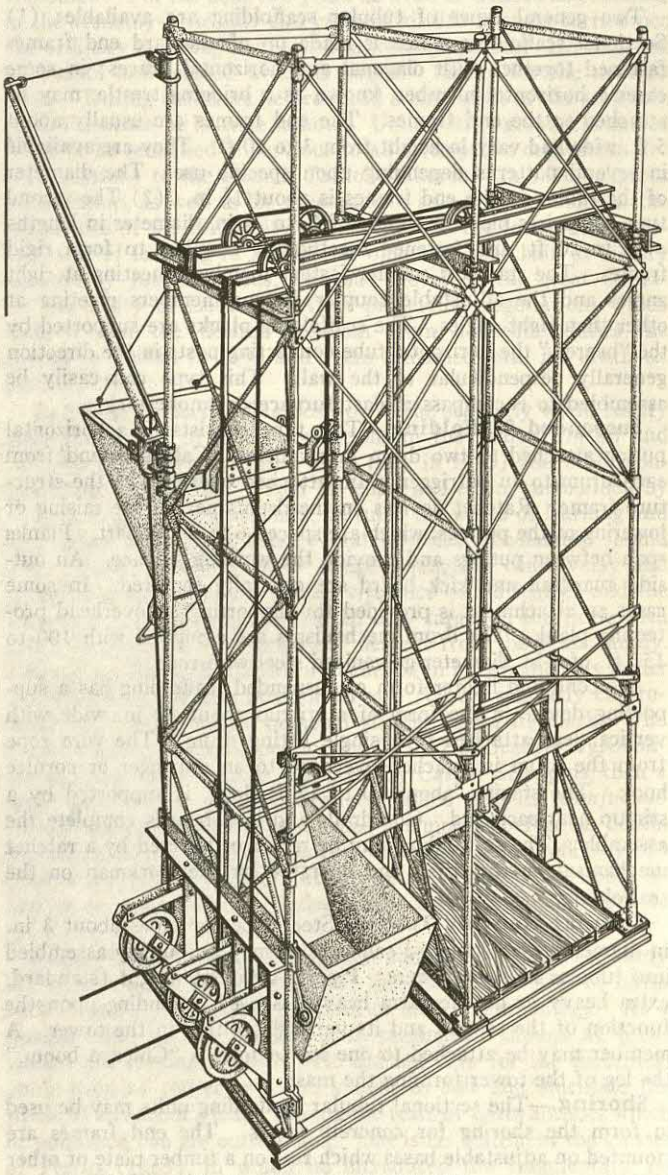

FIG. 3.—TUBULAR HOIST TOWER

support for the plank; this triangular frame may be adjusted to provide the horizontal support on a roof of any pitch. Another type of roof bracket provides support for 2 × 4 staging so the 4-in. dimension is normal to the roof surface. This serves as footing for shinglers.

Ladder Jacks.—A ladder jack is a Y-shaped frame with an adjustable bracket which may be placed on the rungs of a ladder to provide support for staging. Two ladders, each with a jack, are used to support one span of plank. The arms of the Y hook over a rung of the ladder and the stem generally extends to the second rung below and may be clipped to it. The bracket may be adjusted to provide horizontal support for staging for different inclinations of the ladder. The jacks may be attached above the ladder or hung underneath. An alternate type hooks around the rails of the ladder instead of around the rungs. Scaffolding provided in this manner is frequently used in painting houses.

Tubular Scaffolding.—Because of its convenience and economy, steel or aluminum tubular scaffolding has very largely replaced timber scaffolding except for installations in remote areas. Tubular scaffolding can easily be erected in any shape, length or height. Furthermore, sections of the tubular scaffolding may be mounted on casters to provide a highly mobile staging. The walkway or working platform generally consists of 2 × 10 or 2 × 12 wooden planks. The scaffolding may be enclosed with canvas for protection against the weather. Tubular scaffolding may be purchased or rented.

Two general types of tubular scaffolding are available: (1) Sectional scaffolding which is made up of standard end frames fastened together with diagonal and horizontal braces; in some cases a horizontal member, known as a bridging trestle, may be attached to the end frames. The end frames are usually about 5 ft. wide and vary in height from 3 to 10 ft. They are available in several patterns depending upon specific use. The diameter of the tubing in the end frames is about $1\frac{5}{8}$ in. (2) The second type comprises pipes or tubing of 2- to $2\frac{1}{2}$-in. diameter in lengths of 6 to 20 ft. and fastened together by couplers to form rigid frames. The standard coupler fastens members meeting at right angles and the adjustable coupler fastens members meeting at other than right angles. The scaffolding planks are supported by the "bearer," the horizontal tube connecting posts in the direction generally perpendicular to the wall. This type can easily be assembled to encompass a blast furnace or smokestack.

Suspended Scaffolding.—This type consists of a horizontal putlog attached to two drum mechanisms. Cables extend from each drum to an outrigger beam attached overhead to the structure frame. Ratchet devices on the drums permit the raising or lowering of the putlogs, which are spaced 6 to 9 ft. apart. Planks span between putlogs and provide the working surface. An outside guardrail and kick board are generally required. In some cases an attachment is provided for supporting an overhead protecting plank. The drum mechanisms are equipped with 100 to 150 ft. of $\frac{1}{2}$-in. diameter galvanized steel wire rope.

A second and lighter form of suspended scaffolding has a supporting device in the form of a stirrup about 30 in. wide with vertical legs attached to a single lifting drum. The wire rope from the drum is attached overhead to an outrigger or cornice hook. The staging, about 10 to 12 ft. long, is supported by a stirrup near each end. Guardrails and kick boards complete the assembly. The scaffolding may be raised or lowered by a ratchet mechanism on the drum and operated by the workman on the scaffolding.

Tubular Hoisting Tower.—Steel tubes or pipes about 3 in. in diameter with standard connections may be quickly assembled into tubular hoisting towers. Pipe of different weight (standard, extra heavy or double extra heavy) is used depending upon the function of the section and its vertical position in the tower. A member may be attached to one leg to form a "Chicago boom," the leg of the tower forming the mast.

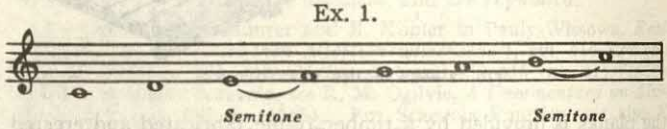
Shoring.—The sectional tubular scaffolding units may be used to form the shoring for concrete forms. The end frames are mounted on adjustable bases which rest on a timber plate or other firm support. (F. W. St.)

SCALE, in music, signifies any selected sequence of notes or intervals dividing the octave. This is a theoretical conception by which the material of an existing or a historical practice can be systematized for readier understanding and explanation. Theoretically, the octave can be divided into a number of microtones; *i.e.*, tones smaller than a semitone. In antiquity, and currently in the Orient but not to any marked extent in the West, intervals smaller than a semitone were in regular use. Such a practice yields a scale that is unfamiliar to the modern Western listener.

Pentatonic Scale.—Many historical and some existing traditions of music make use of five notes only (with their octave transpositions) and such a practice yields a pentatonic scale. This is a "gapped" scale; *i.e.*, a scale containing intervals of more than a tone. One of the more familiar pentatonic scales is the equivalent of the black notes of the keyboard.

Diatonic Scale.—The division of the octave into seven notes appears very early in western music. Medieval musicians employed a variety of seven-note scales, known as modes. These contained two semitone intervals that occurred in a different relation to the "final" in each mode. Two modes, the Ionian and the Aeolian (in a slightly modified form), remain in general use as the diatonic major and minor scales (*see* Greek Music [Ancient]). In each major and each minor scale the semitone intervals occur in the same relation to the key note (or tonic). In the major scale the semitones occur between notes 3–4 and 7–8.

Ex. 1.



The minor scale has two forms, the "melodic minor" and the "harmonic minor." In the melodic minor the semitones occur between notes 2–3 and 7–8 ascending and between notes 6–5 and 3–2 descending.

Ex. 2.

In the harmonic minor the semitones occur between 2–3, 5–6 and 7–8, with the interval of an augmented second (a tone plus a semitone) between notes 6–7.

Ex. 3.

In all forms of the diatonic scale the names given to the degrees of the ascending scale are: 1. tonic; 2. supertonic; 3. mediant; 4. subdominant; 5. dominant; 6. submediant; 7. leading note.

The Chromatic Scale, which comprises all the 12 semitones in the octave, can be considered as a "colouring" of the diatonic scale. The medieval musician regarded the notes C and C sharp, for example, not as separate notes but as two aspects of one note. This could be written as C and altered in performance "by reason of necessity or of beauty." At a later date, owing to the practice of equal temperament, diatonic scales were built on any of the 12 notes of the octave. In the late 19th century the extreme use of chromaticism (*q.v.*) brought about the partial destruction of diatonic tonality. (*See* also Temperament, Musical.)

The scale of "12-note," or dodecaphonic, music (*see* Dodecaphony) uses the notes of the chromatic scale but does not permit the establishment of any tonal centre.

The Whole-tone Scale is often associated with Debussy, although it had been used as early as the 18th century by Mozart (in a sextet called "A Musical Joke"). As its name implies, it is a scale without semitones and therefore consists of only six notes.

Ex. 4.

Other experimental scales have been evolved by 19th- and 20th-century composers.

SCALES: *see* WEIGHING MACHINES.

SCALIGER, from Scaligerus, the Latinized name of the Della Scala family, who ruled during the 13th and 14th centuries in Verona (*q.v.*). The name was later borne by two eminent scholars, father and son.

JULIUS CAESAR SCALIGER (1484–1558), French classical scholar of Italian descent, was born at Riva on Lake Garda on April 23, 1484. His early life is shrouded in myth. According to his own account he was descended from the Della Scala family of Verona. According to the enemies of the younger Scaliger, he was the son of Benedetto Bordone, an illuminator or schoolmaster of Verona. It is unlikely that these matters will ever be verified; the known facts about his later life are of greater importance. In 1525 he left Italy and was appointed physician to the bishop of Agen (Guienne). He settled at Agen, became a French citizen and married a young French girl, Andiettes de Roques Lobejac, by whom he had 15 children, the scholar Joseph Justus Scaliger (*see* below) being the tenth. He died at Agen on Oct. 21, 1558.

Scaliger made himself known as a scholar by two virulent orations (1531, 1536) against the *Ciceronianus* of Erasmus. The language used is the vigorous and trenchant Latin practised with so much gusto in that age of invective. But his Ciceronianism is narrow and short-sighted; Erasmus had shown greater insight when he ridiculed the stylistic excesses of contemporary Ciceronians, and Scaliger had largely misunderstood the purpose of his satire.

Scaliger's contributions to scholarship concern two widely different fields: botany and zoology, on the one hand, and grammar and literary criticism, on the other. His scholarly work (with the exception of a brief tract on Hippocrates' *De insomniis,* 1539) was published during the last few years of his life and some of it was left unfinished. It was put forward in the form of discussions of the work of standard authors. Thus his dialogue *De plantis* (1556) is a running commentary on the book on plants wrongly ascribed to Aristotle, and his *Exercitationes exotericae de subtilitate* (1557) discuss scientific and metaphysical problems raised in the *De subtilitate rerum* by one of the foremost naturalists of the 16th century, Geronimo Cardano (*q.v.*). Aristotle's *Historia animalium* and Theophrastus' *Peri phyton historia,* are the subjects of two unfinished commentaries published posthumously (1619 and 1644).

His two works on literary matters deal with grammar and poetics respectively. The *De causis linguae Latinae* (1540) is one of the most interesting attempts before the coming of comparative philology to discuss the principles of Latin grammar. His *Poetice,* published in 1561, three years after his death, came to be the most widely read of all his books. Here Greco-Roman rhetoric and poetics are used as a foundation for literary criticism. This is a most vigorous and comprehensive attempt to judge literature, made at a time when the Latin literary tradition was still unbroken. On that account alone it remains well worth reading. Scaliger's contemporaries admired his expertise in the physical sciences as much as his erudition and taste in polite letters. While being thoroughly conversant with the language and style of Latin and Greek writers, and while himself being a prolific composer of Latin verse and a competent textual critic, Scaliger aimed not so much at correcting ancient texts as at an understanding and criticism of what the ancients had written about. His teaching impressed not only such men as the younger Scaliger and Muretus (*q.v.*), who had personally learned from him, but a whole generation of savants in the great age of French classical scholarship.

JOSEPH JUSTUS SCALIGER (1540–1609), celebrated as the most eminent scholar of his time, was born at Agen on Aug. 5, 1540, the tenth child of Julius Caesar Scaliger.

The foundation of his great facility in Latin expression, both in verse and prose, was laid when (after his early education at Bordeaux), during the last three years of the elder Scaliger's life, he acted as his Latin secretary, daily taking down and copying his father's Latin verse compositions and daily writing a Latin essay on a subject of his own choosing. He had no such help with his Greek, for when he began the study of that language under A. Turnebus (Turnèbe) at the University of Paris he found the lectures too difficult. So Scaliger taught himself in a very short time, reading Homer in three weeks and thereafter other Greek poets, orators and historians, and forming a grammar on the basis of what he had read. He early acquired, too, a reading knowledge of Hebrew and Arabic. He extended his interests to ancient history (later, during 1570–72, he studied Roman law at Valence under the eminent lawyer Jacobus Cujacius). In Paris he became the tutor and friend of a young nobleman, Louis d'Abain (Louis Chastaigner de la Roche Pozay), his patron for 30 years (1563–93). With D'Abain he traveled in Italy and later visited England and Scotland. In the course of his travels Scaliger became a Protestant, and the religious upheavals of the time drove him out of France in 1572, the year of the massacre of St. Bartholomew. For the next two years he lived at Geneva as professor at the academy—the only two years of his life when he carried out the ordinary lecturing duties of a university teacher. He returned to France and resided with his patron's family for the next 20 years. During that time he produced a large part of the scholarly work for which he became famous. Unlike other great scholars of the time he remained impervious to all attempts at conversion (or reconversion) to the Roman Catholic Church. In 1590 religious partisanship, as well as his preeminence as a scholar, induced the authorities of the University of Leiden, then the foremost Protestant seat of learning in Europe, to offer him the chair of history vacated by Justus Lipsius, who had moved to the great Catholic University of Louvain. After protracted negotiations which secured him the desired freedom from academic duties, he moved to Leiden in 1593 and there remained until his death on Jan. 21, 1609.

To Scaliger's outstanding position in the scholarly world testify alike the record of his conversations in the years 1574–93 and 1603–06 (*Scaligerana,* edited most fully in 1740) and other contemporary documents. From his chair at Leiden, surrounded by a circle of able young scholars, he ruled the world of learning and determined the course literary and historical scholarship should take. Such a position spells danger: religious controversy and personal envy, sharpened by the virulence of his temper and the pungency of his sarcasm, found an easy target in the pride with which he regarded his (supposed) descent from the Scala family. There is no doubt that he firmly believed in it; whether his father did likewise is not now possible to say. Where scholarly controversy had largely failed, personal slander found its mark. The attack culminated in the publication in 1607 of *Scaliger hypobolimaeus,* "the supposititious Scaliger," by Caspar Scioppius, then a spokesman for the Jesuits. Scaliger replied with the *Confutatio fabulae Burdonum* (1608), published five months before his death. He effectually rebutted the charges of atheism and profligacy but could not establish the truth about the noble lineage by which he had set so much store, nor indeed make good the damage done to his name.

Scaliger's achievements as a scholar and man of letters are many but only two can be noticed here: the textual criticism of Latin authors and the historical criticism of ancient chronology. As a textual critic he was brilliant and imaginative though at times violent and lacking in taste. He did not care for the piecemeal publication of conjectures and sought to edit and elucidate the whole of an author's text. Among the texts of Latin authors which he published two are outstanding. One is his edition of the glosses of Festus (1565), in which he introduced the fragmentary remains of archaic Latin to the notice of his contemporaries; his

investigations of the oldest Latin literature and language were not fully continued for two centuries. The second is his edition of Manilius' poem *Astronomica* (1579; 2nd ed. 1600), of which another great editor, A. E. Housman, said that "perhaps no critic has ever effected so great and permanent a change in any author's text as Scaliger in Manilius'." Scaliger's Manilius also offers a critical review of ancient astronomy from the point of view of Copernican science. Thus it forms the link with an even greater contribution to learning. In the *De emendatione temporum* (1583) he reconstructed the ancient system of chronology and brought the early history of the middle east into the purview of the west. This work was enlarged and perfected in the *Thesaurus temporum* (1606), which established Scaliger as one of the founders of modern historical scholarship.

BIBLIOGRAPHY.—J. J. Scaliger published a biography of his father, *De vetustate et splendore gentis Scaligerae et Jul. Caes. Scaligeri vita* (1594). J. J. Scaliger's own autobiography, with selections from his letters, etc., was translated with an introduction by G. W. W. Robinson (1927). There is no adequate modern biography. For earlier accounts of his life and work *see* Mark Pattison, *Essays*, vol. 1 (1889), and Jacob Bernays, *Joseph Justus Scaliger* (1855). There is a brief sketch in J. E. Sandys' *History of Classical Scholarship*, vol. ii (1908). (C. O. BR.)

SCALLOP (ESCALLOP, FAN SHELL, or COMB SHELL) is the common name applied generally to bivalve (*q.v.*) mollusks of the family Pectenidae and particularly to species of the genus *Pecten*. Probably no group of mollusks has held a more prominent place in art, architecture, literature and religion, in addition to supplying an important item of food. The family, containing about 50 genera and subgenera and more than 400 species, is worldwide in distribution and ranges from the intertidal zone to considerable depths. Scallop shells, or valves, are fan-shaped in outline except for the straight hinge line with wings at either side of the hinge. In some species the valves are more or less equally convex while in others one valve is flat or nearly so. The shell may be smooth or sculptured with radial ribs, and the ribs may be smooth, scaly, or knobbed. They range in colour from brilliant red, purple, orange, or yellow to the white of deep-sea forms. The scallop normally lies on one valve, usually the right one; this valve is often lighter in colour and less highly sculptured than the left or upper one.

Scallops were used as food and their shells were used as utensils by primitive man in many parts of the world. During the middle ages the shell of *Pecten jacobaeus* became a religious emblem (the badge of St. James) and was worn by pilgrims visiting the shrine of St. James at Santiago, Spain, and the Holy Land. It has been used in art and architecture throughout the world since earliest times but found its greatest development in Europe, where, because of its religious significance, it was figured in church architecture and in the coats of arms of important families, indicating that some member had made a religious pilgrimage. According to mythology, Aphrodite (Venus) arose fully mature from a scallop.

UPPER AND LOWER VALVES OF THE SCALLOP PECTEN JACOBAEUS

Scallops are an important item of food in all areas where they occur in sufficient numbers to be dredged. The sea scallop, also known as the giant, or deep-sea, scallop (*Placopecten magellanicus*), is the species commonly dredged off New England and eastern Canada, though the bay scallop (*Aequipecten irradians*) is also fished commercially. In the British Isles *Aequipecten opercularis* is the species most commonly fished; it is used for food and for baiting the long lines in the fishing fleet. In the sea scallop fishery a wide variety of dredges are used but most are made of wire rings, about three inches in diameter, linked together to form a coarse mesh bag. The dredge is usually towed from 15 to 30 minutes depending on the bed. The scallops are shucked immediately, the meats (the large adductor muscle is usually the only part eaten) are either stored in sea water or frozen on board ship. In the Bay of Fundy (between New Brunswick and Nova Scotia) the catch may average about 750,000 lb. of meats a year. There dredging is done in depths of 30 to 60 fathoms while in other areas of eastern Canada dredging is done in 4 to 10 fathoms.

The northeastern part of Georges Bank, off Massachusetts, is the most productive and most intensely fished sea scallop ground on the Atlantic coast; fishing there is done in depths of 20 to 60 fathoms. More than 15,000,000 lb. may be taken from this area in a single year.

Scallops belong to the group of bivalves having a single large adductor muscle for closing the valves, and are related to the file shells (Limidae), spiny oysters (Spondylidae), and true oysters (Ostreidae). They are usually found in areas where the bottom is composed of sand, shelly sand, or fine gravel, where the current is sufficient to prevent the deposition of fine mud and where the water is relatively clear. When the scallop is resting on the bottom the valves gape considerably but the animal itself cannot be seen because the free edges of the mantle hang down from the upper valve and extend up from the lower valve leaving only a narrow slit between the two edges.

At the edge of the mantle is a series of short tentacles and brilliant eyes. The eyes are sensitive to light and movement but they probably cannot distinguish form. The tentacles detect changes in the composition of the water and form a net through which food-bearing water is drawn into the mantle cavity. Scallops feed like most other bivalves, on microscopic plants and animals in the water, using cilia and mucus to collect the food and carry it into the mouth.

The Pectenidae are unusual among bivalves in being active, though spasmodic, swimmers. The animal swims by forcing jets of water out through two openings near the hinge. It appears to be clapping its valves as it moves through the water.

Reproduction in scallops is typical of most marine bivalves. Fertilization is external, the eggs and sperm being shed into the water. The eggs develop into normal larval bivalves with a swimming organ. After spending a short time in the plankton, they settle but may crawl for a while. The shell changes to that of a *Pecten* and the byssal gland develops. Then for a period the shell is attached to the substratum by a byssus. Some members of the family remain attached throughout life but most species break free and become spasmodic swimmers.

Starfish, the most important enemy of scallops, often plague commercial fisheries. A starfish attacks a scallop by surrounding the shell with its arms and, by the suction of its tube feet, pulls the valves apart; it then inserts its stomach between the valves and digests the scallop's soft parts.

SCALP, in anatomy, the skin and other tissues covering the top of the head. The skin of the scalp is thick. It contains an abundance of oil and sweat glands and about 100,000 hair follicles. (For information about loss of hair, *see* BALDNESS.) The scalp is subject to a number of ailments, such as dandruff and ringworm. (*See* SKIN, DISEASES OF.)

The arteries of the scalp are remarkable for their tortuosity, which is an adaptation to so movable a part; for their communication across the middle line with their fellows of the opposite side, an arrangement which is not usual in the body; and for the fact that, when cut, their ends are held open by the dense fibrous tissue in which they lie, so that bleeding is more free in the scalp than it is from arteries of the same size elsewhere in the body.

The veins do not follow the twists of the arteries but run a straight course; there is often a considerable distance between an artery and its companion vein. Accompanying the veins are the larger lymphatic vessels. From the forehead the lymphatics accompany the facial vein and usually reach their first gland in the submaxillary region, so that in the case of a poisoned wound of the forehead sympathetic swelling or suppuration would take place below the jaw. From the temple the lymphatics drain into a gland lying just in front of the ear, while those from the region behind the ear drain into glands lying close to the mastoid process. In the occipital region (base of the skull) a small gland (or glands) is found about a third of the distance from the external occipital protuberance to the tip of the mastoid process.

The nerve supply of the front of the scalp is from the trigeminal (5th cranial) nerve; behind the ear the scalp is served by the great auricular nerve and the smaller occipital nerve, while above and behind these, the greater occipital is distributed.

Beneath the skin and fibrous tissue lies the epicranium, formed by the two fleshy bellies of the occipitofrontalis muscle and the flattened tendon (aponeurosis) between them. The anterior belly (frontalis) is the larger, and, when it acts, throws the skin of the forehead into transverse puckers. The much smaller posterior belly (occipitalis) usually merely fixes the aponeurosis for the frontalis to act, though some people have the power of alternately contracting the two muscles and so wagging their scalps backward and forward as monkeys do.

Below the epicranium is a layer of very lax tissue constituting a lymph space and allowing great freedom of movement to the more superficial layers; it was this layer which was torn through when an American Indian scalped his foe. So lax is the tissue here that any collection of blood or pus is quickly distributed throughout its whole area, and, owing to the absence of tension as well as of nerves, very little pain accompanies any such effusion.

The deepest layer of the scalp is the pericranium (also designated the outermost layer, or external periosteum, of the skull bones). Until the sutures of the skull close in middle life, this layer is continuous with the dura mater which forms the internal periosteum, and for this reason any subpericranial effusion is localized to the area of the skull bone over which it happens to lie. Moreover, any suppurative process may extend through the sutures to the meninges of the brain. *See* also HAIR. (F. G. P.; X.)

SCALPING, the removal of all or part of the scalp with its hair, is best known as a trait of North American Indian warfare, and the English term has entered other European languages with this meaning. European contact increased the frequency of Indian scalping greatly and the geographic spread somewhat, by the introduction of firearms (fatalities increased) and metal knives (removing the scalp became easier), and particularly by the offering of bounties for scalps of enemy Indians (and sometimes enemy whites) by the French, English, and Dutch authorities in eastern North America and Spanish authorities in northern Mexico. Many Euro-American frontiersmen and soldiers adopted the custom.

Scalps were most important among Southeastern Indians (*e.g.*, Creek, Choctaw), where obtaining them was a prime motive for warfare since they were necessary to secure status as a warrior and to placate the spirits of the dead. Most Northeastern Indians also took scalps, as proof of valour in warfare, but valued captives more highly. Among Plains Indians scalps varied in importance although all tribes took them. These groups had a graded series of war honours, of which taking a scalp was usually low on the scale since it required less daring than did touching a live enemy or stealing a horse.

Eastern and Plains Indians removed either the whole scalp (sometimes including the ears) or a circle about two to four inches in diameter centring on the hair whorl. Men of many of these tribes cut their hair short except for a long scalp lock left at the vertex as a challenge to the enemy. In the occasional cases when the victim was merely presumed to be dead, removal of a small scalp area was not necessarily fatal; numerous instances of survival are on record. The removed scalp was normally stretched on a small hoop, painted red, and often then carried at the end of a pole in a victory or scalp dance. Strips of scalp were frequently used by Plains Indians to decorate their clothing, weapons, and horse gear.

Scalping was entirely absent in the Arctic and Subarctic, most of the Northwest Coast, and parts of California. In the rest of North America it was of much less importance than on the Plains or in the East, and the scalp area removed tended to be larger, often including the ears and at least some facial skin; frequently the whole head was taken as a trophy (*see* HEAD-HUNTING) from which the scalp was sometimes later removed. In California, the Southwest, and northern Mexico scalps were usually hung on a pole around which a victory dance was conducted. Among many Southwestern tribes scalps were taken but were regarded as ritually dangerous.

Scalping was absent from most of Mexico and Central and South America, but did occur in the Chaco and the Guianas. In both regions an enemy was decapitated and then the scalp removed. In the Chaco, Indian scalping survived as late as the 1920s.

There are a few references to scalping of enemies in other parts of the world: Scythians (according to Herodotus; *see* SCYTHIANS: *The Army*), some western Siberian peoples (Ostyak, Samoyed, and Vogul), and perhaps the ancient Persians.

Knowles, "The Torture of Captives by the Indians of Eastern North America," *Proc. Amer. Phil. Soc.*, vol. 82 (1940); R. H. Lowie, *Indians of the Plains* (1954). (W. C. ST.)

SCAMMONY (*Convolvulus scammonia*), a twining perennial plant native to the eastern Mediterranean region that yields a cathartic drug of the same name. The plant has arrowhead-shaped leaves and flowers similar to those of the bindweed or wild morning glory. The crude drug consists of the dried gum resin that exudes from incisions made in the living root. The product is brownish-black, often dusty gray externally, brittle, and has an acrid taste. Gross adulteration, high prices, and uncertainty of supply have led to true scammony being replaced almost entirely by ipomoea resin, a Mexican product known also as Mexican scammony resin, an extract of the dried, powdered root of *Ipomoea orizabensis*. Ipomoea resin and true scammony have been used as cathartics and may also be used with anthelmintics to expel intestinal worms. (J. W. TT.)

SCAMOZZI, VINCENZO (1552–1616), Italian architect and architectural theorist of the late Renaissance, was born in Vicenza and trained under his father, a pupil of Sebastiano Serlio, and in the atmosphere of the Accademia Olimpico at Vicenza. He provided designs for Salzburg Cathedral, but worked mostly at Venice, Padua, and in the Veneto. He designed palaces, villas, and churches, as well as the permanent classical stage setting for Andrea Palladio's Teatro Olimpico at Vicenza, the ducal theatre at Sabbioneta, and the fortress town of Palmanova. He died in Venice in 1616. Through Scamozzi's writings (*L'Idea dell'architettura universale,* 1615) Palladianism (*q.v.*) influenced English architecture from Inigo Jones onward, but Scamozzi's theories differ in certain respects from Palladio's and he may more properly be regarded as the intellectual father of neoclassicism.

The Scamozzi Ionic order is a type of column the capital of which has four identical faces with the volutes meeting at an angle at each corner. Scamozzi was once thought to have invented it, although there are Roman precedents for the design.

See F. Barbieri, *Vicenzo Scamozzi* (1952). (F. J. B. W.; X.)

SCANDINAVIA, part of Northern Europe, is generally held to consist of the two countries of the Scandinavian Peninsula, Norway and Sweden, with the addition of Denmark. Some authorities include Finland on geological and economic grounds, and on a linguistic basis Iceland and the Faeroe Islands. (*See* SCANDINAVIAN LANGUAGES). The language and people of Scandinavia

are Nordic. The three countries are monarchies and have free democratic government. The established church is the Lutheran.

Norway and Sweden share the western and eastern sides respectively of the same mountain mass, much of which is part of the ancient Baltic Shield, and both have experienced the powerful effects of the Pleistocene glaciation, which had its main European centre in northeast Sweden and the Gulf of Bothnia. Sweden has, however, extensive slopes of fairly gentle gradient down to the Baltic Sea, while Norway's mountains reach to the actual coastline and are deeply dissected by fjords. The southern part of Sweden is mostly lowland with numerous outcrops of solid rock through the glacial deposits, and with much woodland. Denmark is considerably flatter, solid rock is scarcely to be seen, and almost the whole country is intensely cultivated. Toward the end of the glacial period southern Sweden and Denmark were joined, prior to the formation of the present Baltic Sea (*q.v.*).

The term "Norden" has recently come into usage in addition to the word "Scandinavia," and includes Denmark, Finland, Iceland, Norway, and Sweden, a group of countries which have affinities with one another and a distinction from the remainder of continental Europe.

(R. K. GR.)

SCANDINAVIAN ARCHAEOLOGY is treated here as the study of the traces of man in Denmark, Norway, Sweden (*qq.v.*), and adjacent islands from the period of earliest settlement (*c.* 12000 B.C.) to the time of the Vikings (*c.* A.D. 1050).

Paleolithic.—At the end of glacial times (*see* PLEISTOCENE EPOCH) the climate improved sufficiently for man to enter Scandinavia. About 12000 B.C. Denmark was inhabited by a few groups of hunters; their knives of reindeer antler suggest Hamburgian (a northern variant of Magdalenian) culture. Also, flint was made into knives, scrapers, and burins (gravers) for cutting grooves in bones or antlers. Their predominant weapon was an Aurignacian type of tanged arrowhead. The earliest known settlement at Bromme in Zealand has been dated to *c.* 10000 B.C. (*see* RADIOCARBON DATING). Climate deteriorated and tundra spread; axes came into use, made of reindeer antler on which a tine was sharpened into a cutting edge. A heavy tanged arrowhead was found in the most recent tundra layers at Lyngby in Jutland. This culture is related to that of Ahrensburg in north Germany. Two coastal cultures in Norway, Fosna (west of Trondheim) and Komsa (at North Cape, within the polar circle), may belong to the same complex.

Mesolithic.—*Continental Phase* (*c. 9000–5000* B.C.).—During this phase the Baltic was a freshwater lake and, with warmer climate, southern Scandinavia was covered by dense forests, mainly of pine. Aurochs, elk, deer, and boar were stalked by the hunters and their dogs. Settlements were near water, where traces of huts with floors of birchbark strips have been found. The first proper axes of flint core or flake are from Klosterlund in Jutland, the earliest known settlement of the Maglemosian culture, named from a bog site at Maglemose, Denmark. Typical bog finds in bone include barbed harpoons, leister (fishing-spear) points, and axes which sometimes have an inserted flint edge; wooden objects include bows, clubs, ladles, and paddles. Artistic work is scanty: mainly incised geometric designs and zoomorphic figures cut out of amber. A Maglemosian offshoot, the so-called Gudenaa people, lived by the lakes and streams of Jutland and made multishaped microliths (*see* FLINT AND OTHER STONE TOOLS). The seacoast was inhabited by another people whose (Early Coast or Early Ertebølle) culture was more akin to that of Ahrensburg. Many of their sites have been obliterated by the rising sea.

Atlantic Phase (*5000–3500* B.C.).—In this phase the Baltic Sea (*q.v.*) was filled with salt water, the climate became warmer, and oak dominated the forests. The Ertebølle culture continued, its sites marked by huge shell mounds (kitchen middens) where the dead were also buried. Heavy tools were increasingly made of flaked flint; plump greenstone axes were made by grinding. Transverse arrowheads replaced microliths and T-shaped antler axes, and coarse pottery appeared, possibly introduced from northern Germany, from where grain cultivation and cattle breeding also may have come. The Ertebølle culture survived well into the Neolithic; similar cultures existed in southern Sweden and near Oslo Fjord in Norway.

Neolithic (2500–1500 B.C.).—In parts of Denmark and in remoter districts of Norway and Sweden the Mesolithic people long retained their primitive mode of life, during which time more advanced cultures developed to the south. Southern Sweden, as far north as Södermanland, was colonized.

Early Neolithic levels in Danish bogs bear traces of widespread fire, suggesting that farmers had cleared the forest by slash-and-burn methods. Pottery of rounded shape with little ornamentation was followed by highly decorated beakers and collared flasks. Early Neolithic settlement sites have been excavated, including a village at Barkaer in east Jutland. Pit graves, containing skeletons in flexed or contracted position, were followed by impressive megalithic graves (dolmens) set in round or oval mounds surrounded by curbstones. A long dolmen may contain as many as four burial chambers. Votive deposits in Early Neolithic burials were mostly pottery but sometimes included amber beads.

The Middle Neolithic produced larger dolmens and introduced the more elaborate passage grave with a large chamber approached by a roofed passage. Many generations were inhumed in these, along with thick-butted axes, polygonal battle-axes, transverse arrows, and amber beads. Excellent pottery shows a continuous development in shape and ornamentation. The remains indicate a highly organized society of traders in flint and amber, and of farmers living in villages. Traces of domestic animals (mainly pigs and sheep) and of cereal (wheat and barley) are found near the huts. Well into the Middle Neolithic Period, groups of the Battle-Ax (or Single Grave) culture appeared in southern Scandinavia. Excavation of low barrows in the sandy interior of Jutland revealed in each a chronological sequence of graves, all with single inhumation containing well-proportioned battle-axes, crude flint axes, amber beads, and beakers and cups shaped like flowerpots. The Battle-Ax people seem to have practised stock breeding rather than agriculture. A related culture group inhabited east Jutland and adjacent islands; and a third lived on the island of Bornholm and in Sweden. The distinct Pitted Ware culture, named after its pottery with deeply punched holes, has been found in the Scandinavian peninsula, with an offshoot on the eastern seaboard of Denmark. These were Mesolithic fishers and hunters who kept pigs and made fishhooks, long triangular arrowheads, and harpoons. The invading Battle-Ax people seem to have expelled the megalith builders, first from Jutland, later from the islands. At the end of the Middle Neolithic, however, some fusion took place.

In Late Neolithic the megaliths were still used for burials, but large stone cists became more common. Pottery was plain and coarse; flint daggers and spearheads replaced axes and elegantly shaped flint arrowheads were made to meet increasing competition from metal weapons and tools imported from the British Isles and western Europe. The extensive trade connections built up during this period shaped the background for the Scandinavian (Nordic) Bronze Age, which began late, because all metal had to be imported.

Early Bronze Age (1500–900 B.C.).—The introduction of bronze casting brought about a revolutionary change. The quality of Scandinavian workmanship and design soon became outstanding. Bronze flat axes and daggers (similar to those from Britain and central Europe, but containing very little tin) were followed by palstaves (socketed, perforated axes), spearheads with riveted sockets, and rapiers that were superseded by heavier swords with wood, bronze, or horn hilts riveted to flanged bronze tangs. Personal ornaments of bronze or gold included finger rings, bracelets, and torques (cast, hammered, or made of entwined wire); *tutuli* (ornamental buttons); belt boxes; belt discs with a central protruding spike (worn by women only); and fibulae (brooches resembling safety pins). Weapons and ornaments were decorated with incised geometric designs.

Almost all Early Bronze Age traces have come from graves; thousands of barrows in southern Scandinavia indicate dense population there. During this period the body, wrapped in oxhide and fully dressed (with weapons, ornaments, and personal belongings), was placed in a small stone cist or a hollowed oak-log coffin. Some barrows have yielded well-preserved complete outfits of twilled clothes woven from sheep's wool. Men's garments consisted of a cap, wide cloak, a short, belted, sleeveless "gown," and leather sandals. Women wore a short smock, sometimes embroidered, and a belt with tassels; a knee-length skirt of cords joined at the waist and hem was wrapped twice around the hips. A long piece of cloth belted at the waist was probably a winding sheet. Women's hair was covered by a delicate net or cap. The preserved body of a girl found at Skrydstrup in south Jutland had an elaborate coiffure arranged over a horsehair pad.

Late Bronze Age (900–400 B.C.).—Cremation, introduced at the end of the preceding period, was in use throughout the Late Bronze Age. Cremated remains were placed in stone cists and later in urns that were buried in the ground or in old barrows. Some of these urns were shaped like huts or had anthropoid features. These new customs tended to reduce the size of burial gifts, which began to include such articles as razors, tweezers, or tattooing needles; small iron objects heralded the Iron Age.

Fields and bogs have produced the richest Late Bronze Age finds, most of them women's belongings such as large ribbed neck rings, pendants and chains, hair braids, enormous belt boxes, and fibulae. These may have been offerings to a goddess represented as a tiny female bronze figure with huge golden eyes. Spearheads, swords, imported shields of bronze sheeting, and horned bronze helmets were also found. Small bronze figures have been found adorned with such horned headgear, a type also depicted in rock carvings and drawn on razor blades. The most outstanding find of the period, the lur, a type of bronze trumpet made in attuned pairs, is of Scandinavian origin and shows a very high degree of skill in metallurgy. Importation of vessels from western Europe continued and golden bowls were given handles of Scandinavian design. Most of the numerous rock carvings found throughout Scandinavia date from the Bronze Age (*see* PRIMITIVE ART: *Prehistoric Europe*).

EARLY SCANDINAVIAN ARTIFACTS

(Top left) Late Bronze Age lur; (top right) Iron Age cart found in the bog at Dejbjerg, West Jutland; (bottom left) Viking ship found at Gokstad, Nor.; (bottom right) Iron Age Celtic silver caldron from Gundestrup, North Jutland

Iron Age (400 B.C.–A.D. 400).—The Pre-Roman Iron Age may have been a period of economic decline; certainly the finds from this period are few and poor in quality; the cultural centre remained in Denmark. Cremation was at first universal, urns being deposited in large cemeteries with sparse amounts of grave goods that included pins, fibulae of the La Tène (*q.v.*) type, and belt ornaments. A boat found preserved in a bog on the island of Als in Jutland was about 58 ft. (17.7 m.) long and was propelled by oars; little metal and no iron was used in its construction. It contained a great many shields (with no iron in them), spears, suits of chain mail, and a few iron swords; it was probably a war canoe sacrificed to the gods. Two carts found in a bog at Dejbjerg in west Jutland were overlaid with bronze mountings of Celtic design, and may have been used in Nerthus fertility rites. Several mutilated bodies, found mummified in Jutlandic bogs, may also have been sacrifices. Several imported caldrons of bronze or iron have been found, and a large silver caldron from Gundestrup in north Jutland is decorated with scenes that blend Celtic, Oriental, and classical features. Pointed ploughs found in Danish bogs have been assigned to this pre-Roman period, as have small, square or rectangular fields surrounded by low banks and associated with farmhouses.

The Roman Iron Age, beginning *c.* A.D. 1, provided rich finds from settlements, graves, and bogs. Regular trade with the Roman Empire brought silver, bronze, and glass; large numbers of Roman coins have been found, especially on the island of Gotland (*q.v.*). Roman influence is particularly noticeable in the high-quality Scandinavian pottery. Progress in agriculture is demonstrated by fully recognizable village sites surrounded by fields; and by the introduction of the wheel plow and rye. Cremation

was practised but the richest graves are inhumations; the body was fully clothed, wearing ornaments and weapons. Bogs have produced great hoards including double-edged swords of Romano-Celtic design, helmets, and ornamental discs for shoulder straps, perhaps the equipment of *auxilia* (auxiliary troops) in the Roman army. Clinker-built boats from Nydam in Schleswig show great progress in shipbuilding. Many objects apparently had been deliberately damaged before deposit, probably in obedience to the custom (noted by Julius Caesar) of offering part of the spoils to the god of war. Clothes from the bogs show that men wore trousers and a long-sleeved jacket, while women wore long gowns made from beautifully woven cloth of various designs.

Migration Period (A.D. 400–800).—Scandinavian tribes may have played a part in attacks that contributed to the collapse (5th century) of the Roman Empire in the west. Evidence of contact is provided by hoards of gold coins found especially in eastern Scandinavia, to which the cultural centre had shifted. Impressive barrows and boat-shaped graves revealed princely grave furniture, visored helmets with gilded bronze decorations, coats of mail, shields, magnificent swords with golden hilts inlaid with garnets, and glass from Frankish centres on the Rhine. Graves from this period in western Norway show a distinctive Frankish influence on weapons. Apart from the island of Bornholm in the Baltic, grave and settlement finds are rare in Denmark for this period; the few graves were sparsely furnished. Nevertheless, great treasures of gold and precious stones have been found in southern Scandinavia. Most notable are two richly decorated golden horns from Jutland. Other hoards contained heavy gold neck and arm rings, square and cruciform brooches, gold coins, and bracteates (disc-shaped pendants, barbaric copies of late Roman medals). Weapons and ornaments were decorated with animal figures that were deformed to suit the shape of the object. Variations on this style provide a rough dating method.

Viking Period (A.D. 800–1050).—The extraordinary achievements of the Scandinavian sea warriors (*see* VIKING) depended primarily on their ships. It was the custom to bury the dead in ships under huge barrows; such ships were discovered in Norway, at Gokstad, Oseberg, and Tune; preserved in Oslo, they show the final stage in the evolution of the rowing boat into a craft with keel, mast, and sails. They contained special chambers for the remains, and were loaded with tents, small boats, beds, sledges and carts (many richly carved), and personal belongings. Within Scandinavia at this time there was a great variety of burial customs. Cremation was practised, gradually dying out as Christianity spread. Men were buried with weapons, riding gear, horse, and dogs; women had personal ornaments and household utensils. Stone burial chambers shaped like boats have been found throughout Scandinavia. In Denmark and Schleswig princely persons were buried in wooden chamber tombs under huge mounds.

Towns grew up rapidly in Viking times: Haitabu in Jutland, Birka in Sweden, and many others were fortified and had special areas for craftsmen. Dannevirke (Danewerk), a system of earthworks made to protect Denmark from the south (the most extensive ancient monument in Scandinavia), probably took 350 years to build. Military camps with plans that show strong Byzantine influence have been excavated in Denmark at Aggersborg, Fyrkat, Odense, and Trelleborg: in ship-like houses arranged in squares within a circular moat and wall the royal housecarls of Sweyn I and Canute (*qq.v.*) were billeted.

HEAD OF THE TOLLUND MAN

These remains, discovered in 1948 in a peat bog at Tollund, Jutland, are the best preserved of almost 100 comparable findings dating from the Iron Age

Among the Vikings' weapons (*e.g.*, spear, bow and arrow) the sword was most prized. Swords were inlaid with gold and silver; many were of Frankish manufacture. But the typically Nordic long-handled battle-ax became the symbol of the Vikings. Defensive equipment included shields, coats of mail, and leather or iron helmets; spurs, stirrups, saddles, bridles, and collar harness were richly decorated. Men wore armlets, and women had gold and silver rings for neck and hair. For clothing there was an almost standard set of buckles (two oval and one three-lobed) usually of bronze or silver. A tapestry from Oseberg depicts Viking men in long-sleeved, thick coats and in trousers; long cloaks hang freely from their shoulders. Women wear a chemise under a sleeveless dress that reaches the ground and often has a train; a sleeveless cape is thrown back to expose the arms. Costly imported materials were used: gold brocade, Chinese silk, and Frisian worsted.

Silver hoards (deposited as offerings or concealed as treasure) contain ornaments, bars, cups, bowls, and various fragments. In the decoration a small beast with masklike face and gripping paws (as in Oseberg carvings) was constantly depicted. By the mid-9th century a fusion of styles led to that known as the Borrestyle: the animal had the elongated body typical of Migration Period art but had acquired the face and paws of the gripping beast. In the 10th century this was overshadowed by the Jelling style, of which the ribbon-shaped and tuft-headed animal betrays a strong Irish influence. The early 11th century was dominated by a style known as Ringerike, characterized by interlacing lines and conventionalized foliage borrowed from Anglo-Saxon art. The animal theme reappeared in the Urnes style, the last phase of Viking decorative art.

(E. M. E. B.)

SCANDINAVIAN LANGUAGES. This term is usually limited to the Germanic languages (*q.v.*), of the Indo-European family, spoken and written in the Scandinavian countries, thus excluding Finnish and Lappish, which have most of their speakers in the same area. There are six distinct written languages in Scandinavia: the Danish language (*q.v.*), in Denmark; the Faeroese language, in the Faeroe Islands, a possession of Denmark; the Icelandic language (*q.v.*), in Iceland; the Norwegian language (*q.v.*), in Norway, split into two norms called *bokmål* and *nynorsk;* and the Swedish language (*q.v.*), in Sweden and Finland (by only 7.4% of the population of Finland). Outside Scandinavia there are small areas of Danish speech in northern Germany and of Swedish in Estonia, as well as among numerous emigrants in the United States and Canada. If these are estimated at about 1,000,000, the total number of Scandinavian speakers in the late 1960s was about 17,500,000.

In speech there is a great deal more variation than the number of written norms would indicate. Icelandic has the least dialectal differentiation, while in the Faeroes nearly every island has its own dialect.

The continental countries all show a typically European cleavage into class and regional dialects. In each country there is an upper-class urban dialect which approaches the written norm more closely than do the rest; this is often regarded as a standard, though it varies from city to city, the speech of the capital having the greatest prestige: Oslo, Stockholm, Copenhagen. Closest to it, but by contrast regarded as vulgar, is the speech of the urban working classes; more remote, and often so different as to be mutually incomprehensible, is rustic speech. The rural dialects are divided regionally, reflecting the patterns of communication in medieval and early modern times. Every parish and village may be said to have its own dialect.

It is not known when Indo-European speech entered the north; some believe it may have come with the so-called Battle-Ax people of the Neolithic (*c.* 2500 B.C.). The earliest linguistic monuments are about 150 inscriptions in the Germanic alphabet known as the older runic *futhark* (*see* RUNE). These date from *c.* A.D. 200 to 800, the earliest of which show a language close to

the reconstructed Proto-Germanic branch of the Indo-European languages; it may be called either North Germanic (contrasting it with East and West Germanic) or Proto-Scandinavian. Between A.D. 500 and 700 a radical change in the word forms led to what may be called the Common Scandinavian of the Viking age (750–1050). First came a vowel assimilation known as umlaut (mutation), in which the accented vowel was coloured by the quality of the following unaccented vowel; then came a loss of unaccented vowels, which greatly shortened the length of the words; *e.g., landa,* "land," became *land,* while its plural *landu* became *lǫnd;* similarly *katilaz* > *kætilR* > *ketill,* "kettle." Other changes were the loss of initial *j,* for example, in *ár,* "year" (corresponding to German *Jahr*), and of *w* before *u* and *o,* as in *ull,* "wool," and *orð,* "word." Our evidence for Common Scandinavian consists of about 4,000 inscriptions in the younger runic alphabet of 16 characters, mostly memorial stones.

During this period Scandinavian was carried also to Normandy, the English Danelaw, the Orkneys, Shetlands and Hebrides, to Ireland and the Isle of Man, to Greenland and the North American continent, as well as to the Swedish kingdoms in Russia; but in these areas the Scandinavian settlers were all absorbed or died out in later centuries.

Although some of the differences within the Scandinavian area undoubtedly date back to an earlier period, they do not become evident until the use of Latin writing after the introduction of Christianity. The native languages were first written in Norway, under the influence of English missionaries, in the late 11th century. From there Anglo-Saxon influences spread to Iceland also. The earliest manuscripts from Iceland and Norway date from *c.* 1150, while the earliest in Denmark and Sweden are nearly a century later. These show a substantially consistent form, characteristic for each centre of writing, down to about 1350; this may be called the Old Scandinavian period, in which fall Old Icelandic, Old Norwegian, Old Swedish and Old Danish, the two former distinguishable as Old West Scandinavian (also called Old Norse), the two latter as Old East Scandinavian. In the period from 1350 to 1525 a transition took place to the essentially modern forms of the present-day languages. During this Middle Scandinavian transition the manuscripts show a gradual loss of the old case system in favour of the modern analytic structure. The political and dynastic unions of the Scandinavian countries, under the hegemony of Denmark, spread Danish norms to the other countries, gradually diluting and even supplanting those which had been developing elsewhere.

The language of the royal chancery at Copenhagen eventually supplanted completely the norms of Jutland and Skåne within the Danish realm, as well as those of Norway, which was united with Denmark. The last documents in pure Norwegian were written in the period 1450–1500, and the introduction of the Reformation in 1537 did not lead to a distinct Norwegian translation of the Bible. The authors who wrote in Norway after the Reformation used Danish in their literary composition; the notion of a separate Norwegian language did not arise again until the 18th century but acquired special force after the separation of 1814. In Iceland, on the contrary, the written tradition remained unbroken, though influenced by Danish. The same was true in Sweden, and the establishment of a separate Swedish state in 1525, with Stockholm as its capital, led to a strong and conscious reaction against Danish influences.

The modern Scandinavian era since the Reformation has led to three new norms as the result of modern nationalism: Faeroese, established by V. U. Hammershaimb in 1846, New Norwegian (*landsmål, nynorsk*) by Ivar Aasen in 1853, and Dano-Norwegian (*riksmål, bokmål*), which gradually deviated from Danish in the 19th and early 20th centuries. Icelandic is the language that has most tenaciously preserved the grammar and vocabulary of the common Scandinavian period, with Faeroese a not too close second; these languages have therefore become largely unintelligible to other Scandinavians. On the continent, Scandinavians are usually able to communicate with each other by speaking and writing their own languages. This is because of the common developments which the languages have undergone, including an extensive simplification of morphology and the adoption of loanwords from common sources, especially Low German. Danish is phonetically most deviant from the rest but has a large area of vocabulary in common with Dano-Norwegian; the cleavage is therefore greatest between Danish and Swedish.

Attempts have been made to promote communication by bringing the norms closer to one another, but with little success. Instead, an active program of mutual language teaching has been instituted in the school systems, as well as cultural exchanges under the aegis of the inter-Scandinavian society Norden.

SCANDINAVIAN LAW in medieval times constituted a separate and independent branch of early Germanic law (*see* GERMANIC LAWS, EARLY) which, originating within the territories of present-day Norway, Denmark, and Sweden, was extended between the 9th and 13th centuries to places settled or conquered by Scandinavian peoples. These were, in the west, Iceland, Greenland, and the Faeroe Islands, parts of Great Britain and Ireland with surrounding isles, Normandy, etc.; with, in the east, Finland and other territories along the Baltic shore. In modern times Scandinavian law embraces Norway, Denmark, Sweden, Iceland, Greenland, the Faeroe Islands, and Finland.

Early Times.—Before the Scandinavian states emerged as unified kingdoms in the 9th century, the several districts and provinces were virtually independent administratively and legally. Although social organization in the main was the same, and legal developments followed similar lines, there came into existence a number of separate legal systems or "laws." Originally there were no written laws; the legal system consisted of customary law which was conserved, developed, and vindicated by the people itself at the so-called *things; i.e.,* popular meetings of all free men. Separate *things* were generally held in smaller localities and common *things* or *all-things* for more comprehensive regions. The meetings were conducted by one or more prominent men, conversant with the law, who made statements of law; gave directions concerning rules of law applicable in particular cases; and, with the assent of the *thing,* created new law when traditional law was insufficient. Consolidation of several provinces under one king did not at first effect any important change, cohesion being feeble and the central authority's influence in the legislative field restricted. However, a trend toward greater legal unity gradually asserted itself, with the formation of more comprehensive regions with common *things* and identical laws.

Between the 11th and 13th centuries the provincial laws were recorded in writing (invariably in the vernacular), most often as private compilations but occasionally by instructions from the king. The best-known laws of this period are the Gulathing's law (written in the 11th century, Norwegian); the law of Jutland (1241, Danish); and the laws of Uppland (1296) and Götaland (early 13th century), both Swedish. More or less complete legal unity was accomplished at different times. In Norway King Magnus V (1263–80) provided a common code of law for the rural districts as early as 1274 and for the towns two years later. A corresponding royal initiative was taken in Sweden in the 14th century (King Magnus Ericsson, *c.* 1350), but Denmark remained subject to three different provincial laws until the promulgation of Christian V's Danish Law (1683). Iceland, which had been organized as a free state by settlers from Norway and had developed a legal system of particular interest, came under the Norwegian crown in the 13th century (Haakon IV, 1262), and received new laws mostly borrowed from King Magnus' code.

The early laws or codes had not the character of civil codes as understood today. Besides subjects of private law (matrimony, inheritance, property, and contract), they contained constitutional and administrative law, criminal law, and law of procedure. Ecclesiastical law was usually excluded and treated separately. The codes represented chiefly codification of customary law; influences from abroad were negligible except for some traces

of canon law. Whereas the provincial laws, in common with other early Germanic laws, had tolerated and regulated blood feuds (setting up detailed tariffs for manslaughter and offenses against the body), the codes are in several respects more progressive. Thus, King Magnus' code abolished private vengeance, declaring that the king's officials should initiate criminal proceedings and provide for the punishment of evildoers. Further, presumably under the influence of Christianity, legal provisions were introduced for assistance to paupers and the helpless. Rules concerning landed property (*e.g.*, the right of redemption belonging to the family) were markedly original.

Intermediate Period.—In 1380 Norway and Denmark were united under a common king (Olaf IV), but the two countries retained their separate laws. During the next 300 years, before the acquisition of absolute royal power by Frederick III (1660), supplementary laws were issued by the king in conjunction with an assembly of nobles. Finally, during the reign of Christian V, a comprehensive work of codification was accomplished and the earlier and often obsolete law replaced by Christian V's Danish Law (1683) and Norwegian Law (1687). The new codes were mainly based on the existing national laws of the two countries, and foreign influence, whether of German, Roman, or canon law, was comparatively slight. Like the early codes, they comprised public as well as private law, purporting to treat exhaustively all more or less permanent legal rules and institutions. They were excellent for their times, drafted in a plain and popular style, inspired by respect for individual rights and the idea of equality before the law. Provisions of criminal law were relatively humane as compared with other European legislation.

In Sweden a revised edition of the original code, issued by King Christopher (1442), was expressly confirmed by Charles IX (1608). The need of more modern legislation, however, made itself increasingly felt, and following the Danish-Norwegian example a royal commission was entrusted with the task of drafting a new code. The result, commonly called "the Law of 1734," was promulgated by Frederick I.

Finland, annexed by Sweden in the 13th century and made subject to Swedish law, came under the Swedish code of 1734, translated into Finnish as "Law of the Realm of Finland."

Modern Times.—These old codes have been all but completely displaced by modern parliamentary statutes. In Sweden the law of 1734 has been conserved as a formal framework. Elsewhere plans for new, all-embracing codes are no longer entertained, but an extensive codification of important parts of public and private law has taken place. Projects have been discussed for consolidation of the several codification laws into a civil code of the type found in the rest of continental Europe, and preparatory work to this end was undertaken in Norway in the mid-1950s.

An interesting feature of Scandinavian law is the organized legislative cooperation which was begun in 1872 and has steadily increased in importance. In this way the Scandinavian states, including Iceland and Finland, have to a considerable degree obtained uniform legislation, especially regarding contracts and commerce, but also in the fields of law concerned with family, the person, nationality, extradition, etc.

While conserving their national character, the Scandinavian legal systems have adopted certain conceptions of Roman or continental European (mainly German and French) origin, chiefly through the influence of the law schools; commercial law and the law of shipping and of companies, for example, conform more or less to common European patterns. Modern social welfare legislation, which has reached a high standard, also has strong international connections. Scandinavian law today is pliable and close to life, less dogmatic than other European legal systems, and little bound by formal rules and exigencies. Great attention is paid to rules and principles evolved in practice, especially by the courts. Much of the law is judge-made, and, as the principle of *stare decisis* (*i.e.*, being bound by precedent) does not obtain, the courts have been free to meet the demands of changing social conditions. Extensive participation of laymen in both civil and criminal proceedings may have contributed in some measure to the present standard of law.

SCANDINAVIAN MYTHOLOGY: *see* GERMANIC MYTHOLOGY AND HEROIC LEGENDS.

SCANDIUM is a metallic element of the first transition series and a member of Group III of the periodic table. Although it is usually classed with the rare-earth elements, scandium is not actually a member of that group (*see* below). The symbol for scandium is Sc. Its atomic number is 21 and its atomic weight is 44.956. There is only one stable isotope, Sc^{45}, which occurs naturally in 100% abundance.

Scandium was one of the several elements predicted in 1871 by Mendeléyev to fill gaps in the periodic classification; he called it ekaboron. The missing element was not discovered until 1879, when L. F. Nilson separated its oxide from the rare-earth minerals gadolinite and euxenite. This discovery was of great scientific interest, for the oxide, named scandia, and other compounds prepared from it had properties closely corresponding to those predicted for ekaboron.

Scandium is found in many of the heavy rare-earth ores of Scandinavia, from which its name was derived, and in many tin and tungsten ores; it also occurs in the products of atomic fission. The cosmic abundance of scandium is relatively high. It is easily separated from the rare earths with which it occurs by precipitation of the very insoluble potassium scandium sulfate or by extraction of scandium thiocyanate by diethyl ether.

The chemistry of scandium bears a superficial resemblance to that of the trivalent rare-earth elements. A series of white salts, Sc_2O_3, $Sc_2(SO_4)_3$, $ScCl_3$, $ScBr_3$, and $Sc_2(CO_3)_3$, are similar to those formed by the rare earths. The ionic radius of Sc^{+3} is 0.68 Å. The Sc^{+3} ion is a much weaker base than the corresponding ions of the rare earths and has much greater complex-forming ability. For example, the weak basic character of Sc^{+3} permits the precipitation of the hydrated oxide, ScO(OH)—scandium does not appear to form a definite hydroxide—at pH 4.9 whereas pH 6.3 or higher is appropriate for the precipitation of the rare-earth hydroxides. The ether extraction of scandium from chloride or thiocyanate solutions is an example of the difference in complex-ion formation. Scandium also forms soluble complex fluoride ions, a behaviour atypical of the rare earths. The Sc^{+3} ion is paramagnetic.

The metal is prepared by the thermoreduction of the halides by alkali or alkaline-earth metals. It melts at 1,539° C and its density is 2.992 g. per cc. for the hexagonal close-packed structure.

Very few uses of this unusual metal have been developed. Its low density and high melting point suggest applications as an alloying agent for devices requiring lightweight metals. Scandium might also be used as a portable source of hard radiation: when activated in an atomic pile it emits 1 Mev (million electron volts) of gamma radiation with a half-life of 85 days; hence as a "bottled X-ray" source it could compete with the artificial isotope of cobalt, Co^{60}. (LD. B. A.; J. B. PS.)

SCAPA FLOW, an extensive landlocked anchorage in the Orkney Islands, about 15 mi. (24 km.) in length from north to south and 8 mi. (13 km.) in mean breadth, bounded by Pomona on the north, by South Ronaldsay on the east and southeast, and by Hoy on the west and southwest. The principal entrance is on the south from Pentland Firth through Hoxa Sound. Hoy Sound on the west leads into the Atlantic Ocean and three intricate channels on the east lead through Holm Sound to the North Sea.

Long before 1914 Scapa Flow was frequented by the Channel and Home fleets as its spacious and well-sheltered waters provided

an excellent practice ground, and the Admiralty planned that the main fleet should work from this base in wartime, to control the North Sea. However, little defensive work had been done when World War I started. The strong tides and intricate navigation of the entrances were considered sufficient defense against enemy submarines. The Grand Fleet was based there from Aug. 4, 1914, and for most of the war. On Sept. 1 as a result of an unfounded report of an enemy submarine having entered the Flow the fleet put to sea, moving to western Scotland and Northern Ireland, and returning to Scapa Flow in November. Temporary net defenses were rigged until permanent ones could be installed. In November an enemy submarine was destroyed in the outer approaches. Four years later, after the mutiny in the German fleet, one of their U-boats perished in a last desperate attempt to achieve success, but no U-boat managed to enter the Flow during World War I.

The battle cruiser force with its attendant flotillas moved to the Firth of Forth as soon as adequate antisubmarine defenses had been provided and in the latter part of the war Lord Beatty based the whole Grand Fleet there.

After the surrender of the German fleet in 1918 the Allies would not agree to Britain's definitely taking over the German vessels but, in spite of Britain's protests, the most important units of what had been the High Sea Fleet were interned in Scapa Flow with skeleton German crews on board, but not handed over. They were therefore only under distant observation by the British, and the result was that on June 21, 1919, the ships were scuttled by their German crews and the majority sank. They were later raised, broken up, and sold as scrap.

The story of Scapa Flow during 1939–40 bears a striking resemblance to that of 1914–15. Once more the main fleet was at anchor there when war broke out, and once more it had to abandon the base in the early days because of lack of defenses. In 1914 there were none, in 1939 there were only single lines of antisubmarine nets and a few antiaircraft guns. This time, however, the evacuation was due to no false alarm but to the sinking of HMS "Royal Oak" on Oct. 14, 1939, by a German submarine that had entered the Flow through the eastern entrance. This disaster (833 lives were lost) was quickly followed by the bombing of the depot ship, and once more the fleet had to move west, farther from the danger zone, which its task was to protect.

A new defense plan was immediately prepared and work proceeded with great activity. Eighty-eight heavy antiaircraft guns, together with many light ones, and more than 100 searchlights were mounted. Coast defense artillery was installed and three large controlled minefields were laid in the entrances. All antisubmarine nets were doubled and additional inner lines were laid. Airfields had to be constructed on the most unpromising sites, and there was much anxiety over the gaps continually occurring in the line of block ships closing the eastern entrance. This problem was eventually solved by joining the islands concerned with concrete emplacements. To the north the defense of Kirkwall as a large convoy assembly port also had to be organized. A most far-seeing part of the defense was the installation of the first really efficient radar system near Kirkwall by September 1939. This proved of immense value, and an efficient balloon barrage was also installed. Early in 1940 the defenses were sufficiently advanced for the fleet to return.

A successful air attack on the anchorage took place at the end of March 1940 when HMS "Norfolk" was hit by a bomb. Two further air attacks were made in April, but after this air attacks were never resumed. The efficiency of the defenses was proved by the fact that for five years the fleet's main base, although only 250 mi. (402 km.) from enemy airfields, was not again attacked.

In 1956 the base at Scapa Flow was closed, in company with many other naval shore establishments, in order to reduce the number of posts ashore held by uniformed personnel.

(R. N. Ba.)

SCAPHOPODA, a class of marine mollusks constituting the elephant's tusks, tusk shells, or tooth shells. There are four genera (of which *Dentalium* is the most familiar) and more than 350 species. Scaphopods are sedentary, and in the adult stage live on the sea bottom, into the surface layers of which they burrow and usually remain with part of the tubular tusklike shell, ½ in. to 6 in. long, projecting from the surface. They are carnivorous and feed upon such small animals as foraminifers, young bivalves, etc. The majority live in fairly deep water; *Dentalium peruvianum* has been found at a depth of 2,235 fathoms. Many of the deep-sea species are cosmopolitan in distribution. The origin of the class can be traced back at least to the Ordovician Period.

External Features.—The structure of scaphopods is quite distinct from that of other mollusks. They are bilaterally symmetrical, elongate animals, in which the right and left edges of the mantle are joined in the mid-ventral line except at the anterior and posterior ends. The visceral mass is thus enclosed in a tubular sheath. The head is imperfectly developed and bears numerous long filaments. The animal is devoid of gills. The cylindrical foot is adapted for digging and burrowing into sand, in which the animals lie with the posterior extremity of the shell projecting from the surface.

The tooth shells were originally placed in the same class (Acephala) as the Lamellibranchia; but beyond the conformation of the mantle and the digging foot, there is no close resemblance to that group, whereas their possession of a radula, mandible, and buccal bulb point to affinities with the Gastropoda.

The shell of *Dentalium* is elongate, conical, and slightly curved. There are two apertures in all scaphopod shells, a larger anterior one from which the foot projects and a smaller posterior one. The smaller orifice is kept clear of the sand and admits water for respiration and allows wastes to be discharged when the animal is buried on the bottom. The mantle cavity is continuous from one end of the body to the other. The head is cylindrical and bears two lobes beset with long filaments (captacula). These are mainly sensory but also serve to capture the small organisms on which the animal feeds. The foot is capable of considerable extension and has an expansible end, of great service in digging.

Internal Anatomy.—All scaphopods have a well-developed buccal mass with mandible and radula. From the esophagus the food passes into the stomach, which is little differentiated and receives the ducts of a bilobed liver and a pyloric cecum. The intestine is provided with an anal gland. The circulation and respiratory system is extremely simple. The heart is rudimentary, and there are no proper blood vessels. The blood is oxygenated in the inner surface of the mantle. There are two kidneys in the mid-ventral region of the body, which open to the exterior, one on each side of the anus. The nervous system consists of the same pairs of ganglia, with their commissures, as in the Gastropoda. The cerebral and pleural ganglia are joined to the pedal ganglia by

a long connective. These animals have only three kinds of sensory organs—the captacula, apparently tactile and olfactory; the subradular organ, probably an organ of taste; and the organs of balance (statocysts), situated in the foot. The sexes are separate. The ovary and the testis are unpaired and open into the right kidney, as in certain Gastropoda.

Development.—This has been studied in *Dentalium*. The eggs are laid singly, and segmentation is unequal and irregular. A gastrula arises through invagination, as in most Mollusca, and subsequently develops into a floating trochophore larva. A veliger stage succeeds, and after five or six days the velum (girdle of cilia) atrophies and the young *Dentalium* abandons its floating life and starts to creep about on the sea bottom. Interesting experiments have been done on this form. *See* EMBRYOLOGY AND DEVELOPMENT, ANIMAL: *Experimental Embryology*.

BIBLIOGRAPHY.—The most important papers up to 1906 are cited by P. Pelseneer in E. R. Lankester's *Treatise on Zoology* (part v, *Mollusca*). *See* also J. Henderson, "A Monograph of the East American Scaphopod Molluscs," *United States National Museum*, Bull. III (1920). (G. C. R.; W. K. E.)

SCAPOLITE, a group of rock-forming minerals, which are silicates of aluminum with calcium or sodium but containing more or less chlorine, carbonate, or sulfate radicals. The name is from the Greek for "rod" and "stone" after the shape of some crystals. Scapolite also is known as wernerite.

Mineralogy.—The species of the scapolite group, ranging from marialite to meionite, must be regarded as variable isomorphous mixtures of the following five components:

Ma = $3NaAlSi_3O_8{\cdot}NaCl$—chloride-marialite
MaS = $3NaAlSi_3O_8{\cdot}Na_2SO_4$—sulfate-marialite
MaC = $3NaAlSi_3O_8{\cdot}Na_2CO_3$—carbonate-marialite
MeC = $3CaAl_2Si_2O_8{\cdot}CaCO_3$—carbonate-meionite
MeS = $3CaAl_2Si_2O_8{\cdot}CaSO_4$—sulfate-meionite

It seems likely that in marialite, NaCl, etc., may be replaced to a limited extent by KOH, and in meionite, $CaCO_3$, etc., may be similarly replaced by CaF_2. The close relation which this group of minerals bears to the plagioclase feldspars is apparent in the formulas indicated above (*see* FELDSPAR: *The Plagioclases*). The scapolites crystallize in the tetragonal system, the crystals being prismatic hemihedral. The hardness is 5–6, while the specific gravity varies with the composition, pure chloride marialite being 2.560 and carbonate-meionite 2.772. The colour is usually white or gray. Between the end members, marialite and meionite, there are mixtures which have been given definite names. These include dipyre and mizzonite, and may, as in the case of the plagioclase feldspars, be arbitrarily fixed as follows:

marialite $Ma_{100} \rightarrow Ma_{80}Me_{20}$
dipyre $Ma_{80}Me_{20} \rightarrow Ma_{50}Me_{50}$
mizzonite $Ma_{50}Me_{50} \rightarrow Ma_{20}Me_{80}$
meionite $Ma_{20}Me_{80} \rightarrow Me_{100}$

The scapolites show varying resistance to acids, the meionite-rich members being most readily attacked, CO_2 being released by HCl-HF mixtures from the carbonate meionite, while marialite is only slightly attacked. They are destroyed by fusion, the lime-rich members giving plagioclase feldspar on cooling. The commonest alteration products are calcite kaolin, white mica, and zeolites. The scapolites are essentially metamorphic minerals, appearing very commonly in metamorphosed limestones.

Well-developed glassy crystals of scapolite occur in the ejected blocks of limestone of Monte Somma, Vesuvius, and large crystals occur in the apatite deposits of Bamle, southern Norway, where they arise from alteration of plagioclase feldspar in gabbro. The mode of occurrence of scapolite is referred to in detail below.

(C. E. T.)

Scapolite Rocks.—Scapolites have three principal types of occurrence in rocks:

1. Scapolites are common in crystalline limestones and in calc-silicate hornfelses near igneous contacts. Even marialite, the variety richest in sodium, occurs in this manner as small crystals lining cavities in ejected blocks of limestone at Vesuvius and the Eifel craters in Germany. The scapolite may occur as small inconspicuous grains or as large, well-formed crystals. Minerals found with it in rocks of this sort include calcite, diopside, grossularite garnet, tremolite, wollastonite, sphene, and idocrase. In the Pyrenees, scapolite is common in limestone and calcareous shale where these rocks are in contact with diabase and peridotite.

2. Scapolite is also common in beds of marble and calc-silicate granulite associated with gneiss and mica schist. The scapolite is characteristically associated with calcite, diopside, garnet, wollastonite, or amphibole. Rocks of this sort have formed by metamorphism, on a regional scale, of impure limestones and calcareous shales. Examples are numerous in the Precambrian rocks of Canada and Fennoscandia (the Baltic shield) as well as in areas of crystalline schist formed in more recent geologic times. Some scapolite-bearing amphibolites and pyroxene-gneisses are probably metamorphosed igneous rocks. At Bolton, Mass., coarsely crystalline scapolite and scapolite-quartz rocks occur as dikelike bodies, several feet thick, cutting across dolomitic marble. These masses resemble in texture the pegmatite dikes cutting the adjacent mica schists and their origin may be similar.

3. In gabbros and related rocks, plagioclase feldspars may be wholly or partly converted to scapolite. Excellent examples occur in Norway and Sweden; in the Pyrenees; in Ontario, Can.; and in the Adirondack Mountains of New York. The pyroxenes in these rocks are altered in some occurrences to a uralitic hornblende, and the rock may have a spotted appearance with white, rounded patches of scapolite in a granular matrix of green hornblende. Chlorine-bearing apatite is commonly associated with such occurrences and it has been suggested that the scapolitization has been brought about by the action at depth of aqueous solutions rich in chlorides and phosphates, presumably from an igneous source.

(J. B. T.)

SCARAB (Lat. *scarabaeus*, connected with Gr. *karabos*), literally a beetle, and hence an Egyptian symbol in the form of a beetle. The Egyptian hieroglyph represents the dung beetle *Scarabaeus* (or *Ateuchus*) *sacer*, which may be seen on sunny days forming a ball of dung and rolling it over the sand to its burrow, where the morsel is consumed during the following days. The Egyptians apparently shared the widespread belief that the beetle lays its egg in this ball of dung, and saw in the life cycle of the beetle a microcosm of the cyclical processes in nature, and particularly of the daily rebirth of the sun, a parallel made

even more striking by the globular shape of the pellet. The ancient sun-god Khepri was conceived of as a great scarab rolling the sun across the heavens. The scarab became as well a symbol of the enduring human soul, whence its frequent appearance, often with wings spread, in funerary art. Quantities of dead scarabs have been discovered in burials of the earliest period, apparently to ensure the continued existence of the soul; the later mummification (*see* MUMMY) of scarabs stems from the fact that they were sacred to Khepri at Heliopolis. Several stone scarabs of monumental size are known; one in the British Museum perhaps came from the Heliopolis temple, and another stands by the sacred lake at Karnak. The Egyptian name of the beetle was *ḫprr* (or *xprw*), a derivative from the stem *ḫpr* (or *xpr*) "become," and the hieroglyph was used to write these and related words (*see* HIEROGLYPHS).

An important class of Egyptian antiquities is in the form of scarabs of various materials, glazed steatite being most common, but other stones, faïence, and pottery also being used. Such objects usually have the bases inscribed or decorated with designs, and are simultaneously amulets and seals. They first appeared in the late Old Kingdom, when they evolved from the so-called button seals (*see* BABYLONIA AND ASSYRIA: *Art and Art Objects: Glyptic*). Scarabs remained rare until Middle Kingdom times, when they became abundant and replaced the earlier stamp seals and cylinders. Pierced lengthwise for stringing or mounting in ring bezels of precious metal, they were also used simply as ornaments; plain amethyst scarabs are common articles of Middle Kingdom jewelry (*q.v.*). Some scarabs are purely amuletic in purpose, as the large basalt "heart scarabs" of New Kingdom and later times. Such an amulet was placed in the mummy bandages and was inscribed with Chapter 30b of the *Book of the Dead*, a spell that identified the scarab with the heart of the deceased and conjured it not to betray him in the judgment before Osiris (*q.v.*). A winged scarab might also be placed on the breast, and later a number of amuletic scarabs were placed about the body.

The seal type of scarab is, however, the most common, and many clay sealings attesting this use have been found on sites of the Middle and New Kingdoms. Spiral motifs and names and titles of officials are characteristic of the Middle Kingdom examples, while on New Kingdom and later scarabs a wide variety of designs and inscriptions is found. Some of the inscriptions, although carefully executed, have been so corrupted by illiterate copying as to be meaningless. Various hieroglyphs expressing luck or happiness may be collected into a design. Real inscriptions are sometimes mottoes referring to places, deities and so on, or containing words of good omen or friendly wishes (*e.g.*, "Memphis [*q.v.*] is mighty forever," "Amon [*q.v.*] protecteth," "Bubastis [*q.v.*] grant a good New Year," "May thy name endure and a son be born thee").

SCARAB FROM THEBES COMMEMORATING THE REIGN OF AMENHOTEP III (ABOUT 1417–1379 B.C.). THE BEETLE IS INSCRIBED TO THE KING; REVERSE (RIGHT) IS COVERED WITH HIEROGLYPHICS

Historically the most valuable class is that which bears royal names, ranging from the 11th dynasty to the Late period. Some great kings are commemorated on scarabs of periods long subsequent to them. Thus Cheops (*see* KHUFU) of the 4th dynasty, appears on examples of 26th dynasty date, and Tuthmosis (Thutmose) III's name is found throughout later times. Nevertheless, distinctions of style and pattern often make it possible to recognize contemporary royal scarabs, and the names of the Hyksos dynasts have been largely recovered from collections of scarabs (*see* HYKSOS).

A series of exceptionally large scarabs was engraved in the reign of Amenhotep III (*c.* 1417–1379 B.C.; *see* AMENHOTEP), all bearing the king's titles and those of Queen Tiy. Five varieties are known; the simplest commemorates the queen's parentage and the northern and southern limits of the empire; another, dated in the king's second regnal year, a great wild-cattle hunt; the third, the arrival of Princess Gilu-Khepa of Mitanni (*see* MESOPOTAMIA: *Hurrians and Aryans*) in year 10; the fourth (many specimens), the number of lions slain by the king down to year 10; the last, the creation of the lake of Zarukha in year 11.

A related type of seal-amulet, called by Egyptologists the scaraboid, is similar in shape but lacks the details of the beetle's anatomy. Egyptian scarabs were carried by trade over all the eastern Mediterranean and to Mesopotamia. The Greeks, especially in their Egyptian colony of Naukratis (*q.v.*), imitated them in soft paste. The finest Etruscan gems of the 6th and 5th centuries B.C. are in the form of scarabs, inspired by Egyptian imports.

Bonner, *Studies in Magical Amulets, Chiefly Graeco-Egyptian* (1950); S. H. Horn, "Scarabs from Shechem," *Journal of Near Eastern Studies*, vol. 21 (1962). (F. LL. G.; N. B. MI.)

SCARAMOUCH (English spelling) is the stage character of a comic servant created by the Italian actor Tiberio Fiorillo, leader of a company of impromptu players, who acted in Paris in 1645–47 and frequently shared the stage of the Palais-Royal with Molière from 1662 to 1673. Before going to Paris, Fiorillo had made a name for himself as a member of the Uniti company, in which he had acted the Captain's part under the name of Scaramuccia. At what point he dropped the braggart soldier and became the comic servant it is impossible to tell. As Scaramouche (the French spelling) he charmed Parisians with the finesse and suppleness of his miming. He relied very little on the spoken word, placing all the emphasis on expressive body movement. Molière learned many tricks of his trade by watching the performances of Fiorillo. In a satirical print the French actor is portrayed as aping the Italian master. (A. M. N.)

SCARBOROUGH, a municipal borough of the North Riding of Yorkshire, Eng., is 41 mi. (66 km.) NE of York by road. Pop. (1961) 43,061. Scarborough lies behind a peninsula of high land on which the ruins of the castle stand like a sentinel overlooking the North and South bays. The castle was built during the reign of King Stephen about 70 years after the town was raided by Harald Hardraade (*see* HARALD III) in 1066. In 1312 the earl of Pembroke captured Piers Gaveston, earl of Cornwall, after laying siege to the castle. It fell to Parliamentary forces in 1645 and 1648, and from 1665 to 1666 the Quaker George Fox was imprisoned there.

Scarborough is probably the oldest seaside resort in England, and it is now generally accepted that its name derived from a character in the Icelandic *Kormaks Saga*, which tells how two Viking brothers, Kormak and Thorgils, were the first men to set up a stronghold there (from 965 to 967). As Thorgils was nicknamed "Skarthi the harelipped," the derivation of Scarborough's medieval name Scardeburg, from Skarthiburg, seems probable. Scarborough was granted its first charter by Henry II in 1181. In the burial ground of the parish Church of St. Mary the Virgin (Early English) is the grave of Anne Brontë (d. 1849).

By 1660 the merits of the Scarborough "spaw" were becoming known throughout the country and the first spa water cistern was

built in 1698, a governor of the spa being appointed by the corporation. Many new inns catered for the "spaws"—as the visitors were known—and in the 18th century began the fashion of combining the taking of the spa waters with bathing in the sea. Thus it was that Scarborough first became famous as a sea-bathing resort. Its two bays are linked by the Marine Drive, a sea defense around the base of Castle Hill, which was opened in 1908. The modern town extends a considerable distance inland, its southern limits being dominated by Oliver's Mount (said to have been named after Oliver Cromwell) on which stands the war memorial, a gigantic obelisk.

Old houses are still to be found in Sandside and other steep winding lanes at the back of the harbour, which is enclosed by the East and West piers and divided into two basins by the Vincent Pier, at the end of which stands the lighthouse. There are two splendid beaches with boating and bathing in both bays and boating in two of the gardens and parks. On an island in the lake of Northstead Manor Gardens is the stage of the Open Air Theatre, while the auditorium, which seats 7,000 spectators, rises up the facing hillside. Wood End, formerly the home of the Sitwell family, is a museum devoted to natural history and includes a vivarium. There is also a collection of books, manuscripts, etc., connected with the Sitwells.

The stewardship of the ancient manor of Northstead, which lies under the lake in the nearby Peasholm Gardens, is given alternatively with that of the Chiltern Hundreds to members of Parliament who adopt the traditional method of retirement by taking "an office of profit under the crown."

The resort is famous for its cricket festival and tennis and golf tournaments, the latter being played on the championship course at Ganton, 9 mi. (14 km.) SW. Although mainly a residential and holiday town, Scarborough has a number of small industries. It is a quarter sessions borough and has a separate commission of the peace. (E. Go.)

SCARLATTI, (PIETRO) ALESSANDRO GASPARE (1660–1725), Italian composer of operas and religious works, and one of the most important figures in the development of classical harmony, was born at Palermo on May 2, 1660. He was sent to Rome at about age 12; there he met Bernardo Pasquini, by whom he was greatly influenced, and Arcangelo Corelli. The first of his 115 operas, *Gli equivoci nel sembriante* (1679), written for a religious fraternity in Rome, won him the protection of Queen Christina of Sweden, for whom he wrote *L'onestà negli amori* (1680), and in whose service he remained until 1683. These works brought him commissions for operas from Naples, where, in 1684, he became *maestro di cappella* in the royal service. He remained there until 1702, writing over 40 operas and musical entertainments for the court and its circle. *Gli equivoci in amore* (1690) is a typical example of his work at that period of his life.

In 1702 Scarlatti went to Pratolino, near Florence, where, over the next two years, he wrote four operas for the theatre of Prince Ferdinando III de'Medici; the scores of these works have disappeared. In 1706 he was appointed *maestro di cappella* to Cardinal Pietro Ottoboni in Rome, and was also elected to the Arcadian Academy there. The following year he held a like post at Sta. Maria Maggiore in Rome and also wrote two operas on a larger scale, *Il trionfo della libertà* and *Mitridate Eupatore*, for production during the carnival in Venice. The latter is one of his finest works. Scarlatti traveled to Venice to supervise the performances; in 1709 he returned to his old post at Naples. There followed a period of intense activity during which he wrote serenades and Masses as well as operas. *La principessa fedele* (1710), *Scipione nelle Spagne* (1714), and *Tigrane* (1715) are among his principal operatic successes of this period. The ternary aria form is developed in these works, which are also remarkable for a bolder use of the orchestral stringed instruments. In 1716 he wrote a Mass for Pope Clement XI and in the same year completed his first *opera buffa*, *Il trionfo dell'onore* (Naples, 1718). Between 1718 and 1721 he wrote more operas and religious works. On his return to Naples in 1723 he seems to have gone into retirement. He died there on Oct. 24, 1725.

DETAIL FROM A PORTRAIT BY AN UNKNOWN ARTIST, IN THE LICEO MUSICALE, BOLOGNA; PHOTO, THE GRANGER COLLECTION

ALESSANDRO SCARLATTI

Scarlatti uses thematic development and chromatic harmony with great mastery and in a way which anticipates the work of much later composers, among them Mozart and Schubert. Though he is chiefly remembered for his operas, in which he established the form of the "Italian overture," his chamber music is equally characteristic and shows him to have had a commanding conception of form. Over 500 chamber cantatas from all periods of his life are extant. His church music is of unequal value, though the second of his two Masses with orchestra (1720) marks a new development, anticipating the Masses of Bach and Beethoven. He wrote little orchestral music but he contributed to the development of the opera orchestra. Whereas in his youth the strings were used mainly to play introductions and *ritornelli*, Scarlatti placed more emphasis on the orchestral accompaniment to the voices. His use of wind instruments was similarly novel: trumpets, flutes, oboes, and bassoons were used for particular effects, and horns were introduced into the orchestra.

See E. J. Dent, *Alessandro Scarlatti: His Life and Works*, 2nd ed. with preface and notes by F. Walker (1960).

SCARLATTI, (GIUSEPPE) DOMENICO (1685–1757), Italian composer whose harpsichord works represent the most fully developed style of keyboard writing in his time, was born at Naples on Oct. 26, 1685. He studied with his father, Alessandro Scarlatti, and became organist at the royal chapel in Naples in 1701. His first opera was produced in Naples in 1703. From 1705 to 1708 he studied under Francesco Gasparini in Venice. There Scarlatti met Thomas Roseingrave and also Handel, who became his lifelong friend. In 1709, in Rome, he entered the service of Maria Casimira, queen dowager of Poland, for whom, between 1710 and 1714, he wrote seven operas. Later he held posts at the Vatican and the Portuguese embassy in Rome. From 1720 to 1724 he is believed to have been both the music director of the royal chapel in Lisbon and the music teacher of Princess Maria Barbara. He was again in Naples in 1724, and in 1728 in Rome. When in 1729 the princess married the prince of Asturias, later Ferdinand VI, Scarlatti accompanied her to Spain. He spent the remainder of his life at Madrid and the royal palaces at Seville and Aranjuez. He died at Madrid on July 23, 1757.

Of his 555 published harpsichord sonatas only 30 appeared during his lifetime. These were published in London in 1738 under the title *Essercizi per Gravicembalo* ("Harpsichord Exercises") and form the first important group in this series written for the delectation of the Spanish court. The *Essercizi* and the manuscripts made for the royal family and deposited in the Biblioteca Nazionale Marciana, Venice, and the Conservatorio Arrigo Boito, Parma, are the principal sources for all but a few of the sonatas. The composition of these original works, which form the foundation of the modern keyboard style, occupied most of the latter part of Scarlatti's life. Unlike the suites of Bach and Handel, they are comparatively short pieces in binary form, written in pairs and displaying great rhythmic and harmonic subtleties. The best 20th-century edition is Alessandro Longo's (ten volumes and supplement). Besides his harpsichord works and operas Scarlatti also wrote religious works.

See S. Sitwell, *A Background for Domenico Scarlatti 1685–1757* (1935); R. Kirkpatrick, *Domenico Scarlatti* (1953).

SCARLET FEVER (SCARLATINA) is an acute infectious disease caused by certain types of hemolytic streptococcal bacteria. The first clear description of it is credited to the German physician Daniel Sennert (1619), although Michael Doering probably first observed the disease in Breslau, Pol. The English physician

Thomas Sydenham in 1676 gave a clear differentiation of scarlet fever, as follows: "The skin is marked with small, red spots, more frequent, more diffuse, and more red than in measles. These last two or three days. They then disappear, leaving the skin covered with brawny squamulae, as if powdered with meal." The disease appeared in North America about 1735 and was described by Benjamin Rush.

Practically all strains of streptococci capable of producing the disease belong to Lancefield's group A and are serologically distinguished from other groups of streptococci on the basis of a specific group antigen, the C substance, which is carbohydrate in nature. Group A is typified by *Streptococcus pyogenes*. Within group A many types of hemolytic streptococci have been identified on the basis of their M substance, which is protein in nature. Occasionally scarlet fever is caused by streptococci belonging to a group other than A. Certain types (1, 4, 18, and others) have often been associated with kidney complications.

Under suitable growth conditions the hemolytic streptococcus elaborates a number of toxic substances, some of which seem to be important factors in its disease-producing mechanism. These are erythrogenic toxin, streptolysin, fibrinolysin, leukocidin, and the so-called spreading factor, the enzyme hyaluronidase. The erythrogenic toxin causes the toxic manifestations of the disease such as the eruption, rapid pulse, fever, and delirium. Injection of a small amount of this toxin into the skin to determine susceptibility to the disease is known as the Dick test, developed by the leading U.S. investigator of scarlet fever, George Frederick Dick (*q.v.*).

Symptoms and Treatment.—The onset of the disease begins from two to seven days after exposure. The first symptoms are fever, sore throat, headache and, in children, vomiting. From two to three days later the rash appears as a reddening of the skin which begins on the neck, in the armpits and groin, and upon the chest. The face is flushed, with a ring of pallor around the lips. The throat is inflamed and red spots appear upon the palate. The tongue is coated, but the edges are deeply inflamed. After four days the coating on the tongue disappears, leaving a swollen, deeply injected surface with prominent papillae (strawberry tongue).

The eruption lasts for a week or more, and in about one-third of the cases is followed by desquamation, or peeling off of portions of the skin. The glands of the body are usually swollen; those of the neck may be tender and painful to touch. The eruption may be very faint; indeed, it may never occur in persons who have immunity to the toxin (*scarlatina sine exanthemata*). Such individuals represent important agents in the spread of the disease to others. The fever may last for a week or more.

Various clinical patterns, such as mild, moderately severe, severe, toxic, septic, and malignant scarlet fever have been described. Such classifications merely denote variations in the degree of severity and are a matter of opinion. The clinical manifestations may be regarded as primary and secondary. The primary infection usually occurs in the pharynx; the secondary features are the result of toxic and septic reactions. Toxic reactions include headache, fever, vomiting, rapid pulse, delirium, eruption, and disturbances in the heart and kidneys. The septic reactions result from invasion of the tissues by the hemolytic streptococcus and include cellulitis, swollen glands, and infections of the ear, mastoid, sinuses, blood, and brain.

Complications are frequent. The sinuses probably are always secondarily involved, frequently remain infected during convalescence and constitute an important focus in which the organism remains to cause the patient to become a carrier. Abscesses of the ear and mastoiditis occur. Infection of the glands of the neck frequently results in abscess formation. In certain instances the streptococcus enters the blood stream and is carried to various parts of the body where localized areas of infection develop. Among the late complications are nephritis (which occurs in 0.5% to 1.0% of all cases), arthritis, and rheumatic fever. The urine should be tested frequently during the course of the disease.

Diagnosis is based upon the characteristic symptoms and signs. As a general rule, a child who becomes ill with fever, sore throat, headache, and vomiting, and who develops a fine generalized rash within 24 to 72 hr. after the onset of symptoms presumably has scarlet fever until proved otherwise. The diagnosis may be confirmed by isolation of the streptococcus from the throat or from some other region of the body, which may be the focus in so-called surgical scarlet fever. When an injection of a small amount of immune serum (0.1 cc. to 0.3 cc.) is made into the skin while the rash is at its height, a blanched area results at the point of injection within 18 hr. if the rash in question is caused by scarlet fever toxin. This reaction is known as the Schultz-Charlton test. Another confirmatory test consists in the reversal of the Dick test from positive to negative during the course of the disease.

Second attacks of scarlet fever are relatively rare but the recovered patient may subsequently experience other types of streptococcal infection.

Penicillin, to which the streptococcus is highly sensitive, is the treatment of choice. Gamma globulin, prepared from human serum, is also effective. Treatment should include bed rest, adequate fluids, and a diet commensurate with the patient's appetite.

Occurrence.—Scarlet fever is extremely variable in its severity not only in different countries but in different outbreaks occurring in the same country. In the U.S. it is relatively mild, with a mortality rate of less than 1%. In the Balkans and in China severe forms of the disease exist. It is found principally in the temperate zones, rarely in the tropics. It is primarily a disease of childhood; half the cases occur between the ages of two and eight years. Most cases of scarlet fever occur during the winter and spring months, with an increase of incidence in September when schools open. Nonwhite people are less susceptible than white, and slightly more males than females develop the disease. Certain families are especially susceptible, but in general the communicability rate among susceptibles in a given family is between 5% and 15%.

The disease is spread chiefly by droplet infection but may be disseminated by contaminated dust particles and by contaminated hands, food, drinks, and fomites. Contaminated milk may give rise to an outbreak. Surgical scarlet fever may result from infected wounds and burns. Convalescent cases and persons harbouring the organism in discharges from infected ears, sinuses, and wounds may act as carriers, constituting an important factor in the spread of the disease. Control measures include isolation of the active case and the treatment of carriers, many of whom become free of streptococcus after treatment with penicillin. Because of the fact that scarlet fever is only one of several related types of infections caused by the hemolytic streptococcus (designated by some as streptococcosis), quarantine and isolation procedures alone do not prove to be adequate measures in the prevention of the disease.

(W. L. Bo.)

SCARPANTO: *see* KARPATHOS.

SCARRON, PAUL (1610–1660), French writer whose burlesque poems set him among the wits of the age, whose plays show a gift of lively comedy that immediately foreshadows Molière, and whose major novel is a masterpiece of the picaresque genre. The son of a counselor in the *parlement* of Paris, he was baptized July 4, 1610. Becoming an abbé in 1629, he entered the service of Charles de Beaumanoir, bishop of Le Mans, in 1633. After a visit to Rome with him in 1635, Scarron returned to Le Mans and there, in 1638, was attacked by a disease which in 1640 became so much worse that the rest of his life was spent in pain and progressive deformity.

His life up to this point had been dissolute but he now found consolation in the chaste sympathy of Louis XIII's former favourite, Marie de Hautefort (the future maréchale de Schomberg), temporarily exiled at Le Mans. Returning to Paris, he was further troubled by lawsuits with his stepmother after his father's death (1643).

For some time Scarron enjoyed the patronage of the future cardinal de Retz (*q.v.*), and during the Fronde he eventually published a violent pamphlet against Mazarin (early in 1651). In 1652, almost entirely paralyzed, he married a beautiful but poor young girl, Françoise d'Aubigné, who later became world-famous as Madame de Maintenon (*q.v.*). He died in the night of Oct. 6–7, 1660.

Scarron's first book, *Recueil de quelques vers burlesques* (1643; supplemented by *Suite des oeuvres burlesques,* 1644) had some success, but his burlesque epic, *Typhon, ou la gigantomachie* (1644) was less well received. His play *Jodelet, ou le maître valet* (1645), named after the comedian Jodelet for whom the principal role was destined, inaugurated that tradition of developing the valet's role in comedy which Molière was to exploit so brilliantly.

The work for which Scarron was most famous in his own day, *Virgile travesty* (7 books, 1648–53), a parody of the *Aeneid,* seems rather deplorable to modern readers, but his *Roman comique* (*Le Romant comique,* 2 vol., 1651–57, unfinished; 3rd vol. by other hands, 1659) is recognized as of great merit and interest. The desultory story of a troop of strolling actors (in the style of the Spanish picaresque romances), it depicts manners and character in a singularly vivid way that makes it a landmark in the development of the French novel. Scarron's other works include eight more comedies (the most notable was *Don Japhet d'Arménie, c.* 1647) and a series of five tragicomical tales in the Spanish manner (1655–57). Of the latter, Molière drew on *La Précaution inutile* as a main source for *L'École des femmes* and on *Les Hypocrites* to a lesser extent for *Tartuffe.*

Scarron was at the centre of the literary activity of his time. He knew all the young men who were putting new life into the French drama—Jean Mairet, Tristan L'Hermite, Corneille, and Rotrou. His own plays show a gift for realistic comedy that is the nearest thing to Molière before 1650. He was moreover a most important representative of the critical strain in French literature. While his burlesque verses parody contemporary epic, the vivid scenes of the *Roman comique* seem to be meant as an antidote to idealistic and pretentious novels. The vigour and wit of his writing reveal a talent as remarkable as the personality that, in the opinion of many who knew him, triumphed over years of pain. A critical edition of Scarron's collected works began with *Le Romant comique,* edited by H. Bénac (1951).

SCAURUS, MARCUS AEMILIUS, the name of two Roman politicians, father and son.

MARCUS AEMILIUS SCAURUS (*c.* 162–*c.* 89 B.C.) was a leader of the Optimates (or nobility). His family, though patrician, was impoverished, so he had to work his way up. Having acquired wealth, he turned from business to public life and, helped by the family of the Metelli, reached the consulship in 115 B.C., when he defeated some Alpine tribes and gained a triumph. Chosen *princeps senatus,* he held this position until his death. Sent to check the ambitions of the Numidian king Jugurtha in 112, Scaurus was alleged in 111 to have been bribed by him, but he neatly avoided trouble by getting himself selected as one of the presidents of the commission appointed to inquire into such allegations (109). In 109, as censor, he constructed a Via Aemilia through Pisa to Dertona (Tortona) and repaired the Milvian Bridge near Rome. In 104, as grain commissioner at Ostia, he replaced Saturninus, whose sedition in 100 he helped to suppress (*see* SATURNINUS, LUCIUS APPULEIUS). Accused of extortion in 92, he managed to get the trial postponed. He supported his friend the reforming tribune M. Livius Drusus (the younger) in 91, in his attempt to secure the franchise for the Italian allies, and in 90 was accused of intriguing with the allies but acquitted. He married Caecilia Metella, later Sulla's wife, and was the father of Aemilia, later Pompey's wife. He wrote three volumes of autobiography, which Sallust may have used in writing his history of the Jugurthine War. A conservative who moved with the times, Scaurus exercised great influence. Cicero (*Pro Fonteio,* 24) said that the world was almost ruled by the nod of his head; Sallust gives a less flattering portrait.

MARCUS AEMILIUS SCAURUS, son of the above, served as Pompey's quaestor and proquaestor in the Third Mithradatic War (66–61 B.C.). Sent to Judaea and Nabataea, in return for large bribes he decided the quarrel between Hyrcanus and Aristobulus (*see* HYRCANUS) in the latter's favour in 64 (Pompey later reversed this) and allowed the king Aretas to retain Nabataea (*see* NABATAEANS) in 62. The settlement with Aretas was commemorated on a coin which Scaurus, as curule aedile (*see* AEDILE), issued in 58, when he staged public games of unusual magnificence. Having been praetor (56) and propraetor in Sardinia (55), he was accused of provincial extortion in 54, was defended by Cicero and by Hortensius and was acquitted. Accused of electoral corruption, he went into exile in 52. He married Mucia, formerly Pompey's wife.

SCAVENGER'S DAUGHTER (corruption of Skevington's or Skeffington's daughter), an instrument of torture in use during the 16th century in England. It was invented by Sir W. Skevington, lieutenant of the Tower in the reign of Henry VIII. It consisted of a wide iron hoop which by means of screws was tightened round the victim's body until the blood was forced from the nose and ears, and sometimes from the hands and feet.

SCENERY, THEATRICAL: *see* STAGE DESIGN.

SCENTED PLANTS. The supreme joyous notes of plant life are colour and fragrance. Colour is shared with many animal groups, among them birds, fishes and butterflies, but fragrance is the openly broadcast gift of plant life. Natural animal fragrances are rare, but it is worth noting that certain flower-visiting butterflies and moths produce a flowery fragrance composed of essential oils, the same group of substances that produces redolence in flowers.

Fragrance and colour, so welcome to the aesthetic sense, have been the practical guideposts to food, consisting of pollen and nectar, for certain insects for thousands of centuries. There are many wind-pollinated and bird-pollinated flowers, none of which possess fragrance, and of the many flowers dependent on insects for pollination, only some are fragrant.

The sweet scents of flowers are nearly always associated with the showy parts of the blossom, being released by the petals or by sepals or bracts when there are no petals, but there are a few plants with small inconspicuous flowers, such as the pussy willow and a few others, that are fragrant. In the mint family (Labiatae) the pleasant refreshing scent comes from the green parts of the flower cluster and especially from the leaves and stems.

A LEAF OF LAVENDER (LAVANDULA MULTIFIDA) ABOUT ½ ACTUAL SIZE, WITH OUTLINE OF THE EDGE OF THE SAME LEAF, ENLARGED ABOUT 50 TIMES

Globe-tipped glandular or oil-secreting hairs are present on the edge of the leaf; thousands of smaller glandular organs are on both leaf surfaces

The attractive odours of flowers and foliage are predominantly attributable to the presence of essential oils (*q.v.*). These volatile substances are found in about one plant family out of five. An essential oil is a complex secretion product, apparently a normal part of the functioning of the plant and not an isolated end in itself. The essential oils are rather powerful substances and often appear in minute quantities and perhaps never constitute more than about 2% of the floral plant material. The violet can be taken as an example, 15 tons of the flowers being needed to produce a pound of oil. The essential oils of flowers are more complicated than those of leaves—the former may consist of a dozen components while the simplest of leaf essential oils may have but one.

Both flower and leaf fragrances are much used in the manufacture of perfumes. Outstanding flowers for this purpose are rose, tuberose, hyacinth, jasmine, acacia (*Acacia farnesiana*), lily of

the valley and ylang-ylang (an Asiatic tree, *Cananga odorata*); leaves (and green sepals) used in perfumery include those of geranium (*Pelargonium* species), lavender, rosemary, patchouli (*Pogostemon cablin*), clary sage and even a few species of grass (of the genus *Cymbopogon*), which produce citronella, lemon grass and palmarosa oils.

Fragrance occurs not only in flowers and leaves but also in fleshy fruits of many kinds. This odour attracts mammals which help disseminate the seeds contained within the fruit. The same scents found in fruits, or very similar ones, are found in flowers and even in leaves of unrelated species. Thus one finds apple-scented (apple mint, sweetbrier rose) among other fruit-scented leaves, and peach, lemon, raspberry and quince odours among others in flowers of plants totally unrelated to those fruits.

The particular sweetness of a flower is usually not the result of the presence of a single chemical compound, but often includes one or more unrelated compounds that closely imitate the dominating odour. The constituents of the volatile oils are esters, alcohols, aldehydes, ketones, etc. The dominating ester can be accompanied by a closely related set of esters, making for overtones, and the final fragrance results from an intricate combination and proportion of volatile substances characteristic of the species.

The oil secretion of flowers takes place in the epidermal cells of the coloured part, usually on the upper side, but occasionally on both sides, as in the rose. Additional petallike parts, interior to the normal ring of petals, which make for doubling of flowers may also secrete oils, causing many double flowers to have that much more scentedness (violets, roses). Sometimes, however, doubling results in reduction of fragrance over that in single forms of the same kind of flower (lily of the valley, poet's narcissus). In some leaves, odours originate in hairs projecting from the surface or recessed in tiny depressions.

In the mint family (lavender, thyme, basil, marjoram, sage, etc.), the short-stalked glandular hairs that secrete the oil appear among several other kinds of hairs. They have rounded heads consisting of 1 to 16 or more cells. Other families, such as citrus (Rutaceae), myrtle (Myrtaceae) and laurel (Lauraceae), produce the fragrant oils in tough sacs in the interior of the leaf. These can be readily seen with a hand lens by holding a leaf up against the light.

There has been extensive neglect in maintaining fragrance in a large number of cultivated flowers. It has been customary to think of a flower as being beautiful because of its colour, size and form, and hybridists have been concentrating on this ideal. In the course of extensive hybridization, workers have drawn parents from many sources, and when unscented flowers are crossed with scented ones, the progeny will include some without fragrance. As an example, the group of yellow rose species (of Asiatic origin) have no rose scent. When they are bred even with fragrant kinds, many of their progeny will be unscented. One large grower of sweet peas finds that after considerable hybridizing his crimson and scarlet kinds are practically devoid of fragrance. It is extremely rare for any flower to lose its scent in nature, as this factor is so fundamental in the maintenance of the species. A fragrant plant introduced into cultivation and given conditions approaching its natural habitat should retain its fragrance.

A pronounced impetus to interest in scented plants has been given by the establishment in several large cities of fragrance gardens for the blind. The first such garden was founded in Exeter, Eng., in 1939; the first in the United States at Lima, Pa., in 1949. Fragrance gardens located in large cities—*e.g.*, one (started in 1955) at the Brooklyn Botanic Garden in New York City, and another (started in 1956) at the Lighthouse for the Blind in Chicago—are, because of their locations, much visited. In these gardens the blind can "view" trees, flowers and herbs by their fragrance and texture. Braille markers are placed so that the plants can be readily identified. The gardens are so designed that the sightless can guide themselves through the paths and experience the only realities of plants that are available to them—the furry leaf, the prickly stem, the juice of crushed leaves, the softness and fragility of the petals and, above all, the faint bouquets and the incense of the unseen blossoms.

Among plants grown for their fragrance and texture—and therefore essential in gardens for the sightless—are those with light and elusive bouquets: wallflower, cottage pink, flowering tobacco, sweet william, alyssum, heliotrope and violet; those with characteristically heavy redolence, hyacinth, rose, tuberose, jonquil, lily of the valley, lilac and mock orange. Plants with pungent piercing scent, to be tasted and bruised with the fingers, are thyme, dill, laurel, sage, lemon balm, rosemary, lavender, marigold and the astringent witch hazel and mints; and those to be touched and held in the hand, plants of interesting texture as well as unique odour, the hairy leaves of many herbs (mint, lavender, geranium), the unfolding leaves of the pungent balm of Gilead, the apple-scented foliage of sweetbrier rose and especially most needle-leaved and some broad-leaved evergreens with their aromatic resins.

SCÈVE, MAURICE (*c.* 1501–1560/4?), French poet who was considered great in his own day, and, after long neglect, has been reinstated by 20th-century critics and poets, chiefly for his poem-cycle, *Délie*. He was born at Lyons, where his father held high municipal office, and was prominent in the affairs and literary circles of his native city. Indeed, he has often been described as the leader of the Lyonese school of writers (including Pernette du Guillet, *c.* 1520–45; and Louise Labé, *q.v.*), although there is no evidence of an organized school. Lyons, on the trade route between northern and southern Europe, was a centre of humanism, and Scève first achieved fame in 1533 by his "discovery" of the tomb of Petrarch's Laura at Avignon, and again in 1536 with his *Blason du sourcil*, adjudged the best entry in a poetic competition held at Ferrara. (A *blason* is a minute description of the qualities of an object.) This poem, with some other *blasons* of his, was later published in the anthology, *Les Blasons du Corps Féminin*, often reprinted between 1537 and 1550. His *Délie, object de plus haulte vertu* (1544) is a poetic cycle of 449 highly organized decasyllabic ten-line stanzas (*dizains*), rich in imagery, and platonic and Petrarchan in theme and style. "Délie" (an anagram of "L'Idée"), long thought to be an imaginary ideal, may have been Pernette du Guillet, whose death seems to have partly inspired Scève's *Saulsaye, églogue de la vie solitaire* (1547), written in retirement in the country. After returning to Lyons, he wrote his last poem, *Le Microcosme* (1562), an epic, praising the efforts and progress of man from Adam's fall, which sustains its ambitious conception only in occasional passages of magnificent verse. Nothing certain is known of his last years, although several conflicting hypotheses have been put forward.

SCHADOW, a family of German artists.

JOHANN GOTTFRIED SCHADOW (1764–1850), sculptor, was born in Berlin on May 20, 1764. He learned his craft under the court sculptor J. P. A. Tassaert and perfected it in Rome from 1785–87 in the studios of A. Trippel and A. Canova. In November 1787 he returned to Berlin, and a year later succeeded Tassaert as director of the royal school of sculpture.

His first monumental work is the tombstone for Count Alexander von der Mark (1790, Berlin); his best known is the quadriga (1793), on the Brandenburg Gate. Among his finest work is the group of the princesses Louise and Frederike of Prussia (1797, Berlin). He was also responsible for the statue of Frederick the Great at Stettin (1793) and the Luther memorial at Wittenberg (1821). From 1800 on Gottfried Schadow was increasingly sur-

passed by Christian Rauch. After 1807 he executed a series of busts for the Bavarian crown prince's "Valhalla." He was one of the chief representatives of classicism in Germany, but he largely replaced the idealistic by a rigorous realism. In the last three decades of his life his sight became affected; he then stood out primarily for his writings on the theory of art and for his genius as a draftsman. He died on Jan. 27, 1850, in Berlin.

See H. Mackowsky, *Die Bildwerke Gottfried Schadows* (1951).

RUDOLF SCHADOW (1786–1822), eldest son of Gottfried, also a sculptor, was born on July 9, 1786, in Rome and was first taught by his father in Berlin. In 1811 he went to Rome, where he came into contact with the J. F. Overbeck and P. von Cornelius circle. He became the pupil of B. Thorvaldsen and A. Canova and took over C. Rauch's studio in Rome. From 1812 he was a member of the S. Luca Academy. Of his youthful, versatile work must be mentioned "The Spinner" (1816, Berlin and Budapest), the "Girl Binding on her Sandals" (1817, Munich), and the model for the monumental group in Berlin "Achilles Defends the Dying Penthesilea" (1821). Rudolf Schadow died in Rome on Jan. 31, 1822.

WILHELM VON SCHADOW-GODENHAUS (1788–1862), painter, founder of the Düsseldorf school, second son of Gottfried, was born in Berlin on Sept. 6, 1788. He was the pupil of his father and later of the painters J. F. Weitsch and W. Wach. He went to Rome in 1811 with his brother Rudolf, becoming a member in 1813 of the "Lukasbund" founded by F. Pforr and J. F. Overbeck. From 1816 to 1817 Wilhelm, together with P. von Cornelius, Overbeck, and P. Veit, painted the frescoes in the Casa Bartholdi. From 1819 to 1826 he was professor at the Berlin Academy and then succeeded Cornelius as director of the Düsseldorf Academy. The Düsseldorf school, which he founded, soon departed completely in its special type of painting and in its anecdotal, religiously-determined realism from the artistic ideas of Overbeck and his Nazarenes. Wilhelm died in Düsseldorf on March 19, 1862. His chief works are: a portrait of Gabriele von Humboldt (1818, Berlin); "Adoration of the Shepherds" (1824, Potsdam); and the fresco of "The Wise and Foolish Virgins" (1842, Frankfurt). He educated a generation of painters, including K. F. Lessing (1808–80).

See Anton Fahne, *Die Düsseldorfer Malerschule in den Jahren 1834, 1835 und 1836*, new ed. (1937); Julius Hübner, *Schadow und seine Schule* (1869). (J. C. JE.)

SCHAFF, PHILIP (1819–1893), U.S. theologian, church historian, and pioneer in church union, was born in Chur, Switz., Jan. 1, 1819. He was educated at the *Gymnasium* of Stuttgart and at the universities of Tübingen, Halle, and Berlin. At Berlin, where he became *Privatdozent* in 1842, he was deeply influenced by the historian J. A. W. Neander. His brilliant scholarship early attracted favourable attention. In 1844 he became professor of church history and biblical literature in the Theological Seminary of the German Reformed Church at Mercersburg, Pa. His inaugural address on *The Principle of Protestantism*, published in both German and English editions, viewed the history of the Christian Church as a divinely appointed development leading to a higher form of church life in which the values of Roman Catholicism and Protestantism would be blended in an evangelical Catholicism. This address, with its prophetic interest in church union, provoked charges of heresy, from which he was exonerated. Schaff, together with the theologian John W. Nevin (1803–86), shaped the Mercersburg theology, which resisted revivalist theology and emphasized the doctrine of the church. In 1864 Schaff began a six-year term as secretary of the New York Sabbath Association, becoming a widely known Protestant leader. He became professor at Union Theological Seminary, New York City, in 1870, serving until the year of his death. An inveterate traveler, he continued active leadership in Protestant affairs, especially in the interests of church unity through the Evangelical Alliance. He won a secure place as one of America's great theological scholars, both through the quality and remarkable quantity of his work as author and editor.

Outstanding among his many productions are the seven-volume *History of the Christian Church* (1858–92) and the three-volume *Bibliotheca Symbolicae Ecclesiae Universalis: The Creeds of Christendom* (1877). He edited the translation and revision of Lange's massive *Commentary* (1864–80), the great Schaff-Herzog *Encyclopaedia of Religious Knowledge* (1884), and other biblical and historical works. He participated actively in the preparation of the Revised Version of the Bible. He founded the American Society of Church History in 1888 and served as its first president. He was an originator and general editor of the American Church History series. Schaff died in New York on Oct. 20, 1893.

See David S. Schaff, *Life of Philip Schaff* (1897). (R. T. H.)

SCHAFFHAUSEN (SCHAFFHOUSE), the name of the most northerly Swiss canton and of its capital city.

The City.—Schaffhausen stands on the right bank of the Rhine about 15 mi. (24 km.) W of Lake Constance. Pop. (1960) 30,904, of whom the majority were German speaking. Bordering one of the main squares, the Münsterplatz, is the Protestant cathedral or Münster, a Romanesque pillared basilica, once the church of the Benedictine monastery of All Saints. The early-13th-century tower is surmounted by a 17th-century spire; in the 12th-century cloisters is the bell (cast in 1486) inscribed "vivos voco, mortuos plango, fulgura frango," which is said to have inspired Schiller's famous poem *Song of the Bell*. The municipal museum is now housed in the former monastery and contains sections for archaeology and ecclesiastical works of art, and arts and crafts. Facing the Fronwagplatz are several 17th- and 18th-century houses with oriel windows. Along the Vordergasse are the late Gothic *Haus zum Ritter* with famous frescoes by Tobias Stimmer (the originals are now in the museum), and the old Rathaus (meeting place of the *Grosser Rat*) which dates from the 15th century; the new Rathaus in the Renaissance style of 1617 stands near Beekenstube. Also notable is the 16th-century Gothic Church of St. John. The massive 16th-century Munot Fort overlooks the town and the Rhine.

The site of the city was first mentioned in 1045, as "Villa Scafhusun," and in 1050 there was a ford there across the Rhine. About 1049 Count Eberhard III of Nellenburg founded the Benedictine monastery of All Saints, which henceforth became the centre of the town. Perhaps as early as 1190, certainly by 1218, it was a free imperial city, though the first seal dates from 1253. The powers of the abbot were gradually limited, and in 1277 the emperor Rudolf of Habsburg gave the town a charter of liberties. In 1454 it made an alliance with six of the Swiss confederates, by whom it was received as an ally against the Habsburgs, being finally admitted a full member of the Swiss Confederation in 1501. Schaffhausen is now an industrial city and a tourist centre; medieval architecture of the true Swabian type mingles with modern manufacturing enterprises. An important railway junction, it is on the main line from Zürich to Stuttgart and is linked by rail with Basel, Constance, and Winterthur. There are motorboat connections with Lake Constance.

The Canton.—Schaffhausen canton lies almost entirely north of the Rhine where the river flows westward on leaving Lake Constance. The Rhine forms most of the southern boundary separating Schaffhausen from the cantons of Zürich and Thurgau. The remainder of the boundary borders on Germany, penetrating portions of which divide the canton into three detached parts: a large region including the town of Schaffhausen; the small isolated district of Rüdlingen-Buchberg to the southwest; and an area extending northward from Stein (Stein am Rhein). The canton contains two small German enclaves of which the village of Büsingen is the more important. The dominant relief feature is the plateau of Randen (the summit, Hoher Randen, reaches 3,031 ft. [924 m.]) sloping gently southward to the Rhine and intersected by short glens such as Klettgau. On the Rhine just below Schaffhausen is the celebrated Rheinfall (Falls of the Rhine). Hydroelectricity produced farther west at Rheinau supplies power for the chemical industry at Rheinfelden, the aluminum plant at Neuhausen (Neuhausen am Rheinfall, an industrial suburb of Schaffhausen), and engineering works at Schaffhausen. The area of the canton is 115 sq.mi. (298 sq.km.) of which about 95% is classed as "productive." The population in 1960 was 65,981, mostly German speaking and largely Protestant. The major industries include the production of machinery and metal goods, watches, jewelry,

textiles, canned food, leather goods, cement, glass, and paper; woodworking, brewing, and chemical production are also important. Vine growing is the predominant agricultural activity; forestry is a considerable source of revenue.

The canton is divided into six administrative districts, containing 34 communes. The cantonal constitution dates from 1874. The legislative assembly (*Grosser Rat*) is composed of 80 members elected every four years by the male adults. The executive council (*Regierungsrat*) of 5 members is also elected for four years by popular vote, as are the two members of the Federal Council of the States (*Ständerat*) and the two members of the Federal National Council (*Nationalrat*). Electors have the right of "initiative," both for legislative projects and for constitutional matters. Since 1895 the "obligatory referendum" for all legislative projects has prevailed. The canton, admitted into the Confederation in 1501, arose from acquisitions made at various times by the town of Schaffhausen. Of historical interest is the picturesque little town of Stein, with old painted, gabled, and turreted houses, a Benedictine monastery (1005–1526), now restored to form a museum, and the Hohenklingen Castle (12th century), overlooking the town. (W. V.)

SCHAFFNER, JAKOB (1875–1944), Swiss writer, who lived in Germany from 1913, was born at Basel on Nov. 14, 1875. He belonged to a new generation of Swiss writers who, in search of uncompromising greatness and believing in life as a boundless adventure, broke away from the saturated tradition of middle-class society. He lost his Swiss father and German mother early, and four autobiographical novels (*Johannes,* 1922; *Die Jünglingszeit des Johannes Schattenhold,* 1930; *Eine deutsche Wanderschaft,* 1931; *Kampf und Reife,* 1939) depict his experiences as a child, a charity schoolboy, a shoemaker, and a roving and autodidactic writer. Although Schaffner's colourful, spirited, imaginative style is in the realistic tradition of Gottfried Keller and of Jeremias Gotthelf, his convictions are rather those of Nietzsche and, to some extent, of Dostoevski and finally led him to follow the lure of National Socialism. Besides other novels (*Konrad Pilater,* 1910; *Der Dechant von Gottesbüren,* 1917; *Die Glücksfischer,* 1925), he wrote poems (*Bekenntnisse,* 1940) and essays (*Die Predigt der Marienburg,* 1931; *Berge, Ströme und Städte, eine schweizerische Heimatschau,* 1938). He was killed in an air raid on Strasbourg on Sept. 23, 1944.

See P. Fässler, *J. Schaffner, Leben und Werk,* with bibliography (1937); H. Bänziger, *Heimat und Fremde* (1959; on Schaffner's ambivalent attitude to Switzerland). (A. Bx.)

SCHARNHORST, GERHARD JOHANN DAVID VON (1755–1813), a general in the Prussian Army during the Napoleonic Wars and a pioneer of the general staff system (*see* STAFF, MILITARY). Born at Bordenau, Hanover, on Nov. 12, 1755, he was the son of a tenant farmer who had been a sergeant major in the Hanoverian artillery. As a young officer in the Hanoverian Army (commissioned 1778) he was brought up as a disciple of Wilhelm von Schaumburg-Lippe, who had helped to reorganize the Portuguese Army in the 1760s. He made a name for himself in Belgium during the French Revolutionary Wars, directing a successful sortie from the besieged fortress of Menin in 1794. Later he became chief of staff to Count von Wallmoden, commander in chief of the Hanoverian forces.

In 1801 he applied, in an unusual manner, to the king of Prussia for employment in the Prussian Army: then a major, he asked to be made a lieutenant colonel, to be raised to the nobility, and to be permitted to reorganize the Prussian Army in accordance with his own theories. To show his qualifications, he enclosed three military essays with the application. Somewhat surprisingly, his request was approved and all his conditions were granted: he was ennobled in 1804. On entering Prussian service he was employed at the war academy in Berlin where Karl von Clausewitz, later to become a noted military writer, was one of his pupils. While in Berlin he founded the Berlin Military Society. In 1804–05 he was chief of staff to the duke of Brunswick, and was engaged in preparing the Prussian forces for the war of 1806. In the campaign of that year he, with Gebhard von Blücher (*q.v.*), was taken prisoner at the surrender at Ratkau, near Lübeck, following the Battle of Jena (Oct. 14). He was soon released in an exchange of prisoners, and subsequently took a prominent part in leading L'Estocq's Prussian Corps serving with the Russians. (*See* also NAPOLEONIC WARS.)

After the Peace of Tilsit (1807) Scharnhorst was made head of the Army Reform Commission, and in this capacity came into contact with August von Gneisenau (*q.v.*) and other progressively minded men. Although brought up in the military tradition of Frederick the Great, he was one of the first to realize, after the Prussian defeat at Jena, the necessity for conscripted national forces in place of small, long-service professional mercenary armies. He also realized that national service must be accompanied by political reform. His appointment to the Army Reform Commission afforded him access to the king; but Napoleon soon became suspicious of Scharnhorst's activities and forced the king to cancel many of the reforms he had proposed. When, during 1811–12, Prussia was forced into alliance with France against Russia, Scharnhorst left Berlin on indefinite leave. He returned to service with the call to arms following the retreat from Moscow, and in 1813 was made chief of staff to Blücher. He took part in the Battle of Lützen, where he received a wound from which he did not recover. He died in Prague, where he had gone to negotiate for Austria's entry into the war, on June 28, 1813.

Scharnhorst's reputation rests on his work as a military reformer rather than as a fighting general, and on his ability to impress his views on colleagues by nature and training unreceptive to new ideas. He was a founder of the general staff system: that it was not at first entirely successful was not his fault; there had been insufficient time to train officers in, and accustom them to, the new techniques. His system was later accepted and adopted by the armed forces of all the great powers. It is remarkable that, from humble origins, he rose to such heights and influence in an army of which the officers were almost entirely drawn from the hereditary nobility.

SCHAUDINN, FRITZ (1871–1906), German microbiologist who discovered the syphilis germ, was born at Röseningken, East Prussia, on Sept. 19, 1871. He studied zoology at the University of Berlin and took his doctorate in 1894. In 1898 he was appointed lecturer there in recognition of his work on the life histories of protozoans. His studies of fertilization in the protozoan parasite *Coccidia* provided the zoological clues which enabled Ronald Ross and Giovanni Grassi independently to work out the life cycle of the malaria parasite. Schaudinn himself made important discoveries concerning the causative organisms of human malaria and bird malaria. These researches led Robert Koch to recommend Schaudinn for a post in the German Imperial Health Office, where he carried out a series of classic studies of medically important protozoans. He was the first to differentiate between *Endamoeba histolytica,* which causes amoebic dysentery, and its harmless counterpart, *E. coli.* In 1905 he discovered the syphilis bacterium, which he named *Spirochaeta pallida* (now called *Treponema pallidum*). This discovery stimulated Paul Ehrlich to begin researches which culminated in the discovery of the antisyphilis drug arsphenamine (Salvarsan). Schaudinn died in Hamburg on June 22, 1906. (M. C. L.)

SCHAUMBURG-LIPPE, one of the smallest of the former member-states of the German Reich. With a present area of 132 sq.mi. (342 sq.km.), it lay east of the middle bend of the Weser River and was bounded on all sides by Prussian territory from 1866 to 1946. Bückeburg was its capital.

Schaumburg, or Schauenburg, northeast of Rinteln, was the ancestral seat of a line of counts recorded from the early 12th century (*see* HOLSTEIN for an important branch of the dynasty). Lutheran from 1559, this line died out in 1640. Some of its fiefs then reverted to Brunswick, and its other lands were partitioned in 1647: Hesse-Kassel took the east and the south, with Rinteln; but Philip of Lippe-Alverdissen, brother of the last countess of Schaumburg, obtained Bückeburg, Arensburg, Stadthagen, Hagen-

burg, and half of Sachsenhagen, as a fief of Hesse.

Schaumburg-Lippe was admitted to the Confederation of the Rhine as a sovereign principality in 1807. It joined the German Confederation in 1815, the Fiscal Union of the northwestern states in 1837, the *Zollverein* in 1854, the North German Confederation in 1866, the German Empire in 1871. The revolution of 1918 made it a "free state" with a republican and democratic constitution from 1922 (the constitution of 1868 had kept representation by Estates). In 1946 it was merged in Lower Saxony (*q.v.*).

See O. Wagenführer, *Schaumburgische Geschichte* (1908); K. Brüning, *Der Landkreis Schaumburg-Lippe* (1955). (FH. H.)

SCHECHTER, SOLOMON (1847–1915), U.S. Jewish theologian and talmudist, president (1902–15) of the Jewish Theological Seminary of America, and for many years the leading spokesman for Conservative Judaism in the U.S. Born on Dec. 7, 1847, in Fokshan, Rum., he pursued advanced studies in Vienna and Berlin and was one of the first scholars to study the talmudic literature of Judaism in the light of modern critical research. Schechter's *Some Aspects of Rabbinic Theology,* published while he was still a lecturer in rabbinics at Cambridge University, and other writings led to a sympathetic reappraisal of the teachings of the Pharisees. In 1902 Schechter went to New York City to serve as president of the Jewish Theological Seminary of America, which he developed into a foremost institution for Jewish research and for the training of rabbis and teachers. The United Synagogue of America, which he founded in 1913, grew from an original membership of 23 Conservative congregations to about 650 congregations.

In 1896 Schechter discovered the Geniza (archive) in the old synagogue in Cairo, which contained over 90,000 manuscripts, many of them of great significance for biblical and rabbinic research. Among them was a copy of the original Hebrew text of Ecclesiasticus (*q.v.*). Schechter's identification of another manuscript as relating to an ancient Jewish sect in pre-Christian times was confirmed almost 50 years later, by the discovery among the Dead Sea Scrolls of the Manual of Discipline, which is very similar in content to what Schechter identified as a Zadokite document. He died on Nov. 19, 1915, in New York City. (M. AT.)

SCHEELE, CARL WILHELM (1742–1786), Swedish chemist, who anticipated by several years Joseph Priestley's discovery of oxygen and made many other important investigations, was born at Stralsund, the capital of Pomerania, which then belonged to Sweden, on Dec. 9, 1742. He studied the elements of chemistry during his apprenticeship to an apothecary in Göteborg, with whom he stayed for eight years before taking similar positions in Malmö (1765) and Stockholm (1768). He read chemistry avidly and experimented constantly during his free time. In 1770 he settled at Uppsala, where he made the acquaintance of the eclectic scientist Torbern O. Bergman. A friendship sprang up between the two, and it has been said that Scheele was Bergman's greatest discovery. In 1775, the year in which he was elected to the Stockholm Academy of Sciences, he moved to Köping, a small place on Lake Mälaren, where he became proprietor of a pharmacy. Frederick the Great tried to induce him to accept a chair of chemistry at Berlin, but this flattering offer, as well as one from England, was refused.

He found time for an extraordinary amount of original research, and every year he published two or three papers, most of which contained some discovery or observation of importance. It is said that his unremitting work, especially at night, and in a poorly ventilated laboratory, together with his handling of the most toxic materials and his habit of tasting and smelling materials indiscriminately, induced illness which brought about his death in Köping at the age of 43 on May 21, 1786.

Scheele's record as a discoverer of new substances is probably unequaled, in spite of his poverty and lack of ordinary laboratory conveniences. His work touched every province of the chemistry of his time. His first paper, published in 1770 in conjunction with his friend Anders Retzius, dealt with the isolation of tartaric acid from cream of tartar. Analysis of manganese dioxide in 1774 led him to the discovery of chlorine and baryta (barium oxide) and to the description of various salts of manganese, including the manganates and permanganates, and to the explanation of the action of manganese compounds in colouring and decolourizing glass. He showed that iron, copper, and mercury exhibit various degrees of oxidation. In 1775 he investigated arsenic acid and its reactions, discovering arsine (hydrogen arsenide) and the pigment Scheele's green (copper arsenite). Papers published in 1776 were concerned with quartz, alum, and clay and with the analysis of *calculi vesicae* (bladder stones), from which for the first time he obtained uric acid.

Scheele's only book, *Air and Fire,* was published in 1777 but was written some years before. One of the chief observations recorded in it is that the atmosphere is composed of two gases—one which supports combustion and the other which prevents it. The former, "fire-air," or oxygen, he prepared from nitric acid, saltpetre (potassium nitrate), manganese dioxide, oxide of mercury, and other substances, and there is little doubt that he obtained the gas two years before Priestley. Because of the delay in the publication of his results he is rarely given credit for this discovery. In all, he described ten methods of preparing oxygen. He showed that it played an essential part in the life processes of aquatic animals and plants, as well as those that live in air. Scheele remained in favour of the phlogiston theory (the belief that burning and rusting were caused by loss of a "substance" or "principle" called phlogiston) until his death; he apparently thought that hydrogen, which he had obtained by the action of certain acids on iron or zinc, was pure phlogiston.

In 1777 Scheele prepared hydrogen sulfide by a variety of methods and noted the chemical action of light on silver compounds and other substances. In 1778 he proposed a new method of making calomel (mercurous chloride) and powder of algaroth (antimony oxychloride), and he got molybdic acid from the mineral *molybdaena nitens* (molybdenite), which he was the first to distinguish from ordinary molybdena (graphite). In the following year he showed that graphite consists essentially of carbon, and he published a record of estimations of the proportions of oxygen in the atmosphere, which he had carried on daily during the whole of 1778—three years before Henry Cavendish made a similar experiment. In 1780 he proved that the acidity of sour milk is due to what was afterward called lactic acid, and by boiling milk sugar with nitric acid he obtained mucic acid.

His next discovery, in 1781, was in connection with the mineral scheelite (calcium tungstate), from which he obtained tungstic acid. In 1782 he published some experiments on the formation of ether and in 1783 examined the properties of glycerine, which he had discovered several years before. About the same time, in the course of some work on Prussian blue, he described the composition, properties, and compounds of prussic (hydrocyanic) acid and even ascertained its smell and taste, quite unaware of its poisonous character. In the last years of his life he returned to the vegetable acids. He isolated and investigated citric, malic, oxalic, and gallic acids.

Bugge (ed.), *Buch der grossen Chemiker* (1929–30); *Collected Papers of Carl Wilhelm Scheele,* trans. by L. Dobbin (1931); E. Farber (ed.), *Great Chemists* (1962).

SCHEELITE, a mineral consisting of calcium tungstate, is an important ore of tungsten. Before the development of high-speed tool steels around 1900, the ore had little commercial value. Since then, however, consumption has increased greatly as a source of tungsten for use in the manufacture of alloy steel, and in carbides and as filaments in electric lights and electronic equipment. Synthetic scheelite has the same uses. Named after C. W. Scheele, a Swedish chemist, it is the mineral in which he discovered tungstic acid. Scheelite is commonly found in heavy, compact and granular masses, but tetragonal, dipyramidal crystals occasionally occur. It is white, yellow, brown or green and has a vitreous to adamantine lustre. The hardness is 4.5 to 5 and the specific gravity 5.9 to 6.1. Most scheelite fluoresces, the colour ranging from blue-white or white to yellow, depending upon the amount of molybdenum present. The formula is $CaWO_4$. CaO = 19.4%; WO_3 = 80.6%. The high density, high lustre and

fluorescence are distinguishing characteristics.

Scheelite is found in contact metasomatic deposits, high-temperature veins and in granite pegmatites. Associated minerals include cassiterite, fluorite, topaz, apatite, wolframite and certain sulfides. In the United States scheelite has been mined in quantity in North Carolina, California, Nevada and in smaller amounts in a number of other western states. It also occurs in Cornwall and Cumberland, Eng.; and in Bolivia, New South Wales, New Zealand and Tasmania. *See* also TUNGSTEN. (A. F. HR.)

SCHEEMAKERS, PETER (1691–1781), a sculptor who worked almost entirely in the classical tradition and may be considered one of the founders of modern sculpture in England, was born at Antwerp in 1691. He studied in the workshop of his father and worked in Rome, Copenhagen and, about 1720, in London, first with P. D. Plumier and later with F. Bird. After another stay in Rome and at Antwerp he returned to London about 1735 and worked there until about 1770. He spent the last years of his life in Antwerp, where he died in 1781.

Scheemakers is responsible for a great deal of work in England, and monuments signed by him are to be found in churches all over the country. His most famous work is the monument to Shakespeare, which was designed by William Kent and erected in Westminster abbey in 1741.

See M. Whinney, *Sculpture in Britain, 1530–1830* (1964). (J. A. DR.)

SCHEFFEL, (JOSEPH) VIKTOR VON (1826–1886), German writer, for many years his country's most popular poet and the author of a novel *Ekkehard* of remarkable popularity, was born at Karlsruhe on Feb. 16, 1826. He studied law at Munich, Heidelberg, and Berlin (1843–47) and was appointed legal attaché at Frankfurt am Main, with a law practice at Säckingen.

His early ambition was to become a painter, but he had already written numerous poems when he suddenly achieved fame with his lyric-epic poem *Der Trompeter von Säckingen* (1854), in which his romantically idealized vision of the German past is presented with humour and charm. He left government service in 1854 and settled at Heidelberg, hoping to be appointed to the staff of the university and working on a translation of the Latin *Waltharius*, but his studies were hindered by an eye infection and he moved to Lake Constance, where he completed his novel, *Ekkehard* (1857; Eng. trans., 1872); set in the 10th century in the monastery of Sankt Gallen, it was one of the most successful German novels of the century. He returned to his beloved Heidelberg and in 1868 published a collection of student songs, *Gaudeamus, Lieder aus dem Engeren und Weiteren*, the material drawn largely from German legends and historical subjects, the tone humorous and jovial. Like his earlier successes, the book ran into many editions and some of the songs (*e.g.*, "Alt-Heidelberg, du feine!") are still sung. Eventually he returned to settle at Karlsruhe, where he died on April 9, 1886.

See Scheffel's *Gesammelte Werke*, 6 vol. (1907); W. Klinke, *Scheffel*, a biography in letters (1947). (W. D. WI.)

SCHEFFLER, JOHANNES (favourite pen name ANGELUS SILESIUS) (1624–1677), Silesian mystic, whose abiding fame derives from his poetry, was born at Breslau (now Wroclaw, Pol.) and died there on July 9, 1677. Son of a Lutheran Polish nobleman, Scheffler was court physician to the duke of Oels in his native Silesia when readings in the mystics, especially Jakob Böhme (*q.v.*), and in the Church Fathers led him to the Roman Catholic Church, into which he was received in 1653. Thereafter he devoted himself almost entirely to writing. Following his ordination to the priesthood in 1661 he contributed some 55 polemical pieces to a Lutheran-Catholic controversy, notable even in that day for asperity and bad manners on both sides.

In 1657 was published his *Geistreiche Sinn- und Schlussreime* ("Epigrammatic Verses on the Spiritual Life"), a collection of couplets on various religious truths better known under the title of its second edition (1674), *Der Cherubinischer Wandersmann* ("The Pilgrim of Truth"); and *Heilige Seelenlust* ("Holy Pleasure of the Soul"), religious songs celebrating the nuptials of the soul with God, many of which have found an honoured place in both Protestant and Catholic hymnals. The best edition of the poems is Hans L. Held's *Angelus Silesius: Sämtliche poetische Werke*, three volumes (1949–52). *Angelus Silesius* (1909) is a selection, translated into English by P. Carus, from *Der Cherubinischer Wandersmann*.

BIBLIOGRAPHY.—The standard biography is that of G. Ellinger, *Angelus Silesius, ein Lebensbild* (1927). *See* also H. Plard, *La Mystique d'Angelus Silesius* (1942); W. Dürig, *Zur Frömmigkeit des Angelus Silesius in Amt und Sendung* (1950). (E. O'B.)

SCHEIDT, SAMUEL (1587–1654), German composer best known for his works for organ, was born in Halle in 1587. He went to Amsterdam in about 1605 and studied there with J. P. Sweelinck. In 1609 he returned to Halle where he was first appointed organist at the Moritzkirche and, about 1619, organist and later *Kapellmeister* to the margrave of Brandenburg. Scheidt remained in Halle until his death on March 30, 1654. He had a high reputation as a teacher, his most famous pupil being the composer Adam Krieger.

Scheidt's first published works contain sacred vocal music; they include *Cantiones sacrae* (1620) for eight voices, and four books of *Geistliche Concerten* (1631–40) for two to four voices and continuo. The publication of his *Tabulatura nova* (three parts, 1624) was an important event in the history of organ music. The *tabulatura* of the title is keyboard tablature in the Italian sense; *i.e.*, staff notation for a keyboard instrument, rather than the alphabetical tablature associated with early German organ music until the time of J. S. Bach. The work contains fantasias, toccatas, "echo pieces," sets of variations, and organ responses for liturgical use. Although the influence of Sweelinck is noticeable, Scheidt's work throughout displays his own technical skill and feeling for the organ, with well-developed counterpoint and carefully indicated directions for registration. By contrast, his *Tabulatur-Buch* (1650), containing harmonized accompaniments for 100 "sacred songs and psalms," is indicative of the growing practice of congregational chorale singing which was to become customary in the Lutheran Church. (C. P. Co.)

SCHELDT (French ESCAUT; Flemish SCHELDE), a river rising in northern France and flowing across Belgium to its outlet in Dutch territory. Along with the lower Rhine and the Meuse it drains one of the most populous areas in the world and as a waterway, with its navigable tributaries and numerous branch canals, it serves an area which includes the agriculturally important Flanders Plain, the Belgian textile centres, the coalfield of northern France, and the industrial complex of Lille-Roubaix-Tourcoing. Among well-known towns on its banks are Cambrai and Valenciennes in France; Tournai, Oudenaarde, Ghent, and Antwerp in Belgium. The chief tributaries are the Scarpe, Lys, Dender, and Rupel. The estuary formerly had two channels, the East and the West Scheldt, divided by the islands of Beveland and Walcheren, but in 1866 the East Scheldt was sealed off by a dike carrying the railway to Flushing. The outlet between South Beveland and Walcheren is closed by a dike and the only connection is via the South Beveland Canal. A channel in the West Scheldt, maintained at a minimum depth of 24 ft. (7.3 m.), allows vessels drawing up to 33 ft. (10 m.) to reach Antwerp at full tide. With its upper course canalized, the Scheldt is navigable for about 125 mi. (201 km.) in Belgium and 39 mi. (63 km.) in France.

The busiest section of the river lies between Antwerp and Ghent, along which are many industrial undertakings. Above Cambrai the river is unnavigable, but from this point the Saint-Quentin Canal connects it with the Somme-Seine system. The Scheldt waterway is also connected with the Sambre-Meuse system by the Mons-Condé Canal. From Ghent the Ghent-Terneuzen Ship Canal gives direct access to the West Scheldt, and the small Ghent-Ostende Canal links the Scheldt with the North Sea.

Use of the Scheldt as a shipping outlet was long a subject of bitter contention between the Flemish and the Dutch, as the latter controlled most of the estuary. Seeking to cripple the trade of Antwerp, the Dutch in 1648 secured the right to close the estuary to navigation (*see* ANTWERP: *History*). In 1863 Belgium finally bought out this right, with assistance from other maritime countries, and declared the Scheldt free, thereby giving impetus to the

development of Antwerp as a great international port.
(K. C. E.)

SCHELDT QUESTION, the international problem arising from the fact that the Belgian port of Antwerp was for more than 250 years deprived of free access to the North Sea by Dutch control over both sides of the estuary of the Scheldt River.

By the middle of the 16th century, when both the northern and the southern Netherlands were under Spanish rule (*see* NETHERLANDS, THE: *History*), Antwerp was of commercial importance. It played a considerable part in the distribution throughout western Europe of colonial produce from the Portuguese Indies and from Spanish America. It was also the seat of a notable colony of Italian merchants handling trade between the countries of the North Sea coast and the Mediterranean, while the German Hansa (*see* HANSEATIC LEAGUE) and the English Merchant Adventurers (*q.v.*) had made it the centre of commercial operations between central Europe and the Baltic countries on the one hand and England on the other. The local Antwerp firms had a leading role in international trade till 1585, when the town fell to the Spaniards. The government of the United Provinces then decided to block the estuary of the Scheldt north of Antwerp, so as to make Antwerp's sea trade impossible. This step was intended not only to thwart Spanish policy in the southern Netherlands (*i.e.*, in the future Belgium) but also to promote the trade of Amsterdam.

The Dutch, who already held the island territories of Zeeland, took possession of the left bank of the Scheldt adjacent to Flanders. In 1609 the Twelve Years' Truce between the United Provinces and Spain stipulated that the subjects of both parties could trade freely by sea and river, but in fact the Scheldt remained closed. On the expiry of the truce, war broke out again (1621), and the Dutch seized Sas van Gent in 1644 and Hulst in 1645. Furthermore, the conquest of Maastricht by Prince Frederick Henry for the Dutch in 1632 had made impossible any linking of the Scheldt with the Rhine by way of the Meuse. The Peace of Westphalia (1648), which finally recognized the Dutch conquests, laid down, in its article xiv, that the Scheldt and the seaways leading to it should be closed in favour of the United Provinces; and it even prescribed in article xv that vessels and merchandise leaving or entering the ports of Flanders should be liable to the same dues as those making use of the Scheldt and of the navigable waters specified in article xiv. Flushing, Middelburg, and, above all, Amsterdam were thus assured of keeping Antwerp's former trade, which they had diverted to themselves during the war.

These conditions were confirmed by the Barrier Treaty of Nov. 15, 1715, under which the Austrians, having succeeded to the Spanish inheritance in the southern Netherlands, had to accept from the Dutch the same treatment the Spaniards had received. But meanwhile Ostend, which was linked by a canal to Bruges and to Ghent and to the Scheldt, seemed destined to assume some of the functions of Antwerp. The Ostend Company (*q.v.*), whose capital came mainly from Antwerp, began to trade with India. The Holy Roman emperor Charles VI, however, lent an ear to the remonstrances of the Dutch, who were supported by Great Britain, France, Denmark, Prussia, and Sweden. Under the Treaty of Vienna of March 16, 1731, he suppressed the Ostend Company.

The emperor Joseph II in 1780 tried to profit from the decline of the Dutch Republic and occupied some of the forts along the canal from Bruges to Sluis. Next, at the Brussels Conference of May 1784, he demanded that the Dutch should evacuate the forts on the lower Scheldt and grant freedom of navigation; and later he declared that what he chiefly desired was the opening of the Scheldt and the reestablishment of the Indies trade, with Antwerp as a free port. He sent a small warship down the Scheldt, but when the Dutch opened fire on it he did not press the action and, finally, accepted French mediation, which, in effect, maintained the *status quo* by the Treaty of Fontainebleau (Nov. 8, 1785).

France's conquest of Belgium in the French Revolutionary Wars (*q.v.*) led to the Treaty of The Hague (May 16, 1795), whereby the Dutch ceded the left bank of the Scheldt to France and opened not only the Scheldt but also the Rhine and the Meuse to the ships of all friendly nations. For a few years after the Peace of Amiens (1802), Antwerp enjoyed a period of prosperity; but after the inauguration of Napoleon's Continental System the Scheldt estuary was closed again by the British fleet in its retaliatory blockade of the European ports (*see* NAPOLEONIC WARS).

On the downfall of Napoleon, the Treaty of Paris of May 30, 1814, incorporated Belgium with the Kingdom of the Netherlands and once again opened the Scheldt to free navigation. Immediately the rivalry of Amsterdam made itself felt, at any rate until Dutch firms had set up branches of their own in Antwerp.

The Belgian revolution of 1830 produced fresh complications. The Treaty of 24 Articles, accepted by Belgium on Nov. 15, 1831, laid down that shipping proceeding to Antwerp should pay moderate pilotage dues, but the Dutch refused to acknowledge Belgium's independence till 1839. On April 19, 1839, the Dutch government agreed to accept a toll of 1.50 florins per ton on ships proceeding to and coming from Antwerp. The Belgian government assumed responsibility for this payment.

The rapid growth of the Antwerp traffic brought the amount of payments to a total burdensome for the Belgian treasury. Finally Auguste Lambermont was authorized to negotiate with the Dutch for the abolition of the toll; and on May 12, 1863, a convention was signed at The Hague settling the terms on which the obligations were to be redeemed. The other interested powers confirmed the convention in Brussels in July, and a sum of 32,276,566 francs was paid to the Dutch, Belgium contributing 12,000,000.

There remained some secondary issues between the Kingdom of the Netherlands and Belgium. The solution for some of them was found after World War I; others were settled after World War II. Benelux (*q.v.*) simplified the negotiations which economic development and technical progress still occasionally necessitated.

See A. Pierrard, *La Question de l'Escaut de 1648 à 1930* (1930); S. T. Bindoff, *The Scheldt Question to 1839* (1945). (C. VE.)

SCHELER, MAX (1874–1928), German philosopher, born in Munich on Aug. 22, 1874, began teaching philosophy at Jena in 1902, when he had already come under the influence of Edmund Husserl (*q.v.*). From 1907 to 1910 he taught at Munich. Finally, after some work for the German foreign office in Geneva (1917) and at The Hague (1918), he was in 1919 appointed professor of philosophy at Cologne. He died at Frankfurt am Main on May 19, 1928.

Throughout his work Scheler's method is phenomenological, that is to say, he tries to discover what is essentially involved in mental attitudes and their objects; he differs from Husserl in his readiness to accord an independently real status to the objects of such attitudes.

In ethics Scheler's main work is *Der Formalismus in der Ethik und die materiale Wertethik* (Halle, 1913–16), in which, after severely criticizing the formalistic ethics of Kant, he pleads for a teleological ethics of value not unlike British ideal utilitarianism. Values are ranged in an objective order of higher and lower, which are presented a priori through our feelings: Scheler builds largely on Pascal's "order" or "logic of the heart." In philosophical psychology Scheler's most interesting work is *Wesen und Formen der Sympathie* (1923; Eng. trans. by P. Heath as *The Nature of Sympathy*, 1954). In the work entitled *Vom Ewigen im Menschen* (1921) Scheler gives a penetrating analysis of the religious consciousness (called by him the "religious act") and of the kind of object to which it is essentially directed; *i.e.*, an object self-sufficient, all-performing, holy, etc. The theistic flavour of this work yields to a more pantheistic attitude in the later *Die Stellung des Menschen im Kosmos* (1927, 1928). Scheler's principal contribution to philosophical sociology is *Die Wissensformen und die Gesellschaft* (1926), where he passes criticism and attempts to improve on Marxist and Comtist accounts of the relation of ideas and beliefs to social structure and development.

See the collected *Werke* (1954–); also the special issue of *Philosophy and Phenomenological Research*, vol. 2, no. 3 (1942), devoted to Scheler. (J. N. F.)

SCHELLING, FRIEDRICH WILHELM JOSEPH VON (1775–1854), German philosopher who, following a departure from Fichte's ethical philosophy, formulated a system of metaphysics based on the philosophy of nature. He was born on Jan. 27, 1775, at Leonberg, a small town of Württemberg. He was educated at the cloister school of Bebenhausen, near Tübingen, where his father, an able orientalist, was chaplain and professor. In 1790 he entered the theological seminary at Tübingen. Among his (elder) contemporaries were Hegel and Hölderlin. He shared in the revolutionary sentiments common among his fellow students. In 1792 he graduated. Meanwhile he was a close student of Kant, Fichte and Spinoza, more especially of Fichte. Schelling had no sooner grasped the leading ideas of Fichte's amended form of the critical philosophy than he put together his impressions of it in his *Über die Möglichkeit einer Philosophie überhaupt* (Tübingen, 1795). The more elaborate work, *Vom Ich als Prinzip der Philosophie, oder über das Unbedingte im menschlichen Wissen* (Tübingen, 1795), while remaining within the limits of the Fichtean idealism, exhibits a tendency to give the Fichtean method a more objective application and to amalgamate with it Spinoza's more realistic view.

After two years as tutor to two youths of noble family, Schelling was called as extraordinary professor of philosophy to Jena, the centre of the poets and philosophers of the Romantic school, in midsummer 1798. He had already contributed articles and reviews to F. I. Niethammer's *Philosophisches Journal* (Neustrelitz, 1795–96; Jena, 1797–98), to which his *Philosophische Briefe über Dogmatismus und Kritizismus* (a critique of the ultimate issues of the Kantian system) and his *Neue Deduction des Naturrechts* (the composition of which, in 1795, to some extent anticipated Fichte's *Grundlage des Naturrechts*) had been sent. His studies of physical science bore rapid fruit in his *Ideen zu einer Philosophie der Natur* (Leipzig, 1797) and in the treatise *Von der Weltseele* (Hamburg, 1798); and these were followed by his *Erster Entwurf eines Systems der Naturphilosophie* (Jena and Leipzig, 1799), by the *Einleitung zu dem Entwurf eines Systems der Naturphilosophie* (Jena and Leipzig, 1799), by the *System des transzendentalen Idealismus* (Tübingen, 1800), by the *Darstellung meines Systems der Philosophie* (in the *Zeitschrift für spekulative Physik*, ii, Jena, 1801), by *Bruno, oder über das natürliche und göttliche Prinzip der Dinge* (Berlin, 1802) and by the *Vorlesungen über die Methode des akademischen Studiums* (Tübingen, 1803). The philosophical renown of Jena was at its height during Schelling's years of residence there (1798–1803). His intellectual sympathies, moreover, united him closely with some of the most active literary tendencies of the time. With Goethe he was on excellent terms, but he was repelled by Schiller's less speculative philosophy. In Schelling, essentially a self-conscious genius, eager and rash, yet with undeniable power, the Romanticists hailed a personality of the true Romantic type. With August Wilhelm von Schlegel and his wife Caroline, herself the embodiment of the Romantic spirit, Schelling's relations were close, and a marriage between Schelling and Caroline's young daughter by a previous marriage, Auguste Böhmer, was perhaps contemplated by both. Auguste's death in 1800 drew Schelling and Caroline together. Schlegel divorced his wife, and in June 1803 she married Schelling. This marriage marks the end of Schelling's life at Jena.

From 1803 to 1806 Schelling was professor at the new university of Würzburg. In 1804 he published the essay *Philosophie und Religion* (Tübingen). During this period, however, he not only broke with Fichte and with Hegel but also embroiled himself with his colleagues and with the government. In 1806, then, he moved to Munich, where he was to remain until 1841. There Schelling enjoyed ease and leisure, thanks to state appointments: he was made an associate of the academy of sciences, secretary of the academy of arts and then secretary of the academy of sciences. These appointments did not prevent his lecturing for a short time at Stuttgart and annually at Erlangen (1820–26). Finally, in 1827, he became professor at Munich. Caroline's death (1809) was followed by his marriage in 1812 to one of her closest friends, Pauline Gotter, in whom he found a faithful companion.

FRIEDRICH VON SCHELLING

The early years of Schelling's Munich period were marked by several publications. The aphorisms on *Naturphilosophie* in the *Jahrbücher der Medicin als Wissenschaft* (Tübingen, 1806–08) are for the most part extracts from lectures delivered at Würzburg; but the treatise *Über das Verhältniss der bildenden Künste zu der Natur* (Munich, 1807; Eng. trans. by A. Johnson, *The Philosophy of Art,* London, 1845) and the *Philosophische Untersuchungen über das Wesen der menschlichen Freiheit* (first published in *Philosophische Schriften,* Landshut, 1809; Eng. trans. by J. Gutmann, *Of Human Freedom,* Chicago, 1936) represent interesting developments in his thought. Subsequently, however, his literary activity came gradually to a standstill. The *Denkmal der Schrift von den göttlichen Dingen des Herrn F. H. Jacobi* (Tübingen, 1812) was called forth by the incident of Jacobi's book. The tract *Über die Gottheiten von Samothrake* (Stuttgart and Tübingen, 1815) was ostensibly part of a great work, *Die Weltalter,* which was frequently announced as ready for publication but which was never finished (*cf.* the fragment trans. by F. de Wolfe Bolman, *The Ages of the World,* New York, 1942).

The dominance of Hegel in the German schools appears to have silenced Schelling. It was only in 1834, after the death of Hegel, that, in a preface to a translation of a work by Cousin, he expressed in writing the antagonism in which he stood to the Hegelian and to his own earlier conceptions of philosophy. The antagonism certainly was not new: it was evidenced in his Erlangen lectures of 1822 on the history of philosophy (*Sämmtliche Werke,* x, 124–125); and Schelling had already begun the treatment of mythology and religion which in his view constituted the true positive complement to the negative of logical or speculative philosophy. The writings of D. F. Strauss, L. Feuerbach and other members of the Hegelian left having alarmed the religious element, Frederick William IV invited Schelling to Berlin in 1841 in the hope that he would lecture at the university and counteract the Hegelians. But the latter were too strongly entrenched, and in 1845 Schelling ceased to lecture. No authentic information as to the nature of the new positive philosophy was made generally available till after Schelling's death, which took place on Aug. 20, 1854, at Ragaz. His Berlin lectures were then printed in the first four volumes (1856–58) of the 2nd section of his collected works, setting forth his "philosophy of mythology" and his "philosophy of revelation."

Philosophy.—Schelling indicated the turning points of his philosophical career as follows: (1) the transition from Fichte's method to the more objective conception of nature—the advance, in other words, to *Naturphilosophie;* (2) the definite formulation, in the *Identitätsphilosophie,* of that which implicitly, as Schelling claims, was involved in the idea of *Naturphilosophie,* that is to say the thought of the identical, indifferent, absolute substratum of both nature and spirit; (3) the opposition of negative and positive philosophy, an opposition which is the theme of the Berlin lectures, though its germs may be traced back to 1804.

Schelling's philosophy of nature, though first conceived as a supplement to Fichte's mainly ethical position, soon developed into an entirely different outlook. Whereas Fichte's *Wissenschaftslehre* made the knowing and willing subject the centre of existence altogether, Schelling emphasized the self-existence of the objective world. Nature is not to be understood only from the perspective of empirical observation and scientific theory; it is rather a reality of its own which speculative or intellectual intuition has to interpret. Such an interpretation discloses that nature is a universal organism endowed with a world soul, as Plato taught. In nature as in the human ego the same original tendencies operate: the one finite and material, the other infinite and ideal.

In his system of transcendental idealism (1800) Schelling tried

to unite his philosophy of nature with epistemology and ethics, the objective and the subjective aspect of speculation. He subordinated nature to mind, but he denied that morality is the zenith of subjective activity (as Kant and Fichte had assumed). Mind reaches its consummation rather in the creative act of the artist. On the one hand, the genius works as nature does, but consciously and intentionally; on the other, nature works as the genius, but unconsciously and unintentionally. This magnificent solution of the basic problem of reconciling nature and mind to one another corresponded best to the Romantic spirit of the epoch.

But impressive and fascinating as the solution was, it could not fully satisfy the thinking intellect just because it was too Romantic and not rational enough. In 1801 Hegel began his academic career in Jena, and it was probably under the influence of Hegel's more rational thinking that Schelling hastily conceived of a new scheme in which he concentrated upon the original identity of the opposites, the finite and the infinite, the objective and the subjective, the real and the ideal. This identical ground cannot be comprehended in itself, but can be known indirectly by the relative balance of the antagonistic polarity in both the objective and the subjective sphere open to our experience. This scheme was not carried out, but remained a sketch.

The objective tendency, which was dominant in Schelling, soon led him to a Platonic conception of the subjective sphere: he renewed the time-honoured doctrine of the ideas. But the ultimate unity out of which the opposites arise could not be expounded unless the realm of the ideas was understood as being the origin of the finite self and the finite world. Schelling took a new step in 1804 when he wrote his essay *Philosophie und Religion* in order to explain this most hidden relation. Like Coleridge, he longed "to know metaphysically the Spirit of God." The ideas have their absolute unity in that spirit. But since it is the nature of the ideas to be both necessary (objective) and free (subjective), they are able to fall away from their origin and centre. This defection is possible because of the absolute freedom of the ideas; but for the same reason it cannot be accounted for. Schelling here renews the doctrine of Origen. Slowly he is going back to Christian speculation. Through debasing themselves the ideas transform themselves into the phenomenal world in which we live. The original unity of ideas and God can be restored only through the return of man to his creator.

These half-religious, half-speculative conceptions were further modified under the influence of the Catholic Romantic F. X. von Baader (who in turn was inspired by Jakob Böhme) in Schelling's work on human freedom (1809). Schelling now carried the ground of the apostasy of the ideas back into the nature of God himself: in God there is an original abyss, a kind of absolute and non-rational will, which is the ultimate source of the independence and contingency of the finite world, or of its existence in contrast to its divine essence. But the final and definitive form of Schelling's speculation was gained only in the Berlin lectures.

According to these lectures, God cannot be known by any speculative effort whatsoever ("negative philosophy"): God has to be experienced. This position Schelling calls metaphysical empiricism. The experience of the absolute ground of all things is impossible apart from the self-manifestation of God. We learn his nature from the history of myth and revelation, which is at the same time God's own spiritual history ("positive philosophy"), culminating in the Incarnation and Resurrection of Christ. These lectures, which, as has been said, had no success when Schelling delivered them, were to arouse the interest of existentialists in the 20th century.

BIBLIOGRAPHY.—Collected editions are *F. W. J. von Schellings Sämmtliche Werke*, ed. by K. F. A. von Schelling, in 2 sections, 10 vol. and 4 vol. (1856–61); and the *Werke*, ed. by M. Schröter, 6 vol. (1927–28). The Munich lectures were ed. by A. Drews (1902). For selected letters *see* G. L. Plitt (ed.), *Aus Schellings Leben: in Briefen*, 3 vol. (1869–70). *See* further Kuno Fischer, *Geschichte der neueren Philosophie*, 4th ed., vol. vii (1923), particularly for biography; also K. Rosenkranz, *Schelling* (1843); L. Noack, *Schelling und die Philosophie der Romantik*, 2 vol. (1859); Constantin Frantz, *Schellings positive Philosophie*, 3 vol. SCHENDEL, ARTHUR FRANÇOIS ÉMILE VAN (1874–1946), Dutch novelist, and one of the most important and most personal Dutch prose-writers of his time. Born on March 5, 1874, in Batavia (now Djakarta, Indonesia), he spent his youth in Haarlem, The Hague, and Amsterdam. He studied English language and literature and taught in England before becoming a writer in the Netherlands. From 1920 he lived in Italy, returning after World War II to Amsterdam, where he died on Sept. 13, 1946. He attracted attention with his first novel, *Drogon* (1896), which dealt with the period of the Crusades. His main theme in his 25 novels and many collections of short stories is the lonely but self-sufficient human being who, in his search for happiness, is constantly the victim of fate, a theme which first took shape in stories about medieval Italy: *Een Zwerver verliefd* ("A Wanderer in Love," 1904; French trans. *Le vagabond amoureux*, 1923), *Een Zwerver verdwaald* ("A Lost Wanderer," 1907), *De berg van droomen* ("The Mountain of Dreams," 1913), *Der liefde bloesems* ("The Blossoms of Love," 1921). His later works are less poetical and more realistic: the fight against fate is manfully accepted, although defeat is inevitable. The best-known are *Het Fregatschip Johanna Maria* (1930; Eng. trans. *The "Johanna Maria,"* 1935), *Een Hollandsch drama* (1935; Eng. trans. *The House in Haarlem*, 1940), *De grauwe vogels* (1937; Eng. trans. *Grey Birds*, 1939), *De wereld een dansfeest* ("The World a Dance," 1938), and *Het oude huis* ("The Old House," 1946). Van Schendel also wrote essays on Shakespeare (1910) and a biography of Paul Verlaine (1927).

See G. H.'s-Gravesande, *A. van Schendel, zijn leven en werk* (1949). (GD. W. HS.)

SCHENECTADY, a city of New York, U.S., is located 16 mi. (25 km.) N.W. of Albany on the Mohawk River, the seat of Schenectady County. It was established in 1661 when the Mohawk Indians sold the title to the wide, flat river plain immediately above the falls of the river to Arent van Curler and his associates. The site was only 14 mi. (23 km.) by easy portage from the seaport of Albany; the place name is of Indian origin. In 1690 the little village was virtually extinguished by the Schenectady massacre, occurring when a war party of French and Indians walked by the snowmen which the overconfident citizens had erected as sentries. About 1700 there was an influx of English settlers. Schenectady was chartered as a borough in 1765 and as a city in 1798. Its location on the portage between the Hudson and Mohawk rivers assured it of a prosperous business in the transshipment of goods. In the period after the American Revolution a vast tide of New England immigrants moved into the Mohawk Valley, and Schenectady, being the transfer point, was further stimulated by new business. With the opening of the Erie Canal in 1825, however, the canal boats carried their cargoes directly into Albany, and Schenectady suffered a decline. Recovery began with the manufacture of brooms and brushes during the next decade.

New forms of transportation and industry came to Schenectady when the Mohawk and Hudson Railroad began to operate in 1831. The railroad was a forerunner of the New York Central, and the consequent demand for locomotives led to the establishment of the Schenectady Locomotive Works in 1848. This firm, which has built tanks as well as steam and diesel locomotives, became the American Locomotive Company (later Alco Products, Inc.) in 1901.

In 1886 the Edison Machine Works were moved to Schenectady and in 1892 mergers created the General Electric Company, with its main administrative offices there and, later, plants manufacturing gas turbines, motor generators, and electronic equipment, and experimental laboratories which provided research facilities for many famous scientists, including Charles Steinmetz, Willis Whitney, William David Coolidge, and Irving Langmuir. The Atomic Energy Commission's Knolls Atomic Power Laboratory,

established to provide facilities for the investigation of uses of nuclear power, and its nearby establishment at West Milton, Saratoga county, are operated by the company. Other manufactures include varnish, mica products, wire and cable equipment, and athletic and sporting goods.

Union College, a private liberal arts college for men, established in 1795, is in Schenectady; the college and its affiliated professional schools in Albany form Union University.

The city has a council-manager form of government, in effect since 1936.

The population of Schenectady in 1960 was 81,682 (for comparative population figures *see* table in NEW YORK: *Population*). It is a part of the Albany-Schenectady-Troy standard metropolitan statistical area (*see* ALBANY). (H. S. PR.)

SCHERZO, the name of a musical form, means, in Italian, a jest or caprice. Humour is, however, not always a characteristic of this form. The *Scherzi musicali* (1607) of Monteverdi are canzonets which are bright rather than humorous, and in 1614 religious pieces were published in Rome under the title *Scherzi sacri.* The term acquired a new meaning in the sonatas, quartets, and symphonies of the 19th century, principally those of Beethoven. In these works the scherzo was a development of the 18-century minuet, which in fact had already acquired some of the characteristics of the scherzo. Several of the minuets of Haydn, in both his quartets and his symphonies, use reiterated or abrupt rhythms which are foreign to the stately nature of the minuet and which anticipate the gruesome humour of the Beethoven type of scherzo. In the set of six quartets, Op. 33, known as "Gli scherzi," Haydn actually uses the term scherzo in place of minuet.

The distinguishing feature of the 19th-century symphonic scherzo is that it is in rapid $\frac{3}{4}$ time, with elements of surprise in dynamics and orchestration. The solo drumbeats in the scherzo of Beethoven's Ninth Symphony form one of the most dramatic effects in this form. Frequently the playfulness of the Beethoven scherzo is designed to conceal an underlying dramatic tension. In the Fifth Symphony the theme of the jubilant scherzo is used as a bridge passage expressing a mood of terror. Other composers who developed the symphonic scherzo were Schubert and Bruckner. In sonatas and symphonies the scherzo is usually followed by a trio, a piece in a slower tempo, with a repeat of the opening scherzo according to the scheme ABA.

In the 19th century the scherzo was also an independent instrumental or orchestral movement in a vivacious, airy style. The masters of this animated type of scherzo were Weber, Berlioz, and Mendelssohn. Brilliant effects of orchestration and exhilarating, pointed rhythms in a swift tempo mark such virtuoso works of this kind as Berlioz's *Queen Mab* scherzo and Mendelssohn's scherzo from his *Midsummer Night's Dream* music. Mendelssohn's chamber works, particularly the octet, the two piano trios, and the two string quintets, contain remarkable examples of the light, swift-moving scherzo.

In the symphonies and instrumental works of Schumann the scherzos have a lyrical or a nostalgic nature, and they are frequently combined with two trios. Brahms, in his symphonies and chamber music, similarly conceived the scherzo as a movement with dark undertones. The four scherzos of Chopin are in a class by themselves. His use of the term appears to be purely arbitrary, unless it was meant to convey an element of ironic humour at the core of such highly romantic works. In later romantic music one of the most successful examples of the form is Paul Dukas' *Sorcerer's Apprentice,* described as a "scherzo based on a ballad of Goethe." The scherzo or *scherzando* movements in the symphonies of Mahler combine humour with lugubrious or even diabolic elements. In the scherzo of Mahler's Tenth Symphony these darker elements are so boldly exteriorized as to determine the essential character of the movement. The score of this scherzo bears the inscription, "The devil dances with me. Madness seizes me . . . annihilates me."

SCHEVENINGEN, a fashionable seaside resort and fishing port in South Holland province, Neth., lies on the North Sea coast, 2 mi. (3 km.) N of The Hague, of which it forms a part. Pop. (1964 est.) 38,000. Gently shelving, wide, sandy beaches stretch for miles on each side, and the country's first bathing establishments were set up there in 1818. The recreational centre, Gevers Deijnoot Square, offers many kinds of entertainment. The Holland Festival is held annually in summer, and the place is a centre for international conventions. The harbours to the south shelter most of the Dutch herring fleet; the Fish Auction Hall is the leading one in Europe and herring is widely exported. *See* also HAGUE, THE. (D. P. M.; C. A. P. P.)

SCHIAPARELLI, GIOVANNI VIRGINIO (1835–1910), Italian astronomer and senator of the kingdom of Italy who possessed exceptional powers as an observer of stars, was born March 14, 1835, at Savigliano, Piedmont. After graduating from Turin University in 1854, he went to Berlin to study astronomy under J. F. Encke. In 1859 he was appointed assistant observer at Pulkovo in Russia, a post he resigned in 1860 for a similar one at Brera, Milan. In 1862 he succeeded to the directorship at Brera, a position which he held until 1900.

Schiaparelli's first discovery was of the asteroid Hesperia in 1861. In 1866 he showed the connection between meteor streams and cometary orbits, giving, in particular, the identity of the orbits of the Perseids and Comet 1862 III, and of the Leonids and Comet 1866 I. These discoveries were amplified in his *Le Stelle cadenti* (1873) and *Norme per le osservazioni delle-stelle cadenti dei bolidi* (1896). He observed double stars, and the results of his measures are published in two volumes, the first containing those made between 1875–85 and the second those between 1886–1900. He also made extensive studies of Mercury, Venus, and Mars. In 1877 he observed on Mars the peculiar markings, which he called *canali,* the nature and origin of which is still controversial. (*See* MARS.) From his observations of Mercury and Venus, Schiaparelli concluded that these planets rotated on their axes in the same amount of time as they revolved about the sun. On his retirement he studied the astronomy of the Hebrews and Babylonians, publishing in 1903 *L'Astronomia nell'Antico Testamento;* Eng. trans. *Astronomy in the Old Testament* (1905). He later published various papers on the same subject, the last being in *Scientia* (1908).

Schiaparelli died at Milan on July 4, 1910.

SCHICHAU, FERDINAND (1814–1896), German engineer and pioneer shipbuilder, was born at Elbing (now Elblag, Pol.), the son of a smith and ironworker, on Jan. 30, 1814. He established his own industrial plant at Elbing in 1837, and was soon employing 8,000 men. He began by making steam engines, hydraulic presses, and industrial machinery, then pioneered in the design and construction of dredgers (1841), and finally turned to the building of ships. His "Borussia," in 1855, was the first screw-vessel constructed in Germany. Schichau began to specialize in building torpedoboats and destroyers at an early date. From 1873 he had the cooperation of Carl H. Ziese, who married his daughter. Ziese introduced compound engines into the first vessels built by Schichau for the German Navy, the gunboats "Habicht" and "Möwe," launched in 1879, and also designed in 1881 the first triple-expansion machinery constructed on the Continent, supplying these engines to the torpedoboats built by Schichau for the German Navy in 1884. In 1889 Schichau established a floating dock and repair shops at Pillau (now Baltisk, U.S.S.R.), and soon afterward, by arrangement with the government, started a large yard at Danzig. He died at Elbing on Jan. 23, 1896.

SCHICKELE, RENÉ (1883–1940), German writer, whose personal experience of conflict between nations made his work an intense plea for peace and understanding, was born in Oberehnheim, Alsace, on Aug. 4, 1883, the son of a German father and a French mother. He was educated in Zabern and Strasbourg, and subsequently lived in Paris and Berlin, working as a journalist and editor of German *avant-garde* periodicals. He had published verse before the appearance of *Der Fremde* (1907), a novel which depicts his central preoccupation, the place of Alsace between the rival powers of France and Germany. During World War I Schickele lived in Switzerland. The play *Hans im Schnakenloch* (1916) depicts the impact of the war upon an Alsatian family. His major work is the novel-trilogy *Das Erbe am Rhein* (*Maria Cap-*

poni, 1925; *Blick auf die Vogesen*, 1927; *Der Wolf in der Hürde*, 1931), a saga reflecting Alsatian problems before and after World War I. Schickele's last novel, *Die Flaschenpost* (1937), is set in the south of France, where he settled in 1933, after assuming French citizenship. In his approach to the delineation of sexual relationships he found affinities with D. H. Lawrence (on whom he wrote a substantial essay). Schickele died on Jan. 31, 1940, near Nice, France.

See *R. Schickele: Werke in drei Bänden*, ed. by H. Kesten (1959). (H. M. WA.)

SCHIEDAM, a town and river port in the province of South Holland, Neth., lies 3 mi. (5 km.) W of Rotterdam at the confluence of the Schie and Nieuwe Maas rivers. Pop. (1960) 80,299 (mun.). The buildings of interest include St. John's Church (1335), the 16th-century town hall, the municipal museum of modern art (1786), the exchange (1792), and the ruins of the Mathenesse Castle (1260). There are several recreation grounds and parks.

Schiedam is well known for its manufacture of gin and other liquors. Early in the 20th century several shipyards were established, and Schiedam also developed into an important centre of the iron industry. Manufactures include machinery, anchors and chains, metal tubes, and rivets. There are also tanker cleaning facilities. Schiedam is a rail junction and is connected by motor road with Rotterdam and The Hague. The town was chartered in 1273. (P. TH. J. K.)

SCHIFF, MORITZ (1823–1896), German physiologist whose most notable work, on the thyroid gland, contributed greatly to the understanding of endocrine functions, was born at Frankfurt am Main on Jan. 28, 1823. He studied medicine at Heidelberg, Berlin, and Göttingen (M.D. 1844), and physiology in Paris with François Magendie and F. A. Longet. Returning to Frankfurt in 1846, he became a consultant in medicine but devoted most of his time to his duties as director of the ornithology section of the Frankfurt Zoological Museum; during this period he published memoirs on South American birds. A man of liberal views, he served as a physician to the insurgents during the Revolution of 1848; as a result, he was not granted the academic position he desired at Göttingen. He became professor of comparative anatomy at Bern in 1854. In 1863 he went to Florence as professor of physiology at the Istituto di Studi Superiori, where he remained until 1876. Opposition, led ostensibly by antivivisectionists, prompted his transfer to Geneva, where he worked and taught until his death on Oct. 6, 1896.

Schiff's work ranged over many fields of physiology: digestive functions, the role of the spleen, motor and sensory activities of nerves and brain centres, the regeneration of nerve structures, etc. Above all, he was a pioneer in the study of internal secretions, through his observations of the effects of experimental removal of the thyroid gland in dogs and the counteracting of these effects by thyroid grafts and the ingestion or injection of thyroid extract—work that foreshadowed the later development of hormonal therapy. He was esteemed by his contemporaries equally for his experimental skill, teaching abilities, and linguistic prowess. Among his many contributions to scientific literature, the most important was his four-volume *Gesammelte Beiträge zur Physiologie* (1894–96). (R. LE.)

SCHILLER, JOHANN CHRISTOPH FRIEDRICH (1759–1805) (ennobled VON SCHILLER, 1802), one of the greatest German dramatists, poets, and literary theorists, who exemplifies in his life and work the triumph of man's spirit over adverse circumstance. In one of his last letters (April 2, 1805), he said to his friend Wilhelm von Humboldt: "After all, we are both idealists, and should be ashamed to have it said that the material world formed us, instead of being formed by us."

Schiller was born at Marbach on the River Neckar on Nov. 10, 1759, the second child of Lieut. Johann Kaspar Schiller and of his wife Dorothea (née Kodweiss). Johann Kaspar gave his only son a sound grammar school education up to the age of 13; then, in deference to what amounted to a command from his sovereign, the autocratic duke Karl Eugen of Württemberg, he reluctantly agreed to send his boy to the "military academy," an institution founded and personally supervised by the duke. Against the wishes of the parents, who had hoped to have their son trained for the ministry, the duke decreed that young Friedrich was to prepare for the study of law; later, however, he was allowed to transfer to medicine. Having endured the irksome regimentation at the academy for eight years—during which period he was virtually cut off from his family and the outside world—Schiller left with a medical qualification to take up an appointment as an assistant medical officer (noncommissioned) to a Stuttgart regiment, a post which brought him no prestige and very little pay.

His adolescence under the rule of a petty tyrant confronted Schiller with the problem of power, a theme which recurs in most of his plays. His resentment found expression in some of his early poems (published in the *Anthologie auf das Jahr 1782*) and especially in his first play, *Die Räuber* (printed, at his own expense and with borrowed money, in 1781), a stirring Rousseauesque protest against stifling convention and corruption in high places. Its first performance (Jan. 13, 1782) at the National Theatre at Mannheim, in the neighbouring Palatinate, created a sensation and was a milestone in the history of the German theatre. Schiller traveled to Mannheim without leave in order to be present on the first night. When the duke heard of this and of a subsequent secret visit, he sentenced the poet to a fortnight's detention and forbade him to write any more plays. To escape from this intolerable situation, Schiller decided to cut himself adrift. In the company of a loyal friend, the musician Andreas Streicher, he fled from Stuttgart and made for Mannheim, in the hope of receiving help from Baron von Dalberg, the director of the theatre which had launched his first play. This hope, however, proved illusory. His second play, *Fiesco*, was rejected out of hand; Dalberg kept his embarrassing protégé at arm's length, and for some weeks Schiller led the hand-to-mouth life of a refugee, until he found a temporary refuge with Henriette von Wolzogen, whose sons had been fellow students of his and who invited him to stay at her house at Bauerbach in Thuringia. There he finished his third tragedy, *Kabale und Liebe* (printed 1784), and started work on *Don Carlos*.

FRIEDRICH SCHILLER, CHALK DRAWING BY FRIEDRICH GEORG WEITSCH, 1804

On second thoughts, Dalberg eventually offered Schiller an appointment as resident playwright with the Mannheim Theatre. Schiller accepted and had the satisfaction of seeing *Kabale und Liebe* score a resounding success on the stage; but his hopes of clearing his debts and gaining a measure of financial security were doomed to disappointment. When his contract lapsed after a year, it was not renewed, and once again Schiller needed the help of friends to extricate him, both from his financial predicament and from an emotional crisis precipitated by his attachment to a married woman, the charming but unstable Charlotte von Kalb. Four unknown admirers wrote to him from Leipzig and finally invited him to join them there. One of them, Christian Gottfried Körner, became his close and lifelong friend; being a man of some substance, he was able to support Schiller during his two years' stay in Saxony, toward the end of which *Don Carlos*, his first play in blank verse, was published in book form (1787). (Parts of it had previously appeared in Schiller's journal *Thalia*.)

In July 1787 Schiller went to Weimar, then the literary capital of Germany, where he met C. M. Wieland and J. G. Herder. Goethe, who was in Italy at the time, returned to Weimar in the following year. At first Goethe's studied aloofness prevented any close personal contact, but in the long run the older man could not resist the magnetism of Schiller's personality. A chance meeting

in 1794 and the ensuing exchange of letters mark the beginning of their friendship, a union of opposites which forms an inspiring chapter in the history of German letters. Their fascinating correspondence is a worthy memorial to a momentous literary partnership. In spite of his initial antipathy, Goethe had recommended Schiller for appointment to a professorship of history (unsalaried) in the University of Jena, Schiller having presented the requisite credentials in his history of the revolt of the Netherlands (*Geschichte des Abfalls der vereinigten Niederlande*, 1788). His history of the Thirty Years' War (*Geschichte des dreissigjährigen Krieges*, 1791–93) further enhanced his prestige as a historian; it also provided him with the material for his greatest drama, *Wallenstein*, published in 1800, and brilliantly translated by Coleridge, who thought it "not unlike Shakespeare's historical plays—a species by itself."

Although Schiller's academic post was unremunerative, he felt sufficiently confident about his prospects to embark upon matrimony: in 1790 he married Charlotte von Lengefeld, a cultured young woman of good family, who bore him two sons and two daughters. Schiller was an affectionate husband and father, and Charlotte proved her devotion in all the trials that lay ahead. In the second year of their married life, Schiller's health gave way under the strain of perpetual overwork. For a time he lay critically ill, and although he rallied after several relapses, he never fully recovered good health. The rest of his life was a losing battle, fought with superb courage, against the inexorable advance of disease. To give him a respite from his financial worries, two Danish patrons—Prince Friedrich Christian of Holstein-Augustenburg and Count Schimmelmann—granted him a generous pension for three years. Schiller decided to devote part of this time to the study of Kant. The encounter with Kant's philosophy produced a series of essays in which Schiller sought to define the character of aesthetic activity, its function in society, and its relation to moral experience—*Über Anmut und Würde* (1793), *Briefe über die ästhetische Erziehung des Menschen* (1795), *Über das Erhabene* (1801)—as well as the essay *Über naive und sentimentalische Dichtung* (1795–96), an attempt to distinguish between two types of poetic creativity. (Like the "Letters on the Aesthetic Education of Man," this celebrated essay first appeared in *Die Horen*, an ambitious but short-lived literary periodical edited by Schiller and published by Johann Friedrich Cotta.) This period of critical stocktaking also produced some exquisite reflective poems: *Das Ideal und das Leben*, *Der Spaziergang*, *Die Macht des Gesanges*. In 1797 he wrote a group of ballads (including *Der Handschuh*, *Der Taucher*, *Die Kraniche des Ibykus*) which are among his most popular productions. In these poems, and in the famous *Lied von der Glocke*, Schiller shows how to make poetry accessible to the man in the street without debasing it. Popularity, he insists in his review of G. A. Bürger's poems, need not and should not mean pandering to vulgar taste.

In the *Wallenstein* trilogy Schiller had reached the height of his powers as a dramatist. Working against time, he produced four more plays in quick succession (apart from his adaptations of *Macbeth* and of Gozzi's *Turandot* for the German stage, and his fine translation of Racine's *Phèdre*): *Maria Stuart* (completed 1800), *Die Jungfrau von Orleans* (completed 1801), *Die Braut von Messina*, with its important preface, Schiller's last critical pronouncement (completed 1803), and *Wilhelm Tell* (completed 1804). Death overtook him at Weimar (May 9, 1805) while he was working at a new play on a Russian theme, *Demetrius*, which, to judge by the noble fragments that remain, might well have developed into a masterpiece.

At the age of 34, Schiller said in a letter to Goethe: "Now that I have begun to know and to employ my spiritual powers properly, an illness unfortunately threatens to undermine my physical ones . . . . However, I shall do what I can, and when in the end the edifice comes crashing down, I shall perhaps have salvaged what was worth preserving." He was as good as his word. "The idea of freedom," Goethe said to J. P. Eckermann, "assumed a different form as Schiller advanced in his own development and became a different man. In his youth it was physical freedom that preoccupied him and found its way into his works; in later life it was spiritual freedom." Schiller's early tragedies are attacks upon political oppression and the tyranny of social convention; his later plays are concerned with the inward freedom of the soul which enables a man to rise superior to the frailties of the flesh and to the pressure of material conditions; they show the hero torn between the claims of this world and the demands of an eternal moral order, striving to keep his integrity in the conflict. In his reflective poems and in his treatises, Schiller sets out to show how art can help man to attain this inner harmony and how, through the "aesthetic education" of the individual citizen, a happier, more humane social order may develop. His reflections on aesthetics thus link up with his political and historical thinking.

Schiller's thought has sometimes been called escapist, a retreat into an ivory tower, and yet he has also been charged with trying to press art into the service of morality or social reform. Both criticisms are unjust. Nowhere does Schiller advocate an ascetic or cowardly withdrawal from ordinary experience; on the contrary, he boldly faces the problems of modern life: the disintegration of the human personality in a highly mechanized civilization, the loss of individual freedom under forms of government which put a premium on conformity. Nor does he deny the autonomy of art: far from postulating any direct influence of art on private morals or public affairs, he insists that its effect can only be a mediate and long-term one.

One of the most striking features of Schiller's *oeuvre* is its modernity, its startling relevance to the life of the 20th century. Although for a time he fell out of favour with the German intelligentsia, the enduring value of his work is not likely to be obscured by fashions in criticism.

TITLE PAGES FROM FRIEDRICH SCHILLER'S DRAMA DIE RÄUBER: (LEFT) FIRST EDITION, 1781; (RIGHT) SECOND EDITION, 1782

BIBLIOGRAPHY.—Two of the principal modern editions of Schiller's works are the centenary edition, the *Säkularausgabe*, ed. by E. von der Hellen *et al.*, 16 vol. (1904–05), and the *Horenausgabe*, ed. by C. Schüddekopf and C. Höfer, 22 vol. (1910–26), which presents Schiller's *oeuvre*, including most of his letters, in chronological order. The letters were edited by F. Jonas, 7 vol. (1892–96). Supplementary material which has since come to light is incorporated in the comprehensive *Nationalausgabe*, ed. by J. Petersen *et al.*, a major critical edition designed to consist of about 40 vol. (1943–).

Of the many critical biographies *see* Thomas Carlyle, *Life of Friedrich Schiller* (1825), the earliest monograph on Schiller of any lasting value; Jakob Minor, *Schiller*, 2 vol. (1890); Otto Harnack, *Schiller* (1898); Eugen Kühnemann, *Schiller* (1905); Karl Berger, *Schiller*, 2 vol. (1905–09); Herbert Cysarz, *Schiller* (1934); W. Witte, *Schiller* (1949); Melitta Gerhard, *Schiller* (1950); Reinhard Buchwald, *Schiller*, 2 vol., rev. ed. (1953–54); Bernhard Zeller, *Schiller, eine Bildbiographie* (1958), richly illustrated; Gerhard Storz, *Der Dichter Friedrich Schiller* (1959); B. von Wiese, *Schiller* (1959).

Various special aspects of Schiller's work and personality are treated in the following: Ludwig Bellermann, *Schillers Dramen*, 2 vol. (1888–

91); Heinrich Düntzer, *Schillers lyrische Gedichte,* 3rd rev. ed. (1893); *Schillers Gespräche,* ed. by Julius Petersen (1911); Max Hecker, *Schillers Tod und Bestattung* (1935); E. L. Stahl, *Schiller's Drama: Theory and Practice* (1954); Thomas Mann, *Versuch über Schiller* (1955); W. F. Mainland, *Schiller and the Changing Past* (1957); W. Witte, *Schiller and Burns and Other Essays* (1959); *Schiller Bicentenary Lectures,* ed. by F. Norman (1960).

Schiller's style does not readily lend itself to translation into English; most of the existing English versions of his works do not rise above mediocrity. *Wallenstein* is the outstanding exception: *Die Piccolomini* and *Wallensteins Tod* were translated by Coleridge, at a time (December 1799–April 1800) when the poet, who had just returned from his visit to Germany, was still at the height of his powers. Among later contributions, a translation of the *Letters on the Aesthetic Education of Man* by E. M. Wilkinson and L. A. Willoughby deserves to be specially mentioned.

For detailed bibliographical information *see* Wolfgang Vulpius, *Schiller-Bibliographie 1893–1958* (1959), and "Schiller in England" in the *Publications of the English Goethe Society,* vol. xxx (1961).

(W. Wi.)

SCHILTBERGER, JOHANN (or Hans) (1380–1440?), Bavarian nobleman and author of the *Reisebuch,* an important record of medieval European history and topography, was born in 1380 near Lohhof, north of Munich. When King Sigismund appealed for assistance in fighting the Turks in Hungary, Schiltberger followed this call. In the Nikopol disaster of Sept. 28, 1396, he was taken prisoner and became a slave. For the next six years he served the sultan and so came to see Asia Minor and Egypt. Taking part in the battle at Ankara on July 20, 1402, when the Turks were defeated by the Tatars, he passed into the possession of the khan Timur and thus saw Samarkand, Armenia and Georgia. Having served several masters, he accompanied a Tatar prince to Siberia and the middle Volga. Later he spent some time in southeastern Russia. Near Batumi he escaped and returned via Constantinople and Kilia and then along the route north of the Carpathians to his Bavarian home which he reached in 1427. He became chamberlain to the duke of Bavaria. The place and time of his death are uncertain.

Of his *Reisebuch,* wherein he described his experiences and the countries he saw, a number of contemporary manuscripts exist. It was first printed at Augsburg *c.* 1460 and there were four other editions in the 15th and six in the 16th century. Of 19th-century editions there are two in German, one in Russian and an English edition by the Hakluyt Society in 1879.

See C. R. Beazley, *The Dawn of Modern Geography,* vol. iii, pp. 356–378, 550 (1906).

(K. A. S.)

SCHIMPER, ANDREAS FRANZ WILHELM (1856–1901), German botanist best known for his work on the ecology of tropical plants, was born at Strasbourg on May 12, 1856, a member of a celebrated family of botanists. He received his doctorate at Strasbourg in 1878, and afterward studied under H. A. de Bary. From 1880 to 1881 he was a fellow at Johns Hopkins University. Upon returning to Europe he became *Privatdozent* ("official but unpaid lecturer") and professor (1886) at Bonn Botanical Institute where he remained until 1898. From 1898 to 1901 he was professor at Basel, Switz. Schimper's botanical travels took him to the West Indies (1881, 1882–83), to Brazil (1886), to Ceylon and Java (1889–90), and to the Canary Islands, Cameroons, East Africa, Seychelles, and Sumatra with the "Valdivia" deep-sea expedition (1898–99).

Schimper died on Sept. 9, 1901, at Basel.

Schimper's ecological studies included important papers on epiphytes, strand vegetation, and myrmecophilous plants. His *Pflanzengeographie auf physiologischer Grundlage* (1898; 3rd ed., 1935; English trans., *Plant-Geography upon a Physiological Basis,* 1903) ranks with Johannes Warming's *Plantesamfund* (1895) as one of the foundation works of modern plant ecology. The book is divided into three sections: the first considering factors that affect plant life; the second presenting Schimper's influential classification of world vegetation; and the third containing a systematic account of this vegetation. Schimper was instrumental in the establishment of a truly scientific and comprehensive method of ecological investigation. Apart from ecology, he made significant contributions to other branches of botany. He showed (1881) that starch grains are not formed in cytoplasm as previously maintained, and concluded (1883) that plastids do not arise through anything but the division of preexisting plastids.

See notice on Schimper, with a bibliography, in *Ber. Dtsch. Bot. Ges.,* xix, pp. 54–70 (1901).

(J. W. Tr.)

SCHINKEL, KARL FRIEDRICH (1781–1841), German architect and city planner, was born near Brandenburg on March 13, 1781. He studied with Friedrich Gilly and at the Academy of Architecture, Berlin. Two years in Italy, 1803–05, completed his studies.

As state architect of Prussia, Schinkel executed many commissions for King Frederick William III and other members of the royal family. His designs were based on the revival of various historical styles of architecture, his Greek revival buildings including the Royal Theatre, Berlin, 1818–21, and the Altes Museum, Berlin, 1822–30. His design for a monument to Queen Louise, 1810, and the Werdersche Church, Berlin, 1824–30, are two of the earliest Gothic revival designs in Europe. The St. Nicholas Church, Potsdam, 1826–49, is based on Italian Renaissance prototypes. His work as city planner resulted in new boulevards and squares in Berlin. Schinkel also is remembered for his paintings of romantic landscape scenes, stage and scenery designs, and his designs for furniture, decorative ironwork, etc.

Bibliography.—Designs published in *Sammlung architektonischer Entwürfe* (1819–40, 1866), *Werke der höheren Baukunst* (1840–42, 1878). Complete bibliography in P. O. Rave, *K. F. Schinkel* (1935). *See* also "K. F. Schinkel, Das Lebenswerk" series by various authors, ed. by Rave (1942–56).

(E. B. MacD.)

SCHISM, a term commonly applied to breaches of the unity of the Christian Church. In I Cor. 1:10 and 11:18 the term is used (translated "division" or "dissension") to refer simply to parties or factions within the local congregation, but it soon came to be employed more technically where groups broke communion with each other, establishing rival "churches," in particular when the division was not caused by disagreement over fundamental doctrine. Hence the formulation "heresy is sin against truth, schism sin against charity." Roman Catholic canon law defines a schismatic as a baptized person who, while continuing to call himself a Christian, refuses submission to the supreme pontiff or fellowship with the members of the church subject to him (canon 1325). Other churches have similarly defined schism juridically in terms of separation from their own communions. The underlying theological issues are difficult and controversial.

Estimates of the nature and consequences of schism necessarily vary with different conceptions of the church. Where it is held that the church's unity is not only spiritual but also visible, historical, and organizational—in the sense that there must exist according to the divine law one communion, and one only, which is the true church of Christ—a schismatic body is considered to have gone out of the church without impairing the unity and unicity of the church; Roman Catholicism and Eastern Orthodoxy maintain this view in principle. Protestant churches normally hold that schism exists (though it should not) within the visible church; denominations which are out of communion with one another may yet be within (or parts or expressions of) the one catholic church of the creed, provided that they possess the essential marks of the church. Controversy may then turn upon these marks. Again, those who, like many Anglicans, believe episcopacy in apostolic succession (*q.v.*) to be essential to the existence of the church, hold—logically, though they may not wish to draw the conclusion—that schism exists within the church between the separated episcopal churches; the nonepiscopal bodies are sects or schisms from, and outside, the one church, though they may approximate in varying degrees to it and may benefit from the Christian truths and institutions they possess.

In the early church it was usually taught (classically by the 3rd-century bishop St. Cyprian) that the visible unity of the one historic church is intrinsically unbreakable and that schismatic bodies, being by definition outside it, are deprived of all the benefits of Christianity: the Holy Spirit does not work within them, they have no ministry or sacraments and cannot mediate salvation. Cyprian believed that all schisms must quickly wither away. Gradually, and especially through the teaching of Augustine against the schismatic, puritan Donatists, there emerged a theology of schismatic ministries and sacraments outside the church, valid

but still not efficacious in regard to salvation. Thus a person baptized in schism need not be rebaptized, though he cannot enjoy the spiritual benefits of baptism until he is united with the church; and so with ordination. The Augustinian theology was generally adopted in the West and it remains influential, though its inner inconsistency subsequently led to modifications in the direction of conceding efficacy as well as validity to ministries outside the church. Roman Catholicism and Orthodoxy tend to allow the efficacy of each other's sacraments. Catholicism acknowledges the efficacy of Protestant baptism when it is properly administered in good faith. Anglicans frequently recognize the efficacy, even when they deny the validity, of nonepiscopal ministries. Sometimes the concept of validity is questioned, and the acknowledgment of ministerial and sacramental efficacy is taken to involve the recognition of other bodies as true churches; or, conversely, the recognition of bodies as churches on the ground of their Christian faith and life in general is held to involve the acceptance of their ministries even if they are not in the apostolic succession as understood in the early or medieval church. Much modern discussion is therefore concerned with the relations (*e.g.*, of intercommunion) properly allowable between bodies which, though now in schism, are seeking visible unity and acknowledge one another to be churches, however imperfect, within the one catholic church.

Schisms have occurred for many secular reasons, personal, sociological, political. A frequent ecclesiastical cause has been the exercise of discipline, arising from the tension between a rigorist or puritan conception of the church, which must be kept holy by the expulsion of grave sinners, and a more comprehensive notion of it as the totality of the baptized and a school for sinners. Early examples of rigorist schisms are Novatianism and Donatism, and there are many perfectionist sects today. The "separated" Monophysite and Nestorian churches of the East originated in doctrinal controversy, but nontheological factors were also influential, as they were in the major schism between the Greek and Latin churches. The "great schism" in the West turned on rival claims to the papacy (*q.v.*) in the 14th century.

For some centuries the theological issues raised by the East-West schism were obscured, since similarity in structure and belief kept alive the hope that the breach, considered as a temporary division within the church, might soon be healed. Since the Reformation the problems, both theoretical and practical, have become more acute, particularly through the obviously splintering tendencies of Protestantism and the rapid spread of a multiform denominationalism over the world during the 19th century. In the 20th century the sinfulness of disunity, as well as the harm which it does to the mission of the church in the world, has been more deeply felt and more openly confessed. In view of the activities of the ecumenical movement (*q.v.*) and the Second Vatican Council, the older concepts of what entitles a Christian group to be considered, theologically speaking, a church within the church, and consequently the concepts of the nature and consequences of schism, must be regarded as subject to correction.

(S. L. G.)

SCHIST, in geology, a crystalline rock that splits easily. Schists are widely distributed in all major mountain ranges. The ease of splitting is caused by a parallel arrangement of scaly, tabular or prismatic minerals. Nearly all schists are metamorphic rocks, and micas are the most common minerals composing them. Micas are a large family of minerals that have perfect cleavage, and tend to form sheetlike crystals. They are hydrous aluminum silicates with various combinations of iron, magnesium, calcium, manganese, lithium, potassium and sodium. Muscovite (white), biotite (brown to black), chlorite (green) and phlogopite (light brown) are the most common micas. (*See* also MICA.)

Where the earth's crust is being deformed, physicochemical conditions at depths of a few miles are such as to favour the growth of micas as stable minerals in any rock that has the requisite bulk composition. Elevated temperatures, intense shearing of the rock fabric and solutions circulating through pore spaces are probably the most important factors. Siliceous ashes or lavas (rhyolite), granitic rocks or shales may be converted to schists if the deformation is intense enough. Basaltic rocks and gabbros may be converted into greenish-gray chlorite schists, or hornblende schists, composed of combinations of the minerals hornblende (a prismatic calcium-magnesium-iron-aluminum silicate), epidote, magnetite, garnet, members of the mica family and other silicates.

BY COURTESY OF WARD'S NATURAL SCIENCE ESTABLISHMENT, INC.

SCHIST FROM GILPIN COUNTY, COLORADO. SPECIMEN SHOWN HAS BEEN SUBJECTED TO SEVERE FOLDING

However, calcareous shales have a bulk composition similar to that of basalts and gabbros, and can also be converted into chlorite schists or hornblende schists. It may be impossible to determine the parent rock. Igneous rocks high in magnesia and iron but low in silica (peridotites) yield, under metamorphic conditions, aggregates of the fibrous mineral antigorite. Under intensive shear stress, these rocks develop talc and become talc schists. However, certain dolomites (magnesian limestones) may also be metamorphosed to talc or talc-tremolite schists (tremolite is a hydrous calcium-magnesium silicate).

Schists split easily even if mica is a subordinate constituent. Slightly muddy sandstone, metamorphosed and sheared, becomes a quartz-muscovite schist that flakes easily. Slightly muddy limestones turn into calcareous schists, composed of calcite, muscovite, phlogopite or other micas that induce fissility of the rocks. Tabular minerals, such as feldspar, or prismatic minerals like hornblende, tremolite and antigorite may under special conditions arrange themselves in parallel planes and give rise to a crude schistose structure of the rock.

The mineral hematite (ferric oxide) possesses a direction of good cleavage. Larger masses of this mineral, recrystallized under strong shear stress, may slip along the cleavage planes and become schistose (specular hematite, "iron mica"). Some of these rocks contain red jasper beds, and surfaces displaying these scarlet laminae intermixed with the silvery hematite flakes in intricately crumpled beds are extremely beautiful.

Metamorphic processes coarsen the grains of shaly sediments and lead to a series from shale (finest) through slate and phyllite (from the Greek *phyllon,* "leaf, sheet") to schist (coarsest). The grain size of schist averages over one millimetre. If feldspar equals or exceeds the amount of mica, the rock is called a gneiss. Other minerals commonly found in schists are quartz, garnet, tourmaline, feldspar, magnetite, staurolite, hornblende, kyanite, sillimanite, andalusite, epidote and graphite.

The origin and structure of schists discloses many interesting details of rock deformation. Nearly all larger mountain ranges of the earth have gone through a period of preparation during which a major depression in the crust received large volumes of muddy sediment. Subsequently, these large mud-filled depressions have been violently compressed, the strata folded and the folded complex uplifted to form the mountains. At depths of several miles, mud tends to recrystallize into mica aggregates. But simultaneously, the layers are being folded. Thus it can happen that these rocks, having reached their yield strength during the folding, were intimately dissected by slip planes or slip cleavage. If solutions circulate actively along them, the planes will become coated with newly grown mica flakes, extending across the truncated layers of deposition. Along the slip cleavage planes the entire mass of rocks can be further deformed, developing planes of movement unrelated to the layers of deposition. Perhaps some of the longest slip planes in the solid crust of the earth are those that connect major bodies of easily yielding schist.

Unless they contain many nonmicaceous minerals, schists weather readily, and tend to underlie smooth slopes and gentle land forms, yielding fairly good, clayey soils.

Mica crystals in schists are usually too small to be of commercial

use. However, the accompanying minerals of some schists (kyanite, sillimanite, andalusite, talc, garnet, graphite and others) are important as raw materials for high-grade ceramic wares, abrasives, lubricants and other nonmetallic mineral industries.

For a more detailed discussion of the metamorphic processes and concepts referred to in this article *see* METAMORPHISM.

(R. BK.)

SCHISTOSOMIASIS (BILHARZIASIS), a group of diseases caused by parasitic microorganisms called blood flukes, produces symptoms primarily referable to the intestine and liver, with associated dysentery, or to the urinary bladder, with passage of blood in the urine.

Japonica (Eastern) schistosomiasis is endemic in Japan, much of China, the Philippines and Celebes. Manson's schistosomiasis (intestinal bilharziasis) occurs in northern Egypt and many other parts of Africa, Yemen and other places in Arabia, Puerto Rico and several islands of the Lesser Antilles, Venezuela, Dutch Guiana, and extensive areas in Brazil. Vesical schistosomiasis (bladder bilharziasis) exists throughout practically all of Africa, the southern tip of Portugal, Cyprus, and the Near East.

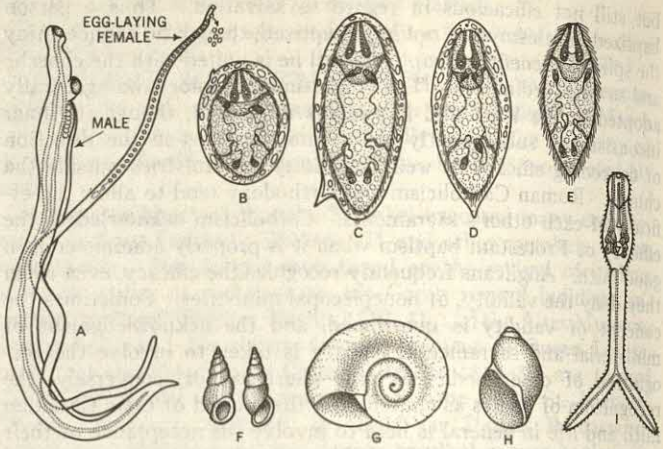
Causative Organisms.—These are commonly called blood flukes or schistosomes because they live in the blood vessels of their definitive host. They belong to the Trematoda, a class of flatworms (Platyhelminthes). The adult blood flukes are delicate, elongated organisms about 10 to 25 mm. long. The sexes are separate. The male holds the delicate female in his ventral sex canal during the long period of egg laying. Japonica schistosomiasis is produced by *Schistosoma japonicum*, Manson's schistosomiasis by *S. mansoni* and vesical (or urinary) schistosomiasis by *S. haematobium*. The first two types reside in the mesenteric-portal venous circulation and *S. haematobium* principally in the vesical and pelvic venous plexuses.

Life Cycle.—Eggs deposited by the female worms in the smaller venules contain rapidly maturing ciliated larvae. The larvae secrete digestive substances, aiding the eggs to escape from the blood vessels through the tissues into the lumen of the intestine or urinary bladder. When the fully embryonated eggs reach fresh water they soon hatch and the ciliated larvae (miracidia) actively swim about.

In case there are appropriate species of snails nearby (species of *Oncomelania* for *S. japonicum*, *Planorbis* for *S. mansoni* and *Bulinus* or *Physopsis* for *S. haematobium*), the miracidia attach to and penetrate the soft tissues of the mollusk and transform into simple hollow sacs (sporocysts). Each of these produces several second-generation sporocysts, which in turn give rise to numerous fork-tailed larvae, the cercariae. Broods of mature cercariae escape at frequent intervals from the snail, swim about in the water and, on contact with mammalian skin, become attached and proceed to penetrate the tissues. Man is the only natural host of *S. haematobium;* man and occasionally monkeys are natural hosts of *S. mansoni;* and almost any mammal is susceptible to infection with *S. japonicum*. Before penetrating exposed skin (or mucous membrane) the cercaria drops its tail. Upon reaching a venule it is passively carried to the pulmonary arterioles, slowly squeezes through the capillaries into the pulmonary venules and passes into the systemic circulation. It will survive only if it reaches a mesenteric artery and proceeds through the capillaries into the portal blood vessels, where it feeds on glycogen in the blood plasma and grows. On reaching adolescence the worms work their way against the venous current: *S. japonicum* migrates to the mesenteric vessels draining the small bowel, *S. mansoni* to those draining the large bowel and *S. haematobium* down the inferior mesenteric venules and through the hemorrhoidal and pudendal anastomoses into the vesical venules. In these localities the worms complete maturity and mate, and the females begin to lay eggs.

From skin exposure until egg deposition the minimum time for *S. japonicum* is about 4 weeks, for *S. mansoni* 6 to 7 weeks and for *S. haematobium* 10 to 12 weeks.

Pathogenesis and Symptoms.—There are three recognized clinical stages in schistosomiasis, namely (1) incubation period, (2) acute stage and (3) chronic stage. The incubation period begins with the penetration of the cercariae and is terminated when egg deposition begins. During this time and continuing during the life of the worms (20 or more years if the patient survives) the by-products of the worms produce local and systemic irritation of an allergic nature. There is inflammation, increase of certain white blood cells (eosinophilia), a nonproductive cough, late afternoon fever, watery skin eruptions (giant urticaria) and swelling, pain and tenderness of the liver. In the intestinal types (*S. japonicum* and *S. mansoni*), diarrhea occurs toward the end of the incubation period. With the beginning of egg deposition the acute stage of the disease is initiated, resulting from trauma caused by eggs escaping from blood vessels through the tissues into the lumen of the intestine or the urinary bladder, typically accompanied by hemorrhages. As the chronic stage gradually develops, eggs become impacted in the walls of the organs and provoke pseudotubercle formation around themselves. This leads to fibrous thickening of the organs, with greatly diminished function. The intestine gradually develops the consistency of an old, nonelastic garden hose, and the bladder becomes impregnated with phosphatic deposits and possesses a gritty surface. Moreover, in the intestinal types, eggs in increasing numbers are carried in the portal current into the liver, filter out and initiate hepatic cirrhosis. This tends to block the flow of blood through the liver, produces abdominal fluid (dropsy) and indirectly causes enlargement of the spleen.



BY COURTESY OF DR. E. C. FAUST

STAGES IN THE DEVELOPMENT OF THE THREE SPECIES OF SCHISTOSOMA RESPONSIBLE FOR SCHISTOSOMIASIS

(A) Adult schistosomes in blood vessels (magnified 2.50 times). (B–D) Mature eggs (X 180): *Schistosoma japonicum, Schistosoma mansoni, Schistosoma haematobium.* (E) Miracidium hatched from egg. (F–H) Snail hosts (X 0.70): *Oncomelania* (*Schistosoma japonicum*), *Planorbis* (*Schistosoma mansoni*), *Bulinus* (*Schistosoma haematobium*). (I) Cercaria (X 90)

In the vesical type, eggs in the lumen of the bladder become centres for concretions ("stones"); meanwhile the fibrosis extends to the pelvic organs. In all types, eggs are frequently swept through the accessory venous circulation to the lungs where they set up centres of tissue reaction. Occasionally nests of eggs reach the brain and other organs where they produce granulomatous tumours.

Diagnosis and Prognosis.—Diagnosis is accomplished by recovery of the characteristic eggs from the stool or by rectal biopsy (*S. japonicum, S. mansoni*) and from the sediment of the urine or by bladder biopsy (*S. haematobium*).

Prognosis depends on the species of *Schistosoma* involved (*S. japonicum* is most dangerous), on the amount of exposure, on the chronicity of the disease and to a considerable degree on the patient's reactiveness to the infection. Unless exposure is overwhelming, early diagnosis and persistent effective treatment usually provide a good prognosis.

Treatment.—The only drugs consistently proved helpful in the eradication of human blood flukes are the antimony compounds. Potassium antimonyl tartrate (tartar emetic), first employed in 1917, proved on the whole satisfactory, although it must be administered intravenously and is rather poorly tolerated in concentrations higher than 0.5%. Certain synthetic antimo-

nials, particularly stibophen and lithium antimony thiomalate, are administered intramuscularly and are better tolerated, but their cure rate is considerably lower than that of tartar emetic. Miracil D is useful in infection with *S. haematobium*.

Prevention.—There is no immunization against schistosomiasis. Theoretically, education in hygiene and public health measures to keep viable eggs from reaching fresh water constitute first-line prevention. This is impractical, however, both because of social and economic practices and, in *S. japonicum* areas, because the disease would be perpetuated by mammalian hosts. Mass chemotherapy in endemic areas likewise proved unsatisfactory. Concentrated attack on the molluskan host by naturalistic methods and by using copper sulfate in the water was moderately successful in reducing the snail population in endemic spots in Egypt, with a comparable decrease in the incidence of the disease. Molluscicides also showed considerable promise.

(E. C. F.)

SCHIZOPHRENIA is a term (replacing the older designation "dementia praecox") used by psychiatrists to indicate a group of mental disorders in which the symptoms occur in varying combinations and with varying degrees of intensity, but generally have in common disturbances of feeling, thought, and relations to the outside world. Neither dementia praecox (which means "early insanity") nor schizophrenia (literally, "splitting of the mind") is entirely satisfactory as a term to cover the various patterns of disturbances usually included in the group. During the 20th century schizophrenia has been considered, at one time or another, either as a single disease entity or a collection of somewhat similar patterns of psychological reactions to life situations.

Types and Symptoms.—Some psychiatrists hold that there are two entirely different kinds of schizophrenia: (1) "process" or "nuclear" schizophrenia, probably based on an organic causation or predisposition, with a poor prognosis, and (2) "reactive" schizophrenia, precipitated by the events of the patient's life and characterized by a relatively mild thought disorder, with a far better prognosis. Others deny the existence of these kinds and retain the traditional division of schizophrenia into four main types, differing in their specific symptomatology, as follows:

1. The "simple" type is characterized mainly by an insidious and gradual reduction in external relations and interests. Emotions are lacking in depth; ideation is simple and refers to concrete things; there is relative absence of activity, a progressive lessening in the use of inner resources, and a retreat to simpler or stereotyped forms of behaviour.

2. The "hebephrenic" type is characterized mainly by shallow and inappropriate emotional responses, foolish or bizarre behaviour, false beliefs (delusions), and false perceptions (hallucinations).

3. The "catatonic" type is characterized by striking motor behaviour. The patient may remain in a state of almost complete immobility, often assuming statuesque positions. Mutism (inability to talk), extreme compliance, and absence of almost all voluntary actions are also common. This state of inactivity is at times preceded or interrupted by episodes of excessive motor activity and excitement, generally of an impulsive, unpredictable kind.

4. The "paranoid" type, which usually arises later in life than the other types, is characterized primarily by unrealistic, illogical thinking, with delusions of persecution or of grandeur, and often by hallucinations. (*See* PARANOID REACTIONS.)

Hallucinations, although not invariably present, are a conspicuous symptom in the hebephrenic and paranoid types. The commonest are auditory: the patient hears voices and believes in their reality. Visual hallucinations are fairly common, especially in acute episodes. Olfactory and gustatory hallucinations, and abnormal bodily perceptions, occur in a smaller number of cases. (*See* also HALLUCINATION.)

One symptom common to all types, although at times only minimally present and difficult to detect, is a disorder of thought characterized by impairment in the use of abstract concepts (*see* CONCEPT FORMATION, PSYCHOLOGY OF) and a withdrawal into a concrete frame of reference, as the neurologist Kurt Goldstein demonstrated. This disorder in the processes of thinking is neither constant nor irreversible. Especially in the initial stages it may be recognized only in the overt symptomatology or when the patient is in situations that arouse anxiety.

A special type of schizophrenia was first described by Sante de Sanctis, early in the century, under the name of dementia praecocissima; it is now usually called child schizophrenia. Margaret Mahler, who stresses the psychological aspects of this disorder, distinguishes two types of child schizophrenia: one characterized by extreme withdrawal (autistic type), the other by a symbiotic relation with the mother. Most authors, following Lauretta Bender, are inclined to believe that organic abnormalities, as yet undefined, underlie the disorder. In spite of some clinical similarities, it is by no means proved that child schizophrenia and adult schizophrenia are related.

The four adult types of schizophrenia are not mutually exclusive. Mixtures are most frequent in the early, acute phases, but may also occur in later, chronic phases. In these later phases the original symptoms sometimes disappear, and the symptom picture becomes indeterminate. In addition to the mixture of schizophrenic symptoms there may also be a mixture of schizophrenic symptoms with those of other psychoses, notably those of the manic-depressive group; patients exhibiting this combination are described as of a schizo-affective type. (For comparisons of schizophrenic symptoms with those of other mental illnesses *see* PSYCHOLOGY, ABNORMAL; PSYCHOSES.)

Incidence.—Comparable estimates for different countries and even for different parts of a single country are difficult to secure owing to variation of the criteria by which schizophrenia is diagnosed. In the U.S. schizophrenia is considered the most important of the major psychoses; it has been estimated that the number of schizophrenics is between 2.5 and 3 per 1,000 of the general population. However, the number of ambulatory patients who seek outpatient treatment is rapidly increasing, and this estimate may be too conservative. Schizophrenics constitute 20 to 25% of first admissions to U.S. public hospitals for mental disease. Because of the relative youth of patients at admittance—the maximum incidence of first admissions in men comes between the ages of 20 and 24, and in women between the ages of 35 and 39—and the relatively long stay per patient, the group makes up about 47% of the population of psychiatric hospitals. About 45% of schizophrenics who are admitted to public mental hospitals or clinics recover or improve greatly. Of those patients who are committed and improve, about 80% leave the hospital within the first year.

There seems to be some relation between the incidence of schizophrenia and the type of society. An urban society, particularly that of a large city, shows a higher incidence, and an industrial society appears to predispose to the condition more than an agricultural society. It is probable, however, that schizophrenia occurs in all cultures and all societies.

Causation.—Theories of the origin of schizophrenia vary from anatomical and biochemical to psychological and social, from genetic to environmental. The general view is that the schizophrenic types of reaction result from faulty adjustments to a variety of underlying conditions, which may be either physical or psychological, or both.

Psychological Theories.—Emil Kraepelin (1856–1926) was the first to differentiate this disorder from other psychiatric conditions. He called it dementia praecox (a term which had been used by the Belgian psychiatrist B. A. Morel in a more restricted sense) and described the essential characteristics of the disorder. Although Kraepelin considered the origin of the syndrome to be either a degenerative disease of the brain or a metabolic distur-

bance causing autointoxication, his description and differentiation of the psychological aspects of the disorder were an important contribution. He took a pessimistic view of the disorder and believed that all cases end in a state of permanent and complete dementia.

Eugen Bleuler (1857–1939) offered the conceptual link between Kraepelin's interpretation of schizophrenia and that of Sigmund Freud (*see* below). It was Bleuler who coined the term schizophrenia. By this term he did not mean a split, divided, or double personality, as is popularly believed, but a lack of coordination between various psychological functions. Although he did not discount the view that a toxin might be responsible for the disorder, Bleuler emphasized the importance of the impairment of association of ideas, and he considered most of the symptoms to be a direct or indirect result of this impairment. He was the first to describe the disordered thinking of the schizophrenic; he called this disorder autistic or dereistic.

Adolf Meyer (1866–1950) regarded schizophrenic reactions as disorganizations of thought and behaviour which result from a progressive maladaptation and then become habitual. The background for the progressive disturbances, he believed, might be both physiological and psychological. Meyer insisted on the psychobiological unity of the organism and refused to separate the mental from the physical.

Although Sigmund Freud (1856–1939) was not primarily interested in this psychosis, his psychoanalytic theories and investigations (*see* PSYCHOANALYSIS) have clarified many of its aspects. Many schizophrenic symptoms can readily be interpreted as symbolic manifestations; they are often similar in form, content, and motivation to the dreams of normal persons, and therefore are susceptible of psychoanalytic interpretation. The psychoanalytic view emphasizes two common features of schizophrenic behaviour. The regressive symptoms are explained as a retreat to less mature levels of the ego (the reality-testing portion of the psyche); and the restitutive symptoms are attempts to replace the existing world, from which the patient has retreated, by such phenomena as hallucinations, delusions, fantasies of world reconstruction, and peculiarities of language.

Carl Gustav Jung (1875–1961) maintained that schizophrenia is characterized by an unusual strength of the unconscious, so that an abnormal number of atavistic tendencies are not brought into adjustment with modern life. He held that the peculiar symptoms of each case result partly from the patient's past life and partly from a resurgence of the collective unconscious, *i.e.*, of the primordial images, or "archetypes," which have been deposited by the experience of primitive generations.

Harry Stack Sullivan (1892–1949) contended that schizophrenia, like most other mental disorders, is largely attributable to faulty interpersonal relations, especially poor relations between parent and child. Anxiety and lack of self-esteem, originating in these early relations, lead the patient to distort his way of living and issue in a lack of "consensual validation," *i.e.*, an unfavourable attitude on the part of others toward the patient's way of seeing the world, and finally to a schizophrenic panic.

Silvano Arieti (1914–) to a large extent accepts Sullivan's dynamic interpretation of schizophrenia. He emphasizes, however, the importance of the special formal mechanisms that express the patient's conflicts and way of life. These mechanisms are most conspicuous in the realm of cognition. The patient adopts a particular form of thinking called by Arieti "paleologic." Paleologic is to a large extent based on E. Von Domarus' principle: namely, whereas the normal person infers identity only on the basis of an identical subject, the schizophrenic, when he thinks in a typically schizophrenic way, infers identity on the basis of identical predicates. For instance, a patient thought she was the Virgin Mary. Asked why, she replied, "I am a virgin, I am the Virgin Mary." The common predicate "being virgin" led to the identification of the two subjects, the Virgin Mary and the patient. By resorting to this type of thinking the patient could deny her feeling of unworthiness and inadequacy and could identify herself with her ideal of feminine perfection. Paleologic thinking, in Arieti's view, is not only a regressive phenomenon but also a psychodynamic or motivational mechanism. He agrees that the schizophrenic process may be explained psychosomatically, since intensely disturbing emotions may bring about the resurgence of obsolete functional and neural patterns.

Biological Theories.—A number of investigators, including H. Luxenburger in Germany, E. Essen-Möller in Sweden, F. J. Kallmann in the U.S., and Eliot Slater in Great Britain, have considered inheritance the most important factor in schizophrenia. The incidence of schizophrenia is higher in the families of schizophrenics than in the general population. There has been much controversy about the mode of inheritance. Kallmann believes in a single recessive gene, of limited manifestation; other investigators assume a dominant gene, and still others a multiple mode of inheritance. Recent studies of chromosomes, confirming the hereditary nature of some types of mental deficiency, have failed to indicate specific chromatin abnormality in schizophrenia.

Biochemical studies of this disorder have been stimulated by the experimental use of substances which produce conditions resembling schizophrenia. One of these substances is bulbocapnine, obtained from the ornamental herb *Corydalis cava;* in animals it produces a state similar but not identical to catatonia. Mescaline, from the peyote cactus, and lysergic acid diethylamide (LSD), from ergot, produce in human beings abnormal perceptions and thought disorders similar to those seen in schizophrenia. (*See* NEUROPHARMACOLOGY AND PSYCHOPHARMACOLOGY.)

Great interest has been shown in the fact that a mescalinelike substance, 3,4-dimethoxyphenylethylamine, has been found in the urine of many schizophrenic patients. A dietary origin, however, has not been excluded. The same doubt could be expressed for abnormal indoles (benzopyrrole compounds) which have been found in the urine of some schizophrenics. Abnormalities of carbohydrate metabolism, occasionally found in some cases, are also believed to be the result of secondary factors. R. G. Heath and his collaborators reported the isolation of a specific protein factor from the serum of schizophrenics. This substance, named taraxein, which is believed to be related to ceruloplasmin (the alpha-globulin transporter of copper in blood plasma), is said to produce psychotic symptoms in volunteers, but this has not been adequately confirmed. Some studies have suggested that schizophrenia is related to endocrine and cardiovascular irregularities and to body build (*see* PERSONALITY: *Morphological or Physical Types*), but not all psychiatrists accept these findings.

Treatment.—Although at one time there was considerable pessimism about the outlook in schizophrenic cases, this attitude changed markedly from the 1940s onward. Freud himself was skeptical about the value of psychoanalysis in the treatment of psychoses, but this approach has since been applied with certain modifications in the technique. The modifications include the abolition of the psychoanalyst's couch, direct intervention and adoption of the symbolic language of the patient, and less reliance on free association (Freud's method of discovering the patient's unconscious processes from his spontaneous association of one thought with another).

Most patients are treated by physical methods. The most important are: (1) Shock therapy, consisting either of the artificial production of comas by administration of large doses of insulin, or electroconvulsive therapy, consisting of the production of convulsions by electrical shocks (*see* PSYCHIATRY: *Shock Therapy*). (2) Drug therapy, consisting of the administration of large doses of ataractic drugs (so-called tranquilizers), the most important being the phenothiazines; *e.g.*, chlorpromazine (*see* TRANQUILIZING DRUGS). (3) So-called psychosurgery—separation of certain areas of the brain—has been carried out in recalcitrant cases. The commonest operation is prefrontal lobotomy, *i.e.*, cutting the nerve fibres connecting the thalamus with the frontal lobes. Recourse to this operation became fairly frequent in the late 1940s, but eventually less drastic procedures came to be preferred even for the most difficult cases. (*See* also PSYCHIATRY: *Psychosurgery.*)

Although mild cases may be treated outside hospitals, most patients diagnosed as schizophrenics need admission to a hospital, especially during acute episodes. Almost all psychiatric hospitals are equipped to provide the various types of physical treatment, as well as occupational therapy, mentioned above, but only a few

provide psychotherapy. In most cases, what is chiefly needed is the provision of a protective environment—one in which the patient can gradually work through his periods of confusion away from the disturbing influences of his own home.

Success varies with the stage of the disease at which treatment is started. If the illness has gone on for long, success is more difficult to attain. Favourable indications are an acute or sudden onset, absence of schizophrenic history in the family, presence of an admixture of symptoms such as those found in manic-depressive states, and the presence of some fairly clear psychological conflict which precipitated the disturbance. Statistical studies of the effects of therapy indicate that shock treatment may be effective in cases with a good outlook, but it is not so successful in schizophrenia as it is in psychotic depressions.

Prevention.—Without a clear-cut understanding of the cause of the illness, specific preventive measures are not available. A number of authorities, influenced largely by psychoanalytic theories, believe that the relations with the family, particularly the mother, during early life play an important role in the development of schizophrenia. Their recommendations for prevention therefore centre largely on providing security for the child through warm, understanding relations in the family (*see* FAMILY: *Influence of the Family on Individual Personality*).

SCHLEGEL, AUGUST WILHELM VON (1767–1845), German translator and critic, one of the most influential disseminators of the ideas of the German Romantic movement and the originator of the standard German translation of Shakespeare. He was born on Sept. 8, 1767, in Hanover, the son of a Protestant pastor and nephew of J. E. Schlegel (*q.v.*). In 1787 he began his studies in Göttingen under C. G. Heyne and G. A. Bürger (*qq.v.*), who taught classical philology and aesthetics, respectively. In 1791 he took a post as private tutor in Amsterdam but in 1795 accepted an invitation to write for Schiller's periodical *Die Horen* and moved to Jena in 1796. When *Die Horen* ceased publication, Schlegel, together with his brother Friedrich, started a periodical, *Athenäum* (1798–1800), which became the organ of the Romantics, numbering Schleiermacher and Novalis among its contributors. He also wrote for the Jena *Allgemeine Literaturzeitung,* in which he published essays on Goethe's *Römische Elegien* and *Hermann und Dorothea,* which were forerunners in the appreciation of Goethe's mature work. In 1798 Schlegel became extraordinary professor at Jena University. In Jena he also began his long-planned poetical translation of Shakespeare (1797–1810), himself completing 17 plays; the translation was finished by Ludwig Tieck's daughter Dorothea and Graf W. H. Baudissin under Tieck's supervision (1825–33). The Schlegel Shakespeare takes a high place among German literary translations and is undoubtedly his greatest achievement. His unfortunately incomplete translation of Calderón (*Spanisches Theater,* 2 vol., 1803–09) and his other translations from the Romance literatures (*Blumensträusse italienischer, spanischer und portugiesischer Poesie,* 1804) also show his gift for catching the spirit of a foreign work and carrying it over into German.

In 1801 Schlegel went to Berlin, where he lectured on literature and art. Influenced by Herder, he gave a comprehensive survey of the nature and development of European literature and thought, scorning the implications of the concept "Enlightenment" and preaching the Middle Ages and what were for him the Romantics —Dante, Shakespeare, Calderón, and Camões. In 1807 he attracted attention with an attack on Racine's classicism, *Comparaison entre la Phèdre de Racine et celle d'Euripide.*

In 1796 Schlegel had married the brilliant Caroline Michaelis, but in 1803 she left him for the philosopher F. W. J. Schelling. After his divorce Schlegel accompanied Mme de Staël on travels in Germany, Italy, France, and Sweden, and her book *De l'Allemagne* (1813) contains many of his ideas. During his travels, in the spring of 1808, he gave a series of lectures in Vienna (*Über dramatische Kunst und Literatur,* 1809–11; Eng. trans., *Lectures on Dramatic Art and Literature,* 1815), which had a wide influence and were translated into many languages.

In 1813–14 he worked as press secretary to the Swedish crown prince Bernadotte. In 1818 he went to Bonn as professor of literature, where he concentrated largely on Oriental literature. He published the scholarly *Indische Bibliothek* (3 vol., 1820–30) and set up a Sanskrit printing press, in which he printed the Bhagavad Gita, with a Latin translation (1823), and the Ramayana (1829–46). He founded Sanskrit studies in Germany. In 1818, a year after Mme de Staël's death, Schlegel married the daughter of the Heidelberg theologian H. E. G. Paulus but was separated from her in 1819. He died in Bonn on May 12, 1845.

Schlegel's own poetry (*Gedichte,* 1800; *Ion,* a tragedy based on Euripides, 1803; *Poetische Werke,* 1811) shows a sovereign mastery of form but remains no more than cultivated verse. As a critic of poetry he was more empirical and systematic and less speculative than his brother Friedrich (*q.v.*). Viewing world literature as an organic whole, his literary criticism is sensitively perceptive. He contributed largely to the spread of the fundamental Romantic ideas in Europe. His view of the work of art as an organic symbol had considerable influence on Coleridge, for example. As a translator he is in the first rank.

SCHLEGEL, FRIEDRICH VON (1772–1829), German writer and critic, the originator of many of the philosophical ideas that inspired the early German Romantic movement (*see* GERMAN LITERATURE: *The Romantic Movement: First Phase*). He was born in Hanover on March 10, 1772, a younger brother of A. W. von Schlegel (*q.v.*). He began to study law but soon turned to philosophy, art, and the classics, which he studied at Göttingen and Leipzig. As he was later to show (*Über das Studium der griechischen Poesie,* 1797; the fragmentary *Geschichte der Poesie der Griechen und Römer,* 1798), Greek philosophy and culture were for him as for Schiller the essence of a complete and harmonious education, and he distinguished them clearly from modern psychologically "interesting" and progressive poetry.

In 1796 he joined his brother in Jena, where his criticism of the *Musenalmanach,* and personal incompatibility, soon led to a breach with Schiller. In 1798 the brothers began to publish the quarterly *Athenäum* (in which Friedrich's famous definition of Romantic poetry first appeared). It ran until 1800, and included contributions from Schleiermacher and Novalis; these four formed the group that formulated the Romantic aesthetic. Friedrich Schlegel, the deepest and most philosophical mind of the group, was at this time strongly influenced by the teaching of J. G. Fichte (*q.v.*), whose transcendental philosophy he transformed into a philosophy of imaginative creation. He developed his conception of the Romantic as the precondition for modern poetry in sharply pointed, paradoxical fragments (aphorisms) and in loosely woven "conversations" and "characteristics," maintaining that poetry should be at once philosophical and mythological, ironic and religious. Goethe's *Wilhelm Meister* became for him the prototype of the universal Romantic novel, and his review of it (in the *Athenäum*) was regarded as a model of critical penetration.

His imaginative work was less successful. His semiautobiographical novel fragment *Lucinde* (1799; Eng. trans. 1913–15) gives a religious significance to love as a physical and spiritual unity but disintegrates in brilliant intermezzi and arabesques. His tragedy *Alarcos* (1802) was a feeble attempt to fuse classical motifs and forms with Romantic elements from Calderón.

In 1801 Schlegel was briefly *Privatdozent* at Jena University, but a restless, difficult life followed. In 1802 he went to Paris, with Dorothea Veit, the eldest daughter of Moses Mendelssohn (*q.v.*) and former wife of Simon Veit, whom she had married in 1783, and who had divorced her in 1798. Schlegel married her in 1804. In Paris he studied Sanskrit, publishing *Über die Sprache und Weisheit der Inder* (1808)—the first attempt at comparative Indo-Germanic linguistics, and the starting point of the study of Indian languages and comparative philology.

In 1808 he and his wife became Roman Catholics, and he turned against his earlier thesis of the unconditional freedom of the individual, uniting his concept of Romanticism with ideas of medieval Christendom. He became the ideological spokesman of the anti-Napoleonic movement for German liberation, and this qualified him for a post as court secretary in the Vienna chancellery (1809). In 1809 he was at the archduke Charles's headquarters, and he helped write the appeal to the German people issued by the archduke. As an Austrian councilor of legation he took part in the Congress of Vienna. In 1820 he became editor of the right-wing Catholic paper *Concordia,* and his attack in it on the beliefs that he had himself earlier cherished led to a breach with his brother, which was never healed.

The two series of lectures that Friedrich gave in Vienna between 1810 and 1812 (*Über die neuere Geschichte,* 1811; Eng. trans. *Lectures on Modern History,* 1849, and *Geschichte der alten und neueren Literatur,* 1815; Eng. trans. *Lectures on the History of Literature,* 1818) show a new conception of history and literature; in them he developed the concept of a "new Middle Ages." During 1803–05 he was editor of *Europa,* a periodical on all the arts; and from 1812 to 1813 of a new periodical, *Deutsches Museum.* In 1828 he lectured at Dresden and died there on Jan. 12, 1829.

Although as an original writer Schlegel's importance is small, as a critic and aesthetic philosopher his achievement is considerable. Open to every new idea, he reveals a rich store of theories and projects in his provocative *Aperçus* and *Fragmente* (contributed to the *Athenäum* and other journals). His theories of creative criticism, his definitions of the Romantic, of irony, of the myth, the arabesque, and the novel, and his conception of a universal, historical, and comparative literary scholarship have had a profound influence on modern literature and criticism, although his ideas were partly communicated through the work of his brother. His wife, Dorothea (1763–1839), wrote an unfinished novel, *Florentin* (vol. i, 1801), published a collection of medieval Romantic poetry (ed. by F. Schlegel, 2 vol., 1804), and translated Mme de Staël's *Corinne* into German (1807–08).

Bibliography.—*Sämtliche Werke,* 10 vol. (1822–25), augmented ed., 15 vol. (1846); *Schlegels prosaische Jugendschriften, 1794–1802,* ed. by J. Minor, 2 vol. (1882; 2nd ed., 1906); *F. Schlegels Werke,* critical ed. by E. Behler, with H. Eichner and J. J. Anstett, 22 vol. planned (1958–); *Briefe von und an F. und D. Schlegel* (1926), and *Krisenjahre der Frühromantik: Briefe aus dem Schlegelkreis,* 2 vol. (1936–37), Commentary (1958), both ed. by J. Körner; *Literary Notebooks 1797–1801,* ed. and trans. by H. Eichner (1957). *See* also I. Rouge, *F. Schlegel et la genèse du romantisme allemand* (1904); R. Haym, *Die romantische Schule,* 5th ed., with bibliography (1928); F. Gundolf, "Schlegels romantische schriften," in *Romantiker* (1930); J. J. Anstett, *La Pensée religieuse de F. Schlegel* (1942); E. R. Curtius, "F. Schlegel und Frankreich," in his *Kritische Essays* (1950); R. Wellek, *History of Modern Criticism,* vol. 2, *The Romantic Age* (1955).

(Ar. H.)

SCHLEGEL, JOHANN ELIAS (1719–1749), German author and critic, uncle of August Wilhelm and Friedrich von Schlegel, was born at Meissen on Jan. 17, 1719. He attended the famous school at Pforta (Schulpforta), where F. G. Klopstock was a fellow pupil. After having studied law in Leipzig, he became private secretary to the Saxon ambassador in Copenhagen (1743) and in 1748 professor at the Sorö Academy. He died at Sorö on Aug. 13, 1749. His plays and criticism helped give the German theatre a much-needed new impetus; at a time when Shakespeare was virtually unknown to the German public, he showed his awareness of Shakespeare's genius (*Vergleichung Shakespeares und Andreas Gryphs,* 1741); and he developed a theory of literary appreciation that anticipated later developments in the field of aesthetics. He insisted that art aims at providing pleasure rather than instruction or moral uplift. Appreciation did not mean to him, as it did to his former teacher J. C. Gottsched (*q.v.*), the mechanical application of a system of fixed rules, but a living response to variable forms. G. E. Lessing quotes Schlegel with approval in his *Hamburgische Dramaturgie* and praises his comedies *Die stumme Schönheit* (1747) and *Der Triumph der guten Frauen* (1748).

Bibliography.—*Werke,* ed. by his brother J. H. Schlegel (1761–70); *Ästhetische und Dramaturgische Schriften,* ed. by J. von Antoniewicz (1887); selections ed. by F. Muncker in Kürschner's *Deutsche National-Literatur,* vol. 44 (1889). *See* also E. Wolff, *J. E. Schlegel* (1889); E. M. Wilkinson, *Johann Elias Schlegel: a German Pioneer in Aesthetics* (1945).

(W. Wi.)

SCHLEICHER, AUGUST (1821–1868), German philologist, the first linguist to study an Indo-European language not from texts but directly from living speakers, was born at Meiningen, on Feb. 19, 1821. He became professor of Germanic and classical philology in Prague in 1850, and in 1857 was appointed to the chair of comparative linguistics at Jena. His *Handbook of the Lithuanian Language* (1856–57) marks an epoch in linguistic history; and his *Compendium of Comparative Grammar of Indo-European* (1861) was the first to emphasize the regularity of phonetic correspondences between the related languages, and the first to attempt reconstructions of proto-Indo-European. His work well sums up the first half century of comparative linguistics, and, methodologically, indicates the direction of much subsequent scholarship. He died on Dec. 6, 1868, at Jena. (M. S. Br.)

SCHLEICHER, KURT VON (1882–1934), German army officer who played an important part in politics and became the last chancellor of the Weimar Republic. He was born at Brandenburg on April 7, 1882. In 1900 he joined the 3rd Foot Guards, Hindenburg's old regiment, and became a friend of Hindenburg's son, Oskar. In 1913, as captain, he joined the staff, having attracted the attention of Wilhelm Groener (*q.v.*). Groener, appointed quartermaster general in 1918, made Schleicher his personal assistant in the political division of general headquarters. In 1919 Schleicher was employed in a similar capacity in the newly created *Reichswehr,* and during the emergency of 1923–24 was aide-de-camp to Gen. Hans von Seeckt (*q.v.*), then chief of the army command, which had replaced the former general staff.

Schleicher's influence was increased when Hindenburg became president in 1925. In February 1926 Schleicher, as colonel, was appointed head of the armed forces division, immediately subordinate to the *Reichswehr* ministry, and he methodically extended the scope of this position. He welcomed Seeckt's fall (October 1926). After January 1928, when Groener became defense minister, Schleicher gained increased political influence and by 1929, as major general, was in charge of a newly created office in the *Reichswehr* ministry. His position is to be explained by the part in politics played by the *Reichswehr* at this period; Schleicher himself had helped bring this about. With Groener, the chancellor Heinrich Brüning (*q.v.*), and Hindenburg, he was one of the determining forces in the Weimar Republic between 1929 and 1933. He came into sharp conflict with Brüning and Hindenburg: his intrigues contributed to Brüning's downfall and helped bring about the appointment as chancellor of Franz von Papen (*q.v.*) in June 1932. Schleicher became defense minister and, when Papen was forced to resign (Dec. 1, 1932), also chancellor.

In the Weimar Republic's last years, Schleicher was the dominant figure in Germany who opposed the rising power of the Nazis. He was anxious, however, to avoid civil war, and he planned to save Germany by identifying the president with the *Reichswehr* and by making the *Reichswehr* the source of political power. His intrigues with Hitler were inspired by a wish to control and exploit him and his party for the good of the *Reich.* In 1932 he often offered to participate in a government of which Hitler would be chancellor, on condition that he himself should remain in charge

of the *Reichswehr*. This would have enabled him to prevent Nazi violation of the law or the constitution. Hitler refused and thereafter concluded that Schleicher was his chief enemy. Meanwhile, Papen's negotiations with Hitler led to his assuring Hindenburg that a coalition government was possible. In January 1933, Hindenburg dismissed Schleicher and made Hitler chancellor. Hitler never forgave Schleicher for trying to keep the Nazi Party under control of the *Reichswehr*, and on June 30, 1934, during the so-called night of the long knives, Schleicher was murdered at his Berlin flat by the SS (*Schutzstaffel*).

Carsten, *Reichswehr und Politik 1918–1933* (1964). (T. V.)

SCHLEIDEN, MATTHIAS JAKOB (1804–1881), German botanist and, with Theodor Schwann, co-founder of the cell theory, was born on April 5, 1804, in Hamburg, where he later practised law before studying medicine and botany. He became professor of botany at Jena and at Dorpat, but in his later years pursued the work of a free-lance writer and lecturer. Although his books, because of their polemics and often passionate discussions of nonbotanical problems, reflect a somewhat erratic personality, they nevertheless made their imprint on the development of biology in the 19th century. A protagonist in the fight against the speculative and vitalistic biology of his time, Schleiden recognized that the complex organization of the plant could be understood only by studying its embryonic development. Guided by this idea he came in his "Contributions to Phytogenesis" (1838) to the fundamental thesis that the different parts of the plant organism are either cells or derivatives of cells. One year after the publication of "Phytogenesis," Schwann, an anatomist who was familiar with Schleiden's discovery through personal discussions, showed by his microscopic studies that the cellular principle was as valid in animals as in plants, thus definitely establishing the cell theory (*see* CELL: *Introduction*).

Schleiden died in Frankfurt am Main on June 23, 1881.

(F. WN.)

SCHLEIERMACHER, FRIEDRICH DANIEL ERNST (1768–1834), German theologian and philosopher, one of the most influential thinkers of 19th-century Protestantism, was born in Breslau (Wroclaw) on Nov. 21, 1768, the son of a Prussian army chaplain of the Reformed confession. He was educated at schools belonging to the Moravian Church and was to have become a Moravian pastor. Under the influence of the literature of the time, however, he began to doubt Christianity in its transmitted form; and he exacted from his father permission to study at Halle university, where at the time rationalism reigned.

He early became a student of Kantian philosophy, though from the first a critical one. In 1796 he was appointed chaplain to the Charité hospital in Berlin. He then became influenced by Spinoza and still more by Plato and by Fichte. Entering the circle of the early Berlin romantics, he formed a great friendship with Friedrich von Schlegel, whom he defended in his *Vertraute Briefe über Schlegels 'Lucinde'* (1800). Schleiermacher established his fame with the *Reden über die Religion* (1799; new ed. by Rudolf Otto, 1926) in which he maintained religion to be independent of knowledge and morality. The *Monologen* (1800; new ed. by F. M. Schiele and H. Mulert, 1914) contain the first statements of his ethical system, which does not take a general moral law as its starting point but claims to establish the particularity of the individual.

From 1802 to 1804 Schleiermacher was pastor at Stolp. During these years he began his translation of Plato and published his first strictly philosophical work, the *Grundlinien einer Kritik der bisherigen Sittenlehre* (1803). In 1804 he became professor of theology at Halle; and it was there that, in 1806, he published *Die Weihnachtsfeier*, an important dialogue for his Christology. In the same year appeared the second, heavily revised edition of his *Reden*, already containing his final conception of religion.

From 1809 until his death (Feb. 12, 1834) Schleiermacher lived in Berlin, becoming professor in the newly founded university there in 1810. He took part in the national movement against Napoleon and did much to promote the union of the Lutheran and Reformed churches in the Church of Prussia (1817). His *Kurze Darstellung des theologischen Studiums* (1811; rev. ed., 1830), an encyclopaedia of theological disciplines, already presupposes the final form of his philosophical-theological system, which had built itself up by the independent use of borrowed stimuli (especially from Schelling). His chief theological work, *Der christliche Glaube nach den Grundsätzen der evangelischen Kirche*, 2 vol. (1821–22), became basic for evangelical theology in the 19th century. Schleiermacher expressed the principles of the second, heavily revised, edition of this work in two letters to his friend Friedrich Lücke (in the periodical *Theologische Studien und Kritiken*, 1829; ed. separately by H. Mulert, 1908); in these he defended his theological position in general and his book in particular. His metaphysic of knowledge, the *Dialektik*, was left incomplete at his death. His lectures on philosophical and theological ethics, as well as those on practical theology, were also printed posthumously.

Theoretical Philosophy.—In Berlin Schleiermacher was overshadowed by Hegel as a philosopher, and the significance of his fragmentary philosophical works was seldom fully appreciated in the century following his death. Although his point of departure was that of the idealist philosophy of identity, he took a critical view of the limits of our knowledge. All knowledge arises from a conflict of thoughts (hence the title *Dialektik*), as knowledge is the agreement which ends the conflict; but the content of all conflicting thoughts lies between a chaotic multiplicity of sense impressions and the general principles of reason; and only through the unity of real and ideal, that is, through the complete mutual interpenetration of these opposites, could perfect knowledge be attained. In the case of such an absolute knowledge, the one "transcendent cause" of all being, God, would be simultaneously apprehended. But the reconciliation of the opposites is never more than approximate; our perception of God is likewise confined to various approximate formulas reached by a differential method; and our knowledge remains incomplete. Nonetheless, God as transcendent cause is already presupposed in all partial knowledge. God cannot be comprehended in a definition, but is immanent to all existing beings, constituting their connection with all other existence. In immediate self-consciousness (or, as Schleiermacher calls it, feeling) God is present as the basis of the unity of the self in the transition from thinking to willing and vice versa. Although immanent in all existence, God is not identical with the world but is its origin. As such, he is not conceivable to our thought apart from the world.

Ethics.—The subject of ethics is the striving of the mind to unite physical nature with itself and to fashion that nature into its instrument and symbol. This ethical striving must presuppose that nature and reason are in principle one in the transcendent cause (in God), that nature is preordained to be the organ and symbol of the mind, just as there is an impulse in the mind working toward this same unity. This impulse is not a general moral law but expresses itself differently in each individual. It always leads the individual to participate in society, however—for example in the forms of family, state, school, and church.

Theology.—While philosophy, from perception of the world, constructs approximate formulas for the transcendent cause, theology contemplates immediate self-conciousness, or feeling, which mirrors the divine unity. Since man in his self-consciousness knows that he does not exist from himself, he feels himself absolutely dependent. This feeling is the source of all religion. All religious language is its expression, and dogmatic theology states in explicit terms what are actual religious assertions within the religious consciousness. So-called natural religion, or the religion of reason, as something distinct from positive religion, is a pure abstraction. All religion is positive because religious feeling is experienced only in conjunction with sense consciousness, and consequently every religious expression has its own particular character. The great religious communions arise through religious heroes, who awake the religious life in others by communicating their special religious experience and who found religious com-

munities, churches, for the cultivation of this religious life. Christianity belongs to the highest, monotheistic stage of religion and is of the ethical type of religion insofar as it regards every deficiency in consciousness of God as sin and any strengthening of this consciousness as grace. The specific feature of Christianity is the relation to Christ as mediator, in whom the consciousness of God was realized prototypically and superlatively, so that one must speak of "God's being in Him." Christians are conscious of having been redeemed by their experience of Christ's religious perfection from a situation in which their religious consciousness was overpowered by their sense consciousness: they have been transplanted from this condition into one where everything is subordinated to the religious feeling. The work of Christ is now carried on in a natural way by the church; but its founder, Jesus, was a completely new and original factor in the process of religious development and was to that extent, like every new and higher stage of being, a supernatural revelation. Schleiermacher believed that this conception of Christianity overcame both the one-sidedness of rationalism and the contrary one-sidedness of supernaturalism. As he assigned to dogmatic theology the task of justifying all Christian teaching as an expression of Christian consciousness, he was compelled to exclude from that theology much that does not seem to be a necessary expression of it; *e.g.*, all historical events, the whole of the Old Testament and also the doctrine of the Trinity. Likewise, he had to offer a considerable reinterpretation of the doctrine of sin and justification and of Christological and eschatological teaching.

BIBLIOGRAPHY.—The collected edition of Schleiermacher's works, 30 vol. (1834–64), comprises three groups of writings, (1) theology, (2) sermons and (3) philosophy and miscellanea. To these must be added the *Aesthetik*, ed. by R. Odebrecht (1931). *See* also the *Dialektik*, new ed. by R. Odebrecht (1942), in conformity with the lecture of 1822.

F. Ueberweg, *Grundriss der Geschichte der Philosophie*, iv (1923), gives a bibliography of the secondary literature. For more recent works *see* F. Flückiger, *Philosophie und Theologie bei Schleiermacher* (1947).

(W. U. P.)

SCHLEITHEIM CONFESSION, the first known Anabaptist confession, which was drawn up at a conference at Schleitheim, near Schaffhausen, Switz. (Feb. 24, 1527). It was known as the *Brüderlich Vereinigung* ("brotherly union") and, in seven articles, summarized certain tenets of the Swiss and South German Anabaptists, which were under attack from orthodox Protestantism. Baptism was held as the basis of Christian faith; the other articles concerned excommunication, the Eucharist, separation from the world, leadership by "shepherds," nonresistance (*i.e.*, refusal to carry arms), and rejection of oaths. The aim of the Anabaptists was the creation of an entirely separate church whose members were forbidden association with other churches, Catholic and Protestant alike.

The confession achieved wide recognition after the trial and execution of Michael Sattler by the civil authorities at Rottenburg (Württemberg) on May 20, 1527. His antagonists drew up nine articles refuting those of Schleitheim and demonstrating official opinion that Anabaptism was immoral and treasonable.

See relevant articles in *The Mennonite Encyclopedia*, 4 vol. (1955–59).

SCHLESINGER, FRANK (1871–1943), U.S. astronomer, "the father of modern astrometry," was born in New York City May 11, 1871, of Silesian parentage. Upon graduation from City College in 1890, Schlesinger practised surveying four years before preparing for the Ph.D. degree at Columbia (1898). After a period with the International Latitude Service in California, he became astronomer at the Yerkes Observatory (1903–05). There he demonstrated the effectiveness of long-focus telescopes for photographic measurements of distances of stars. His highly accurate method proved epoch making. As others followed his procedure, the number of stars with measured distances increased from a few dozen to over 6,000 during Schlesinger's lifetime, and the measurements became basic to knowledge of the scale of the universe beyond the solar system.

In 1905 Schlesinger accepted directorship of the Allegheny Observatory in Pittsburgh. From 1920 until his retirement in 1941 he was director of the Yale University Observatory. For Allegheny he acquired the 30-in. Thaw refractor; for Yale the 26-in. refractor in the Southern Hemisphere. These instruments contributed a large share of the known stellar distances. He also pioneered in the use of wide-angle cameras for determining photographically positions and proper motions of stars formerly measured by laborious visual methods. Fifteen volumes of *Yale Zone Catalogues* give results for about 150,000 stars.

Schlesinger's contributions were recognized by many honours: medals, lectureships, election to the National Academy of Sciences, and the presidency of the International Astronomical union.

He died in Lyme, Conn., July 10, 1943. (D. BR.)

SCHLESINGER, HERMANN IRVING (1882–1960), U.S. chemist and educator, was born in Minneapolis, Minn., on Oct. 11, 1882. Except for two years of study in Germany and a short stay at Johns Hopkins University, he was associated, as student and teacher, with the University of Chicago from 1900 until his death Oct. 3, 1960. In the early 1930s he and his colleagues organized the university's general course in the physical sciences and created films for classroom use in chemistry and physics. This work, together with his textbooks of chemistry and numerous articles on the place of the sciences in education, made Schlesinger an influential figure in teaching chemistry and allied fields. In research, his chief contributions were the development of practical methods of producing boron hydrides and the discovery of a new chemistry of the borohydrides and related compounds of the light elements (*see* BORON). These compounds found important uses as high-energy fuels and propellants and as agents for the industrial synthesis of certain pharmaceuticals. (W. C. J.)

SCHLESWIG, a district headquarters town in West Germany in the *Land* (state) of Schleswig-Holstein, Federal Republic of Germany, lies 32 mi. (51 km.) NW of Kiel by road. Since World War II it has been the seat of the high courts of law and the *Land* museums (located in Gottorp Castle). Pop. (1961) 33,767. The town forms a semicircle around the head of the Schlei, a narrow inlet of the Baltic. St. Peter's Cathedral (begun before 1100, but mainly 13th-century) contains a fine oak reredos carved by Hans Brüggemann in 1514–21. The Schlei affords access to small vessels only, and fishing, tanning, sugar refining, the distillation of alcohol, and market gardening are the chief activities.

Schleswig (anc. Sliesthorp, Sliaswic) and the adjoining Haddeby (anc. Haithabu) were in the 9th–11th centuries of great importance in the trade between the Baltic and North seas. St. Ansgar (*q.v.*) built the first church there in 850; it later became the seat of a bishop. Schleswig, whose charter dates from 1200, also became the seat of the dukes of Schleswig, but its trade dwindled because of the rivalry of Lübeck, local wars, and the silting of the Schlei. From 1721 to 1848 Schleswig was the seat of the Danish governor of the duchies. *See* SCHLESWIG-HOLSTEIN QUESTION.

(W. KU.)

SCHLESWIG-HOLSTEIN, a *Land* (state) in the northeast of the Federal Republic of Germany. Area 6,045 sq.mi. (15,658 sq.km.). Pop. (1961) 2,317,441. It extends from the lower course of the Elbe River and the *Land* of Hamburg northward to Denmark, with its eastern coast on the Baltic Sea and its western coast on the North Sea. It thus contains the southern half of the Jutland Peninsula, and on the mainland is bounded eastward by the German Democratic Republic. The *Land* includes Fehmarn Island in the Baltic; Heligoland (Helgoland) and Sylt (*qq.v.*), Föhr, Amrum, and the other German islands in the North Frisian group (*see* FRISIAN ISLANDS).

Schleswig-Holstein is part of the north German lowland. It is deeply blanketed with glacial and post-glacial deposits and the underlying chalk stratum is exposed in only a few places, such as Lägerdorf in western Holstein. The three main zones are: (1) the harbourless west coast (where the water is shallow), reclaimed marshes, mainly under grass and devoted to livestock farming; (2) a central belt of *Geest* (sandy uplands) with much peat bog, some woodland, and cultivation of rye, oats, and potatoes; (3) the eastern moraines, which are in part wooded hills and in part more fertile land under arable cultivation and dairy farming. Four-fifths of the *Land* drains to the North Sea, and only about

8% is wooded. The Baltic coast is generally steep and irregular, being pierced by *Förden*, or long narrow inlets, which afford good harbours. The climate is temperate and maritime, with mild winters, cool summers, variable weather, and plentiful rain and mist.

For the history of Schleswig-Holstein reference should be made to HOLSTEIN; SCHLESWIG; SCHLESWIG-HOLSTEIN QUESTION. The people are of Lower Saxon stock and predominantly Protestant. The population density, highest on the eastern and southwestern coasts, was after World War II increased by the influx of about 1,200,000 refugees from eastern Germany, but in the 1950s decreased through resettlement of refugees in other *Länder*. By the 1960s, however, refugees still formed about one-third of the population. Low German (*Plattdeutsch*) is commonly spoken outside the towns but there is a small Danish-speaking minority in northern Schleswig. The principal towns are Kiel, which is the capital of the *Land;* Schleswig, which is the seat of the high courts; Lübeck; Flensburg; Neumünster; Rendsburg; Itzehoe; and Elmshorn.

The Prussian province of Schleswig-Holstein was in 1946 reconstituted to form the existing *Land* and in 1949 executive power passed to the *Landtag* (diet), which is elected for a four-year term. Schleswig-Holstein is divided into 4 *Stadtkreise* (urban districts) and 17 *Landkreise* (rural districts). The Christian-Albrechts University at Kiel has an attached Institute of International Commerce. There are colleges of engineering at Kiel and Lübeck, of building in Eckernförde and Lübeck, of marine engineering in Flensburg, and of textile engineering in Neumünster. Lübeck has an academy of music and Kiel an art college.

The economy is mainly agricultural, and three-quarters of the area is farmed (cattle for milk and meat, pigs, potatoes, sugar beet, wheat, and rye). At Halstenbek in the southwest is one of the largest tree nurseries in Europe. Industry employs fewer than 10% of the population (shipbuilding, foodstuffs, engineering and electrical products, and textiles) and is concentrated mainly in Kiel, Lübeck, Flensburg, and Neumünster. Petroleum obtained in western Holstein as well as that imported is refined at Heide. Extensive fisheries on both coasts support canning and curing industries. Coastal resorts, the lake district of eastern Holstein, and the islands of Heligoland and Sylt attract numerous summer tourists.

The Kiel Canal (*q.v.*) traverses Schleswig-Holstein to form an important route for shipping between the North and Baltic seas; Brunsbüttelkoog at its western end is a major oil terminal. The other leading ports are Kiel and Lübeck, the latter being linked with the inland-waterway network by the Elbe-Trave Canal. As the *Land* forms a natural bridge to Scandinavia the north-south communications are important; these were improved by the completion in 1961 of the four-lane road tunnel beneath the Kiel Canal at Rendsburg, and by the completion in 1963 of a road and rail bridge 1,053 yd. (963 m.) long between Grossenbrode and Fehmarn Island, whence a ferry service connects with Rödby Havn and Copenhagen, Den.

SCHLESWIG-HOLSTEIN QUESTION, a complex of problems arising out of the relationship of Schleswig and Holstein to Denmark, to each other, and to the German Confederation. Involved in it were a disputed succession, a clash of Danish and German nationalism, a threat to the international balance of power, and a problem of minorities.

Earlier History.—The distribution of place-names shows Schleswig to have been an area of Scandinavian rather than of German settlement. At the beginning of the 12th century Southern Jutland (*i.e.,* Schleswig, with the Eider River as its southern boundary) was a distinct duchy, but dependent on the Danish crown; and early in the 13th century the duke of Schleswig, who soon afterward became king of Denmark as Valdemar II, conquered Holstein (between the Eider and the Elbe) from the Germans and Slavs. Holstein, however, was lost by Denmark in 1227; and Schleswig was held by the counts of Holstein from 1386 to 1460, sometimes without any recognition of Danish overlordship. In 1460, at Ribe, the nobility of Schleswig and Holstein elected the king of Denmark, Christian I, of the House of Oldenburg, as their duke and count and obtained a charter of privileges, which affirmed the indissoluble association of Schleswig with Holstein. Holstein, which from 1227 remained a fief of the German *Reich,* became a duchy in 1474.

The practice of dividing the inheritance in the duchies among younger brothers of the Danish king led, from 1544, to the formation of a Gottorp branch of the House of Oldenburg with claims to independent rule in the duchies. The Dano-Swedish Treaty of Frederiksborg of 1720 enabled Denmark to recover the Gottorp parts of Schleswig, but its terms were ambiguous. A second settlement in 1773, by the Treaty of Tsarskoye Selo between Denmark and Russia (after the merging of the Gottorp with the Romanov dynasty), strengthened the rights of the Danish crown in Holstein. When the German Confederation was formed in 1815, Frederick VI of Denmark was a member of it in his capacity as duke of Holstein and Lauenburg, but not in his capacity either as king of Denmark or as duke of Schleswig.

The First Crisis, 1846–52.—Frederick VI of Denmark was succeeded in 1839 by his nephew Christian VIII; but neither Christian's son, the future Frederick VII, nor Christian's brother Ferdinand had any children. In the kingdom the law of succession allowed the crown to pass through females, so that, on Frederick (VII)'s death, it might go to one of Christian VIII's sisters or her heir. In Holstein the law excluded females, so that this duchy would pass to Frederick's nearest male heir, Christian Augustus, duke of Augustenburg, a descendant of Christian III of Denmark. For Schleswig, it was uncertain whether the law was that of the kingdom or that of Holstein. A possible settlement was a royal proclamation that, since the monarchy was indivisible, the law must be reckoned the same in all three parts, and the inheritance pass intact to Frederick's female heir. But national passions rendered this difficult. The population of Schleswig was Danish in the northern countryside, German in the south, and mixed in the northern towns and the centre. The Eider-Dane (claiming the River Eider to be the national boundary) party of Schleswig and of the kingdom was the instrument of Danish nationalism, aspiring to incorporate Schleswig in Denmark, detaching it from Holstein. German nationalists conversely sought to confirm Schleswig's association with Holstein, detaching it from the kingdom. Christian VIII's *Open Letter* of July 8, 1846, proclaimed that, in Schleswig, the law of succession was that of the kingdom, and though it made

SCHLESWIG-HOLSTEIN AFTER THE PEACE OF PRAGUE, 1866

no similar assertion on the law in Holstein, reaffirmed the principle of Schleswig-Holstein solidarity.

Christian VIII sought to overcome the national conflict by drafting a constitution, which recognized the autonomy of each of the three parts, but grouped them in a single organization for common purposes. Frederick VII, who succeeded to the throne on Christian VIII's death (Jan. 20, 1848), published this constitution (Jan. 28); but German feeling was then predominant, and the Estates of each duchy answered by appealing to the German Confederation, demanding inclusion as a single state. On the outbreak of revolution in Germany, the duchies rebelled against Denmark, and on March 24 a provisional government at Kiel proclaimed their independence, offered support to German freedom and unity, and renewed the appeal to the German Confederation. Frederick VII then declared the union of the duchies dissolved and, on March 27, published a plan of a constitution linking Schleswig more closely to Denmark than to Holstein.

Danish action against the rebels was checked, in April 1848, by the military intervention of Prussia on their behalf, with the approval of the Diet of the German Confederation. Prussia's object was to induce Denmark to recognize Schleswig as part of the German system, and to enforce the principle that the duchies were indissolubly united and hereditary only in the male line. From Holstein the Prussian forces overran Schleswig and entered Jutland proper. But in June the Prussians withdrew from Jutland and, on Aug. 26, signed the seven-month truce of Malmö with Denmark. This reserved the rights of the German Confederation and of the Danish king alike. King Frederick William IV of Prussia apparently decided to withdraw at the bidding of Russia, Great Britain, France, and Sweden; but he knew that he could not prevail against the Danish fleet in the Baltic, and he disliked the antimonarchical cause in which, for the sake of an ill-thought-out German policy, he had become engaged.

The international balance of power was threatened, if Denmark were weakened either as keeper of the gate into the Baltic or as counterpoise to a possible united Germany. Lord Palmerston, the British foreign secretary, had mediated between Denmark and Prussia. In form, he acted on the British guarantee of the Treaty of Frederiksborg of 1720. France, also a guarantor, and Russia joined Great Britain in ignoring the clash of nationalities and in striving simply to maintain the Danish monarchy intact.

Negotiations for a definitive settlement after Malmö were interrupted by the renewal of war. The Danish government, in a note of Feb. 23, 1849, warned Prussia that the truce would not be renewed on its expiry (March 26) unless terms more satisfactory to Denmark had been agreed upon. The Prussian government, partly for reasons of prestige in Germany, where it had embarked on an independent attempt at reconstruction, partly to protect Prussia's Baltic trade, stood firm; fighting broke out in April; and the Prussians advanced into Jutland again. Once more, Russian threats, French pressure, and British mediation procured a six months' truce on July 10, 1849. Preliminaries of peace, signed at the same time, enunciated the principle of a separate constitution for Schleswig, which would release that duchy from Holstein but leave it united to Denmark. This was reaffirmed in the treaty of peace between Denmark and Prussia, signed at Berlin on July 2, 1850. Despite this treaty, the duchies continued to resist the Danish Army.

The Prussian government had made war for the sake of its German policy; but Austria, after the defeat of the Italian and Hungarian revolutions, had begun to react vigorously against Prussia. Consequently Frederick William got rid of the Danish war in order to concentrate on Germany. Yet failure in the Danish war had already undermined his German policy. The Schleswig-Holstein and the German question were inextricably connected; and Prussia by the Treaty of Berlin was defeated twice over. The defeat was confirmed when Prussia, by the Punctation of Olmütz (November 1850), accepted Austria's terms for the reconstitution of the German Confederation and agreed to assist Denmark to reconquer the duchies.

The Danes won a victory over the rebels at Idstedt in July 1850, but fighting continued until December and was concluded only after the intervention of an Austro-Prussian army acting in the name of the restored Confederation. Meanwhile international negotiations continued. Indeed, the Treaty of Berlin had been in part due to Palmerston's having organized a European front to maintain the territorial integrity of the Danish realm. By the London Protocol of Aug. 2, 1850, this principle was placed under the guarantee of Great Britain, Russia, France, and Sweden. Austria, after reserving the rights of the German Confederation, also signed on Aug. 23. Finally, the Treaty of London (May 8, 1852), signed by Denmark, Great Britain, France, Russia, Sweden, Austria, and Prussia, declared the integrity of the Danish realm to be a permanent element in the European balance of power and recognized Prince Christian of Glücksburg (the future Christian IX of Denmark, another descendant of Christian III, but of a branch junior to the Augustenburgs) as heir to "all the states at present united under the sceptre of His Majesty the King of Denmark." The duke of Augustenburg promised not to try to upset this arrangement, and other claimants renounced their rights.

Danish Constitutional Reforms.—Desiring a constitutional settlement adverse equally to Danish and to German nationalism, Austria had obtained a Danish undertaking, in December 1851, to reestablish the Estates in Holstein and in Schleswig and, by discussions in these assemblies and in the Danish *rigsraad*, to bring about "an organic and homogeneous union of all parts of the monarchy." The constitution of July 26, 1854, partially fulfilled this promise in a conservative sense, that of Oct. 2, 1855, in a more liberal sense; but neither had been framed in cooperation with the three assemblies. This and other grievances caused protests from the German Confederation and from Prussia; and Austria dared not lag behind. In November 1858 the constitution of 1855 was suspended for Holstein, pending the assembly of the Holstein Estates promised for 1859. One result of the crisis was thus the achievement of the Eider-Danes' ideal: Schleswig and Denmark together and Holstein left out.

The Second Crisis, 1862–66.—The meetings of the Holstein Estates in 1859 and 1861 and of those of Schleswig in 1860 failed to settle the constitutional dispute. In his so-called Gotha dispatch (Sept. 24, 1862), the British foreign secretary, Earl Russell, attempted a solution. It leaned to the German rather than to the Danish side, was neither acceptable to Denmark nor liked in Great Britain, and was soon dropped.

In autumn 1862, when Bismarck (*q.v.*) came to power in Prussia, the question was thus still open. Danish nationalism was then on top, ideas of a common Scandinavian front against Germany were being canvassed, and Eider-Denmark seemed to have been attained. Frederick VII's patent of March 30, 1863, seemed to confirm Holstein's being apart: it allowed legislation enacted for the whole monarchy to be valid for Denmark and for Schleswig and invalid for Holstein, if the Holstein Estates vetoed it.

The German Confederation summoned Denmark to withdraw the March patent, but many things encouraged Danish resistance. Prussia had apparently abandoned the patronage of German nationalism in order to develop an anti-Austrian policy and in any case was apparently immersed, from May, in an internal constitutional struggle. On July 23, 1863, Palmerston, now the British prime minister, reversing the trend of the Gotha dispatch, warned those who threatened the integrity of Denmark that it would not be Denmark alone with whom they would have to contend. In August, Prussia's antagonism to Austria was demonstrated by refusal to take part in the congress of princes which Austria had convened to consider the reconstruction of Germany. Great Britain and France were reacting against Russia's treatment of Poland, but in November the British rejected the emperor Napoleon III's proposal of a congress to settle the outstanding problems of Europe.

Danish illusions were shattered by the results of proclaiming a new Eider-Dane constitution. Announced by Frederick VII on Sept. 28, 1863, and ratified by the *rigsraad* on Nov. 13, this constitution was signed on Nov. 18 by the new king, Christian IX, three days after Frederick's death. It was similar to the constitution of 1855, except that it embodied the provisions of the March patent. Christian IX had come to the throne in accordance with the Treaty of London; but in the duchies Prince Frederick of

Augustenburg, eldest son of Christian Augustus, had been proclaimed duke (Nov. 18). Christian Augustus has been censured for passing on to his son claims which he himself was bound not to exercise. But Prince Frederick's proclamation was popular in Germany, and he was recognized by the chief German princes.

The Danes had taken too lightly the German Confederation's threats of an invasion of Holstein. They had not understood that, if Prussia would not accept Austria's views and if Austria still intended to be Prussia's equal in Germany, then Austria must accept Prussia's views on Schleswig-Holstein; or that Prussian patronage of German nationalism would be enormously strengthened by Bismarck's ruthlessness and by his new power to dominate Austria. Prussia and Austria induced the Confederation, on Nov. 21, 1863, to refuse observance of the Treaty of London, with its exclusion of Augustenburg, unless Denmark fulfilled the undertaking of December 1851; and on Dec. 7, 1863, it was resolved to begin armed enforcement of the Confederation's policy. Federal troops occupied Holstein soon afterward.

Prussia and Austria declared war upon Denmark. Their action was governed by their punctation of Jan. 16, 1864, and was followed by a fresh Danish refusal (Jan. 18) to withdraw the November constitution. The punctation provided for a joint settlement of the Schleswig-Holstein question and excluded the German Confederation. The Austro-Prussian army, therefore, ignored the federal troops in Holstein; and on Feb. 1 it invaded Schleswig. The punctation marked the separation of Prussian from federal policy. Bismarck was about to exploit the German movement so as to achieve the annexation of the duchies, with Kiel as a naval base, to Prussia.

The European situation was favourable. Napoleon III had drawn toward Prussia. Russia, unassertive after the Crimean War, was no longer inclined to support Denmark, and now backed Austro-Prussian conservatism. Though Great Britain claimed that the Treaty of London was valid whether Denmark fulfilled the undertaking of December 1851 or not, Palmerston and Russell could not win either Queen Victoria or the Cabinet for a pro-Danish policy.

In these circumstances, Bismarck signed a fresh alliance with Austria on March 6, 1864, to cover the invasion of Denmark proper. It aimed at a settlement that would discard the undertaking of December 1851, but still—to meet Austria's wishes—achieve the union of the duchies with Denmark on a personal basis. The German movement, which aimed at independence for Schleswig-Holstein under Frederick of Augustenburg, was disregarded. Austria and Prussia were still, however, faced with a European conference.

The London Conference, which met on April 25, 1864, was never master of the situation which it tried to regulate. The meeting was delayed by unavailing efforts to bring about an armistice first (the armistice eventually took effect from May 12); by the difficulty of securing the representation of the German Confederation, which was not a signatory of the Treaty of London; and by Bismarck's deliberate effort to postpone the opening until Prussia and Austria were in possession of all Denmark. Napoleon's proposal to consult the wishes of the populations was altered by Bismarck to a proposal for separating Holstein and southern Schleswig from Denmark and letting the populations decide the frontier line and the question of independence or union with Prussia—this last possibility being now first raised internationally. Though he could not publicly work for this without breaking the March alliance, Bismarck privately began to wean Austria from the principle of Danish integrity.

The London Conference tacitly abandoned the principle of Danish integrity, and the Danes rejected the proposal for personal union contained in the March alliance. This left independence for the duchies under Augustenburg as the only solution still in the field. But the conference dispersed on June 25, 1864, without achieving it: Denmark rejected independence within the frontier proposed, and Austria rejected Bismarck's stipulation that the duchies should be militarily subordinated to Prussia. A fresh spell of fighting from the end of June to July 20, 1864, enabled Bismarck to free the question from international discussion. Fresh peace negotiations, directed toward the cession of the duchies to Austria and Prussia jointly, achieved their purpose in the Treaty of Vienna of Oct. 30, 1864.

The Austrian and the Prussian attitudes to the duchies were different and led to conflict. The Convention of Gastein (Aug. 14, 1865) therefore modified the condominium by assigning the internal administration of Holstein to Austria and that of Schleswig to Prussia. Next year, however, the wider conflict over Germany led to war between Austria and Prussia (*see* SEVEN WEEKS' WAR). The Peace of Prague (Aug. 23, 1866) ceded the duchies to Prussia.

The Question of North Schleswig.—After Prussia's formation of the German Empire (1871) the Schleswig-Holstein question was narrowed to a contest between Denmark and Germany over North Schleswig. Article v of the Peace of Prague had provided for a plebiscite to decide whether it should be German or Danish. This proviso was abrogated by an Austro-Prussian treaty of Oct. 11, 1878. The Danes of North Schleswig then adopted a policy of passive protest, and many young Danes emigrated to Denmark. The mistake of this was seen in the mid-1880s, and constructive measures were taken to strengthen the Danish minority of North Schleswig. Between 1900 and 1914 Danish organizations fought the German government for the children's allegiance through the schools and for the land through the farmers. Both sides advanced loans to their nationals so that they could buy farms.

The conscription of Danes into the German armies in World War I, when Denmark was neutral, strengthened the movement for reunion with Denmark. H. P. Hanssen, a leader of the Danish movement and deputy for a North Schleswig constituency in the German *Reichstag,* demanded the application of the Wilsonian principle of self-determination. This was accepted by the Conference of Paris, and a plebiscite was organized by the Danish government. The plebiscite took place, under the supervision of an international commission, on Feb. 10, 1920, for the northern zone of the disputed country, and on March 14 for central Schleswig. Denmark won in the first zone by 75,431 votes against 25,329, but Germany won in the second by 48,148 against 13,029. On June 15 the international commission was dissolved, and North Schleswig as far south as Tonder and the northern bank of Flensburg Fjord became part of Denmark.

The question thereafter became a contest over the claims of the German minority in Danish North Schleswig. Different groups demanded: the revision of the southern frontier; or cultural autonomy; or a self-governing farmers' state of North Schleswig (this was dropped by 1926). The advent of the Nazis strengthened the German minority, but they did not reverse the decision of 1920, because they came to aim at absorbing all Denmark in the *Reich.*

After World War II a settlement was sought by putting national allegiance on a personal instead of a territorial basis. On Denmark's side, school laws of 1946 and 1955 satisfied the Germans of North Schleswig. On Germany's side, Schleswig-Holstein was organized as a separate *Land,* with its own Parliament and ministry at Kiel by 1947; guarantees for the Danish minority in South Schleswig were embodied in the Kiel Declaration of Sept. 26, 1949; and a school law in 1950 put the Danes there on the same footing as the Germans in North Schleswig. Danish-German minority talks were held in Copenhagen in the spring of 1955, and the consequent reform of the electoral law in South Schleswig and the regulation of remaining school difficulties brought stability.

SCHLICK, MORITZ (1882–1936), German philosopher and leader of the group of neopositivists who composed the Vienna circle, was born in Berlin on April 14, 1882, the son of a manufacturer. After attending the *Realgymnasium* in Berlin, he studied physics at Heidelberg, at Lausanne and at Berlin where, as a pupil of Max Planck, he obtained his doctorate of philosophy in 1904 with a thesis on physics. In 1911 he qualified for a teaching post in Rostock with a dissertation on "The Nature of Truth According to Modern Logic." In 1921 he was appointed to

a post in Kiel. In 1922 Schlick went to Vienna as professor of the philosophy of the inductive sciences. His predecessors in this chair included Ernst Mach and Ludwig Boltzmann. In Vienna he gathered around him a group of philosophers, such as Rudolf Carnap, Otto Neurath and Friedrich Waismann, and of mathematicians and scientists, such as Kurt Gödel, Philipp Frank, Karl Menger and Hans Hahn, which met regularly to discuss problems of common interest. The group, the Vienna circle, was characterized by its hostility to metaphysics, by its radical empiricism, by its faith in the techniques of modern symbolic logic and by its belief that the future of philosophy lay in its becoming the logic of science. Claiming to continue the positivist tradition of Mach and Boltzmann, it was much influenced also by Bertrand Russell and by Ludwig Wittgenstein (*qq.v.*). Its views were publicized in a series of books, *Schriften zur wissenschaftlichen Weltauffassung* (1928 ff.); and the manifesto *Wissenschaftliche Weltauffassung: der Wiener Kreis* (1929) served to organize it on a more formal basis. Making contact with philosophers of similar tendencies in other countries, it launched the international movement in philosophy which has come to be known as logical positivism. Schlick went to California in 1929 for a short period as visiting professor at Stanford university. On his return he continued to direct the activities of the Vienna circle and wrote regularly for its review *Erkenntnis*. On June 22, 1936, as he was entering the university to give his lecture, he was shot by a demented student and killed.

In his philosophical view Schlick belonged to what may be called the right wing of the Vienna circle. He did not agree with Carnap and Neurath that statements which appeared to be about mental events were all translatable into statements about physical events, nor did he accept their contention that it was metaphysical to talk of comparing statements with reality. On the contrary, he insisted always that the individual's private experience was the ultimate test of the truth of any assertion of fact. To the objection that this made it impossible to account for there being a public language, he replied that while the content of one's experience was incommunicable, its structure was not. He was thus led to the implausible conclusion that all empirical statements, insofar as they are publicly intelligible, are statements about structure. In his early days he was influenced by Kant, but he believed that the discoveries of modern physics, which he was one of the first to interpret philosophically, showed Kant's views of space and time and causality to be untenable. He also appealed to modern physics in support of the fundamental principle of the logical positivists that "the meaning of any statement turns entirely on the possibility of its empirical verification." It was from this principle that he drew the conclusion that metaphysical statements were meaningless. Metaphysics for him did not include ethics; he took a utilitarian view of ethical statements, which allowed them to be empirically verifiable. It did, however, include any attempt to characterize a transcendent reality. The philosopher, therefore, should not try to compete with the scientist. The object of philosophy was not to establish a body of philosophical propositions, but to make other propositions clear.

See also LOGICAL POSITIVISM: *Characteristic Views of the Vienna Circle.*

Schlick wrote a great many essays, of which some were collected in the posthumous *Gesammelte Aufsätze 1926–36* (1938). His most important books were *Raum und Zeit in der gegenwärtigen Physik* (1917; 2nd ed., 1919; Eng. trans., 1920); *Allgemeine Erkenntnislehre* (1918; 2nd ed., 1925); *Fragen der Ethik* (1930); and the posthumous *Grundzüge der Naturphilosophie* (1948) and *Natur und Kultur* (1952). (AD. J. A.)

SCHLIEFFEN, ALFRED, GRAF VON (1833–1913), German army officer and author of the Schlieffen Plan that guided the German offensive in 1914, was born in Berlin on Feb. 28, 1833. Though the son of a Prussian major general, he was not entirely typical of the Prussian Junker class; he attributed his capacity for hard work and attention to detail to his descent from a line of Kolberg (Kolobrzeg) mayors and aldermen. Physically he was of aristocratic, somewhat effete, appearance. After attending a grammar school in Berlin, he studied law, but soon decided to follow in his father's footsteps, and in 1854 joined the 2nd Guard Uhlans as a second lieutenant. He was posted to the general staff in 1865 and shortly afterward married his cousin, Countess Anna Schlieffen. She died four years later, and thereafter he devoted his life entirely to military affairs.

E. BIEDER, BERLIN

GRAF VON SCHLIEFFEN

Many stories are told of his obsession with military matters. Once, when one of his staff officers drew his attention to the beauty of a valley in the morning sunlight, Schlieffen replied only, "An unimportant obstacle!" He habitually presented his staff on Christmas Eve with a complicated military problem, demanding a written solution by the evening of Christmas Day. He was described by a subordinate as a proud and distant man who often offended people by his sarcasm; although admired for his efficiency and respected for his devotion to duty, he was incapable of inspiring affection in his subordinates.

Schlieffen's first experience of war was at Königgrätz (1866) as a staff officer to Prince Albrecht of Prussia. In the Franco-German War of 1870–71 he was on the staff of the grand duke of Mecklenburg-Schwerin's Corps. In 1884, as a colonel, he became head of the military history section of the great general staff, and four years later was made a general, and deputy to the chief of the general staff. He became chief of the general staff in 1891; but even before that he had begun to work out the great strategic plan that was to bear his name. For some years the likelihood of Germany's having to fight a war on two fronts—against Russia in the east and France in the west—had been apparent, and Schlieffen set about drawing up a detailed plan and making adjustments in the organization, manpower, and equipment of the army to implement it. He decided that the maximum strength must be deployed in the west to win a quick victory over France, and to discourage British intervention. Meanwhile, Russia, whose mobilization was expected to be slow, was to be contained by a weaker force, and then was to be dealt with after France had been defeated. Schlieffen, realizing that rapid success against France was impossible by frontal attack, began to study the possibilities of a flank attack, either to the south through Switzerland or to the north through the Low Countries. Because of the difficulties of terrain, the Swiss plan was rejected in favour of an outflanking movement through Belgium, or through both Belgium and Holland. This plan was thought to have much better prospect of success because of the flatness of the country and excellent rail and road communications in Belgium and Holland. Between 1893 and 1905 the plan was often revised, but all versions had the same basic principle: an overwhelmingly strong right wing was to advance rapidly through Belgium and northern France and outflank the French armies, which would eventually be encircled.

Schlieffen retired at the end of 1905, but for some years continued to interest himself in the plan of campaign that had long been his main concern. His advice was frequently sought when operations against France and Russia were under discussion. He died in Berlin on Jan. 4, 1913. It is said that his last words were: "The struggle is inevitable. Keep my right flank strong!"

As things turned out, the small forces allotted to the east succeeded in holding the Russians, but the campaign in France failed to obtain a quick victory. This failure was attributed to changes in the plan carried out by Schlieffen's successor—Graf Helmuth von Moltke (*q.v.*), the younger—on the eve of, and in the early stages of, the campaign. After the publication in 1956 of Gerhard Ritter's critical study of the Schlieffen Plan (see *Bibliography*), opinion tended to change. Many students of military history came to believe that the plan itself had inherent weaknesses, and in particular, that Schlieffen had overestimated the speed of advance

possible in northwest Europe in face of artillery, machine-gun fire, and demolitions. The plan also ignored the grave political consequences of violating Belgian neutrality.

On the Schlieffen Plan, *see* also FORTIFICATION: *Permanent Fortifications: World War I;* STRATEGY: *Development of Strategy: American Civil War to World War I;* and WORLD WAR I: *Introduction: Rival Plans.*

SCHLIEMANN, HEINRICH (1822–1890), German archaeologist, excavator of Troy, Mycenae, and Tiryns (*qq.v.*), is sometimes called the modern discoverer of prehistoric Greece (the Heroic or Homeric Age and the Bronze Age to as early as 3000 B.C.). Born the son of a poor pastor on Jan. 6, 1822, at Neu Buckow in Mecklenburg-Schwerin, his early fascination with antiquity was nurtured by his father. Schliemann later wrote that he resolved as a boy that he would one day excavate Troy. Family misfortunes interrupted his education, and at 14 he became apprenticed to a grocer in whose shop he first heard Homer (*q.v.*) declaimed in Greek. Poor health led him to become cabin boy on the ship "Dorothea" (soon to be wrecked) bound for Venezuela. After the wreck, while working as office boy and bookkeeper in Amsterdam, Neth., Schliemann is said to have spent half of his wages on the study of languages, eventually mastering 13.

In 1846 his employers sent him to St. Petersburg, Russia, as their agent; he established his own business there in 1847 (dealing especially in indigo) and soon became wealthy. In 1856 he learned modern and ancient Greek, steeping himself in Greek literature, especially Homer. Retiring from business at 36, he traveled extensively, including trips to Egypt, Greece, the Near and Far East, and North America. In 1866 he went to Paris to study archaeology, devoting his fortune and the next quarter-century of his life to his dream of excavating Troy.

HEINRICH SCHLIEMANN

Schliemann settled in Greece (1868) and investigated Ithaca (*q.v.*), the topography of which he felt to be in agreement with indications in the *Odyssey.* He then visited Mycenae and decided that the royal tombs mentioned by the Greek geographer Pausanias (*q.v.*) were on the citadel rather than in the lower town. Proceeding to the plain of Troy, he at once rejected the usually accepted site of Bunarbashi as that of Troy and chose instead the hill called Hisarlik (*see* Schliemann's *Ithaka, der Peloponnes und Troja;* 1869). Preliminary testing in April 1870 indicated a great depth of accumulation at Hisarlik; late in 1871 large-scale excavations began, supervised by Schliemann and his young Greek wife, Sophia. In 1872 a large cut was gouged across the mound to the lowest levels (where he expected to find the remains of Homeric Troy), destroying much of what he was seeking. In the following year, with the discovery of fortification walls and of a "great treasure" in a "burnt city," he proclaimed he had found Priam's Troy; however, by 1890 it was known that the treasures and palatial buildings were in earlier levels, now dated about 2600–2300 B.C.

Schliemann's successful efforts in keeping the great treasure together, in the face of demands to divide it with the Ottoman government, kept him from further excavations until 1876; even then, conditions at Troy were still so adverse that he went to work at Mycenae, where initial success was so great that Troy was forgotten for the moment. A circle of royal tombs was discovered just inside the Lion Gate at Mycenae and the riches that poured from five graves dimmed the radiance of the Trojan treasures; a sixth grave was found just after his departure. Schliemann's publication of *Mycenae* (1877) brought him full share of honours and fame, for the Mycenean treasures surpassed any known to that time. Established in the National Museum in Athens, they give glorious testimony to his vision and industry.

After a brief and unspectacular interlude at Ithaca in 1878, Schliemann resumed at Troy, continuing in 1879 with good results; he summed up the work in *Ilios* (1881), providing much new evidence to equate Hisarlik with Troy. In 1880–81 at Orchomenos (*q.v.*) he cleared the beehive tomb known as the "Treasury of Minyas," and published *Orchomenos* (1881). He returned to Troy with the young German architect-archaeologist, W. Dörpfeld, who introduced new methods of excavation; their efforts of 1882 were reported in *Troja* (1883). Excavations followed (1884) at Marathon, and at Tiryns where the ground plan of a Mycenaean palace was uncovered, to be described in *Tiryns* (1886). With less success, Schliemann tried (1886–88) to find the Caesareum at Alexandria, the Palace of Minos at Knossos (*see* CRETE), and the Temple of Aphrodite on Cythera, and to investigate "sandy Pylos." He undertook new excavations in Troy (1889–90) to answer assertions of P. A. de Lagarde that Troy was "a mere fire-necropolis" and that Schliemann's evidence had been falsified. Two delegations of archaeologists who visited Troy completely vindicated him and his colleagues. New and more extensive work at Troy was planned, but in December 1890, Schliemann fell ill at Naples and died there on Christmas Day.

SCHLÜSSELBURG: *see* PETROKREPOST.

SCHLÜTER, ANDREAS (1664–1714), German sculptor and architect, was the first important native master of the late Baroque style in Germany. His early life is obscure, but he is probably to be identified with the Andreas Schlüter baptized in Hamburg on May 22, 1664. He received his early training in Danzig, and was active in Warsaw (1689–1693). In 1694 he was called to Berlin as court sculptor by the elector Frederick III, and it is with Berlin and the Hohenzollern that his name is primarily associated. The bronze statue of Frederick III (1696–97), now at Kaliningrad (formerly Königsberg), and the equestrian statue of the Great Elector (completed in 1703), now in the forecourt of Schloss Charlottenburg, Berlin, are among the most important of his surviving sculptures. Both testify to Schlüter's familiarity with current trends in Rome and at the French court.

Between 1698 and 1706 Schlüter was actively engaged in Berlin in directing building operations and supplying sculptural decorations for the Arsenal, the royal palace, and the old post office. The last named was demolished in 1889, and the royal palace (his greatest achievement) was a casualty of World War II, but the sculptured keystones from the Arsenal, particularly the series of dying warriors, remain the supreme example of Schlüter's genius for synthesizing German tradition and European Baroque. The collapse of the Mint Tower, built on sandy soil adjacent to the royal palace, brought an abrupt end to Schlüter's career as supervisor of the royal buildings and saddened his last years. He was summoned by Peter the Great to St. Petersburg in 1713, but died there in 1714 without having achieved anything of note.

SCHMALKALDEN, LEAGUE OF (1531–1547), a defensive organization of Protestant Estates of the Holy Roman Empire in Germany (*see* GERMANY: *History;* REFORMATION).

The final recess of the Diet of Augsburg (Nov. 19, 1530) threatened the Protestant Estates with prosecution by the Imperial Chamber (*q.v.*) and with outlawry under the ban of the Empire if they maintained their faith and retained church property which they had confiscated. In this predicament they faced the question whether an Estate of the Empire had the right to defend itself by force of arms against the emperor—in this case Charles V (*q.v.*)—if he attacked it on religious grounds. The landgrave Philip (*q.v.*) of Hesse and the jurists of Electoral Saxony convinced Martin Luther that there was such a right.

On Dec. 31, 1530, at a meeting at Schmalkalden in Thuringia, a project of defensive alliance against any aggression was concerted between John (*q.v.*) the Steadfast, elector of Saxony, Ernest, duke of Brunswick-Lüneburg, Philip of Hesse, Prince Wolfgang of Anhalt-Bernburg, Counts Gebhard and Albrecht of Mansfeld (the latter also being plenipotentiary for Philip, duke of Brunswick-Grubenhagen), and representatives of the cities of Magdeburg and Bremen. Strassburg (Strasbourg), Ulm, and some smaller South German cities accepted the project; but efforts by Philip of Hesse and by Strassburg to co-opt Zürich, Bern, and Basel failed because Saxony did not want any alliance with adherents of Zwinglianism. A treaty was signed on Feb. 27, 1531, to last for six years; but in 1535 it was renewed for ten years.

After arduous negotiations a constitution for the League was drafted in July 1533 and ratified, with some modifications, in December 1535. John Frederick I (*q.v.*) of Saxony and Philip of Hesse were to take six-monthly turns in conducting the League's affairs and were to summon diets of the League when they saw fit. Financial and military organs were set up. The army, whose strength was planned at 12,000 men, was to be mustered only in the event of war, but funds to maintain troops for two months were to be deposited in advance as a precaution against emergency. The League's defensive character remained unchanged.

The League not only helped to safeguard Protestantism in Germany but also encouraged foreign powers, especially France and England, to oppose the Habsburgs and the papacy. Menaced by the French and by the Turks, Charles V and his brother, the German king Ferdinand I, needed the support of the German Lutherans, both those of the League and those outside it. Charles more than once had to suspend the Imperial Chamber's proceedings and to grant recognition to the Lutherans' ecclesiastical systems.

The development and the decline of the League were alike due chiefly to Philip of Hesse. On the one hand it was he who, with France's backing, overthrew Habsburg rule in Württemberg and restored the long-dispossessed Duke Ulrich there in 1534. After this, Württemberg, Pōmerania (Pomorze), Anhalt-Dessau, Augsburg, Frankfurt am Main, Kempten, Hamburg, and Hanover joined the League. On the other hand the outcry against Philip's bigamous marriage induced him to seek Charles V's protection: by a secret treaty (June 13, 1541) he obtained pardon for all his offenses against the Habsburgs or against the laws of the Empire in return for promising to abstain from any foreign alliance and to obstruct the entry of Charles's enemy, Duke William the Rich of Cleves, into the League. Charles's assurances to Philip, however, did not cover the case of a general war against Protestants.

With the Peace of Crépy between Charles V and France (1544), the League's position became precarious; and in summer 1546 Charles declared war on John Frederick I of Saxony and on Philip of Hesse. The League had military superiority in the first months of hostilities, but won no decisive success, and Charles's invasion of Saxony turned the scale. Defeated at Mühlberg (April 24, 1547), John Frederick was taken prisoner; and Philip gave himself up without resistance (June 20). Though individual members fought on for a time, the League disintegrated.

SCHMIDT, BERNHARD VOLDEMAR (1879–1935), Estonian optical instrument maker whose invention of the telescope named after him was an outstanding development in astronomical optics for the increase in dimension which it gave to the useful field and for its fine image definition (*see* PHOTOGRAPHY, CELESTIAL: *Photographic Telescopes*). Schmidt was born on the island of Naissaar near Reval (Tallinn), Estonia, on March 30, 1879. After little schooling, he worked until 1898 as a telegraph operator, photographer, and designer, meanwhile continuing independent studies and experiments with increasing interest in astronomy and optics. After a short period at the Chalmers Institute in Göteborg, Swed., he went in 1901 to the engineering school at Mittweida in Germany for a few terms' study, but remained until 1926, installing a small workshop and observatory there. The parabolic mirrors which he made during this period and his 16-in. horizontal telescope of 1909 established his reputation as an optical technician, and he obtained several patents. In 1926 Schmidt joined the staff of the Hamburg Observatory at Bergedorf. During the far eastern solar eclipse expedition of 1929, he conceived the idea of a coma-free mirror system, and after initial difficulties, the first 14-in. Schmidt telescope (1:1.75) was begun at Bergedorf in 1930 and completed in 1932. *See* his "Ein lichtstarkes Komafreies Spiegel-system," *Mitteilungen der Hamburger Sternwarte in Bergedorf*, no. 36 (1931). Schmidt died at Bergedorf on Dec. 1, 1935. His optical system has proved its efficiency in various technical fields, including that of television projection.

See A. A. Wachmann, "From the Life of Bernhard Schmidt," *Sky and Telescope*, vol. xv, no. 1 (Nov. 1955). (A. A. WN.)

SCHMIDT, WILHELM (1868–1954), German Roman Catholic priest and anthropologist, the leader of an influential school of ethnology, was born Feb. 16, 1868, in Hörde, Westphalia. He was educated at a seminary in the Netherlands and at the universities of Berlin and Vienna. A member of the Society of the Divine Word, Father Schmidt taught ethnology and linguistics at St. Gabriel's Seminary at Wien-Mödling, Aust., 1895–1938, and at the universities of Vienna and Fribourg (Switz.). He began his career in linguistics and soon broadened it to include ethnology, joining the culture-historical (*Kulturkreis* or "culture circle") movement founded by F. Ratzel, F. Graebner and B. Ankermann, of which he eventually became leader. Schmidt vigorously opposed the evolutionism of L. H. Morgan, E. B. Tylor and H. Spencer. Following the lead of Andrew Lang, Schmidt challenged the evolutionists' theory of the development of religion, and maintained in *Der Ursprung der Gottesidee* ("The Origin of the Idea of God," 12 vol., 1912–55), his principal work, and in *The Origin and Growth of Religion* (1931), that the most primitive peoples believed in a supreme being. In 1906 he founded the Anthropos Institute and its journal, *Anthropos*. His philosophy of ethnology was expounded in *The Culture Historical Method of Ethnology*, translated by S. Sieber (1939). Father Schmidt died on Feb. 10, 1954, in Fribourg.

SCHMIDT-ROTTLUFF, KARL (1884–), German painter and graphic artist and an important figure in the Expressionist movement, was born in Rottluff near Chemnitz on Dec. 1, 1884. Originally a student of architecture, Schmidt-Rottluff turned to painting in Dresden where he became one of the founders of *die Brücke* ("the bridge")—an influential group of artists in the initial years of Expressionism. His finest work is characterized by a dynamism of brilliant colour and boldness of cubic form. His religious woodcuts, done immediately after World War I, were inspired by African sculpture. They are characterized by a power of religious statement that could not have been achieved with traditionalistic liturgical art forms.

See Will Grohmann, *Karl Schmidt-Rottluff* (1956). (P. H. S.)

SCHMITT, FLORENT (1870–1958), French composer, known for his orchestral works, was born at Blâmont, Meurthe-et-Moselle, Sept. 28, 1870. He studied at Nancy and in 1889 entered the Paris Conservatoire, where he was a pupil of Massenet and Fauré. In 1900 he won the Prix de Rome with his lyric scene *Sémiramis* and later traveled throughout Europe. His reputation was established with the *Psaume XLVI* (1906) for chorus and orchestra, the ballet, *La Tragédie de Salomé* (1907) and a piano quintet (1908). Between 1894 and 1950 he wrote many orchestral works, showing a bold sense of orchestral colour, and including *Antoine et Cléopâtre* (1920), *Mirages* (1924) and *Salammbô* (1927). Among his piano works, several of which he orchestrated, are the *Reflets d'Allemagne* (1905). He wrote unaccompanied choral works and chamber works, including the *Suite en rocaille* (1935), *A tour d'anches* (1947), quartets for woodwind instruments and for brass, and a sextet for clarinets. He died Aug. 17, 1958, at Neuilly-sur-Seine.

See Yves Hucher, *Florent Schmitt* (1953).

SCHMUCKER, SAMUEL SIMON (1799–1873), a leading theologian of the American Lutheran Church during the period of development of an indigenous type of liberal Lutheranism, was born at Hagerstown, Md., on Feb. 28, 1799. He was educated at first under private tutors and then at the University of Pennsylvania and at Princeton Seminary. Schmucker fostered a strongly pietistic emphasis, moving on to a prophetic ecumenical spirit. He was a pioneer in the establishment of a first united Lutheran Church of district synods in America, the General Synod (1820); he became and remained for 38 years professor in charge of Gettysburg Seminary, an institution he helped to promote (1826; now Lutheran Theological Seminary); and he founded a classical school that later became Gettysburg College (chartered 1832).

Constitutions for churches and district synods, liturgies, hymnbooks and editions of Luther's catechisms (with his own freer interpretations) were only a few of his numerous works. In 1834 appeared his *Elements of Popular Theology,* a first systematic treatment in English of Lutheran theology in America. In 1838 was published his *Appeal to the American Churches,* outlining a plan of church fraternity, a forerunner of the Federal Council of Churches which came years later. When the Evangelical Alliance was organized in 1846 he played a major role.

What has been called the crisis in American Lutheran theology centred about Schmucker's name, particularly in an anonymous pamphlet which he caused to circulate entitled *Definite Synodical Platform* in 1855. This document proposed an amended and abridged form of the Augsburg Confession as a confessional statement for the American Lutheran Churches. The incentive to its publication lay in the pressure groups of conservative Lutheran immigrants, who, in increasing numbers, began to flood the American scene, calling for a return to a stricter allegiance to the Lutheran Confessions of the 16th century. Schmucker went down to defeat, and with him the tender plant of "American Lutheranism," the term given to the liberal movement he had so strongly nurtured. He died on July 26, 1873. (V. F.)

SCHNABEL, ARTUR (1882–1951), Austrian-born pianist and composer, known for his masterly interpretations of Beethoven, was born at Lipnik, near what was then Bielitz-Biala, Aus., April 17, 1882. From about 1892 to 1897 he studied the piano with T. Leschetizky and theory with E. Mandyczewski in Vienna. His first performance was given in 1893 at Bielitz. After giving recitals in Vienna and Berlin he became the accompanist of the singer Therese Behr, whom he married in 1905. From 1919 to 1933 he taught at the Hochschule für Musik at Berlin. During this period his performances throughout Europe and the United States of the works of Beethoven, particularly the late sonatas, became known for their intellectual grasp of Beethoven's forms. His repertory also included Mozart, Schubert, Schumann, and Brahms. He settled in London in 1934 and moved to the United States in 1939, becoming naturalized five years later. His own compositions, which show the influence of Schoenberg, include three symphonies, an orchestral rhapsody, five string quartets and some piano pieces. He also edited Beethoven's sonatas and published books on musical aesthetics. He died at Axenheim, Switz., on Aug. 15, 1951.

See C. Saerchinger, *Artur Schnabel* (1957).

SCHNITZLER, ARTHUR (1862–1931), Austrian playwright and novelist notable for his bittersweet presentation of Viennese society at the turn of the 19th century. The declining Austro-Hungarian Empire, with its *fin-de-siècle* atmosphere, is the background for Schnitzler's amusing yet melancholy, sympathetic yet skeptical, picture of the charming and frivolous Vienna of his day. The erotic element in his work later became coloured by his interest in psychoanalysis. He was born in Vienna on May 15, 1862, took a medical degree and practised for some time as a doctor. Schnitzler's first and one of his most characteristic pieces was *Anatol* (1893; English translation by H. Granville Barker, 1911), a series of seven dramatic sketches describing the love adventures of a rich young Viennese. Nearly all Schnitzler's gifts appear in this series: style, adroitness, a never overstressed sense of humour, a light touch, and, above all, a gift of characterization. *Liebelei* (1896; Eng. trans., *Playing with Love,* 1914) and *Freiwild* (1896) are in the same style but they strike a more tragic note in the fate of the "sweet little poor girl" on whom the Viennese romance centres. *Reigen* (1900) is a series of dialogues describing Viennese amours in such detail that it could not be performed until 1920; it later achieved success as the French film *La Ronde* (1950). In *Leutnant Gustl* (1901) and the later *Fräulein Else* (1924; Eng. trans., 1925) Schnitzler made interesting experiments in the use of the monologue, a form which was to play so important a part in the 20th-century novel. *Leutnant Gustl* portrayed the kindly but stupid soul of the Austrian subaltern with such accuracy as to involve Schnitzler in some unpleasantness.

BY COURTESY OF OSTERREICHISCHE NATIONAL-BIBLIOTHEK BILDARCHIV

ARTHUR SCHNITZLER

As Schnitzler grew older he approached his themes with more seriousness and less lightness of touch. The ironical skepticism of his earlier work developed into a more open preoccupation with the problems of destiny and free will (as is indicated in his *Buch der Sprüche und Bedenken,* 1927). He continued, however, to produce unflaggingly stylish stories and plays, notably the two *Novellen, Casanovas Heimfahrt* (1918; Eng. trans., *Casanova's Homecoming,* 1922) and *Flucht in die Finsternis* (1931; Eng. trans., *Flight into Darkness,* 1931). His one long novel, *Der Weg ins Freie* (1908; Eng. trans., *The Road to the Open,* 1923), was less successful. His verse, while polished and brilliant, was less revealing of his talents than his prose. He died in Vienna on Oct. 21, 1931.

SCHNORR VON CAROLSFELD, JULIUS (1794–1872), German painter, was born on March 26, 1794, at Leipzig, where he received his earliest instruction from his father, Hans Veit Schnorr (1764–1841), a draftsman, engraver, and painter. In 1818 he went to Rome, where he was associated with the German Pre-Raphaelites (the Nazarenes), a school of religious and romantic art that abjured modern styles and set itself to recover fresco painting and "monumental art." Together with Peter von Cornelius, J. F. Overbeck, and Philipp Veit, Schnorr received a commission to decorate the entrance hall of the Villa Massimi with frescoes after Ariosto. In 1825 he left Rome, settled in Munich, entered the service of King Ludwig and transplanted to Germany the art of wall painting learned in Italy. Schnorr published a pictorial Bible, with about 200 pictures, in 1852–60; it does not bear comparison with Raphael's Bible. He also made designs, carried out in the royal factory at Munich, for windows in Glasgow cathedral and in St. Paul's cathedral, London. He died on May 24, 1872.

His son, LUDWIG SCHNORR VON CAROLSFELD (1836–1865), was a singer, well known for his interpretation of Wagnerian parts. He created the role of Tristan.

SCHOBER, JOHANN (1874–1932), Austrian statesman, twice chancellor, was born at Perg, Upper Austria, on Nov. 14, 1874. Entering the Imperial Austrian police service as a young man, he became the Austrian president of police in 1918, some months before the revolution at the end of World War I. On the proclamation of the Austrian Republic (Nov. 12, 1918), Schober placed his force at the disposal of the new government, and did much to ensure a peaceful change of regime. At the same time, he secured the safety of the ex-imperial family, whose departure from Vienna he supervised. During the two years of Socialist government which followed, Schober's force was reproached unjustly by the extreme left wing with being reactionary.

His administrative ability, and, above all, his honesty, gained

him the confidence of moderate opinion in Austria, and especially of the inter-Allied missions and advisers. Because of this confidence it was expected that, if he were chancellor, the Allies would be willing to grant the loan necessary to restore Austria's chaotic finances, and he was selected to form, on June 20, 1921, a coalition government supported by Social Christians and by Pan-Germans. He took the first step toward establishing friendly relations between Austria and its neighbours when he concluded the Treaty of Lány with Czechoslovakia on Dec. 16, 1921. But the Pan-Germans, who formed a part of the coalition, resented any treaty with Czechoslovakia as putting difficulties in the way of ultimate union with Germany; they withdrew from the government and on May 24, 1922, Schober resigned, returning to the post of president of police.

On July 15, 1927, he suppressed a revolt of the Socialist *Schutzbund* in Vienna. He became chancellor again from Sept. 26, 1929, to Sept. 25, 1930. On Dec. 3, 1930, he was appointed vice-chancellor and minister of foreign affairs in Otto Ender's coalition of Social Christians and Pan-Germans. On March 19, 1931, he concluded an agreement with Germany which would have led to an *Anschluss* but which under French and Czechoslovak pressure had to be abandoned. Schober retired from the government on Jan. 27, 1932, and died at Baden, near Vienna, on Aug. 19.

See O. Kleinschmied, *Schober* (1930).

SCHOECK, OTHMAR (1886–1957), one of the principal composers of *Lieder* of his time, was born at Brunnen, Switz., on Sept. 1, 1886. He studied first at Zürich and in 1907 under Max Reger in Leipzig. His first songs appeared on his return the following year to Zürich where, until 1917, he conducted choral societies. From 1917 to 1944 he was conductor of the symphony concerts at Sankt Gallen. His principal song cycles, for voice and small ensemble, include *Elegie* (1915–22), on poems of N. Lenau and J. von Eichendorff; *Gaselen* (1923), on poems of G. Keller; and *Wandersprüche* (1928), on poems of Eichendorff. He also wrote eight stage works, including *Penthesilea* (1927) and *Massimilla Doni* (1937), as well as orchestral and chamber works. He died at Zürich on March 8, 1957. To further interest in his works the *Othmar Schoeck Gesellschaft* was founded in 1959.

See H. Corrodi, *Othmar Schoeck*, 3rd ed. (1956).

SCHOENBERG, ARNOLD (1874–1951), Austrian-U.S. composer whose innovations were one of the most powerful influences in 20th-century music. Born in Vienna on Sept. 13, 1874, he lived there, apart from two short periods in Berlin (1901–03 and 1911–15), until he was over 50. He learned the violin as a child and later taught himself the cello, but he was not originally destined for a musical career. He worked in a bank for several years before finally devoting himself to music (1895). As a composer he was almost entirely self-taught, though he received some help from his friend Alexander von Zemlinsky, whose sister he married in 1901. Schoenberg's first model was Brahms, but the earliest works he published, the string sextet *Verklärte Nacht* and the choral work *Gurrelieder*, are indebted to Wagner. These two influences are reconciled in the first and second string quartets (1905 and 1908) and the first chamber symphony (1906), all of which show Schoenberg's lifelong concern with structural unity and at the same time an advanced form of chromaticism that threatened to undermine the traditional major-minor tonal system.

PICTORIAL PARADE

ARNOLD SCHOENBERG

About 1909 Schoenberg began to write music that could no longer be related to a single tonal centre; hence the term atonality, or, as he himself preferred, pantonality. Dissonances are no longer felt to need resolution, and the recapitulations and symmetrical melodic paragraphs belonging to tonality disappear. The three piano pieces, op. 11, and the five orchestral pieces, op. 16, both of 1909, opened up unexplored fields of expression and soon became internationally famous. They were followed by two one-act operas, *Erwartung* (1909; performed 1924) and *Die glückliche Hand* (1908–13; performed 1924); *Pierrot Lunaire* (1912); and, in 1917, the oratorio *Die Jakobsleiter*, the composition of which was cut short by the second of two periods of military service.

From 1907 onward Schoenberg was also painting pictures. He became friendly with Wassily Kandinsky and in 1912 exhibited with the "Blue Rider" group. Through this association the term "expressionist" was applied to Schoenberg's music and to that of his two most gifted pupils, Anton Webern and Alban Berg. These composers were to remain his close friends, adapting his successive technical discoveries to their own needs. A by-product of his work as a teacher, which continued throughout his life, was a series of important theoretical works on music, the first of which was the *Harmonielehre* (1911; Eng. trans., *Theory of Harmony* 1947).

From 1920 Schoenberg became preoccupied with a group of works embodying a new principle of composition. Since abandoning tonality, he had confined his instrumental music to short pieces built of contrasting lyrical or dramatic elements. His longer works had been vocal, the text providing the basis for the form. Large-scale instrumental composition had formerly depended on two elements, the tonal and the thematic. Schoenberg realized that the loss of the one could be offset by strengthening the other. He gradually evolved the technique of serialism, through which a whole composition could be derived from a series of notes, usually the 12 notes of the chromatic scale (*see* DODECAPHONY), disposed in an order specially chosen for the particular work. He called it a "method of composing with twelve notes related only to one another." In the works of the 1920s, which are all serial, Schoenberg's profound sympathy with the Viennese classical tradition reasserts itself in his adaptation of his new language to symphonic forms. He wrote four important chamber works, including a third quartet, the Variations for Orchestra, a short comic opera, *Von Heute auf Morgen* (1928; produced 1930), and the first two acts of *Moses und Aron* (1930–32; produced 1957). This opera is concerned with the nature of divine revelation and the problem of its communication, and it embodies Schoenberg's deepest beliefs.

In 1923 Schoenberg's first wife died, and the following year he married Gertrud Kolisch, the sister of the violinist Rudolf Kolisch. In 1926 he went to Berlin as director of a master class in composition at the Prussian Academy of Arts but in 1933 was dismissed from this post because he was a Jew. He moved to Paris for a few months, and while there formally returned to the Jewish faith, which as a young man he had left for the Lutheran Church. In the autumn of the same year he went to Boston and spent a year teaching there and in New York. From 1936 to 1944 he taught at the University of California, Los Angeles, having become a U.S. citizen in 1940. He died at Los Angeles on July 13, 1951.

During his last months in Europe Schoenberg wrote concertos for cello and for string quartet, based on material from concertos by G. M. Monn and Handel respectively, and in 1934 a suite in G for string orchestra. After these tonal works, his first for over 20 years, Schoenberg completed two major serial works in 1936, the Violin Concerto and the fourth quartet. In the last 15 years of his life he composed less, overcome at first by the political situation in Europe and later because of failing health. Some of the works of this period are serial, among them such masterpieces as the Piano Concerto (1942), the string trio (1946), and the unfinished *Moderner Psalm* ("Modern Psalm"), on his own text (1950); others are based on tonality in one form or another. All show the composer's extraordinary mastery in developing a whole work within the terms of the opening idea. His strong personality is similarly felt through every phase of his output, for the revolutionary, who strongly influenced the course of musical history both in his break with tonality and his formulation of serialism, was also a traditionalist for whom innovation was never experiment but simply the most direct means to an end.

SCHOENHEIMER, RUDOLF (1898–1941), German biochemist whose technique of "tagging" molecules revolutionized the study of chemical processes in the living cell, was born in Berlin on May 10, 1898. He obtained a medical degree from the University of Berlin in 1923. During his internship at the Moabit Hospital in Berlin he began a lifelong interest in the relationship of cholesterol (*q.v.*) to atherosclerosis, a form of arteriosclerosis (hardening of the arteries). He taught biochemistry in relation to pathology, at Leipzig and later at Freiburg, until 1933, when he went to the United States at the invitation of Columbia University, gratefully fleeing the rising tide of Nazism. As assistant professor of biochemistry at Columbia he was an associate of H. C. Urey, the discoverer of heavy hydrogen and investigator of many other isotopes. In collaboration with David Rittenberg, one of Urey's students, Schoenheimer developed the technique of using isotopes as labels for organic molecules of food and the like during their passage through the living cell (*see* ISOTOPE: *Uses of Isotopes*). By using this technique biochemists were able to trace the course of certain molecules and thereby demonstrate for the first time many details of the cell's metabolic processes (*see* METABOLISM). Schoenheimer, apparently despondent over the war, committed suicide in New York on Sept. 11, 1941. (D. RG.)

SCHOLASTICISM. The word Scholasticism has been applied in many senses, but particularly to philosophy, theology, and teaching method. It is correctly used of the system of Western Christian philosophy that flourished from the 11th to the 15th century. This was not only the system of the majority of medieval thinkers but it can boast of many of the greatest names in medieval thought, *e.g.*, Anselm, Abelard, Albertus Magnus, Bonaventura, Thomas Aquinas, Duns Scotus, and William Ockham. As Neo-scholasticism, it is of considerable importance in modern times.

Particularly in the 19th century, Scholastic philosophy has been regarded as being synonymous with medieval philosophy. Thus some writers defined Scholastic philosophy as being merely a teaching method, *e.g.*, philosophy as taught in the schools of the medieval period (J. B. Hauréau), or as "the child of the schools" (F. Picavet). Others would include all thinkers who lived in the medieval period among Scholastics. There is some excuse for this view because in the Middle Ages any lecturer in a recognized school was given the title of *scholasticus*, but such definitions are purely verbal and ignore fundamental points of difference. Erigena, David of Dinant, Avicenna, and Averroës, for example, are medieval philosophers who were non-Scholastic or even anti-Scholastic. The same applies to the very interesting school of Byzantine thought. Even in the West, Boëthius (*c.* 480–524) falls within the conventional chronological limits of the Middle Ages (5th to 15th centuries) but cannot be classed as a Scholastic, though, like St. Augustine and Pseudo-Dionysius, he is in some ways a precursor of Scholastic philosophy. Moreover, to view Scholasticism as medieval is to disregard its amazing resurgence in the late 19th and 20th centuries.

It has also been maintained that the chief characteristic of Scholasticism was a servile bondage to Aristotle and the dogmas of the church. This view is historically incorrect. The earlier Scholastics, *e.g.*, Anselm, were strongly influenced by Platonic and Neoplatonic ideas, which came through Augustine. The christianized Aristotelianism was mainly the work of Albertus Magnus and Aquinas, both original thinkers who were in no way subservient to the authority of Aristotle. Aquinas wrote: "The object of philosophical thought is not to know men's opinions but the truth of things," and when he found Aristotle's teaching on certain questions hesitating or inadequate, he turned to the Platonic tradition. The result of the revolution in Christian thought produced by Albertus and Aquinas was that although in theology Augustinianism was still predominant, the Scholasticism of the 13th century was strongly affected by the philosophy of Aristotle.

All Scholastic philosophers accepted the truths of revelation as taught by the Scriptures and the Western Church, but their views concerning the relations between philosophy and theology varied considerably. Some few 11th-century thinkers, such as Peter Damian (*q.v.*) and Manegold of Lautenbach, were highly suspicious of all philosophy, and at best regarded it as subsidiary to theology (*ancilla fidei*). Aquinas distinguished the respective fields of theology and philosophy. He emphasized that all truth has its ultimate source in God and therefore that which is the conclusion of the right exercise of reason cannot contradict that which is derived from revelation. He admitted that some doctrines such as those concerning the Trinity and the Eucharist might be beyond the scope of human reason but were not contradictory to it. Indeed reason might be able to advance arguments in their support. Later thinkers widened the distinction between philosophy and revelation, and William Ockham completely separated them.

Method.—The Scholastic method in teaching and lecturing involved the *lectio*, the public lecture in which the master explained the text, and the *disputatio*, in which a view was expounded and objections to it proposed and answered in syllogistic form. It is often attributed to Abelard who applied dialectic to theological dogma; the idea originated in the practice of the canon lawyers during the 11th and 12th centuries. In their task of collecting and arranging the decisions of church councils and papal decrees they were faced with a mass of conflicting material, and they endeavoured to find a means of reconciling apparently conflicting statements. Anselm of Laon and Guillaume de Champeaux (*qq.v.*) adopted similar means in dealing with views expressed in the Scriptures and in the writings of the Church Fathers and Doctors. Abelard had studied under Guillaume and Anselm and developed the method in the *Sic et non*, a collection of opinions from Scripture and the Fathers for and against various propositions. This work in its turn influenced the methods of the canon lawyers, *e.g.*, in the *Decretum* or *Concordantia discordantium Canonum* (*c.* 1140) of Gratian (*q.v.*) of Bologna. Abelard's example was followed by Peter Lombard (*q.v.*; *c.* 1100–60), bishop of Paris, who was the author of the *Sentences* (*Quattuor libri sententiarum*), which became the chief textbook in the theological faculties of the medieval universities. Numerous commentaries on the *Sentences* appeared and those of the more famous masters such as Aquinas, Duns Scotus, and William Ockham are still accessible. The commentaries gave rise to more systematic and concise expositions covering the whole field of theology which became known as "Summae," *e.g.*, the *Summae* attributed to Alexander of Hales (*c.* 1170 or 1185–1245), which is probably a compilation by his disciples, and of Albertus Magnus (*c.* 1200–80), and the *Summa theologiae* of St. Thomas Aquinas (1225–74). The latter fixed the scholastic method for the next two centuries. For details of the scholastic methods that governed the *lectio* and the *disputatio*, *see* S. J. Curtis and M. E. A. Boultwood, *A Short History of Educational Ideas*, ch. 5, 3rd ed. (1961).

History.—This article does not attempt to deal with the teaching of individual philosophers, which appears under their respective names, but is confined to a historical outline of the development of Scholasticism (*see* also PHILOSOPHY, HISTORY OF: *Patristic and Medieval Philosophy: Western Philosophy*). The growth of medieval Scholasticism may be conveniently divided into three stages—a formative period (11th and 12th centuries), a period of consolidation (13th century), and one of criticism (14th and 15th centuries).

In the first period Scholastic thought was influenced by Platonism derived from St. Augustine, Pseudo-Dionysius (the Areopagite; 5th or early 6th century) and other writers of the Eastern and Western Churches. Aristotelian dialectic became important in the 12th century, largely through the works of Abelard, but Aristotle's philosophical works were not available in Latin translations. It was not until 1162 that John of Salisbury was able to make use of the whole of the *Organon*. This period was dominated by the controversy about the nature of universals, though it

was by no means the only topic that was discussed: there was also, *e.g.*, the ontological argument of Anselm for the existence of God.

The problem of the universal is one with which philosophy is always concerned, but it has taken different forms at different periods. It is concerned with the relation between our universal conceptions and external reality. Thus it may be asked if our thought can supply a true account of the external world. Are the uniformities now known as scientific laws to be found in the objects themselves, or are they modes in which the mind is forced to think in order to explain the phenomena presented by the senses? The medievals had not reached this stage of analysis but approached the problem from the logical point of view, *e.g.*, the function of class names and the names of abstract qualities. The problem was presented to medieval thinkers through the form in which it appeared in Boëthius' *Commentary* on the *Isagoge* of Porphyry:

> What does Porphyry mean by saying that he merely touches and passes over certain points which older philosophers had discussed at great length? He means this: he omits the question whether genera and species have an actual subsistence, or dwell in the mind and intellect only; whether they are corporeal or incorporeal; and whether they are separated or joined to the objects our senses perceive.

This was a challenge to the successors of Boëthius, but it was the occasion rather than the cause of the controversy. The problem is so fundamental to philosophy that sooner or later it was bound to arise. Four types of answer were possible:

(1) The first and simplest was that of extreme realism, based on Plato and developed in a modified form by Christian thinkers. This solution asserted that mental conceptions such as goodness, justice, or equality exist independently of the particular sense objects that exhibit such qualities. The latter are real insofar as they share in the independently existing ideas. Augustine had introduced an important Christian modification in making the ideas exemplars, archetypes in the mind of God. Many early medieval thinkers, influenced by Augustine and Pseudo-Dionysius, tended toward this position of extreme realism. Thus Erigena and St. Anselm, though in many ways diverse in their philosophy, fall into this group.

(2) The solution of moderate realism developed later. This was the position that was defended by Albertus Magnus and Aquinas and that had been represented in Greek philosophy by Aristotle. Moderate realists emphasized that particular things are the most real to us but universals are most real in themselves. They believed that universals exist in particular things as the common natures of them, *e.g.*, humanity exists in individual men and justice exists as realized in just men and just actions. As a result of abstraction, this common nature of the species has a secondary mode of being in the knowing mind where it exists as an idea. Thinkers of the 12th century adhered strictly to the alternatives presented by Boëthius and conducted their arguments on logical lines. In the following century, when Aquinas developed the psychology of conceptual thinking, moderate realism attained its fullest expression.

(3) The final development of Scholastic thought was conceptualism, a position adopted by William Ockham and his school. He acknowledged the existence of universal ideas as mental facts and attributed their formation to the synthetic activity of the mind.

(4) Nominalism (*i.e.*, the view that universals are mere names used for convenience's sake), the opposite of extreme realism, is an entirely modern development and was not held by any Scholastic philosopher. Earlier historians of philosophy described the thought of such men as Roscelin (*q.v.*; *c.* 1050–*c.* 1125), as nominalism but it was not nominalism in the modern sense of the term. Philosophers of that period had not reached the stage of psychological analysis that would have enabled them to express accurately their objections to extreme realism. Their attitude is most adequately summed up in the term antirealist and, as M. de Wulf has suggested, they were really feeling their way toward moderate realism. They restricted their discussion to the logical alternatives proposed by Boëthius; and even Abelard, who saw the need of positing a process of abstraction, was not able to describe the formation of the concept in any detail.

The formative period also included the most important treatise on ethics that had been written since the closing of the schools of Athens, the *Ethica seu Scito te ipsum* of Abelard. This work replaced the Augustinian doctrine of original sin by one less harsh and emphasized the consent of the will as being essential in actual sin. Abelard's views were not approved by the church at that time, but they influenced the moral philosophy of Aquinas. The *Policraticus* of John of Salisbury also belongs to this period. It is a treatise on political philosophy and it was one of the most influential examples of the earlier theory of the state as an organism.

The 13th century marked the culmination and consolidation of medieval Scholastic philosophy and was dominated by such outstanding personalities as Albertus Magnus, St. Thomas Aquinas, St. Bonaventura, and Duns Scotus. Medieval mathematical and scientific speculation are represented by Robert Grosseteste (*c.* 1168–1253) and Roger Bacon (*c.* 1220–*c.* 1292) (*qq.v.*). Grosseteste's theory of light and his application of mathematics to optics and physical science in some ways anticipate modern thought. His pupil, Roger Bacon, is popularly known as the discoverer of gunpowder. From the philosophical standpoint, Bacon's emphasis on experience and the experimental method is interesting but it is probable that his admirers attribute much to him that belongs to his master.

Certain aspects of this period are extremely important. The medieval universities had originated in the latter part of the previous century but now their influence developed considerably. They were the chief agents in transmitting Scholastic theology and philosophy and their influence was bound up with two other series of events. The first was the acquisition of the Aristotelian corpus in Latin translations and commentaries. The logical works of Aristotle had been available at least since 1162, but soon translations of the philosophical works of Aristotle began to appear. These were chiefly based on versions of the Persian Avicenna and the Spanish-born Arab Averroës, and not only suffered from the influence of Arabic thought, but included treatises of Neoplatonic origin. The church was suspicious of these translations and the study of the newly acquired works of Aristotle was prohibited until more accurate translations and commentaries became available. The translations of William of Moerbeke and the commentaries of Albertus and Aquinas eventually supplied the need but meanwhile a good deal of damage had occurred. A flourishing school of Latin Averroism appeared in the universities of Paris and Oxford. This was not merely of academic importance, but because of the anti-Christian tenets of the Averroists, the Christian civilization of Europe was threatened (*see* AVERROISM, LATIN). The translations of William of Moerbeke, the commentaries of Albertus and Aquinas, and the grand syntheses of Christian belief and Aristotelian philosophy produced by these writers arrested the subversive movement.

Ernest Renan was the first to draw attention to Latin Averroism but he was unable to discover the originator of the movement. In the 20th century, P. Mandonnet ascribed it to Siger (*q.v.*) of Brabant. More recently, manuscripts have been discovered at Munich and Oxford and it is suggested that Mandonnet was mistaken and that the controversy between Siger and Aquinas was mainly an academic one concerned with the nature and aims of philosophy. The fact remains, however, that Latin Averroism was driven underground and did not appear in the open until much later in the medieval period.

The other important event was the coming of the Franciscan and Dominican orders to the universities. The Dominicans appeared in Paris about 1218 and in Oxford in 1220. Within a few years they were followed by the Franciscans. At Paris the mendicants were at first received coldly and after a short time, when they demanded chairs of theology in the university, the secular and regular clergy changed their attitude to one of open hostility. In 1229 the dispersion that followed a quarrel between "town and gown" left many professorships vacant and enabled the mendicants to press their claims successfully. The hostility continued

until 1256 when St. Thomas Aquinas and St. Bonaventura were nominated as masters. At Oxford the ambitious plans of the Dominicans precipitated a dispute which came to an end only in 1320. The Franciscans profited by the unpopularity of the Dominicans and through the ability of such outstanding teachers as Grosseteste, Roger Bacon, and Duns Scotus, they gained an ascendancy in the university. On the whole, the Dominicans favoured the Christian-Aristotelian synthesis of Aquinas, while the Franciscans were more conservative and clung to the teaching of Augustine, though they made use of a good deal of Aristotelian terminology. There were, however, exceptions to this general tendency. Aquinas was regarded by some of his contemporaries as an innovator and certain of his views, such as the doctrine of the unity of substantial forms in the individual, were included in the condemnations of 1277 at Paris and Oxford.

Two important treatises in political philosophy belong to this period: the first part of the *Rule of Princes* (*De regimine principum*) by Aquinas (*c.* 1267), and the *De Monarchia* of Dante (date unknown; possibly *c.* 1313 or even earlier). The interesting Franciscan thinker Ramon Llull (*q.v.; c.* 1235–1316) was an early pioneer of symbolic logic.

The final period of medieval Scholasticism has sometimes been regarded as the beginning of the decline, but this view does less than justice to the thinkers of the 14th century and their influence on later thought. Just as the 13th century was an age of construction and synthesis, the century that followed was a period of criticism. One is reminded of the parallel of the 17th and 18th centuries. The critical attitude can be found in the works of Duns Scotus and Roger Bacon, who began to question the conclusions of previous thinkers, but it was overshadowed by their own constructive achievements. The critical spirit became more explicit in the writings of William Ockham and his followers. It is found in two predecessors of Ockham, Durandus of Saint-Pourçain (*q.v.; c.* 1270–1334) and Petrus Aureoli (*q.v.; c.* 1280–1322), who criticized the Thomist theory of knowledge. Durandus appealed to the principle of economy in thought, generally known as "Ockham's razor"; *e.g.*, relation is not to be reckoned as an extra entity: two men are similar in respect of humanity, not in respect of similarity. Petrus Aureoli was feeling his way to the conceptualism that was more fully developed by Ockham (*q.v.*). As Ockham had studied and taught at Oxford, he was influenced by the interest in natural science that was characteristic of the Franciscan masters in that university. In his moral theory he pushed to the extreme the primacy of the will over the intellect which had been taught by Duns Scotus, and he finally separated the respective fields of philosophy and theology. Ockham's teaching spread rapidly during the 14th and 15th centuries, especially at Paris. His political treatises in which he supported the secular power against the papacy provoked the antagonism of the church. His followers, Nicholas of Autrecourt (*c.* 1300–after 1350), Jean Buridan (*c.* 1295–after 1366), Albert of Saxony (1316?–1390?), and Nicole Oresme (*c.* 1320–1382), developed different aspects of Ockham's thought. Nicholas investigated the nature of relations, especially that of cause and effect, and his anticipation of modern thought led Hastings Rashdall to describe him as "the Hume of the Middle Ages." Buridan, Albert, and Oresme were interested in the mathematical and scientific tendencies of the age. Oresme can claim fame as the first to write an important philosophical work in the vernacular (in French). He also produced an economic treatise on the coinage, and his mathematical and scientific thought anticipated the work of Descartes in analytical geometry and the theories of Copernicus and Galileo.

The chief philosopher of the 15th century, Nicholas of Cusa (*q.v.;* 1401–64), is difficult to classify. M. de Wulf considered that he remained "a medieval and a Scholastic," but other writers regard him as a Renaissance philosopher. Whatever view is taken, he was an individual who combined both the old and the new in his mathematical speculations, which foreshadow the theory of relativity and non-Euclidean geometry. He also took an active interest in political affairs. In his younger days he was a supporter of the Conciliar theory, and he later brought about a temporary union between the Eastern and Western Churches.

By the close of the 15th century, medieval Scholasticism was in rapid decline, very largely because of the numerous second-rate thinkers who held themselves aloof from the great scientific discoveries of the age, and who eventually became bitterly antagonistic to the new outlook. In turn, the Renaissance thinkers despised what they termed the outworn attitude of Scholasticism. In addition, because of the theological controversies of the Reformation period, Scholasticism, at least to the inhabitants of those countries that had adopted Protestantism, appeared to be bound up with the doctrinal system of the Roman Catholic Church. The decline was not as apparent in the countries of southern Europe. Two outstanding philosophers and theologians of the 16th and 17th centuries respectively not only remained faithful to Scholasticism but show in their writings evidence of constructive thought. They were Cajetan (*q.v.;* Tommaso de Vio; 1468?–1534), in Italy, and Francisco Suárez (1548–1617), in Spain. Cajetan's development and clarification of the Thomist doctrine of analogy is accepted by many modern Thomists. Suárez was a prolific writer whose *Disputationes metaphysicae* paved the way for the numerous courses in philosophy (*Cursus philosophici*) published during the latter 17th and the 18th centuries to replace the traditional commentaries on Aristotle and later on St. Thomas Aquinas (on whom the Spanish Dominican John of St. Thomas [1589–1644] was an illuminating commentator). Suárez' *Tractatus de legibus* was an original development of Scholastic legal and political theory.

This revival was mainly the work of the Dominicans and Jesuits but was only partially successful. Though a few Scholastics were interested in mathematics and physics, the majority ignored the problems raised by the scientific discoveries of the period. Hence Scholasticism had no place in the main current of philosophical thought.

The revival of Scholasticism under the name of Neoscholasticism was one of the last of a series of changes in the attitude of the modern world to the Middle Ages, which, starting from an interest in the life and activities, the literature, art, and architecture of the medieval period, eventually reached its philosophy. A convenient starting point in the revival was the publication of Victor Cousin's *Introduction aux ouvrages inédits d'Abélard* (1836). This was followed by a series of studies by X. Rousselot, C. F. M. de Rémusat, and others, culminating in the classic *Histoire de la philosophie scolastique* of J. B. Hauréau (2 vol. [1850], revised ed., 3 vol. [1872–80]). Though defective as regards critical scholarship, it was for many years a very important contribution. The modern critical study of Scholasticism developed after 1880 and included the works of C. Baeumker, F. Ehrle, H. S. Denifle, and others. Since then most European countries and the United States have made important contributions, with the result that there is now a considerable literature on the subject of Scholasticism. Scholastic philosophers are now fully concerned with modern problems, so that Neoscholasticism is a force that commands wide recognition and respect on both sides of the Atlantic.

SCHOMBERG (SCHÖNBERG), **FRIEDRICH HERMANN,** DUKE OF (1615–1690), German soldier of fortune who fought in the service of various countries in the major European wars between 1634 and 1690, was born at Heidelberg on Dec. 6, 1615, the son of the Protestant court marshal of Frederick V, elector palatine, and of Anne, daughter of an English peer, the 5th Lord Dudley. He volunteered under Frederick Henry of Orange in 1633, and from 1634 to 1637 during the Thirty Years' War served in the army of Bernard of Saxe-Weimar for campaigns on the upper Rhine. In 1639 he again went to Holland for some years of service.

In 1650 Jules Cardinal Mazarin, in the crisis of the Fronde (*q.v.*), secured him and his German infantry for the French Royal Army that defeated the rebel marshal de Turenne at the Battle of Rethel (Dec. 15, 1650). Schomberg was appointed *maréchal de camp* on Oct. 28, 1652, after Turenne had changed sides, and was one of Turenne's best officers in the campaigns against the Spaniards and the prince de Condé. In the Battle of the Dunes (1658) he commanded, as lieutenant general, Turenne's second line.

In 1660 he went to Lisbon to organize a Portuguese Army against Spain. His forces recovered Évora (1663) and in 1665 defeated the Spaniards at Montes Claros. The independence of Portugal was recognized by Spain at the Treaty of Lisbon (1668) and after placing Dom Pedro (later Pedro II) in power in a palace revolution in the same year, he returned to his position in the French Army, having become naturalized as a Frenchman.

During the Dutch War (1672–78) he went to England in 1673 on the invitation of Charles II to form an army for the proposed invasion of Holland, but soon returned to the French Army and was on Louis XIV's staff at the siege and capture of Maastricht (June 1673). Spain and the emperor Leopold I allied with the Dutch in the same year and Schomberg took command of the French in Catalonia; in 1675 he was one of eight marshals of France appointed on Turenne's death. When the marshal duc de Luxembourg was moved to the Rhine in 1676, Schomberg commanded the Netherlands front where his maneuvers gave him a reputation equal to that of Luxembourg.

The revocation of the Edict of Nantes (1685) drove Schomberg from France but he was welcomed by Frederick William of Brandenburg, "the Great Elector." In 1688 the elector lent him and a Prussian force to William of Orange (later William III of Great Britain), whom he accompanied to England. He was naturalized as English in April 1689 and in May was created duke of Schomberg. He went to Ireland as commander in chief against James II in August 1689, but could do little more than hold Ulster as there was much sickness in his small army, and he took no risks. When William joined him in 1690, Schomberg was reluctant to cross the River Boyne. He was killed by some Irish cavalry at the Battle of the Boyne on July 1, 1690, having ridden without escort to rally some troops. (I. D. E.)

SCHOMBURGK, SIR ROBERT HERMANN (1804–1865), British explorer and surveyor whose "Schomburgk line" marked the boundary of British Guiana from 1841 to 1895 (*see* GUYANA), was born at Freiberg, Lower Saxony, Ger., on June 5, 1804. In 1829 he went to the United States and from there in 1831 visited Anegada, one of the British Virgin Islands. He surveyed it and noted the frequency of the wrecks, particularly of U.S. ships, which occurred upon it. In 1835 the Royal Geographical Society sent Schomburgk to explore British Guiana. On this trip he discovered the giant water lily, *Victoria regia,* and in 1840 produced his *Description of British Guiana.* In 1841 he surveyed the colony and fixed its boundary, being knighted on his return to England in 1844. He continued his geographical surveys as British consul to Santo Domingo, now the Dominican Republic (1848), and to Bangkok (1857). Schomburgk died at Berlin on March 11, 1865.

SCHÖNBEIN, CHRISTIAN FRIEDRICH (1799–1868), German-Swiss chemist, discovered and named ozone (*q.v.*) in 1840, and was the first to describe guncotton and collodion (*qq.v.;* 1846). He was born at Metzingen, Swabia, on Oct. 18, 1799. After studying at Tübingen and Erlangen, he taught chemistry and physics, first at Keilhau, Thuringia, and then at Epsom, Eng., but most of his life was spent at Basel, where he began to lecture on chemistry and physics in 1828 and was appointed full professor in 1835. Schönbein did notable work on the passivity of iron, the properties of hydrogen peroxide, and catalysis. He was a most prolific writer, 364 papers appearing under his name in the Royal Society's *Catalogue.* He died at Sauersberg, near Baden-Baden, on Aug. 29, 1868.

Many of Schönbein's letters together with a biography will be found in G. W. A. Kahlbaum, *Monographien aus der Geschichte der Chemie,* vol. iv and vi (1899, 1901). *See* also E. Färber in G. Bugge, *Buch der grossen Chemiker* (1955).

SCHÖNEBECK, a town of East Germany in the Magdeburg *Bezirk* (district) of the German Democratic Republic, lies on the left bank of the Elbe River 9 mi. (14½ km.) SE of Magdeburg. Pop. (1964) 44,302. It is a river port and a station on the main railway between Magdeburg and Halle. Its principal industries are salt mining and the production of vehicles, cement, paints and dyes, and chemical apparatus. The town's charter dates from 1280. The brine springs in nearby Bad Salzelmen are of ancient renown.

SCHÖNEBERG, a *Bezirk* (district) of West Berlin, Germany, lies southwest of the city centre. Pop. (1961) 193,790. The 13th-century peasant settlement of Alt-Schöneberg was in 1874 merged with Neu-Schöneberg, which had been founded by Frederick the Great in 1750 to accommodate Bohemian weavers. The existing district was formed in 1920 by uniting Schöneberg with Friedenau. The Supreme Court Building on the Potsdamer Strasse became in 1945 the seat of the Allied Control Council, and the town hall on Rudolph-Wilde-Platz became in 1948 the administrative centre of West Berlin. Industries include printing, brewing, and the production of precision instruments, optical goods, and telecommunications equipment.

SCHONGAUER, MARTIN (called MARTIN SCHÖN and HIPSCH [Hübsch] MARTIN) (1445/50–1491), German engraver and painter of the early German school, was born in Colmar, Alsace, the son of the goldsmith Caspar Schongauer from Augsburg, where the family, originally from Schongau, had been prominent for two centuries. Dates of his birth proposed in German literature after 1941 range from 1425 to 1453. In 1465 he was registered at the University of Leipzig, but apparently remained there only one semester. In view of the variance of opinion on his age, it is not clear whether he was there as a student or as a visiting artist enjoying the university's protection from interference of the local painters' guild. That he was a student appears more likely because no work of his has ever been discovered which could with certainty be dated earlier than 1469 and because the wide distribution of his work did not get under way until the late 1470s, judging from the flood of copies which are dated. In 1469 his name is mentioned for the first time in the Colmar register of property. The same date appears also on three of his drawings, all obviously early works, but these dates and signatures were added by Albrecht Dürer, who may have received them from Schongauer's brothers when he arrived in Colmar the year after Martin's death. In 1488 Schongauer left Colmar and moved to Breisach, Baden. He died a bachelor in Breisach on Feb. 2, 1491, being survived by three brothers, the goldsmiths Jörg and Paulus and the painter Ludwig.

According to contemporary sources, Schongauer was a prolific painter, whose panels were sought in many countries. Few paintings by his hand survive. Among them the "Madonna in a Rose Garden" of 1473, altarpiece of the church of Saint-Martin in Colmar, ranks first in importance. This work strikingly combines monumentality with tenderness and is the only painting in which Schongauer approached the heights of the great Flemish painter Rogier van der Weyden by whom he was so profoundly influenced. Other paintings by Schongauer include two wings of the Orliac altar (Colmar museum); six small panels among which the "Nativity" (Berlin) and the "Holy Family" (Vienna) are the most mature; and finally the murals of the "Last Judgment" in the cathedral of Breisach, probably his last work (uncovered in 1932). The 24 panels depicting the "Joys of Mary" and the "Passion of

GIRAUDON, PARIS

"MADONNA IN A ROSE GARDEN," BY MARTIN SCHONGAUER (1473). THE ALTARPIECE OF THE CHURCH OF SAINT-MARTIN, COLMAR, FRANCE

Christ," painted for the church of the Dominicans (Colmar museum), appear to be mainly the work of his assistants.

As an engraver, however, Schongauer stands without rival in northern Europe in his time. His engraved work, consisting of about 115 plates, all signed with his monogram, is a final, highly refined and sensitive manifestation of the late Gothic spirit. Technically he brought the art of engraving to maturity by expanding its range of contrasts and textures, thus introducing a painter's viewpoint into an art which had been primarily the domain of the goldsmith's shop. The larger and more elaborate engravings, such as the "Temptation of St. Anthony" or the "Death of the Virgin," belong to his earlier period. In his later years, he preferred smaller plates, even for subjects as the "Passion of Christ," a set of twelve engravings. Some of his most eloquent plates are single figures, such as the "Madonna in a Courtyard" or "St. Sebastian." Within the diversity of trends in German art in this period, Schongauer represents the most idealistic and aristocratic element, devoting his art mainly to Christian subjects and shunning the gross and often bawdy humorous realism of some of his fellow engravers. The sensitive grace of his work became proverbial even in his lifetime and gave rise to such names as "Hübsch Martin" or "Schön Martin" ("Bel Martino" in Italian), whereby the adjective "Schön" became often confused with the artist's real family name. Schongauer's engravings are well represented in the print rooms of the larger museums of Europe as well as numerous U.S. museums (New York, Boston, Chicago, Cincinnati, Cleveland and Washington, D.C.).

(H. JM.)

SCHÖNHERR, KARL (1867–1943), Austrian writer, primarily a dramatist, whose most famous drama, *Glaube und Heimat* (1910), deals with the conflict between religion and patriotism at the time of the Counter-Reformation and aroused religious controversy, was born at Axams, Tirol, on Feb. 24, 1867. He was the son of a country schoolmaster, studied in Vienna, and became a doctor there. Following Ludwig Anzengruber and Peter Rosegger, Schönherr made the Austrian peasant the focus of his work. His first publications (1895) were dialect poems of an unassuming nature and short stories; but in 1897 he turned his attention to the stage with *Der Judas von Tirol* (remodeled 1927). Acknowledging Ibsen as his master, Schönherr stood midway between realism and symbolism. His style was vigorous and robust and his accomplished technique enabled him to write successful plays with a very limited number of characters, simple emotions and the problems and crises arising out of them being presented with inexorable consistency. He published *Der Weibsteufel* in 1915. Other important works are *Die Bildschnitzer* (1900), *Erde* (1907), *Volk in Not* (1915), *Vivat academia* (1922), *Es* (1923), and *Die Hungerblockade* (1925). His later plays, *e.g., Der Armendoktor* (1927), *Passionsspiel* (1933), and *Die Fahne weht* (1938), added little to his reputation. Most of his work was first produced in the Burgtheater and in the Deutsches Volkstheater in Vienna. His stories and sketches, *Caritas* and *Aus meinem Merkbuch,* express much the same trend of thought and motif as his plays. He died in Vienna, March 15, 1943.

(W. I. L.)

SCHÖNLEIN, JOHANN LUKAS (1793–1864), German physician and pioneer of modern clinical medicine, was born in Bamberg on Nov. 30, 1793. He obtained his medical degree from the University of Würzburg in 1816 and was lecturer there for the next eight years. He became professor of medicine at Würzburg in 1824, at Zürich in 1833, and at Berlin in 1840. He retired in failing health to Bamberg in 1859 and died there on Jan. 23, 1864.

When Schönlein began his career German medicine was dominated by the so-called natural philosophy school, whose unscientific doctrines stemmed from the organismic theories of the philosopher Friedrich von Schelling (*q.v.*). At first a devotee of this school, Schönlein soon broke away and founded the so-called natural history school, which attempted (often with ludicrous results) to classify diseases by methods analogous to the way botanists were then classifying plants. However deficient, this scheme had the strong merit of turning medicine into a natural science. Schönlein abandoned his theory even as he concentrated more and more on the observational techniques it had relied upon—so that in time his teachings came to consist, in the words of his follower Rudolf Virchow, of "little system, many facts." He was the first to make use of the microscope, together with chemical analysis of the urine and blood, in the diagnosis of disease. He discovered the true nature of favus (a skin disease caused by a fungus) and described the minute hemorrhages of the skin in anaphylactoid (allergic) purpura (Schönlein-Henoch purpura).

Although he published little—only two very brief papers—his lectures attracted large numbers of enthusiastic students; and although his behaviour was remarkably boorish, he was consulted by patients from all over Europe, who benefited by the thoroughness of his examinations and his great therapeutic skill.

(H. D. v. W.)

SCHOOL ADMINISTRATION. School administration deals with the control, management and direction of all matters affecting the school, including organization, finances, policies, personnel, curriculum and methods, standards and related areas.

In this article school administration is treated under the following headings: types of administration; national systems; local

systems; joint local and national systems; sectarian systems; political party control; and trends. For information concerning school administration in various countries, states and provinces, etc., not specifically treated here, *see* the articles on those political divisions. (*See* also EDUCATION, HISTORY OF.)

Types of Administration.—The schools of the world are organized and administered for the most part by four agencies functioning separately or in combination: the church, the state, the political party and the private group. Of these, the church and private groups have become less powerful.

Most school systems of the world are centralized; that is, they are administered by the national government. Decentralized types of administration may be classified under such headings as provincial (state), county, township, community, etc. In Communist countries much administration is determined by local or regional cultural preference, but over-all policy is governed by directives issued from party headquarters in accordance with the prevailing political philosophy.

Administration differs also with the level of education. In centralized systems of education much responsibility for the early stages of schooling is granted to local authorities, whereas secondary education tends to gravitate toward centralized control. Higher education defies generalization. Publicly controlled universities in the United States and Canada may be either local or state in nature; at the same time they are supported to a very small degree, if land-grant colleges, by the federal government. In Great Britain both private and civic universities are dependent upon public funds but remain autonomous. Governmental influences are strong in French, Spanish, Italian and Latin-American universities, while in countries similar to the Soviet Union, universities are controlled by the Communist party, trade and professional unions, and various governmental departments.

National Systems.—*France.*—The classic example of a national system of education is that of France. Its administrative structure was originated by Napoleon in 1802. The country is divided into politico-educational units decreasing in size from *académies* to *départements* to communes. Each of the 17 *académies* is headed by a university. The chief administrator of both the university and the *académie* is called a rector, who is appointed from the ranks of university professors by the president of France on recommendation of the national minister of education. He is responsible primarily for secondary and higher education within his *académie;* he nominates candidates for administrative positions in his area, appoints examination committees, supervises examination content and procedures and presides over a sort of personal cabinet called an academic council. Unlike political divisions in such countries as Australia, Canada, the United States and West Germany, the *académies* have little power or authority of their own; rather, they are administrative arms of the national ministry of education; they represent a devolution rather than a delegation of power from the central government. The 97 *départements* are likewise administrative units governed by prefects who are appointed in Paris. The prefect heads the elementary school system, acting in a manner similar to the rector. The prefect, too, has an advisory council, appointive in nature, and by no means equivalent to local boards of education in such countries as the United States and Canada. *Départements* are empowered to levy subsidiary school taxes as approved by the national government; in the early 1960s about half the cost of *département* schooling was met by local taxation. *Départements* are also permitted to provide further school services, on approval of higher authorities, including additional emoluments for teachers. There are about 38,000 communes, varying in size from the smallest community to the city of Paris. The chief officer of the commune is the mayor, who is likewise the president of the commune school board. Again, these school boards are largely advisory in nature; they also see to it that national and *département* educational procedures and policies are carried out in their particular area; they have only minor administrative responsibilities and can initiate very little school legislation and practice. In practice, the *département* prefect assumes much of the control over education in the commune, as such control is derived from higher authorities.

The French educational system is also characterized by a pyramid of bureaus which reach their apex in the ministry of national education in Paris. As in all national systems, even including Great Britain, the minister of education is a political appointee of the prime minister, and he usually falls when his government falls. Practical control is exercised by a powerful and permanent civil service, which remains relatively unaffected by political changes. The ministry of education consists of five directorates: general administration; elementary; secondary; technical; and higher education. The minister is assisted by a higher council of national education, consisting of 56 members appointed in part by the president of the republic and the minister of education and elected in part by the universities and representatives of elementary and secondary education. Although its primary function is advisory in nature, the higher council is really a sort of educational parliament, in that the minister is required to consult its members and secure their approval in nearly all major matters of educational policy and procedure. A corps of inspectors general, appointed by the ministry of education, reports on progress and needs in all areas. Although some determination of school practices is allowed local governments, especially in matters involving purely internal conduct, the responsibility for education is actually not delegated, as in such countries as the United States, Great Britain and Canada. Administration is a sort of "line and staff" arrangement ordered in such a way that directives may readily be executed by subordinate officers.

Other National Systems.—National systems of education prevail in Belgium, the Netherlands, Greece, Scandinavia and other countries where centralized controls are geographically practical and strategic; the middle east (Turkey, Iraq, Syria, Egypt, etc.); most Latin-American countries; and other political systems not federal in nature. In most national systems, however, local control over educational administration increased after World War II.

An example of a different type of centralized control is Uruguay. The highest administrative agency is the ministry of public education and social welfare, but the ministry concerns itself primarily with welfare services. Educational administration falls within the province of four national autonomous educational councils: the National Council for Primary and Teacher Education; the National Council for Secondary and Preparatory Education; the Higher University council; and the National Council for Industrial Education, which occupies itself with agricultural, vocational and industrial schools of all types, but it is divorced from the political and ideological overtones which characterize labour educational administration in such a country as Mexico. The coexistence of these four councils illustrates a form of decentralization; since the councils operate on a national basis, however, and since their functions interlock, the resulting organization might be conceived as a type of pluralistic centralized control.

Local Systems.—Included in local systems are state, provincial, county and community types of school administration. Local emphases in administration are to be found in countries where public schooling originated in grass roots or separatist movements, or where political unity was achieved out of a confederation of sovereign states. In some instances of federalization, as in Italy and to some extent Switzerland, a central ministry has been granted administrative as well as advisory power. As a rule, however, cultural and political units have jealously guarded their control over education. Characteristics of local control may be generalized thus: (1) weak central ministries or bureaus of education, which are largely advisory in character; (2) financial support for education locally derived, aid from central authorities being mostly in the form of supplementary or emergency funds accepted with a minimum amount of control; and (3) administrative power lodged in local boards of education, sometimes appointed, sometimes elected. In countries like Canada, West Germany and Australia, where the separate states are sovereign, state ministers of education are appointed and state systems of inspection prevail. In the United States the state executive officer of education becomes either a commissioner of education (if appointed) or a state superintendent of schools, each with less power than his counterpart abroad.

United States.—The United States is an outstanding example of local control on state, county and community levels. The decentralization of education characteristic of U.S. schooling is a source of bewilderment to observers from other countries who seek to understand not only the many different types of state-controlled education but yet another system in the District of Columbia, administered by the federal government.

The whole is complicated by the myriads of local county, township or community units of education, by types of schooling directly supported and controlled by the federal government, and by the great variation among the states as regards internal administration and relations with local organizations. Some states, like Delaware, tend toward centralization. Massachusetts is an example of decentralization. Even in the support of education, the amount of funds provided can vary from the practice in such a state as Nebraska, where in the 1960s, for example, about 90% of expenditures were underwritten by local authorities, to states like New Mexico where state rather than local revenues paid for most public schooling. In addition to the various state public-school systems, there exist, outside these systems, parochial schools which are administered by church groups and a large variety of privately supported schools.

Although no mention is made of education in the United States constitution, the federal government has been mindful of the need to support formal schooling, exemplified in the Land ordinance of 1785 and the Northwest ordinance of 1787, by which part of the national domain was set aside for school purposes, and in the numerous federal statutes which have supported types of education (technical, military, agricultural, etc.) necessary to national welfare. The earliest federal statutes, enacted in accordance with traditional educational practices, gave control of lands and resources to local townships; but by 1804, with the Ohio Territory act, the states had accepted custodianship and assumed control of school endowments.

Education in the United States was originally conceived as a private or local affair. If not undertaken by the family or the church, schooling became the concern of charity groups. Hence, education was considered a matter of public welfare. But the federal government did not relinquish its responsibility; acting by authority of the "general welfare clause" of the constitution (sec. 8, art. i), it required of all states joining the union that satisfactory provision for public education be stipulated in the state's constitution. By a series of supreme court decisions the federal government settled local educational disputes and in part guided the course of education in its national implications. The federal government has also supervised the educational welfare of territories, trusts and dependencies, and assumed the responsibility for educational agencies supplying the federal government with the kind of personnel and services it requires. Included in this category are the various academies and institutes which train officers and specialists for such areas as national defense, diplomacy, internal security and technology. The federal government has also supported educational relief programs, such as the National Youth administration and the Civilian Conservation corps in the 1930s, the work-study and other educational programs set up under the Economic Opportunity ("War on Poverty") act of 1964 and the school-aid bill of 1965.

The United States office of education was established by congress in 1867. In 1939 it was transferred from the department of the interior to the Federal Security agency. It became a branch of the department of health, education and welfare when that department was established in 1953. It is not an administrative agency in essence, although it has assumed control over certain projects supported by the federal government, such as certain programs of vocational education, exchange of students and teachers with other countries, certain aspects of land-grant college administration and the general promotion of educational thought and practice throughout the country. Specifically, its functions involve the collection, interpretation, publication and dissemination of factual information on education, not only in the U.S. but abroad. Its specialists may be drawn upon for counsel by any educational group in the country. Similar agencies exist in India, Canada, Australia, West Germany and other nations where federated governments and local controls determine educational administration.

Responsibility for education in the United States rests with the individual states. The states delegate this responsibility to the local communities, not simply as a devolution of power, as in France and other centralized systems, but as a matter of self-determination under fairly liberal state school codes. It is commonly claimed that the three levels of educational organization and administration in the U.S.—federal, state and local—are in matter of fact actually interdependent rather than hierarchic. Hence, a system of checks and balances is said to prevail in educational as well as other governmental matters. In practice, however, administration rests heavily on the shoulders of local communities and operates in accordance with local decisions, assuming such decisions accord with federal and state statutes.

On the state level, educational administration generally is headed by a state board of education, sometimes appointed by the governor or the state legislature, sometimes elected. As a rule, state boards of education are less powerful than state ministries of education in other countries, largely because local communities in the United States assume much more administrative responsibility.

However, the board of education of the state of New York, for example, exercises powerful control over educational standards through a system of state-wide examinations. The extensive ramifications of its operations are seen in the fact that its staff consists of over 500 full-time professionals. State boards range in size from 3 to 19 members. They are largely composed of laymen but in some instances professional educators may become members.

Again, the duties of these state boards vary from state to state, but in general they all concern themselves with the distribution of state or federal funds (allotted to the states), the enforcement of educational statutes, the determination of basic courses of study, the adoption or recommendation of textbooks, the certification of teachers, the approval of building and maintenance standards, the provision of library services and the operation of teachers' colleges. State boards likewise interest themselves in the improvement of education as a function of government, the equalization of educational opportunity, the provision of educational leadership and the improvement of local operations. The functions of state departments of education were defined by the White House Conference on Education, Nov. 1955, in which general agreement was reached on the following recommended types of services to be provided local districts: (1) establishment of minimum standards for an adequate educational program; (2) advisory or consultative services in such areas as population trends, transportation, school construction, financial planning, curriculum development and special services; (3) research and statistical studies of a nature to assist in long-term planning; (4) certification of teachers and professional staffs; (5) provision of "dynamic" leadership. Included in a minority report were the following recommended types of services: (1) provision of scholarships for qualified students in financial need; (2) establishment of a sound, equitable tax base among administrative units; (3) assumption of desirable services above or beyond the capabilities of local districts to provide.

Inspection of local schools and school systems by inspectors responsible to state boards or other authorities is found in many states but is not so highly developed as in most other countries. School and classroom supervision is provided by local systems through specialists who do not function as inspectors but rather "helping teachers." In one state they are officially so designated.

The genius, but also the weakness, of the U.S. educational system lies in its more than 30,000 school districts, each exercising an amount of freedom unequaled in any other country. Administrative authority is assumed by a local board of education, which in about 90% of cases is elected by the people. Boards of education are usually independent of other agencies of local government; in fact, school funds voted by boards of education are for the most part not subject to rejection by other bodies. In

cases of dispute over budgets between boards of education and boards of finance, the courts have ruled almost exclusively in favour of the former. In most communities, school taxes have first priority; usually they are independent of other sources of revenue.

The duties of a local board of education are limited to community needs. The local board selects the superintendent of schools, who in turn recommends personnel for appointment by the board. In nearly all cases, boards of education have the power directly to appoint nonteaching employees. The local school board also determines the educational policy for the district, acting usually on professional advice, secured by way of the superintendent of schools and in accordance with the wishes of the community at large. The board assists the superintendent in the preparation of the budget, approval of which obligates the local board to see that tax funds are provided.

India.—India may be used as an example of local control strongly exercised by the various provinces under provincial or state ministries of education. Unlike the United States constitution, the Indian counterpart of 1947 states that the federal government will endeavour to provide free, compulsory education for all children till they reach the age of 14. Partly because the central government did not have sufficient funds to implement this ideal and partly because of the natural diversity of India's population, considerable responsibility for education has been delegated to the states. The functions of the Indian ministry of education approximate those of the United States office, but whereas the United States commissioner of education is appointed by the president, the Indian minister of education is elected by parliament and is directly responsible to that body. The state ministry of education has five divisions: (1) administration and cultural relations; (2) bureau of development; (3) general education; (4) technical education; and (5) scholarships. Delegation of authority by the states to the local communities is restricted to elementary education, as is the case in most countries, while secondary education is subject to state control. State ministers of education, like their federal counterparts, are both elected and appointed and are responsible to state legislative bodies. Indian state governments are responsible for educational policy, the local units being conceived largely as administrative and taxation units. Control over education is exercised through an inspection system.

Advising the Indian state minister of education is the director of public education, who is a permanent executive head of the ministry. He controls the inspectorial staff, the teachers and the government-recognized private schools, and is responsible for executing the policies of the ministry of education, principal among which is the inculcation of basic education through productive activity and local crafts to all children between the ages of 6 and 14.

There are great inequalities of educational opportunity in India, where population distribution, linguistic diversity and the heritage of the caste system aggravate an already difficult educational situation. The Indian central government has confessed its inability to assist adequately in fostering school development, not for want of desire but from sheer financial inability. It has confined its efforts to supporting higher and technical education, research in the interest of national welfare, experiments in educational methods, the production of suitable literature, the training of specialized personnel and the translation of important works into Indian languages. The administrative problem in India is therefore not one of where control ideally may be located but of securing the kind of educational organization and administration which will best serve a country which is as yet economically undeveloped, and where the many religions and sects insist upon tying public education to their own particular beliefs.

West Germany.—West Germany (the German Federal Republic) is another example of decentralization of administration. Art. 7 of the Basic law of the German Federal Republic (1949) places schools under the supervision of the respective states (*Länder*). The various states exercise fairly complete control over all schools and commit themselves to a program of close supervision in major activities. Local boards of education function everywhere, but with less power than in the United States. Again, as in similar systems, the highest administrative agency is the state ministry of education, headed by a minister of education (*Kultusminister*), who is a political appointee. The state minister of education might be compared with the state superintendent of schools in the United States, but he also absorbs some of the duties reserved for the U.S. local superintendent of schools, exemplified by his right of control and jurisdiction over internal school practices. Co-ordination among the state school systems is achieved in part by the Conference of Educational Ministers which meets several times a year in Bonn. In 1953 a federal educational council was established to advise the Conference of Ministers. The West German local school superintendent is appointed by the state minister of education on recommendation of the *Kultusminister*. Local school boards are not elected but are chosen by local legislatures; they are responsible only for those phases of school administration not assumed by the state. External university administration, including certain financial, academic, examination and other aspects, is exercised by the division of higher education of the state ministry of education, though the universities enjoy a large amount of autonomy.

Joint Local and National Systems.—Examples of national and local systems working co-operatively, or in partnership, are to be found in England and, to some extent, Japan.

Great Britain.—Educational administration in England was fixed by the Education act of 1944, which lodged final authority in the central ministry of education but which placed immediate administrative responsibility upon local educational authorities (L.E.A.'s). (*See* EDUCATION, HISTORY OF: *Great Britain and the Commonwealth of Nations: The 1944 Act.*) The Education act sets the structure of administration and control but allows local authorities to interpret policies in accordance with local need, preference and internal school conditions. Central authority is vested in three bodies: the ministry, the central advisory councils and the civil service, representing the political, the advisory and the professional elements of education respectively. The minister of education, appointed by the prime minister, is responsible for broad educational policy and practice within the framework of existing legislation as approved by parliament. The two Central Advisory councils (for England and Wales) advise the minister on internal matters of administration. The civil service is responsible for the communication and interpretation of broad policy at the local level. The permanent education secretary guarantees continuity of policy and operations. The "eyes and ears" of the ministry are her majesty's inspectors, better known as H.M.I.'s, who are members of the civil service. The H.M.I.'s have four major duties: (1) to ensure that government appropriations are being spent wisely; (2) to see that educational legislation is being complied with; (3) to act as missionaries disseminating enlightened educational thought; and (4) to keep the ministry informed on what transpires at the grass roots of education.

The L.E.A.'s are not elected directly by popular vote but are appointed by county and borough councils, which are in turn elected directly by the people. Actual supervision is, however, delegated to education committees, which are appointed by the L.E.A.'s out of their own membership plus a minority of non-L.E.A. members who are interested in education. One of the committee's functions, like that of a local board in the United States, is to appoint a chief education officer, usually called a director of education. The director of education enjoys less power and independence of action than the U.S. superintendent of schools, his chief function being to present proposals to his committee for decision and action, to record decisions and to carry them out. On the other hand, the headmaster of an English school, especially on the secondary level, is a more powerful and influential person than his U.S. colleague; he is given wide latitude in the formulation and execution of internal policy. As the power of the headmaster increases, it is natural that the power of the director of education decreases. Nevertheless, with the aid of a corps of local inspectors and advisers, the director of education commands a post of considerable weight, which takes on added importance in view of the director's responsibility to the national ministry of education, as

well as to his local education committee.

In general, it may be said that in contrast with other leading nations, England presents an educational system which not only operates co-operatively on both local and national levels but unites with private endeavour and voluntary organizations to spread the responsibility for control throughout the entire political and social structure of the nation.

Japan.—After World War II, in Japan educational administration tended to follow directives issued by the United States as the occupying power. Organization is on three levels: national; prefectural or county; and local community. The central ministry of education, though stripped of much of its power, is still, as in England, the chief administrative authority. The ministry has a secretariat and five divisions: elementary and secondary education; higher education and science; social education; research; and administration. Advice on general policy is afforded by 18 councils on education, including a central council for education. The national ministry of education is entitled to draft laws in the interest of national educational standards but its power to instruct local boards is limited by parliament. Since the ministry allots much financial aid to local systems, especially for school buildings, considerable indirect control is added to that which may be exercised directly. In consideration also of the weakness of local boards, due in part to educational tradition in Japan and in part to insufficient funds for vigorous programs at the local level, the ideal of a weak central ministry of education advocated by the United States educational mission failed to materialize. Concrete evidence is seen in such developments as the assumption by the central ministry of responsibility for the nine years of compulsory schooling and the security of teachers' salaries and emoluments. Also, the recommended transfer of university control to local authorities has failed, so that since 1954 universities have fallen within the province of the national educational administration.

Unlike England, the roots of local self-determination, especially in educational matters, are not deep in Japan, so that local controls are in a stage of growth rather difficult to delineate. Local boards of education are responsible, legally, for the establishment and maintenance of elementary and lower secondary schools; while the county (prefectural) board of education administers upper secondary and special schools, the certification of teachers, certain aspects of private schools and the choice of textbooks. Originally, too, these boards were supposed to be elected, but because educated and desirable Japanese people did not wish to run for the office (or could not afford campaign expenses), and because the Japanese themselves did not feel a strong affinity for the elective process, board members became appointive. Another difficulty with implementing the ideal of local controls in Japan has been the traditional method of collecting taxes. It has not been possible to establish a system of special school taxes, so that local boards must depend upon general local revenues, supplemented by allotments from the central ministry. Although the trend is back to a centralized administration in Japan, local authorities still exercise far more control than before the war, so that a modified type of partnership in educational administration may therefore be said to prevail in Japan, in principle if not always in practice.

Sectarian Systems.—Religious and denominational influences control school administration in Spain, Ireland, certain provinces in Canada and certain Latin-American countries. The Spanish state guarantees the teaching of the Catholic religion as a regular and compulsory subject in all educational institutions, whether state controlled or not, and no matter what their level and purpose. Publications of any type may be banned or suppressed if contrary to Catholic dogma and morals. Also, in tests for the selection of teachers, for example, examining boards are composed of five members, three of whom, including the chairman, must be church officers. In Ireland local boards of education, hence local school systems, are controlled by the prevailing local religious denomination.

Canada.—For the most part, educational administration in Canada is similar to that of the United States. Under the British North America act (1867) jurisdiction over education is delegated to the provinces. In the provinces of Quebec and Newfoundland, administration is sectarian in nature, but the schools are otherwise "public." Education is free and compulsory but children must attend the school of their denomination, unless an "outsiders fee" is paid. Quebec developed with two distinct groups: the Protestant English and the Catholic French, each demanding the right to educate its members. There was no minister of education in Quebec until 1964 when such a ministry was established; the dual Catholic-Protestant system was retained (*see* QUEBEC: *Education*). School districts may be organized by minorities in any community, if there are a sufficient number of pupils to justify the procedure and a sufficient number of taxpayers capable of assuming the responsibility. This principle of "dissent" is guaranteed by law. Individual taxpayers may also designate the school system to which their taxes must be paid. The French-speaking school districts in Quebec are generally coterminous with the Catholic parishes; otherwise, it is obvious that political districts and school districts are not necessarily identical.

In Newfoundland, where early settlement took place along denominational lines, nearly every local community has a majority of one or another of the various denominations. This situation has produced a sectarian system of education, whereby the churches of the various groups have built and in large part control their own schools. Directors of education are nevertheless responsible to the provincial ministry of education. Increasingly the schools of Newfoundland are becoming consolidated, however, especially at the secondary level, reflecting a national trend.

Certain general observations may be made about the rest of Canada. There is neither a central ministry of education, as in England, nor an office of education, as in the United States. Instead, the dominion bureau of statistics publishes an *Annual Survey of Education in Canada;* the Canadian Education association collects and publishes research studies and disseminates information on procedures and practices in the various provinces; and a national research council assists materially in advanced research and investigation at the university level. The dominion government is not without authority, however, in educational matters. For one thing, it is empowered to overrule any act of a provincial government. It protects the educational rights of minorities; it has provided crown lands for the support of education; it is responsible for the operation of schools within the territories; it grants a limited amount of aid for vocational and higher education; it supports research and other types of educational investigation; it provides special grants to increase staff salaries in universities; it supports school broadcasts. (Pressures upon the dominion government to support education at the federal level are similar to those in the United States.)

The provincial departments of education exercise control over such matters as courses of study, teacher education, examinations, textbooks, school buildings and legislative grants. The provincial minister of education is a member of the provincial legislature and hence of the political party in power, and he is responsible to the legislature in matters involving broad educational policy. The deputy minister of education is the chief permanent officer of the provincial department of education.

The most persistent administration problem in Canada is how to find the means of providing larger and more efficient units of organization and administration, at the same time preserving local control of schooling in a sparsely settled, widely diversified, heterogeneous nation.

Political Party Control.—The Soviet Union and its satellites, Communist China and, to a limited extent, Spain, are examples of educational administration as controlled by a single political party.

U.S.S.R.—The right of all citizens to education is guaranteed by the constitution (art. 121, revised) which provides for universal, compulsory education through grade eight and for extensive development of secondary education. All forms of education, both secondary and higher, are free of charge, there is a system of state stipends for students who have distinguished themselves in higher schools, education in the schools is in the

students' native language, and free technical, industrial and cultural training for the working people is organized at plants, state farms, machine tractor stations and collective farms.

The Soviet Union resembles India and China in its multiplicity of cultural, national and linguistic groups. There are nearly 200 such groups incorporated into the union; more than 100 different languages are spoken. Within the Russian Soviet Federated Socialist Republic, by far the largest union republic, are no less than 100 cultural and linguistic groups. Under such circumstances, the U.S.S.R. could not help but organize as a federal state; indeed, one secret of Soviet success may be traced to the willingness of the central government to cater in part to national and cultural differences, including instruction in vernacular languages at primary and secondary levels, with Russian the compulsory second language.

In the Soviet Union, as in other federated political systems, education is the responsibility of the individual republic. The U.S.S.R. goes one step further in providing no central ministry of education, relying instead upon ministries of education of the various republics to unify their activities in accordance with educational directives emanating from Communist party headquarters and the central government in Moscow. There is, however, a central ministry of higher educational institutions, which is part of the ministry of culture; and this agency controls all universities, most of the secondary schools (*technicums*) and most of the teachers' institutes. Another sample digression occurs in the fact that the national ministry of labour reserves is in charge of the factory schools and certain vocational institutes, even though it does not contribute materially to their support. Budgets are drawn up by local agencies and the ministries of education of the republics for approval by central authorities, who, in turn, advance direct grants for specified areas and make up deficits. Despite the apparent decentralization of administration, uniformity is guaranteed, as no decision of any consequence, certainly none contravening party directives, is made at levels lower than the republican ministry of education. Policies may originate locally, but they have to be submitted to the republican ministry for approval, or, if of sufficient importance, to the council of ministries for general agreement. The philosophy underlying all agreements and hence all policy and practice is that of the Communist party and party principles are the same for the entire nation.

Control by the Communist party is guaranteed by the central government, which administers the entire economy and the fiscal policies of the nation. In a planned economy, education becomes simply another agency of government and national life, so that all school practices must be co-ordinated with activities planned for other phases of the country's existence. Freedom is allowed only when no directives exist to the contrary. Though directives are many and detailed, the individual republics have been able to exercise a number of prerogatives which give the air of self-determination. In the Georgian Soviet Socialist Republic, for example, the compulsory study of Russian (in addition to the Georgian vernacular) was found to interfere so greatly with the time allotted to other subjects that primary schooling was extended one more year.

Because they are tied to other segments of the government, the republican ministries of education are far more complex in organization than counterparts in other nations. For one thing, the minister of education is also a member of the union republic council of ministers, so that, contrary to practice in other nations, he belongs not only to his republic but also to the central government. He therefore has a multiplicity of divided duties to perform. The following departments exist in a Soviet republican ministry of education: organization and administration (including teacher training, buildings, finance, elementary and secondary educational methods, etc.); vocational education; adult education; social and polytechnic education; literature and publications; science and art institutes; research agencies; and certain commercial trusts, such as the state publishing house, the state motion-picture enterprises and the state supply board. An inspectorial system, under control of the ministry, interests itself in the improvement of teaching and classroom management. Although inspectors must see that party policies are carried out, in practice, they interest themselves primarily in modern pedagogical methods and in supervision; they also teach demonstration classes. Inspectors co-operate closely with school principals; they do not "rate" teachers, except to recommend awards or special honours for particular tasks well done.

Local school boards are appointed by local executive committees of the local council (soviet) concerned. The local director of education is likewise appointed by the executive committee of the council. School principals are, however, named by local school boards and principals in turn select the teachers, subject to approval of the school board. The school principal is also in charge of school purchases; but he must buy all supplies from government houses. The internal duties of local school boards resemble those of most countries but they must look to higher authorities for the determination of over-all policy and practice and have no authority to levy taxes. Each school is guided by a council consisting of parents, teachers, Communist party members and others connected with school life, including clerks and janitors. These councils occupy themselves vigorously with the ongoing activities of the school, uniting with parent-teachers associations in physical (as well as ideational) projects, such as cleaning and redecorating classrooms and providing benefits and perquisites not forthcoming from governmental sources.

The Communist party not only establishes policy but also determines who may be elected to office. Education therefore has the task of preparing future leaders, for whom special party schools are established. In all schools the party exerts its influence in the organization of pupils in various types of political youth leagues, with Pioneer groups for ages between 10 and 15 and the Komsomol, or Young Communist league, for youth over 14. Members of these groups are chosen for their loyalty to party principles and their actual or potential capacity for leadership. In sum, administrative policies in the U.S.S.R. may originate in local areas but to become effective they must be approved at the top. Approved policy then sifts down through the various levels and its enactment is overseen by party members or affiliates, who penetrate every phase of public and educational life.

Communist China.—Similar practices prevail in China. In fact, following World War II Chinese schools were reorganized under the aegis of Russian counselors and modeled after the educational ideals of the Soviet Union. Art. 41 through 47 of ch. v of the Common Program contain the core of Chinese educational policy. Education, according to this program, shall be "national, scientific, and cultural." It shall promote the five "loves": fatherland, people, labour, science and public property. Education and politics become inseparable, so that educational leaders are either members of the Communist party or pledged to support its principles. The entire nation is organized under such centralized ministries as finance, trade, labour, heavy industry, fuel industry, textiles, foods, light industries, railways, communications, agriculture, conservation, forestry and land reclamation. The listing of these ministries is not merely a verbal duty; it reveals the nature of Communist China; and the school system is charged with providing trained personnel for all these ministries.

Contrary to the Soviet Union, China has a central ministry of education, which concerns itself not only with elementary and secondary education but also with the establishment and administration of institutes of higher learning. Hence, it might be said that China is an example of an educational system which is controlled not only by a political party but also by highly centralized administrative agencies. School administration is said to be democratized by the organization of educational councils, in which teachers, students and workmen enjoy equal voting status. The democratic way is also said to be practised in all kinds of meetings and discussion groups, findings of which are transferred for action to higher authorities, on the basis of "discussion by the many but decisions by the few." Heading these educational discussions, or influential in their operation, are members of the party. When one compares two such highly nationalized systems as China and France, political preference is readily discerned as perhaps the

chief agent for ordering educational ends, even though the means of administration are similar.

Trends.—While trends in educational administration differ among nations, certain generalizations may be made:

(1) Nationalized or centralized systems (France, Mexico, India, etc.) are advocating the assumption of greater responsibility at the local level; conversely, local school systems (the United States, Canada, Great Britain, etc.) are looking toward centralized authorities for assistance in the support of schools. Thus, a greater co-operation among all government groups is becoming evident, influenced by two forces: more liberal sociopolitical democratic practices and the need to derive the cost of schooling from more and wider sources of revenue. (2) School-leaving ages are being raised, so that few countries remain in which children are allowed to leave school before the age of 14; only financial and material limitations prevent the fullest application of laws on compulsory education. (3) Administration is rapidly being democratized, largely in co-ordination with greater democratic practices in other phases of a culture, as evidenced in the breakdown of hierarchic controls, in less rigid forms of student selectivity, in the insistence upon basic education for all children up to school-leaving age and in provisions for secondary education for more and more young people. (4) State interest in the education of all citizens is resulting in greater provisions for scholarship help to those in economic need. (5) The single-ladder system of school organization is slowly gaining favour, though in countries like France and Germany, where entrance to secondary school has traditionally been highly selective, the idea of a single school, or "common school," system for all (*école unique; Einheitsschule*) has met considerable opposition, partly in reaction to general reforms of a socializing nature and partly because of the power of the universities over secondary school policy. Otherwise, secondary education for all, wherever physically possible, is becoming fundamental to educational progress. (6) Although more and more money is being spent on education year by year, and although more and more students are attending the world's schools, the proportion of most government budgets allotted to education is either static or actually decreasing. Teachers' salaries have not increased commensurately with the rising cost of living and with salaries paid in other professions or vocations. Problems of administration are everywhere aggravated by the lack of funds and of suitably trained, talented personnel.

SCHOOL ARCHITECTURE: *see* EDUCATIONAL ARCHITECTURE.

SCHOOLCRAFT, HENRY ROWE (1793–1864), U.S. ethnologist and explorer, one of the earliest of important writers on the American Indian, was born on March 28, 1793, in Albany County, New York. He was educated at Union and Middlebury colleges, where he showed a predilection for mineralogy. His *View of the Lead Mines of Missouri* (1819) was based upon a collecting trip through the Indian country of Missouri and Arkansas and led to his appointment as topographer on the Lewis Cass expeditions to the upper Mississippi and Lake Superior copper regions, where he became increasingly interested in Indian life. In 1822 he was appointed Indian agent to the tribes of the Lake Superior region and shortly afterward married a girl of Ojibwa (*q.v.*) extraction. Her tribe became the subject of his special study. From 1836 to 1841 he was superintendent of Indian affairs for Michigan; in this capacity he supervised the treaty of March 28, 1836, by which the Ojibwa ceded much of northern Michigan to the United States. Schoolcraft's contribution to ethnology was made in his *Historical and Statistical Information Respecting the History, Condition, and Prospects of the Indian Tribes of the United States,* 6 vol. (1851–57). Repetitious and disorganized, the work nevertheless remains an invaluable source of information gathered by the author from Indians, missionaries, traders, and agents. The publication of F. Nichols' *Index to Schoolcraft's "Indian Tribes of the United States"* by the Bureau of American Ethnology (1954) greatly enhanced the value of the original volumes. An edition of Schoolcraft's *Literary Voyager* (ed. by P. Mason) appeared in 1962.

Schoolcraft continued his exploratory trips, the most important of which was in 1832, when he discovered Lake Itasca, the source of the Mississippi. Among many books was *Algic Researches* (1839; 1856 ed., *The Myth of Hiawatha*), which Longfellow used for *Hiawatha.* He died on Dec. 10, 1864, in Washington, D.C.

See also Chase S. Osborn and Stellanova Osborn, *Schoolcraft, Longfellow, Hiawatha* (1942). (V. Kz.; X.)

SCHOONER, a sailing vessel having two or more masts and only fore-and-aft rigged sails. The masts have the same names as those of square-rigged ships and the sails forward of the foremast are similar to those of a square-rigged ship. Each mast carries a single gaff-headed sail which takes the name of the mast supporting it; gaff topsails may be carried above these sails. (*See* also RIGGING; SAILS.)

In two-masted schooners the mainmast is higher and carries more sail than the foremast. In schooners having more than two masts the masts are the same height and carry nearly equal sail areas.

Modern schooners are generally used as yachts and have but two masts. The sails on the after side of the masts of schooner yachts are triangular in shape and slide up and down the mast on metal tracks. (M. R. D.)

SCHOPENHAUER, ARTHUR (1788–1860), German philosopher, primarily important as the exponent of a metaphysical doctrine of the will in immediate reaction against Hegelian idealism, was born at Danzig on Feb. 22, 1788, the son of a merchant, Heinrich Floris Schopenhauer, and of his wife Johanna. H. F. Schopenhauer was a liberal-minded man who disliked authoritarian and absolutist governments and moved to Hamburg in 1793 when Danzig surrendered to Prussia; he was also cultivated and cosmopolitan in his tastes and acquainted with French and English literature. Johanna shared her husband's literary interests and herself wrote novels; but otherwise they seem to have been temperamentally unsuited, and the marriage was not a happy one.

Arthur Schopenhauer's education was intermittent. After spending two years (1797–99) at Le Havre to learn French, four years in a private school at Hamburg and another two years traveling in England, France, Switzerland and Austria, he entered a merchant's office at Hamburg.

After the unexpected death of Heinrich Floris in 1805 (he fell, or threw himself, into a canal), Johanna Schopenhauer moved to Weimar. Schopenhauer eventually joined her there and studied classical literature until 1809, when he entered the University of Göttingen, reading first medicine and then philosophy. The years 1811–13 he spent at the University of Berlin, attending the lectures of J. G. Fichte, for whose philosophy he was later to express considerable contempt.

At the time of the uprising of the German states against Na-

poleon, Schopenhauer, who disliked all forms of militarism and was not much moved by appeals to national sentiment, retired to Rudolstadt, where he published his doctoral thesis, *Über die vierfache Wurzel des Satzes vom zureichenden Grunde* (1813; Eng. trans., *On the Fourfold Root of the Principle of Sufficient Reason*, 1889).

ARCHIV FÜR KUNST UND GESCHICHTE, BERLIN

ARTHUR SCHOPENHAUER, PHOTOGRAPHED ABOUT 1855

After his thesis had appeared Schopenhauer returned to Weimar, where in his mother's salon he met the orientalist F. Mayer, who introduced him to Indian philosophical literature. He also met Goethe. The latter having in 1810 published an essay on colours, Schopenhauer took up the same subject and sent his manuscript "On Vision and Colours" (*Über das Sehn und die Farben*, 1816) to Goethe in 1815; it was not, however, very enthusiastically received.

Schopenhauer had meanwhile left Weimar for Dresden, having quarreled with his mother (May 1814); they were never to see one another again. At Dresden he wrote his principal work, *Die Welt als Wille und Vorstellung* (1819; Eng. trans., *The World as Will and Idea*, 3 vol., 1883). Schopenhauer expected that this would at once be recognized as a book of first-class importance; but neither was it well-received nor did it sell. More successful at this time were his efforts to save the family fortunes when the firm in Danzig in which they had been invested went bankrupt.

After the publication of his book, Schopenhauer started lecturing in the University of Berlin (1820), but this too was a failure. Philosophy in Berlin was dominated by Hegel, and Schopenhauer's disdain for Hegelian ideas met with a poor response. He went to Italy in 1822 and to Munich in 1823; there he stayed for nearly a year, sick and isolated. From 1825 to 1831 he lived in Berlin, partly in order to defend himself against a seamstress who was suing him for injuries sustained when Schopenhauer, annoyed by her chatter, had driven her downstairs from a landing outside his room. He was eventually condemned to pay her regularly a certain sum of money until her death, which took place in 1841.

In 1831 Schopenhauer settled in Frankfurt am Main. He seems to have lived very well there: he enjoyed food and wine; he was fond of the theatre and music (he himself played the flute); and he read widely in French, Italian and English literature. Happy, however, he was not. By nature misanthropic, he was also by this time profoundly embittered by lack of recognition, and his bitterness was only exacerbated by his contempt for the official Hegelian philosophy. He expressed his opinions on this score with great vigour, both in *Über den Willen in der Natur* (1836; Eng. trans., "On the Will in Nature," in *Two Essays*, 1889) and in his preface to the second edition (1844) of *Die Welt als Wille und Vorstellung:* he regarded Hegel as a charlatan who had corrupted the minds of an entire generation with bombastic sophistry and meaningless verbiage. Nor was his resentment alleviated when an essay of his, the sole entry for a competition instituted by the Danish academy of science, received no award. This essay was subsequently published in *Die beiden Grundprobleme der Ethik* (1841; Eng. trans., *The Basis of Morality*, 1903).

Schopenhauer's later writings added little that was new to what he had already written. In the second edition of his main work he added 50 supplementary chapters, including a section on sexual love in which there is only a suggestion of the misogynistic sentiment that coloured his later well-known essay "On Women."

With the publication of *Parerga und Paralipomena*, 2 vol. (1851; selective Eng. trans., *Essays From the Parerga and Paralipomena*, 1951), a collection of essays on a variety of topics, Schopenhauer at last began to acquire fame. Articles on his system appeared in English, French and Italian as well as German periodicals; in 1856 the University of Leipzig offered a prize for the best exposition and criticism of his ideas; and by 1857 his doctrines were the subject of lectures at Jena, Bonn and Breslau (Wroclaw). His reputation quickly spread beyond the confines of the academic field, and he gradually became the object of a kind of cult, with admirers in England, Russia and the U.S. He died at Frankfurt on Sept. 21, 1860.

PHILOSOPHY

The main philosophical influence upon Schopenhauer, and one that he freely acknowledged, was undoubtedly Kant. But although he never questioned Kant's greatness, *Die Welt als Wille und Vorstellung* contains a long "Criticism of the Kantian Philosophy" in which Kant's theories are subjected to a severe analysis. Other influences were Plato (particularly noticeable in Schopenhauer's references to eternal "ideas" in his account of artistic experience), Schelling, oriental philosophy and, to a lesser extent, the British empiricists: Schopenhauer speaks with respect of Locke and shared Kant's admiration for Hume.

Theory of Knowledge.—Schopenhauer accepted the Kantian distinction between the phenomenon, or the appearance that a thing presents to the perceiving mind, and the noumenon, or the thing as it is in itself. Thus in perception the mind is aware only of phenomena: what lies behind them, being beyond all possible experience, is unknowable; and the pretensions of traditional metaphysics to provide knowledge of a supra-empirical kind must accordingly be rejected. Again, Schopenhauer derived from Kant his view that the mind makes an important contribution to the general nature of our experience. The human sensibility is such that sense-data can only appear to us as spatially and temporally ordered; further, all phenomena are subject to the a priori category of cause and effect. Time, space and causality, Schopenhauer declares, are "nothing more than functions of the brain."

Schopenhauer went on to argue that we reflect upon and communicate our experience through concepts, or general terms. By means of these we are able to classify together different things in virtue of those common features which are of interest or importance to us. The function of conceptual thinking is thus essentially practical: without it what we learn from our experience could not be retained or put to use. But it is impossible to dissociate it—as some philosophers have tried to do—from the perceptual experience on which it is based: "Conceptions and abstractions which do not ultimately refer to perceptions are like paths in the wood that end without leading out of it." In saying this, Schopenhauer acknowledged his debt to the English empiricist philosophers.

Metaphysical theories that profess to be able to describe the nature of the world a priori and without reference to observed facts "move in the air without support." In the end they do no more than elicit by deductive steps the implications of the highly abstract concepts from which they start, and such a procedure can yield no more than a system of tautologies. Schopenhauer regarded Hegel's work as a prime example of such "trifling and paltry" philosophizing.

Metaphysics.—The basic tenets of Schopenhauer's theory of knowledge would seem to impugn the validity of all metaphysical speculation considered as a source of information about the world. He felt, however, a deep dissatisfaction with the purely empirical type of knowledge represented by the natural science of his time. Scientific explanation, he believed, always ultimately presupposes what is itself inexplicable in scientific terms: it may tell us how things as a matter of fact behave under certain conditions, but it cannot in the final analysis explain why things happen as they do and not otherwise; it is like "a sum which never comes out." Thus metaphysics has, after all, a genuine function, viz., to resolve certain fundamental problems which, although necessarily beyond the scope of science, seem naturally to arise. But how are these problems to be tackled in the light of what Schopenhauer, following Kant, has already said concerning the limitations of human knowledge?

The answer, for Schopenhauer, lay in the nature of our own intimate experience of ourselves. Although, from one point of view,

I am as much a "phenomenal" object as a rock or a tree, self-consciousness reveals that I am more than this. For, apart from my awareness of myself as a perceivable body, occupying space, enduring through time and causally responding to stimuli, I also know that in my overt behaviour I express my will. And just as my own activity is ultimately only explicable as the expression of my will, so it is with everything else in nature. Will is the concept in terms of which all that exists and manifests itself in the world can finally be understood. In this way Schopenhauer believed that he had arrived at a fundamental metaphysical truth by a method which escaped Kant's objections, although the reasons for his confidence are not very clear.

The picture which Schopenhauer thus drew of the inner character of the world was not—and was not intended to be—a pleasant or consoling one. For him the "real" was not, as it was for Hegel, the rational, but the irrational: the metaphysical will is "blind," an insatiable force without conscious purpose or direction. Human beings may deceive themselves into thinking that they are acting from considerations dictated by reason alone, but this is never in fact the case: the function of the intellect is only to assist the will to achieve its ends. From this the conclusion is drawn that all participation in the world is to be avoided, Schopenhauer's final remedy being not, as might be expected, suicide, but quietism.

Theory of Art.—The importance that Schopenhauer assigned to artistic experience is understandable in the light of his general theory. The scientist's attitude to the world is practical: he is concerned with phenomena only with a view to discovering the laws which govern their behaviour; and the sole value of his findings lies in the use to which they can be put in securing the objectives of the will. By contrast, the concern of art is with what Schopenhauer calls "contemplation," or "will-less" perception: the aesthetic frame of mind is characterized by a complete absence of desire or practical interest. What is perceived in artistic apprehension and what the artist strives to communicate through his works are certain archetypal "ideas," described as "the permanent essential forms of the world and all its phenomena." These "ideas" are not to be confused either with concepts or with the objects of everyday perceptual awareness to which concepts are applied: they occupy, in fact, an intermediate place in Schopenhauer's system between phenomenal appearances and the underlying noumenal reality of will. The position is further complicated by the fact that a different account is provided of music, which is regarded as directly exhibiting the inner workings of the will itself. Yet, whatever obscurities surround his theory of the ideas, the general significance of Schopenhauer's discussion of art is plain: the Romantic conception of the artist, as one who can withdraw from the material exigencies of life and reveal aspects of the world to which those dominated by considerations of practical interest are blind, could not fail to appeal to him; and the "knowledge" so achieved seemed to him to be correspondingly superior to any that could be acquired in response to the demands of the will.

Psychology and Ethics.—Schopenhauer's deterministic theory of human action and motivation is consistent with the rest of his system. Whatever a man does is necessarily an expression of his inner will, and this is fixed and unalterable. The knowledge of what we are comes to us as a result of seeing what we do: a man cannot "resolve to be this or that, nor can he become other than he is; but he *is* once and for all, and he knows in the course of his experience *what* he is." The common-sense belief in the freedom of the will is consequently an illusion: in our so-called "free" choices we merely exhibit the nature of our innermost unchangeable character. This belief did not, however, prevent Schopenhauer from distinguishing on moral grounds between different sorts of action. A wrong act is an act by which a man, in expressing his own will, "denies" or inhibits the will of another. Moreover, if justice consists in refraining from such injurious acts, goodness consists in treating the welfare of others as being as important as one's own: thus the good man acts from motives of benevolence and sympathy.

Influence and Originality.—Schopenhauer's philosophy achieved a wide popularity on the continent of Europe in the latter half of the 19th century: both Friedrich Nietzsche and Richard Wagner, for instance, were in different ways profoundly impressed by his ideas. In England, however, his influence on philosophical thinking was small: the dominant school of "absolute idealism," for example, was largely inspired by Hegel's doctrines, against which Schopenhauer had directed his most bitter attacks; and little attention was paid to his writings by British philosophers in the first half of the 20th century, when belief in the validity of metaphysical speculation was declining.

Such neglect is somewhat unjustified. Schopenhauer was not a rigorous thinker, and his theory lacks the tight, connected structure and logical ingenuity characteristic of the systems of men like Spinoza and Leibniz. Yet he compares favourably in a number of respects with other 19th-century metaphysicians—Hegel and his followers, for instance. He recognized, as they did not, the force of Kant's criticisms of metaphysics, and he had a much clearer conception of the relations holding between language and the world and, consequently, of the limitations of a priori knowledge. Moreover, he wrote with great distinction and style and with a natural clarity of expression that prevented him from camouflaging his inconsistencies beneath obscure phraseology and jargon. He showed acute psychological insight, particularly into the metaphysical urge; and his doctrine of the will foreshadowed, in metaphysical form, new categories of thought that were to emerge with advances in the nonphysical sciences—especially psychology. His avowed dissatisfaction with science can in fact be seen—partially at least—as a dissatisfaction with the mechanistic models of explanation and interpretation which theorists of the 17th and 18th centuries, fascinated by the achievements of physics, had sought to extend to all departments of human life and experience. Both here and in his rejection of the optimistic rationalism of the Enlightenment, Schopenhauer showed an originality and a prescience which it is difficult to ignore.

BIBLIOGRAPHY.—The earlier collected editions of Schopenhauer's works, by J. Frauenstädt, 6 vol. (1873–74), M. Brasch, 2 vol., 3rd ed. (1891) and E. Grisebach, 6 vol. (1892; supplemented by *Arthur Schopenhauers handschriftlicher Nachlass,* 4 vol., 1895), were superseded by A. Hübscher's rehandling of Frauenstädt's ed., 7 vol., 2nd ed. (1946–50). *See* also W. L. Hertslet, *Schopenhauer-Register* (1890); and G. F. Wagner, *Encyklopädisches Register zu Schopenhauers Werken* (1909). Hübscher, *Schopenhauer: ein Lebensbild* (1938). For a study of his philosophy in English, *see* F. Copleston, *Arthur Schopenhauer, Philosopher of Pessimism* (1946). (P. L. G.)

SCHORL, in mineralogy the name given to coarse black varieties of tourmaline (*q.v.*). Schorl was originally a mining term applied both to black tourmaline and to hornblende.

Schorl rocks are crystalline aggregates of quartz and tourmaline and occur almost always in association with tourmaline-bearing granites or pegmatites. They originate by the action of gases and vapours on granites, porphyries and other rocks. Sometimes direct pneumatolytic derivatives of the granite itself, they are also frequent as replacement products of the country rock into which the granite is intruded (*see* also GREISEN). The altered granite known as luxullianite, from its occurrence near Luxullian, a village in Cornwall, is a tourmalinized granite in which a progressive replacement of biotite and feldspar by quartz and tourmaline can be traced. The rock still contains pink feldspars in large porphyritic feldspars set in a dark tourmaline matrix, giving polished specimens a handsome appearance. By impregnation with boron-bearing vapours, the slates and sandstones surrounding granites are locally converted into schorl rock, schorl schist or tourmaline hornfels consisting almost wholly of quartz and tourmaline. Banding, lamination or cleavage of the original slates, etc. is frequently preserved. (C. E. T.)

SCHOULER, JAMES (1839–1920), U.S. lawyer and historian, was best known as a legal writer and for his seven-volume history of the United States. Born in West Cambridge (now Arlington), Mass., on March 20, 1839, he graduated at Harvard in 1859, taught a year at St. Paul's school in Concord, N.H.,

studied law in Boston and was admitted to the bar in 1862. His legal practice was interrupted by service in the Union army, and in 1869 he moved to Washington, where he opened a branch office and for several years published the *United States Jurist*.

After his return to Boston, he devoted himself to office practice and to literary pursuits, lecturing also at Boston university, the National university law school, Washington, D.C., and Johns Hopkins university, Baltimore, Md. In 1896–97 he was president of the American Historical association. He died at Intervale, N.H., on April 16, 1920. His legal publications include treatises on domestic relations (1870), bailments (1880) and wills (1887).

Schouler is best known, however, as a historian, his most important work being a *History of the United States Under the Constitution* (1880–1913) covering events from 1783 to 1877. Among his other publications are *Historical Briefs* (1896), which contains his biography up to that period; *Constitutional Studies* (1897); lives of Thomas Jefferson (1893) and Alexander Hamilton (1901); *Americans of 1776* (1906); and *Ideals of the Republic* (1908).

SCHREINER, OLIVE EMILIE ALBERTINA (1855–1920), South African novelist and worker for human rights, was born at Wittebergen Mission Station, Basutoland, of a German Lutheran missionary family, on March 24, 1855. A sensitive, precocious child (she declared herself a freethinker at the age of eight), her imagination was formed by the bush landscape, and her sensibility toward any form of injustice was awakened by racial and national conflicts. She received no formal education, but from 1874 to 1881 was governess to various farming families. During this period she wrote most of her fiction. When she went to England (February 1881) she intended to study medicine, but *The Story of an African Farm* (1883) was accepted by George Meredith, then reader for Chapman and Hall. First published under the pseudonym "Ralph Iron," it ran through ten large editions in as many years, and among its admirers were Gladstone, Gen. Smuts, and Sir Charles Dilke. The orphan heroine, Lyndall, believing in women's right to experience life on equal terms with men, leaves the South African farm of her childhood with a stranger. She refuses to marry him, has his child, and dies. Other important characters include the stagy villain, Bonaparte Blenkins, and Waldo, a repressed artistic child. The plot is poorly handled, but the story lives for its intense moral and poetic insights. Other uneven but powerful novels, published posthumously, were *From Man to Man* (1926) and *Undine* (1928). In England she moved in intellectual circles, and formed a deep and long-lasting friendship with Havelock Ellis (*q.v.*).

In 1894 she married a devoted but intellectually disparate South African farmer, Samuel Cronwright, who at her request took the name Cronwright-Schreiner. Despite severe asthma, her later years were devoted to championing the rights of women (for which *Woman and Labour*, 1911, is a powerful tract); of the Dutch settlers in the South African War, condemning concentration camps; of the natives in Rhodesia (*Trooper Peter Halket of Mashonaland*, 1897); and of pacifism in World War I. She died in Wynberg, South Africa, on Dec. 11, 1920, and was buried in the Karroo Desert.

See S. C. Cronwright-Schreiner, *The Life of Olive Schreiner* (1924); V. Buchanan-Gould, *Not Without Honour* (1948). (W. L. G. Jr.)

SCHRÖDER, FRIEDRICH LUDWIG (1744–1816), German actor, theatrical manager, and playwright, who was the first to bring Shakespeare to the German stage, was born in Schwerin on Nov. 3, 1744. He began his career as a child actor in the company of his stepfather, Konrad Ernst Ackermann. He learned what he could from Ackermann, who was a remarkable comedian, and from his mother, the actress Sophie Schröder. But his decisive inspiration came from Konrad Ekhof, who had joined Ackermann's company in 1764.

In 1771 Schröder became the manager of the Hamburg theatre, an office that he held for nine years. Highlights of his first Hamburg period were his productions of *Hamlet*, *Othello*, *The Merchant of Venice*, *The Comedy of Errors*, *Measure for Measure*, *King Lear*, *Richard II*, *Henry IV*, and *Macbeth*. In such parts as the Ghost (later Hamlet), Iago, Shylock, Lear, Falstaff, and Macbeth, Schröder established himself as the leading actor of the period, with supreme control over his body and voice. He also acquainted Hamburg audiences with the early dramas of Goethe (*Götz von Berlichingen*, *Clavigo*, *Stella*) and the plays of such other Shakespeare-inspired *Sturm und Drang* dramatists as Friedrich Maximilian von Klinger and Heinrich Leopold Wagner. From England he imported Edward Moore's *The Gamester* and George Lillo's *The London Merchant*.

Schröder left Hamburg in 1780 and spent four years at the Vienna Burgtheater. From 1785 to 1798 he was again director of the Hamburg theatre, where he produced many of the plays he had written in Vienna (*Victorine*, *Gustav Wasa*, *Der Fähnrich*, *Der Vetter von Lissabon*, to name but a few of these trifles). Schröder died in Rellingen on Sept. 3, 1816. (A. M. N.)

SCHRÖDINGER, ERWIN (1887–1961), Austrian physicist who, with Paul A. M. Dirac (*q.v.*), was awarded the Nobel Prize for physics in 1933 for work on wave mechanics and its applications to atomic structure. His discoveries agreed with those made independently by Werner K. Heisenberg (*q.v.*).

Schrödinger was born in Vienna on Aug. 12, 1887. He was educated at the University of Vienna, Aus., and was subsequently professor of physics in Stuttgart, Ger., Breslau, Pol., and Zürich, Switz. He succeeded Max Planck as professor of physics at the University of Berlin in 1927, and in 1940 he became professor at the Institute for Advanced Studies in Dublin, Ire. He returned to Vienna in 1956 and died there on Jan. 4, 1961.

His work, which was mainly in the field of mathematical physics and especially in the physics of the atom, was an extension of the ideas of Louis de Broglie (*see* BROGLIE). N. H. D. Bohr (*q.v.*) had pictured the atom as consisting of a nucleus about which electrons rotated in fixed orbits, radiation being absorbed or emitted only when an electron changed from one orbit to another, the energy change involved being therefore discrete, and the atom regarded as being in a series of what were called "stationary states." De Broglie's theory of wave mechanics, or matter waves, had modified this by supposing that a wave, with a wavelength an exact submultiple of the length of the orbit, is associated with the electron circulating about the nucleus. Schrödinger extended these ideas further to the problem of atomic structure by supposing that such waves could be superposed on each other. The emission and absorption frequencies were thus related to the orbital frequencies and were represented by the differences of the frequencies of two standing waves. The mathematical application of these ideas was confirmed by experimental observations of spectral lines. Schrödinger wrote several works on wave mechanics and also developed a new field theory.

SCHUBERT, FRANZ PETER (1797–1828), Austrian composer, one of the principal figures in romantic music of the early 19th century, was born on Jan. 31, 1797, in the Himmelpfortgrund suburb of Vienna. His father, Franz Theodor Schubert, was a schoolmaster; his mother, Elisabeth (*née* Vietz), was in domestic service at the time of her marriage. Schubert was their fourth surviving son. His elder brothers were Ignaz, Karl, and Ferdinand, and there was a younger sister, Maria Theresa. The elder Franz Schubert was a man of character who had established a flourishing school. The family was musical and cultivated string-quartet playing in the home, the boy Schubert playing the violin. He received the foundations of his musical education from his father and his brother Ignaz, continuing later with organ playing and musical theory under the instruction of the parish church organist, Michael Holzer. In 1808 he won a scholarship which earned him a place in the imperial court chapel choir and education at the Stadtkonvikt, the principal boarding school for commoners in Vienna, where his tutors were Wenzel Ruzicka, the imperial court organist, and later Antonio Salieri, then at the height of his fame. Schubert played the violin in the students' orchestra, was quickly promoted to leader, and in Ruzicka's ab-

music, conducted. He also attended choir practice and, with his fellow pupils Josef von Spaun, Albert Stadler, and Anton Holzapfel, cultivated chamber music and piano playing.

From the evidence of his school friends, Schubert was inclined to be shy and was reluctant to show his first compositions. His earliest works included a long fantasia for piano duet, written in 1810, D. 1 (*i.e.*, no. 1 in O. E. Deutsch's *Schubert: Thematic Catalogue of All His Works in Chronological Order*, 1951); his first song, "Hagars Klage," D. 5 (1811); several orchestral overtures; various pieces of chamber music; and, in 1811, three string quartets. An unfinished operetta on a text by August von Kotzebue, *Der Spiegelritter*, D. 11, belongs to that year also. The interest and encouragement of his friends overcame his shyness and eventually brought his work to the notice of Salieri.

FRANZ SCHUBERT, DETAIL FROM A WATER-COLOUR BY W. A. RIEDER, 1825

In 1813 Schubert's voice broke; he left the college but continued his studies privately with Salieri for at least another three years. During this time he entered a teachers' training college in Vienna, and in the autumn of 1814 became assistant in his father's school. Rejected for military service on account of his short stature, he continued as a schoolmaster until 1818.

Years of Promise.—The numerous compositions written between 1813 and 1815 are remarkable for their variety and intrinsic worth. They are the products of young genius, still short of maturity but displaying style, originality, and imagination. Besides five string quartets, including those in E♭, D. 87, and G minor, D. 173, there were three full-scale Masses and three symphonies. The third of these symphonies, in D major, a charming example of Schubert's youthful lyricism and high spirits, was finished in 1815. His first full-length opera, *Des Teufels Lustschloss*, was finished in 1814 while he was at the training college. But at this period song composition was his chief, all-absorbing interest. On Oct. 19, 1814, he set his first poem by Goethe, "Gretchen am Spinnrade" from *Faust*; it was his 30th song and in this masterpiece he created at one stroke the German *Lied* (*q.v.*). The following year, 1815, brought the composition of over 140 songs, including many of the first order such as "Rastlose Liebe," "Meeresstille," and "Erlkönig" and such exquisite specimens of his lyrical art as "Heidenröslein" and "Erster Verlust." The author of the texts of all these was Goethe, whose poems always inspired Schubert's finest songs.

The many unfinished fragments and sketches of songs left by Schubert provide some insight into the working of his creative mind. Clearly, the primary stimulus was melodic. The words of a poem engendered a tune. Harmony and modulation were then suggested by the contours of the melody. But the external details of the poet's scene—natural, domestic, or mythical—prompted such wonderfully graphic images in the accompaniments as the spinning wheel, the ripple of water, or the "shimmering robe" of Spring. These features were fully present in the songs of 1815. The years that followed deepened and enriched but did not revolutionize these novel departures in song. In 1815 also Schubert continued to be preoccupied with his ill-fated operas: between May and December he wrote *Der vierjährige Posten*, *Fernando*, *Claudine von Villa Bella*, and *Die Freunde von Salamanka*.

At this time Schubert's outward life was uneventful. Friends of his college days were faithful, particularly Spaun, who in 1814 introduced him to the poet Johann Mayrhofer. He also induced the young and brilliant Franz von Schober to visit Schubert. Late in 1815 Schober went to the schoolhouse in the Säulengasse, found Schubert in front of a class with his manuscripts piled about him, and inflamed the young composer, a willing listener, with a desire to break free from his duties. In the spring of 1816 Schubert applied for the post of music director in a college at Laibach (now Ljubljana, Yugos.) but was unsuccessful. His friends tried to interest Goethe in the songs and in April 1816 sent a volume of 16 settings to the poet at Weimar. It produced no result. At length, in December 1816, Schober persuaded Schubert to apply for leave of absence. Despite his father's reluctance, he obtained it and spent eight months with Schober, living in the home of his friend's widowed mother and paying for his keep whenever he could.

Early in 1817 Schober brought the baritone Johann Michael Vogl to his home to meet Schubert. As a result of this meeting, Vogl's singing of Schubert's songs became the rage of the Viennese drawing rooms. His friendships with the Hüttenbrenner brothers, Anselm and Josef, and with Josef von Gahy, a pianist with whom he played duets, date from these days. But this period of freedom did not last, and in the autumn of 1817 Schubert returned to his teaching duties. He wrote to his friends of himself as a *verdorbener* ("frustrated") musician. The two earlier years had been particularly fruitful. Songs of this period include "Litanei auf das Fest aller Seelen," "An Schwager Kronos," "Ganymed" (the song which had captivated Vogl at their first meeting), "Der Wanderer," and the Harper's Songs from Goethe's novel *Wilhelm Meister*. Smaller but equally remarkable songs are "An die Musik," "Der Tod und das Mädchen," and "Die Forelle." There were two more symphonies: no. 4 in C minor, which Schubert himself named the "Tragic" (1816), and the popular no. 5 in B♭ (1816). A fourth Mass, in C major, was composed in 1816. The year 1817 is notable for the beginning of his masterly series of piano sonatas. Six were composed at Schober's home, the finest being no. 8 in E♭, D. 568, and no. 10 in B major, D. 575; both were published posthumously.

Schubert's years of uncongenial schoolmastering ended in the summer of 1818. His frustrated period in the spring had produced only one substantial work, the Sixth Symphony in C major. But in the meantime his reputation was growing, and the first public performance of one of his works, the "Italian" overture in C major, took place on March 1, 1818, in Vienna. In June he left the city to take up the post of music master to the two daughters, Marie and Karoline, of Johann, Count Esterházy, in the family's summer residence at Zseliz, Hung. Letters to his friends show him in exuberant spirits, and the summer months were marked by a fresh creative outburst. The variations for piano duet in E minor, D. 624, the piano duet sonata in B♭, D. 617, sets of dances, songs, and a German Requiem were all composed at Zseliz.

Maturity.—On his return to Vienna he shared lodgings with Mayrhofer and during the winter months composed the operetta *Die Zwillingsbrüder*. Although sponsored by Vogl the production of the work was postponed, and in June 1818 Schubert and Vogl set off for a protracted holiday in the singer's native district of Steyr, upper Austria. The composer delighted in the beauty of the countryside and was touched by the enthusiastic reception given everywhere to his music. At Steyr he composed the first of his widely known instrumental compositions, the piano sonata in A major, D. 664, and the celebrated "Trout" quintet for piano and strings, D. 667. The close of 1819 saw him engrossed in songs to poems by his friend Mayrhofer, and by Goethe, who inspired the masterly "Prometheus." A fifth Mass, in A♭, was started but laid aside. Another sacred work, begun in 1820 but left unfinished, was the cantata *Lazarus*, anticipating, by its fusion of lyrical and declamatory styles, the style of Wagner.

In June 1820 *Die Zwillingsbrüder* was performed with moderate success at the Kärntnerthor Theater, Vienna, Vogl doubling the parts of the twin brothers. It was followed by the performance of incidental music for the play *Die Zauberharfe*, given at the Theater an der Wien in August of the same year. The lovely, melodious overture became famous as the *Rosamunde* overture. Schubert was achieving renown in wider social circles than the restricted spheres of friend and patron. The Sonnleithner family was interested in his development; their son, Leopold, became a great friend and supporter. At the close of the year 1820 Schubert

composed the *Quartettsatz* in C minor heralding the great string quartets of the middle 1820s, and another popular piece, the motet for female voices on the text of Psalm XXIII. In December 1820, he began the choral setting of Goethe's "Gesang der Geister über den Wassern," for male-voice octet, D. 714, completed in February 1821.

All Schubert's efforts to publish his own work were fruitless. Early in 1821, however, a few friends, including Leopold von Sonnleithner and Josef Hüttenbrenner, offered the "Erlkönig" on a subscription basis. The response was so successful that enough money was raised for the printing of "Gretchen am Spinnrade" also. "Erlkönig" appeared as Schubert's op. 1 on April 2, 1821, and "Gretchen" as op. 2 on April 30, 1821. From then on songs, part-songs, dances, and pianoforte duets were published. Eighteen months later op. 12 had been reached.

In Vienna the popularity of Schubert's songs and dance music became so great that concert parties were entirely devoted to them. These parties, called *Schubertiade,* were frequently given in the homes of wealthy merchants and civil servants. But the wider worlds of opera and public concerts still eluded him. He worked during August 1821 on a seventh symphony in E minor and major, but this too was put aside along with many other unfinished works of the period. His determination to establish himself in opera led him in September and October to spend a short holiday with Schober at St. Polten where the friends devoted their energies to the production of a 3-act opera *Alfonso und Estrella.* It was completed in February 1822 but was never performed. While spending a few days at Atzenbrugg in July 1822, with Schober and other friends, he produced the document called *Mein Traum* ("My Dream"), describing a quarrel between a music-loving youth and his father. Fanciful biographical interpretations of this document have little, if any, factual foundation. The autumn of 1822 saw the beginning of yet another unfinished composition—not, this time, destined to obscurity: the "Unfinished" Symphony no. 8 in B minor, which speaks from Schubert's very heart. Two movements were completed in October and November 1822, the abandoned work including also a half-finished scherzo. In November of the same year Schubert composed a piano fantasia in which the variations are on a theme from his song "Der Wanderer." The Mass in A♭ was also completed in this month.

At the close of 1822 Schubert contracted a venereal disease, probably syphilis, and the following year was one of illness and retirement. He continued to write almost incessantly. In February he wrote the piano sonata in A minor, D. 784, and in April he made another attempt to gain success in the Viennese theatres with the one-act operetta *Die Verschworenen* ("The Conspirators"), the title being changed later (because of political censorship) to *Der häusliche Krieg* ("War in the Home"). The famous work of the year, however, was the song-cycle *Die schöne Müllerin,* representing the epitome of Schubert's lyrical art. Other songs of this period are "Auf dem Wasser zu singen" and "Du bist die Ruh'." Schubert spent part of the summer in the hospital and probably started work while a patient on his most ambitious opera, *Fierrabras.* The work was rejected by the directorate of the Kärntnerthor Theater. The year 1823 closed with Schubert's composition of the music for the play *Rosamunde,* performed at the Theater an der Wien in December. This production failed. The text of the play is lost, and the music was subsequently heard only in the concert hall.

The early months of 1824 were again unhappy. Schubert was ill, penniless, and plagued by a sense of failure. Yet during these months he composed three masterly chamber works: the string quartet in A minor, a second string quartet in D minor containing variations on his song "Der Tod und das Mädchen," and the octet in F major for strings and wind instruments. His dejection transpires in a letter of March 31, 1824, to his friend Leopold Kupelwieser, the painter, in which he speaks of himself as "the most unfortunate, the most miserable being in the world." In desperate need of money, he returned in the summer to his teaching post with the Esterházy family and in May 1824 went again to Zseliz. Once more his health and spirits revived. The period was marked by some magnificent piano duets, the "Grand Duo" in C major, D. 812, the variations on an original theme in A♭, D. 813, and the "Hungarian Divertissement," D. 818. The first work was published posthumously, the other two in Schubert's lifetime, in 1825 and 1826.

Although his operas remained unperformed, there were frequent public performances of his songs and part-songs in Vienna during these and the following years. Publication proceeded rapidly and his financial position, though still strained, was at any rate eased. In 1825 he spent another holiday in upper Austria, with Vogl, visiting Linz, Gmunden, and Gastein and finding a warm welcome for himself and his music wherever he went. This is the period of the "Lady of the Lake" songs (to words of Sir Walter Scott, translated by P. A. Storck), including the once popular but later neglected "Ave Maria." Instrumental compositions are the sonatas in A minor, D. 845, and in D major, D. 850, the latter composed at Gastein. He sketched a symphony during the summer holiday (in all probability the beginnings of the "Great" C-major Symphony, completed in 1828). The spring of 1825 had seen the composition of two well-known songs, "Im Abendrot" and "Die junge Nonne"; they were followed in the late summer by "Die Allmacht" and "Das Heimweh," two of his greatest songs inspired by nature. New friends, Moritz von Schwind, a young painter, and Eduard Bauernfeld, a dramatist, were almost continuously in his company during this period. Schwind left pictorial records of Schubert; Bauernfeld, reminiscences.

The resignation of Salieri as imperial *Kapellmeister* in 1824 had led to the promotion of his deputy, Josef Eybler. In 1826 Schubert applied for the vacant post of deputy *Kapellmeister,* but in spite of strong support by several influential people he was unsuccessful. From then on until his death two years later he seems to have let matters drift. Neither by application for professional posts nor submission of operatic work did he seek to establish himself. It can hardly be believed that Schubert was unaware of his exceptional powers; yet together with an awareness of genius, and the realization that it opened doors into cultivated society, went the knowledge of his humble birth and upbringing, and also of his somewhat uncouth bearing. This self-consciousness made him diffident, reserved, and hesitant. His life was almost entirely devoted to composition, and he derived his livelihood from publishers' fees and occasional teaching. The songs of 1826 include the settings of Shakespeare's "Hark! Hark! the lark!" and "Who is Silvia?" written during a brief stay in the village of Währing. Three fine instrumental works of this summer and autumn are the last string quartet in G major, the sonata in G major, D. 894, and the start of the piano trio in B♭, D. 898.

In 1827 he composed the first 12 songs of *Winterreise,* a return to the poems of Wilhelm Müller, author of *Die schöne Müllerin.* Beethoven's death in 1827 undoubtedly had a profound effect on Schubert. It is perhaps going too far to imagine that he considered himself Beethoven's heir and that henceforth he deliberately attempted to reproduce Beethoven's manner in his work. But there is no denying that a profounder, more intellectual quality appears in his last instrumental works. Some of them, especially the piano trio in E♭ (1827) and the C minor sonata (1828), suggest the authority of Beethoven, but his own strong individuality is never submerged.

In September 1827 Schubert spent a short holiday in Graz as a guest of Karl and Marie Pachler. On his return he composed the piano trio in E♭ and resumed work on Part II of the *Winterreise;* the 13th song, "Die Post," was written in October 1827. This is the period of his piano solos, the *Impromptus* and *Moments musicaux.*

A succession of masterpieces marks the last year of his life. Early in the year he composed the greatest of his piano duets, the fantasia in F minor, D. 940. The "Great" C-major Symphony was concluded in March, as was also the cantata *Miriams Siegesgesang.* In June he worked at his sixth Mass, in E♭. A return to songwriting in August produced the series published together as the *Schwanengesang.* In September and early October the succession was concluded by the last three sonatas, in C minor, A major, and B♭ (D. 958, 959, and 960), and the great string quintet in C major—the swan song of the classical era in music.

The only public concert Schubert gave took place on March 26, 1828. It was both artistically and financially a success and the impecunious composer, it is recorded, was at last able to buy himself a piano. At the end of August he moved into lodgings with his brother Ferdinand, then living in a suburb of Vienna. Schubert's health, broken by the illness of 1823, had deteriorated, and his ceaseless work had exhausted him. In October he developed typhoid fever as a result of drinking tainted water. His last days were spent in the company of his brother and several close friends. He died in Vienna on Nov. 19, 1828. On his tomb in the Währingerstrasse Cemetery was engraved the epitaph of Grillparzer: "The Art of Music has here entombed a rich treasure, but yet far fairer hopes."

Schubert's place in the history of music is equivocal: he stands between the worlds of classical and romantic music. He is, however, chiefly to be considered as the last of the classical composers. His music, subjectively emotional in the romantic manner, poetically conceived, and revolutionary in language, is nevertheless cast in the formal molds of the classical school—with the result that in the 20th century it was increasingly apparent that Schubert more truly belongs to the age of Haydn, Beethoven, and Mozart than to that of Schumann, Chopin, and Wagner.

SCHUMAN, ROBERT (1886–1963), French statesman and an outstanding worker for European unity after World War II, was born in Luxembourg on June 29, 1886. A Catholic, he studied at several German universities, and returned to Lorraine to practise law. When Alsace-Lorraine was recovered by France, he sat in the Chamber of Deputies from November 1919, representing the Moselle *département* as a member of the Parti Démocrate Populaire (P.D.P.). A specialist on financial matters and Franco-German relations, he was appointed undersecretary of state for refugees for Alsace-Lorraine in Paul Reynaud's government (March 1940) during World War II. Under the Franco-German armistice he went back to Metz in August, but was arrested by the Germans in September 1940. Escaping in 1942, he worked with the Resistance in France till the expulsion of the Germans.

Prominent in the formation of the Mouvement Républicain Populaire (M.R.P.), which superseded the P.D.P. as the principal organ of Christian democracy, Schuman was a deputy again from 1945. Having been minister of finance (July 24–Nov. 28, 1946) and prime minister (Nov. 22, 1947–July 19, 1948), he served as foreign minister in ten successive governments, from July 1948 to December 1952, including his own second cabinet (Aug. 31–Sept. 9, 1948). In this capacity he promoted European unity and, with it, Franco-German reconciliation. The so-called Schuman Plan for the European Coal and Steel Community (*q.v.*), put forward by him in May 1950, became a reality in June 1952; but the idea of an integrated European army, launched by Schuman and by the prime minister, René Pleven, in November 1950, met with strong opposition (it was finally rejected by the Chamber of Deputies in August 1954). When the European Parliamentary Assembly, consultative body of the European Economic Community, met at Strasbourg in March 1958, it elected Schuman as its president. He resigned this post in March 1960, but remained a member of the assembly till February 1963.

Within the M.R.P., Schuman was from 1958 the chief opponent of the rightwing extremism of Georges Bidault (*q.v.*). In January 1961, he collapsed on a walk and lay all night on the ground in a freezing temperature. Never fully recovering, he died, near Metz, on Sept. 4, 1963.

SCHUMAN, WILLIAM HOWARD (1910–), U.S. composer of symphonies, ballets, and chamber music, one of the leading figures in 20th-century American music, was born in New York City on Aug. 4, 1910. He studied at Teachers College, Columbia University. From 1935 to 1945 he was instructor in music at Sarah Lawrence College. From 1945 to 1962 he was president of the Juilliard School of Music, New York City; in 1962 he became president of the city's Lincoln Center for the Performing Arts. Between 1935 and 1962 he wrote eight symphonies, but withdrew the first two. His third and fourth symphonies are predominantly dissonant; the fifth, scored for strings only, is more romantic in feeling, but the sixth is again contemporary in style. The seventh and eighth symphonies show his symphonic style at its best. Like his symphonies, his four string quartets, written between 1936 and 1950, show his polyphonic and rhythmic gifts. His ballets, *Undertow* (choreography by Antony Tudor), *Night Journey,* and *Judith* (choreography by Martha Graham), written between 1945 and 1950, use an expressionist technique. His *American Festival Overture* (1939) and his opera *The Mighty Casey* (1953; story from baseball legend) are conceived in a distinctively American style. In 1943 he received the first Pulitzer Prize to be awarded for a musical work to an American composer for his cantata *A Free Song* (1942), to the words of Walt Whitman.

See F. R. Schreiber and V. Persichetti, *William Schuman* (1954). (N. Sy.)

SCHUMANN, ELISABETH (1885–1952), U.S. (originally German) soprano known for her interpretation of *Lieder* and of the music of Mozart and Richard Strauss, was born at Merseburg on June 13, 1885. She made her debut at the Hamburg Opera in 1910. In 1914 she took the part of Sophie in Strauss's *Der Rosenkavalier* at the Metropolitan Opera, New York City. She sang at the Vienna Opera in 1919, and in 1921 toured the U.S. with Richard Strauss. In 1938 she settled in the U.S., taught at the Curtis Institute at Philadelphia, and in 1944 became a U.S. citizen. She was for a time married to the conductor Karl Alwin. In 1948 her work, *German Song,* was published in London. She died in New York City on April 23, 1952.

SCHUMANN, ROBERT ALEXANDER (1810–1856), German composer particularly notable for his piano music, songs, and orchestral music, was born at Zwickau, Saxony, on June 8, 1810. His father was a bookseller and publisher. After four years at a private school, the boy entered the Zwickau *Gymnasium* in 1820 and remained there for eight years. He began his musical education at the age of six and in 1822 produced his earliest known composition, a setting of Psalm 150. At the same time he began to show at least equal literary ability, embarking on plays (a comedy and two "horror dramas") and poems, including some translations of Horatian odes which have been preserved. In 1827 he came under the musical influence of Schubert and the literary influence of Jean Paul Richter, both of which proved deep and enduring; in the same year he composed some songs (two of which were published in 1933).

Early Career and Marriage.—In 1828 he left school and, under pressure from his mother and his guardian (his father having died), entered Leipzig University as a law student; but his time was devoted not to the law but to song-composition, improvisation at the piano, and attempts to write autobiographical novels in the manner of Jean Paul. For a few months he studied the piano seriously with a celebrated teacher, Friedrich Wieck, and thus got to know Wieck's nine-year-old daughter Clara, a brilliant pianist who was just then beginning a successful concert career.

BY COURTESY OF THE GESELLSCHAFT DER MUSIKFREUNDE, VIENNA

ROBERT SCHUMANN, DETAIL FROM A LITHOGRAPH BY KRIEHUBER, 1839

In the summer of 1829 he left Leipzig for Heidelberg where one of the law professors, Justus Thibaut, was known as a writer on musical aesthetics, and under Thibaut's influence made the ac-

quaintance of a great deal of early choral music, from Palestrina to Bach. He composed Schubertian waltzes, afterward used in the piano-cycle *Papillons,* and practised industriously with a view to abandoning law and becoming a virtuoso pianist—with the result that his mother agreed to allow him to return to Leipzig in October 1830 to study for a trial period with Wieck, who thought highly of his talent but doubted his stability and capacity for hard work.

Schumann's relations with Wieck were never happy, nor were they with the conductor Heinrich Dorn with whom he worked for a year at harmony and counterpoint. He always found it difficult to concentrate and he was distracted from his musical studies by the writing of yet another autobiographical novel, *Die Davidsbündler,* in which two self-projections, Florestan and Eusebius, were created. These two characters also appeared in Schumann's first published critical essay, on Chopin's *Là ci darem* variations (*Allgemeine musikalische Zeitung,* Dec. 7, 1831), and often later in critical writings, as reviewers of new music, and even as the composers of his own works. His Opus 1, also a set of variations —originally conceived, like Chopin's, for piano and orchestra— had been published just two months before the Chopin article. An accident to one of the fingers of his right hand, which put an end to his hopes of a career as a virtuoso, was perhaps not an unmitigated misfortune, since it confined him to composition. This was a period prolific in piano pieces, which were published either at once or later in revised forms. In October 1832 Schumann embarked on a symphony in G minor of which the first movement was played three times in public, the third time in Clara Wieck's concert at the Leipzig Gewandhaus, though the symphony was never quite completed.

Two important piano works of 1834 arose from a love affair with another of Wieck's pupils, Ernestine von Fricken: the cycle *Carnaval,* based on the letters A, S (Es, *i.e.,* E♭), C, H (B♮ in German), which spelled the town, Asch, where she lived and which were also contained in his own name; and the *Études symphoniques,* variations on a theme by her father. The affair lasted for more than a year but, long before the engagement was formally broken off (Jan. 1, 1836), Schumann had fallen in love with the now 15-year-old Clara Wieck. Clara returned his kisses but obeyed her father when he ordered her to break off the relationship. Schumann found himself abandoned for 16 months, during which he expressed his alternate despair and resignation in the great C-major *Phantasie* for piano, drank wildly, sought consolation with other girls, and even published a bitter, veiled lampoon on Clara in the *Neue Zeitschrift für Musik* (a periodical which he had helped to found in 1834 and of which he had been editor and principal proprietor since the beginning of 1835). Clara herself made the first move toward a reconciliation, and on Sept. 13, 1837 —her 18th birthday—Schumann formally asked her father's permission to marry her; the request was at first evaded rather than refused.

Schumann now entered upon one of his most fertile creative periods, producing the *Davidsbündlertänze, Novelletten, Kinderscenen, Arabeske, Blumenstück, Humoreske,* and *Faschingsschwank aus Wien,* among other well-known piano works. (Most of the *Faschingsschwank* was actually written in Vienna, during a visit in the course of which Schumann unearthed a number of Schubert manuscripts, including that of the "Great" C-major Symphony). Even this was not a time of unalloyed happiness, for Clara refused to marry without financial security and her father still withheld his consent. A formal statement by Clara on June 15, 1839, initiated legal proceedings for the setting aside of that condition. The affair dragged on for more than a year; it was taken to a court of appeal which still upheld one of Wieck's objections, that Schumann was a heavy drinker, and to a yet higher one which ruled that Wieck must produce proof of habitual drunkenness. This he failed to do and on Sept. 12, 1840, the marriage took place. Early that year Schumann returned to a field he had neglected for nearly 12 years, that of the solo song; in the space of 11 months (February-December 1840) he composed nearly all the songs on which so much of his reputation rests: the cycles *Myrthen,* the Heine and Chamisso *Liederkreis, Dichterliebe, Frauenliebe und -leben,* and many separate songs.

The Larger Works.—Clara had been pressing him to widen his scope, to launch out in other media—above all, the orchestra. He had in earlier days made at least five unsuccessful attempts at works for piano and orchestra; even the G minor Symphony was never finished. Now in January–February 1841 he composed a symphony in B♭ ("No. 1"), which was at once (March 31) performed under Mendelssohn at the Leipzig Gewandhaus; an *Overture, Scherzo,* and *Finale* (April–May); a *Phantasie* for piano and orchestra (May) which was expanded into the famous Piano Concerto by the addition of two more movements in 1845; another symphony, in D minor (June–September); and the sketches for yet a third symphony, in C minor, of which only the scherzo survives as the piano piece, op. 99, no. 13. The orchestral impulse was temporarily spent. Schumann was much occupied with his *Neue Zeitschrift;* he would have liked to write an opera; and his first experience of a concert tour with Clara showed him, as every later tour was to do, that the public regarded him only as "the great pianist's husband." He returned to Leipzig alone and drowned his melancholy in "beer and champagne."

On Clara's return he essayed another new medium—new except for a youthful piano quartet in C minor (1829): chamber music. Between June 1842 and January 1843 he wrote three string quartets, the Piano Quintet, the E♭ Piano Quartet, a piano trio in A minor (recast in 1850 as the *Fantasiestücke,* op. 88), and an *Andante con variazioni* for two pianos, two cellos, and horn which has become better known in a later version for pianos only. The year 1843 was marked by Schumann's most ambitious work so far, a "secular oratorio" (originally conceived as an opera), on Thomas Moore's *Paradise and the Peri.* He made his debut as a conductor—a role in which he was invariably ineffective—with its first performance (Dec. 4).

During his work on *The Peri* the Leipzig Conservatory had been opened with Mendelssohn as director and Schumann as professor of "piano playing, composition, and playing from score"; again he had embarked on activities for which he was unsuited. The period February–May 1844 was spent on a concert tour of Russia with Clara, which again depressed Schumann by the consciousness of his inferior role. On returning to Leipzig he resigned the editorship of the *Neue Zeitschrift.* In August he composed some numbers for an opera on Goethe's *Faust,* but work was interrupted by a serious nervous collapse which led to the Schumanns' leaving Leipzig. From December 1844 to September 1850 they lived in Dresden, where his health was gradually restored. He began to teach Clara counterpoint, a preoccupation which led to an outburst of contrapuntal composition: the organ fugues on BACH, and other works. Next he completed the Piano Concerto and in December 1845 he began another symphony ("No. 2"), in C major; because of aural nerve trouble nearly ten months passed before the score was finished. Other outstanding works of the Dresden period were two piano trios (op. 63 and op. 80 [1847]); an opera, *Genoveva,* based on a conflation of the dramas by Tieck and Hebbel (1847–50; produced at Leipzig, June 25, 1850); a fine overture, with incidental music, to Byron's *Manfred* (1848–49); the piano *Album für die Jugend* (1848); the *Spanisches Liederspiel* (1849; a cycle for four voices and piano); and the *Requiem für Mignon* (1849; for solo voices, chorus, and orchestra). There were also other instrumental pieces, a host of part-songs, a renewal of solo-song composition, and from time to time additions to the *Szenen aus Goethe's "Faust"* (to which the overture was written last, in 1853).

Last Years.—The insurrection of May 1849 terminated Schumann's never very close friendship with Wagner; indeed he had failed either to make close friends or to obtain any official position in Dresden. Attempts to get posts in Leipzig and Vienna had also been abortive. In the end, for want of anything better, he accepted the appointment of municipal director of music at Düsseldorf. At first things went tolerably well; in 1850–51 Schumann composed a cello concerto, the Third Symphony (the *Rhenish*); overtures to Schiller's *Die Braut von Messina* and Shakespeare's *Julius Caesar;* the cantata *Der Rose Pilgerfahrt* and other choral works; a third piano trio and two violin sonatas; and he drastically rewrote the ten-year-old D minor Symphony ultimately published

as "No. 4." He also conducted eight subscription concerts, but temperamental differences soon showed themselves and Schumann's shortcomings as a conductor became obvious. There were a number of painful scenes and chaotic rehearsals; in December 1852 he was asked to resign but declined, and in October 1853 the refusal of the choir to sing Mendelssohn's *Walpurgisnacht* under him brought the final break. He conducted for the last time on Oct. 27, when the young Joseph Joachim played the *Phantasie* for violin and orchestra Schumann had just written for him. The day after the concert appeared Schumann's last contribution to the *Neue Zeitschrift,* an enthusiastic article in praise of Joachim's still younger friend Brahms. Two other works written for Joachim during October–November 1853 (but published only many years later) were the Violin Concerto and a third violin sonata.

On Feb. 10, 1854, Schumann complained of a "very strong and painful" attack of the ear malady which had troubled him before; this was followed by aural illusions such as the dictation by angels of a theme (actually a reminiscence of the Violin Concerto) on which he proceeded to write some variations for piano. On Feb. 26 he asked to be taken to a lunatic asylum, and the next day attempted suicide by drowning. (He had contemplated suicide on at least three occasions during the 1830s.) On March 4 he was removed to a private asylum at Endenich, near Bonn, where he lived for nearly two and a half years, able to correspond for a time with Clara and his friends. One or two visits by Brahms or Joachim agitated him terribly and Clara was kept from him until July 27, 1856, when it was realized that the end was near. He seemed to recognize her but was unable to speak intelligibly. On July 29, 1856, he died.

Assessment.—As a composer, Schumann was first and most naturally a miniaturist. Until after his marriage the great bulk of his work—including much of his best and that by which he is best known—consisted of short piano-pieces and songs, two genres which in his case are so closely related as to be hardly more than two facets of the same. The song "accompaniments" are often almost self-sufficient piano-pieces, and the piano-pieces often seem to have been melodically inspired by lyrical poems; indeed the slow movements of the G minor and F♯ minor piano sonatas have also survived in their original forms as songs. Even when the musical idea did not originate in literature but as a waltz or polonaise or some striking harmonic progression found at the piano by his improvising fingers, it was usually given a quasi-literary title or brought into relationship with some literary idea—which might or might not be openly revealed. All his most characteristic work is introverted, a selection of pages from a secret diary; his notebooks show how he cherished musical ideas not only for their own sake but because they recorded precise moments and their moods.

It is easy to see why the imagery of the carnival and the masked ball appealed to him so powerfully (*Papillons, Carnaval, Faschingsschwank aus Wien*), for all his early music—and much of the later—is full of enigmas, musical quotations (usually in subtle disguises), and veiled allusions. In this field of the piano-miniature and the pianistic song, Schumann is a supreme master; in the simpler kind of lyrical inspiration and in the invention of aphorisms he has seldom been surpassed.

When, however, under Clara's influence he embarked on more ambitious composition, he was often less happy. It was not only that he felt unsure in writing for the orchestra and relied too often on safe routine procedures, and that his string-writing is pianistic: his most characteristic musical ideas, which he had hitherto been content to fit together in mosaics or remold plastically by variation, were seldom suited for development on a big scale. Nor in sustained thought, in large and to some extent impersonal works directed to the great public, did he find a satisfaction comparable with that which he derived from the creations of his private dreamworld. It is astonishing that Schumann was able to overcome these natural limitations as well and as often as he did; that he was able to construct a symphony as firmly welded as the D minor or a symphonic first movement as organic as that of the E♭, and that he could conceive orchestral music of such gloomy power as the *Manfred* overture or the penultimate movement of the E♭ Symphony, or as light-handed and imaginative as the "Witch of the Alps" scene in the incidental music to *Manfred.* Some of the large-scale works, such as the Piano Concerto and the Piano Quintet, depend overmuch on the piano for their salvation, but the piano certainly saved them. Drama was beyond him—though there are fine passages in the *Faust* music—and *Genoveva* is a failure; yet even *Genoveva* is a fascinating failure, abreast—sometimes even ahead—of the Wagner of the same period in its harmonic idiom and in its use of thematic reminiscence not only to make dramatic points but to build up a character in music.

It was long customary to detect in the works of Schumann's last years evidence of his approaching collapse. But he had been mentally unstable all his life, haunted by fears of insanity since the age of 18, and the change of style noticeable in the music of the 1850s—the increasing angularity of his themes and complication of his harmony—may be attributed to other causes, including the influence of Bach. He was rightly considered a very advanced composer in his day and his influence on later 19th-century composers as different as Brahms and Tchaikovsky, to say nothing of a host of lesser men, was very considerable. He stands in the front rank of German romantic artists. Even his critical writing, as fantastic, subjective, and lyrical as his early music, constitutes a valuable document of the trend and period.

SCHUMANN-HEINK, ERNESTINE (née RÖSSLER) (1861–1936), German-U.S. contralto, who was one of the principal interpreters of the operatic works of Wagner and Strauss before the outbreak of World War I. She was born at Liben, now part of Prague, on June 15, 1861, and made her debut at Dresden in 1878. She sang in Wagnerian operas at Bayreuth between 1896 and 1906 and created the role of Klytemnestra in Richard Strauss's *Elektra* at Dresden in 1909. In 1882 she married Ernst Heink, from whom she was later divorced. Her second husband was Paul Schumann, who died in 1904. In 1905 she married William Rapp, from whom she was divorced in 1914. She became a U.S. citizen in 1908. In the latter part of her life she was well-known for her radio broadcasts in the U.S. She died at Hollywood, Calif., on Nov. 17, 1936.

See M. Lawton, *Schumann-Heink* (1928).

SCHURZ, CARL (1829–1906), U.S. journalist, politician, and reformer who strove for high standards of honesty in government service, was born near Cologne, Ger., on March 2, 1829. As a student at the University of Bonn he became involved in the movement that produced the Revolution of 1848. Forced to flee from Germany, he lived for a time in Switzerland, France, and England. In 1852 he migrated to the United States, settling first in Philadelphia, then in Watertown, Wis. (1856), Detroit (1866), St. Louis (1867), and New York City (1881).

Finding in the United States the democratic system he had hoped to establish in Germany, he saw no need for revolution in his adopted land. But he did find causes to espouse and spent a half century as a political reformer. In the 1850s he opposed slavery; during Reconstruction he fought political corruption; in the 1880s he battled for civil service reform; and he concluded his public career in 1900 by opposing overseas expansion. But Schurz was no radical. He was conservative in social and economic philosophy and sought to preserve what he considered the enduring values of the republic. He viewed with distaste leaders such as Eugene Debs and Henry George, who advocated fundamental change, and he had no sympathy for agrarian inflationists like William Jennings Bryan.

Schurz came into prominence in the late 1850s when he attempted to steer German-Americans into the new Republican Party. This was difficult, for most German-Americans were Douglas Democrats who suspected the Republicans of having anti-foreign leanings. Schurz, however, made some headway with anti-

slavery appeals and at the same time opposed nativism within Republican ranks.

In 1860 Schurz headed the Wisconsin delegation at the Republican national convention that nominated Lincoln. His reward was appointment as minister to Spain in 1861 and as brigadier general (later major general) of volunteers in 1862. Although a "political general," Schurz made a good Civil War officer, commanding troops at the second battle of Bull Run and at Chancellorsville, Gettysburg, and Chattanooga.

After the war Schurz toured the South for President Johnson. His report has interest today because of his strong advocacy of Negro rights. Johnson, however, disagreed with Schurz's views and shelved the report. In 1866 Schurz became editor of the *Detroit Post* and then editor and part owner of the *St. Louis Westliche Post*. In Missouri he won his only elective office, serving as U.S. senator from 1869 to 1875. As senator, he broke with President Grant on reconstruction policy, on the issue of political corruption, and on the proposed annexation of Santo Domingo. These conflicts led Schurz to help organize the Liberal Republican Party in 1872, but he rejoined the Republicans in 1876, supporting Hayes on the issues of hard money and good government. As Hayes's secretary of the interior (1877–81) Schurz promoted civil service reform and an improved Indian policy.

Returning to journalism and writing, Schurz edited the *New York Evening Post* in the early 1880s and wrote biographies of Clay (1887) and of Lincoln (1889), both of whom he admired. In the 1890s he was an editorial writer for *Harper's Weekly*. Continuing his interest in honest government, Schurz headed the National Civil Service Reform League from 1892 to 1901. During this period he broke with the Republicans twice more, leading an independent Republican (Mugwump) bolt from Blaine in 1884 to back Cleveland and reluctantly abandoning McKinley in 1900 to side with Bryan on the anti-imperialist issue. He died in New York City on May 14, 1906.

Schurz was a tireless and effective speaker, a vigorous and outspoken journalist. His uncompromising manner made enemies and reduced his influence among professional politicians. Yet he was respected. Hence, while maintaining the highest standards of political morality, he managed to wield considerable influence in an era when political standards were not conspicuously high.

See his *Reminiscences* (1907–08) and Claude M. Fuess, *Carl Schurz, Reformer* (1932). (F. H. Hn.)
